**Prof. Milind J. Umekar**
President, Indian Pharmaceutical Congress Association (IPCA)
President, Association of Pharmaceutical Teachers of India (APTI)

It is with immense pleasure and great anticipation that I welcome all researchers, academicians, and industry professionals to the 74th Indian Pharmaceutical Congress (IPC), the nation's most inclusive gathering of pharmacy professionals. Hosted by the Association of Pharmaceutical Teachers of India (APTI), this gigantic event is scheduled from December 19th to 21st, 2025, at the Bangalore International Exhibition Centre (BIEC), Bengaluru. The scientific structure of the 74th IPC has been purposefully designed to address the technological evolution necessary for stakeholder advancement, encapsulated in our dynamic theme: "AI & TECHNOLOGY IN PHARMA: EDUCATE, INNOVATE, EMPOWER."

This Abstract Book stands as a definitive compilation of the cutting-edge research to be presented at the Congress, reflecting the depth and breadth of pharmaceutical innovation across India.

We are proud to acknowledge the exceptional response of more than 3300 abstracts submitted across 12 distinct areas of specialization, including Pharmaceutical Technology, Medicinal Chemistry, Pharmacognosy, Indigenous Drugs, Herbal formulations and Phytochemistry, Pharmacology and Toxicology, Clinical Research & Pharmacovigilance, Pharmaceutical Analysis and Quality Assurance, Biopharmaceutics, Pharmacokinetics & Drug Metabolism, Biotechnology and Biotherapeutics, Hospital, Community and Clinical Pharmacy, Pharmaceutical Education and Professional Pharmacy, Drug Regulatory Affairs & Pharmaceutical Management, Pharmacoeconomics and Pharmacoepidemiology, Artificial Intelligence / Bioinformatics / Data Analytics. These selected posters and oral presentations will facilitate a vital scientific discourse and knowledge exchange among learners and professionals from all domains of pharmacy across India.

The program intentionally places major emphasis on the integration of disruptive technologies within the pharmaceutical sphere. A core focus is placed on the scientific presentation and discourse surrounding Artificial Intelligence (AI) and advanced automation methodologies, examining their transformative capacity in optimizing industrial operational efficiency, expediting the drug discovery and development pipeline, and ultimately enhancing therapeutic efficacy and patient care trajectories. Dedicated symposia, plenary, and brainstorming sessions will explore innovations in medical devices, nanotechnology, and biotechnology platforms. Technical discourse will cover the synthesis, markets, and regulatory compliance of APIs, excipients, cosmeceuticals, and nutraceuticals. Concurrently, critical updates on global decisions and guidelines in pharmacovigilance, medical coding, and regulatory affairs will be provided.

My whole-hearted thanks to the IPCA Scientific Committee and the Local Scientific Team for diligently structuring these scientific themes and flawlessly executing the complex process of abstract scrutiny and error resolution. I extend my deepest gratitude to the abstract evaluation team for their tremendous expertise and time in the domain-wise scrutiny and correction process, and to the dedicated abstract book compilation team.

May this Abstract Book serve as an indispensable resource, igniting new collaborations and directing the path of pharmaceutical research. I look forward to an enriching, empowering, and fruitful 74th IPC.

Warm regards,
Dr. Milind J. Umekar
President, IPCA

MESSAGE

## Dr. T V. Narayana
Secretary – Indian Pharmaceutical Congress Association (IPCA)

As the secretary of the Indian Pharmaceutical Congress Association (IPCA) I am delighted to convey my sincere felicitations and an enthusiastic invitation to every scientist, educator, and corporate expert gracing our presence. This summit represents the most all-encompassing assembly for pharmacy professionals nationwide.

The stage for this monumental convention, organized under the stewardship of the Association of Pharmaceutical Teachers of India (APTI), is the Bangalore International Exhibition Centre (BIEC) in Bengaluru, dated December 19th to 21st, 2025. The leitmotif guiding our proceedings is "AI & TECHNOLOGY IN PHARMA: EDUCATE, INNOVATE, EMPOWER," which highlights the essential role of technological progress in elevating all stakeholders.

We celebrate a staggering contribution of over 3500 abstracts, distributed across 12 specialized domains. This robust collection of posters and oral presentations is set to catalyze crucial scientific dialogue and intellectual exchange among the community. The Abstract Book serves as the definitive index of pioneering investigations scheduled for presentation.

A primary pillar of the agenda is the intensive study of game-changing technologies within the pharmaceutical ecosystem. We are dedicating significant attention to the scientific exploration of Artificial Intelligence (AI) and sophisticated automation techniques. The goal is to dissect their power to streamline operational efficiency in industry, accelerate the drug development process, and ultimately improve therapeutic outcomes and patient service pathways.

Furthermore, our technical sessions will meticulously address the synthesis, commercial landscape, and regulatory adherence for Active Pharmaceutical Ingredients (APIs), excipients, cosmeceuticals, and nutraceuticals. Specialized forums and sessions are slated to showcase breakthroughs in nanotechnology, medical devices, and biotechnology platforms, along with essential international regulatory and pharmacovigilance updates.

I extend my deepest appreciation to the IPCA Scientific Committee and the Local Scientific Team for their meticulous effort in designing the themes and flawlessly executing the rigorous process of abstract review. A distinct commendation is reserved for the abstract evaluation and compilation teams, whose expertise and time were indispensable to this massive undertaking.

Dr. T V. Narayana
Secretary –Indian Pharmaceutical Congress Association (IPCA)

MESSAGE

**Prof. Vandana B. Patravale**
Scientific Convener, 74th Indian Pharmaceutical Congress, Bengaluru

It is our great pleasure to welcome all the participants of the 74th Indian Pharmaceutical Congress, Bengaluru, to be held from December 19th to 21st, 2025. This year's Congress marks a defining moment as we stand at the intersection of pharmaceutical science and transformative digital technologies and deliberate on the theme "AI & Technology in Pharma: Educate, Innovate, Empower".

The carefully curated scientific program featuring global experts discussing AI-driven drug discovery, macromolecule delivery, nanomedicine, neurotherapeutics, chemotherapeutics, ADMET prediction, PBPK modelling, medical devices development, pharmacogenomics, precision medicine, 3D printing, phytochemical screening, diagnosis, and sustainable innovation, reflects the breadth and depth of emerging opportunities shaping the future of healthcare. Additionally, lectures tailored for young researchers will focus on AI in pharmaceutical education and research, writing research proposals, and the role of AI as a teaching partner. Industry and academia experts who transformed the pharmaceutical start-up sector will also disseminate their knowledge and experiences.

As pharmacists and pharmaceutical scientists, it is our responsibility to embrace AI not as a replacement, but as a powerful ally that enhances our capability to ensure quality, safety, ethics, and excellence in every aspect of drug development and healthcare delivery.

About 3500 abstracts submitted under 12 areas of specialization have been selected for poster presentation. I urge our young researchers and students to be fearless in exploring new ideas and to fully engage with the enriching learning opportunities this Congress offers through symposia, plenary lectures, oral sessions, and interactions with innovators and thought leaders.

With immense pride, on behalf of the Scientific Services Committee, once again I welcome you all and look forward to a Congress that inspires collaboration, ignites new possibilities, and strengthens India's path toward a technologically empowered pharmaceutical future.

Prof. Vandana B. Patravale
Scientific Convener, IPC

978-81-980623-8-3

MESSAGE

## Dr. G. Jeyabalan,
Co-Convener,
IPCA Scientific Services Committee

It is with profound honor and a deep sense of pride that I extend my felicitations on the resounding success of the 74th Indian Pharmaceutical Congress. This distinguished gathering has once again reaffirmed the Congress as the premier forum for advancing pharmaceutical sciences, fostering innovation, and strengthening professional collaboration across the nation.

The remarkable achievements of this Congress are a testament to the unwavering dedication of the organizers, the scholarly contributions of the participants, and the collective vision of the pharmaceutical fraternity. Together, we have illuminated new pathways for research, education, and practice, thereby fortifying our commitment to the health and well-being of society.

On behalf of the IPCA Scientific Services Committee, I convey my heartfelt appreciation to all who have contributed to this historic milestone. May the spirit of scientific inquiry, professional unity, and service to humanity continue to inspire us toward ever greater accomplishments.

Thanks and regards,
Dr. G. Jeyabalan,
Co-Convener, IPCA Scientific Services Committee

## Dr. Sridhar Yeshamaina
Co-Convener
IPCA Scientific Services Committee

It gives me immense pleasure to extend a warm welcome to all delegates, researchers, academicians, industry leaders, and students to the Indian Pharmaceutical Congress (IPC) 2025.

IPC has consistently served as a premier platform for fostering scientific excellence, innovation, and collaboration within the pharmaceutical sciences. As the Scientific Co - Co-Chairman, I am delighted to present a comprehensive scientific program for IPC 2025 that reflects the evolving landscape of healthcare, drug discovery, pharmaceutical technology, regulatory sciences, and translational research.

The scientific sessions have been thoughtfully curated to encourage knowledge exchange, interdisciplinary dialogue, and meaningful engagement between academia, industry, and regulatory bodies. Eminent speakers from India and across the globe will share their insights on emerging trends, cutting-edge research, and future challenges shaping the pharmaceutical sector. I sincerely believe that IPC 2025 will not only disseminate high-quality scientific knowledge but also inspire young researchers and professionals to pursue innovation with integrity and social responsibility. I extend my appreciation to the Scientific Committee members, reviewers, speakers, and organizers for their dedicated efforts in making this congress scientifically enriching and impactful.

I look forward to your active participation and meaningful contributions toward making IPC 2025 a memorable and successful scientific congregation.

With best wishes,
Dr. Sridhar Yeshamaina,
Co-Convener, IPCA Scientific Services Committee

MESSAGE

**Dr. T. M. Pramod Kumar**
Chairman–Oral Scientific Committee
74th Indian Pharmaceutical Congress 2025, Bengaluru

It gives me great pleasure to welcome all participants to the 74th Indian Pharmaceutical Congress 2025, held at Bengaluru from 19th to 21st December 2025. The theme, "AI & Technology in Pharma: Educate, Innovate, Empower," reflects the progressive vision of our profession as it enters a new era where technology drives transformation across education, research, and healthcare delivery.

Through its scientific sessions, the Oral Scientific Committee aims to showcase the best of contemporary research, innovative thinking, and interdisciplinary collaboration. The integration of artificial intelligence, data science, and digital technologies in pharmaceutical sciences is revolutionizing discovery, development, and patient care pathways.

As educators, researchers, and practitioners, we share the collective responsibility to harness these advancements ethically and effectively to build a healthier, technology-empowered future and align ourselves with the vision of Viksit Bharat 2047.

I extend my heartfelt appreciation to the Organizing Committee, presenters, and reviewers for their dedication to curating a meaningful and forward-looking scientific program. May this Congress serve as a catalyst for fresh ideas, enduring collaborations, and impactful innovation.

Dr. T. M. Pramod Kumar
Chairman–Oral Scientific Committee,
74th Indian Pharmaceutical Congress 2025, Bengaluru

978-81-980623-8-3

MESSAGE

**Dr. S. Bharat**
Chairman, Poster Scientific Committee
74th Indian Pharmaceutical Congress 2025, Bengaluru

I extend with immense pride and pleasure a warm greeting to each and every delegate to the 74th Indian Pharmaceutical Congress (IPC), to be held in IT Hub, Silicon Valley of India - Bengaluru from 19th to 21st December 2025. This year's Congress is being hosted under the prestigious ambit of the Association of Pharmaceutical Teachers of India (APTI)and the Indian Pharmaceutical Congress Association (IPCA).

The 74th IPC promises to be a landmark event with several star attractions, including the CEO and HR Conclave, Pharmathon, AI Pavilion, Pharma Expo —the first of its kind Reverse-Buyer Seller meet to empower MSMEs, drive export business and the IPC Education Expo. This Pharma Congress provides a unique forum for knowledge sharing, information exchange and professional development amongst the delegates by bringing together academicians, researchers, industrialists, practitioners, government agencies and regulatory bodies.

I am extremely happy to place on record the overwhelming response received with over 4,000 abstracts with wide specializations under pharma domain submitted from reputed pharmacy institutions across the country to global. This enthusiastic participation strongly reflects the relevance of our theme, "AI & Technology in Pharma: Educate, Innovate, Empower."

I would like to express my sincere gratitude to the Local Scientific Committee and the IPCA Scientific Services Committee for their unwavering support in completing this giant task in a stipulated short span of time. The dedicated efforts of the Abstracts Review Committee in selecting quality scientific presentations are deeply appreciated.

My heartfelt thanks to all the evaluators, student volunteers of poster sessions & editorial team of scientific abstract book, who are poised to ensure the successful completion of the scientific proceedings of the 74th IPC in Bengaluru.

Dr. Bharath Srinivasan
Professor & Dean,
Faculty of Pharmacy,
M.S. Ramaiah University of Applied Sciences,
Bengaluru

**Dr. Rajiv Raghuvanshi**

Drugs Controller General (India)

Central Drugs Standard Control Organization (HQ), India

dci@cdsco.nic.in

Dr. Rajeev Singh Raghuvanshi currently serves as the Drugs Controller General (India) (DCGI), leading the Central Drugs Standard Control Organization (CDSCO), the apex regulatory body for pharmaceuticals and medical devices in India, under the Ministry of Health & Family Welfare. He was appointed to this pivotal role in February 2023.

A distinguished scientist with a strong background in pharmaceutical innovation, Dr. Raghuvanshi holds a Bachelor's and Master's degree from IIT-BHU and a Ph.D. from the National Institute of Immunology, New Delhi. His scientific expertise is particularly noted in dosage form design and development, including complex formulations like extended-release vaccines, and he has been instrumental in developing products for global markets. His prolific work is reflected in his intellectual property portfolio, which includes over 250 published PCT and Indian patents and 14 granted US patents, alongside numerous publications in peer-reviewed journals.

In his administrative and regulatory capacity as DCGI, Dr. Raghuvanshi is committed to safeguarding public health by ensuring the quality, safety, and efficacy of all drugs, cosmetics, and medical devices circulated in the country. He has aggressively championed the modernization of India's regulatory framework, notably pushing for rigorous Good Manufacturing Practices (GMP) compliance through initiatives like the revised implementation of Schedule M and implementing risk-based inspections. His leadership focuses on transforming India from a high-volume medicine supplier to a global leader in pharma quality and innovation, fostering a culture of self-regulation and collaboration across the pharmaceutical ecosystem, and strengthening crucial programs like the Pharmacovigilance Programme of India (PvPI).

*******

**Dr. Harish K. Jain**

National President, FOPE

Harish K. Jain is a highly influential leader in the Indian pharmaceutical sector, known for his work in industry representation, quality advocacy, and event organization. He is a key figure in both industry associations and his own manufacturing company. Mr. Jain is at the helm of Embiotic Laboratories Pvt. Ltd., a private limited company based in Bengaluru, Karnataka. He has been a Director of the company since its incorporation on August 29, 1988, demonstrating a long-standing commitment to the pharmaceutical manufacturing business. He is currently listed as a Director of the company, alongside Kantilal Vajeraj Jain and Bharat Kantilal Jain. Embiotic Laboratories is involved in manufacturing pharmaceutical formulations. He was appointed as the National President of FOPE for a two-year term, taking over from Mr Vinod Kalani in June 2023. His presidency was centred on resolving the Indian pharma industry's growth and marketing challenges, with a strong emphasis on promoting continuous quality improvement as a self-regulatory initiative. He aims to enhance the sector's quality perception globally and provide value to members, particularly Micro, Small, and Medium Enterprises (MSMEs). He is the President of, Karnataka Drug and Pharmaceutical Manufacturers Association (KDPMA). He actively advocates for strengthening industry-academia collaboration to foster an innovation-led ecosystem in India, noting that while the country holds a large share of the global pharmaceutical market by volume, it represents a smaller value by revenue. Throughout his leadership roles, Mr. Jain has

ISBN: 978-81-980623-8-3

been a vocal proponent for Quality and Compliance, Regulatory Implementation and Technological Adoption.

********

**Dr Annam Visala**

Joint Drugs Controller General (India)

Dr Annam Visala is a prominent figure in India's regulatory framework, currently serving as Joint Drugs Controller (India) (JDC(I)) at the Central Drugs Standard Control Organisation (CDSCO), New Delhi. Her professional journey in drug regulation spans over 21 years with the government. She holds an M. Pharm and a PhD in Pharmaceutical Sciences, demonstrating a strong academic foundation. She was promoted to the rank of JDC(I) effective March 26, 2024, following a UPSC reference, having previously served as a Deputy Drugs Controller (India) (DDC(I)) since September 5, 2012. Her extensive experience includes working with the Drugs Control Administration (DCA) of Telangana and Andhra Pradesh as a Drugs Inspector and Assistant Director, and heading the CDSCO Zonal Office in Hyderabad from 2017 to 2022. In her current capacity at the CDSCO headquarters, she plays a crucial role in overseeing divisions related to Investigational New Drugs (INDs), New Drug Applications (NDAs), and complex biologics, including recombinant products and advanced Cell and Gene Therapy Products (ATMPs). Her key contributions and policy advocacy focus on Regulatory Modernisation, Parallel Review Systems, the 3Rs Principle, and Orphan Drugs. Her work emphasises aligning India's regulatory ecosystem with global standards, leveraging technology like AI and data analytics for enhanced efficiency and patient safety, and fostering an innovation-led environment, particularly in advanced therapy medicinal products.

********

**Shri Sudarshan Jain**

Secretary General,

Indian Pharmaceutical Alliance (IPA), India

Mr. Sudarshan Jain has a strong passion for business, healthcare policy and the education sector. He is currently the Secretary General of the Indian Pharmaceutical Alliance (IPA) and the Chairman of the Indian Institute of Health Management and Research (IIHMR), Jaipur. He is an Advisor at EQT Group, a global investment organization and a Board Member of Abbott India, Sunshine Holdings PLC and various educational institutions.

He serves on the Drugs Technology Advisory Board and the Advisory Committee of the Biotechnology Ignition Grant (BIG), Government of India. He is also a Visiting Faculty member at the Indian Institute of Management Ahmedabad (IIM A) and a Certified Executive Coach from the Coaching Foundation of India.

Mr. Sudarshan Jain has a rich healthcare business experience of over 45 years and has contributed to shaping healthcare policy and improving access to healthcare in India. He has held several leadership positions in Abbott, J&J, Boots and leading Indian companies and last served as the Managing Director at Abbott Healthcare Solutions. His experience spans across Pharmaceutical, OTC, Hospital, Diagnostic and Nutrition businesses. He has been associated with over 30 brands which are among the top 300 in the Indian pharmaceutical market. He also served as Chairman of the Life Sciences Skill Sector Development Council (LSSSDC) of India under the Ministry of Skill Development & Entrepreneurship. He has been the Chair of International Generic and Biosimilar Medicines Association (IGBA) 2021. Till recently, he was associated with APAX partners as Seniors Advisor and also the board member of Healthium. Sudarshan is the first Indian recipient of the Global Chairman's Award at Abbott.

ISBN: 978-81-980623-8-3

He is an alumnus of St. Stephens College, Delhi and Indian Institute of Management, Ahmedabad (IIM A).

**Shri Mehul Shah**

CMD, Encube Ethicals

Mehul Shah, the Promoter & Managing Director of Encube Ethicals, has significantly contributed to the pharmaceutical industry, particularly in the topical drug development and manufacturing sector. With a career that started in 1986, at a stipend of ₹ 250 per month at his first job as a manufacturing pharmacist, to propelling Encube Ethicals to the position of a global leader within the topical landscape, this was a journey filled with perseverance and agility. Under his guidance, Encube Ethicals has excelled in delivering innovation, quality, and operational excellence. Mehul Shah's strategy emphasizes flexibility and specialization in contract manufacturing, setting Encube apart in its capacity to manage diverse projects with efficiency and precision. Since its inception in 1998, Mehul Shah has steered Encube through the dynamic changes in the pharmaceutical manufacturing sector. The journey from facing early skepticism to earning international acclaim has marked a significant evolution of the 'Made in India' brand in the global market. Encube's collaborations with leading dermatology companies underline its dedication to consumer care and commitment to quality and innovation. Encube's manufacturing prowess, highlighted by Mehul Shah's strategic direction, showcases one of the largest manufacturing plants for topical dosage forms, with a strong presence in Goa and expansion into Madhya Pradesh. Additionally, the emphasis on research and development (R&D) has been pivotal, with a Centre of Excellence in India R&D and the US dedicated to advanced drug delivery systems. Mehul Shah's focus on quality and regulatory compliance has solidified Encube's reputation as a reliable partner in the pharmaceutical industry. The company's adherence to global quality standards and regulatory requirements, as evidenced by accreditations from leading agencies such as the US FDA, Japan PMDA and others, reflects his vision for Encube to set a gold standard in pharmaceutical manufacturing. He was awarded as "Emerging Entrepreneur of the Year" at Indian Pharma Awards 2015. He serves as Honorary secretary of IDMA.

Shri. Namit Joshi is the current Chairman of the Pharmaceuticals Export Promotion Council of India (PHARMEXCIL), having assumed the role on December 23, 2024, after two years as Vice Chairman. In his professional capacity, Mr. Joshi serves as the Commercial Director for East (Asia and Africa) at Centrient Pharmaceuticals. He is a seasoned professional with nearly 30 years of extensive experience across the healthcare and pharmaceutical sectors, encompassing diagnostics, biologics, retail pharmacies, and healthcare media, having worked with prominent companies such as Roche Diagnostics and Nicholas Piramal. Academically, he holds a Master's in Organic Chemistry from Rohilkhand University and a Post Graduate Diploma in International Business Strategy from the Indian Institute of Foreign Trade. As Chairman, Mr. Joshi focuses on strategic initiatives including promoting formulation exports, advocating for responsible manufacturing to address antimicrobial resistance (AMR), strengthening international trade relations through agreements like CEPA, and offering expert guidance to PHARMEXCIL members on Foreign Trade Policy and compliance matters.

********

**Dr Ravleen Singh Khurana**

Chief Executive Officer,

Nitika Pharmaceuticals

The life of smiling Sikh Ravleen Singh Khurana, managing director of self-owned Nitika Pharmaceutical Specialities Pvt Ltd, revolves around happiness and health. Forty-four-year-old Khurana's favourite thing is the 'Smiley Ball' that reflects his philosophy of always smiling. It is even part of the logo of his company. His deep humility masks the meteoric rise of his enterprise that now has an annual turnover of almost Rs 40 crore from a humble beginning with just Rs 1.85 lakh in 1993-94. His company, which makes pharmaceutical excipients in Pilli Nadi Industrial Area, boasts a 200% annual growth. Turning entrepreneur at 19, even before securing his degree in Bachelor of Pharmaceuticals from Nagpur University, Khurana had named his company after his niece, who was the only daughter in the family when it was launched. With no experience or financial backing and only his education to rely on, Khurana made an almost impossible leap into the world of entrepreneurship. Khurana's passion for doing something of his own was so strong that he did not even enrol in IIT, for which he was selected with 95% marks. A giant now, Nitika Pharma, has grabbed global attention as a pioneer in manufacturing pharmaceutical excipients or inactive ingredients in tablets, capsules and such drugs. It has an export network spread over 90 countries. Khurana said his company was the first in Asia and second in the world to file a Drug Master File (DMF) with the US Food and Drug Administration for Magnesium stearate (sold under the brand name of Tablube), which is used as an anti-adherent in medicinal tablets and capsules during manufacturing and storage. "Initially, no one was ready to buy Nitika's products as it was not a well-known company. After my visit to the US in 2000, we started getting business from abroad, and now one in every

ISBN: 978-81-980623-8-3

10 tablets or capsules in the world uses our product," said Khurana. The entrepreneur was conferred the 'Business gaurav award' in 2012 by Don and Broadstreet and Axis Bank from a field of almost a lakh other Small and Middle Enterprises (SME). The company was also selected as 'Leading SME of India -2014' by Don and Broadstreets and The Times of India. Adopted as a 'son' by his grandparents, Bhagat Singh and Rajendra Kaur, Khurana now wishes to contribute to the growth of the city by turning it into a pharmaceutical hub in collaboration with Vidarbha Drug Manufacturing Association. "We have taken up the task of making Nagpur a pharmaceutical hub and are pursuing it with senior ministers of the Union and state. Once the city is so declared, the companies here would get relief from excise, VAT, income tax and other facilities," he said. Khurana is also part of an NGO, Vision Next and has taken up the issue of the development of Pilli Nadi Industrial Area with ex-mayor Anil Sole and a budgetary allocation of Rs 5 crore was made for this cause by the government due to his efforts. It was determined resistance of Khurana and his group that saved the NIT swimming pool on North Ambazari road from the verge of closure. Whether in business or social work, Khurana is never out of his wits or spirituality. He says "Hanste raho (Keep Smiling)" is the best way to enjoy life.

********

**Dr Gaurav Pratap Singh**

Senior Principal Scientist,

Indian Pharmacopoeia Commission

Dr Gaurav Pratap Singh is a highly qualified Principal Scientific Officer at the Indian Pharmacopoeia Commission (IPC) in Ghaziabad, where his tenure spans over nine years and four months, starting in September 2016. Holding a PhD in Biotechnology from the National JALMA Institute for Leprosy and Other Mycobacterial Diseases (2003-2008) and an M.Sc. in Biotechnology from Dr B. R. Ambedkar University, Dr Singh has established a robust career in specialised microbiology and pharmaceutical regulatory science. He began his professional life as a Lecturer and a Senior Microbiologist at the Stanley Browne Laboratory, The Leprosy Mission, before spending a pivotal six and a half years as a Scientist at the National Institute of Biologicals (NIB) in Noida (2010-2016), focusing on the quality control and standardisation of biological products. At the IPC, he advanced from Senior Scientific Officer to his current senior role, where he is responsible for guiding scientific teams, drafting and revising the quality standards published in the Indian Pharmacopoeia, and ensuring the national drug quality benchmarks remain current and globally aligned.

********

**Dr. T.V. Narayana**

President

SEAR Pharma Forum

Dr. T.V. Narayana completed his B. Pharm, M. Pharm, M. Phil and PhD from Andhra University, India and working as Director of Vikas Institute of Pharmaceutical Sciences, Rajahmundry, Andhra Pradesh. He has 25 years of experience in the field of pharmacy and has been instrumental in uplifting the profession, particularly in pharmacy education in India. At present, he is Vice-President of The Indian Pharmaceutical Association, Mumbai and Chairman of IPA Education Division. He has been bestowed the honor of IPA fellowship in 2004 for his outstanding contribution. He has initiated the IPA Student forum and organized 4 National Level Student Congresses and 125 workshops throughout the country for the benefit of pharmacy students. His efforts and hard work motivated many pharmacy students throughout the country and

ISBN: 978-81-980623-8-3

resulted in the enrollment of nearly 5000 student pharmacists in IPA. He is responsible for creating the largest network of Indian pharmacy students throughout the country. He has organized 45 QIP Programmes to pharmacy teachers and 25 Continuing Education Programmes for Community and Hospital Pharmacists throughout the country. He is Core Committee Member of the Indian Host Committee of the recently held FIP world Congress at Hyderabad in 2011 and Joint Secretary of the 63rd Indian Pharmaceutical Congress. He was a LOC Secretary for 68th IPC at Visakhapatnam. He is member of Pharmacy Council of India (PCI), a statutory body which regulates the pharmacy profession in India. He is active member of professional pharmacy and pharmacy Ethics Committee of PCI, New Delhi. He is the Hon. Gen. Secretary of Indian Pharmaceutical Congress Association (IPCA). He is member of FIP since 2004 and has been attending the world congress of FIP since 2002. He has motivated and led the Indian pharmacists to FIP Congresses held at Egypt, China, Basel, Istanbul and Lisbon. He has attended the Global Pharma Education Task Force meetings as official representative of IPA and promoted the ongoing projects of FIP in India. He is successful in promoting the FIP objectives in India and instrumental in framing the guidelines to suit the local needs. He has been honored with many awards to his career including the Eminent Pharmacist and Fellowship of IPA for his outstanding service and contribution to the pharmacy profession. He has guided more than 1500 students to mould their career as community pharmacists throughout the country.

**Dr. B. Suresh**

Pro-Chancellor,

JSS AHER;

Former President,

PCI, India

Dr. Suresh Bhojraj is an eminent academic leader, visionary institution builder, and global advocate for quality, ethics, and innovation in pharmacy and higher education. With a distinguished career spanning over four decades, he has been instrumental in shaping the future of health sciences education and research in India and abroad. He currently serves as the Pro-Chancellor of JSS Academy of Higher Education & Research (JSS AHER), Mysuru, Karnataka, JSS University, Noida, Uttar Pradesh, and the Director of the Technical Education Division of JSS Mahavidyapeetha, Mysuru — one of India's largest educational networks. Under his strategic leadership, JSS institutions have emerged as centers of excellence in multidisciplinary education, research, and innovation, with a global presence across Mauritius, Dubai, and the United States. A former President of the Pharmacy Council of India (PCI), Dr. Suresh played a transformative role in modernizing pharmacy education and regulation. He was the driving force behind the introduction of the Doctor of Pharmacy (Pharm.D.) program in India — a milestone that integrated clinical pharmacy into the nation's healthcare system. His leadership redefined the academic and professional landscape of pharmacy education, aligning it with international standards and patient-centric practice. On the global stage, Dr. Suresh has served with the U.S. Pharmacopeia (USP) and worked closely with the Accreditation Council for Pharmacy Education (ACPE), contributing to global educational reforms, harmonization of standards, and capacity-building across continents. His thought leadership has earned him recognition as a key voice in advancing pharmaceutical quality, regulatory science, and professional ethics. He has been a member and advisor to several national and international scientific bodies, steering initiatives in research, innovation, and policy development. His dynamic vision has led to the establishment of Centers of Excellence in frontier areas such as space technology applications, artificial intelligence, molecular modeling, quantum computing, and EV mobility, through collaborations with ISRO, DRDO, DST, DBT, and global universities. Dr. Suresh is a mentor to a generation of educators, researchers, and health professionals, known for his transformative leadership

ISBN: 978-81-980623-8-3

philosophy — "From Healer to Leader." His approach blends science and spirituality, fostering leadership rooted in compassion, purpose, and service. An inspiring orator and author, he is frequently invited to speak at national and international forums, where he articulates his vision for a world where education, innovation, and ethics converge to serve humanity.

Dr. Suresh Bhojraj continues to inspire a global movement in healthcare education — empowering the next generation of professionals to lead with knowledge, humility, and vision.

**Mr. Jagannath Shinde**

President

All India Organization of Chemists and Druggists

Jagannath Shinde serves as the long-standing President of the All India Organisation of Chemists and Druggists (AIOCD), where he represents and advocates for the welfare of the vast network of chemists and druggists across India. Known widely in the sector as "Appa," he is recognized as a key visionary leader dedicated to streamlining the distribution of economical healthcare products throughout the nation. In addition to his primary leadership role at the AIOCD, Mr. Shinde also holds the position of Chairman for AIOCD Pharma Limited—an initiative aimed at establishing a robust, world-class pharmaceutical logistics and supply chain network. He further extends his influence as the Chairman of the Maharashtra State Chemists and Druggists Association (MSCDA) Ltd. and the President of the Shiv Niketan Trust, actively working to guide the industry's future and address critical sectoral challenges.

********

**Mr. Atul Ahire**

President

Maharashtra State Pharmacy Council (MSPC)

Mr. Atul Ahire currently holds the distinguished position of President of the Maharashtra State Pharmacy Council (MSPC), a leadership role he assumed in August 2023, focusing on the professional development and regulatory compliance of pharmacists within the state. A registered pharmacist with a Bachelor of Pharmacy (B. Pharm.) degree earned in 2000, he also possesses a strong entrepreneurial background in the pharmaceutical sector. Since 2013, Mr. Ahire has served as a Director at Raksha Life Sciences Pvt. Ltd., which specializes in basic chemical manufacturing, and he operates a retail pharmacy connected to a hospital facility in Nashik. He is actively involved in advocating for the pharmacy profession and streamlining regulatory processes, such as simplifying Adverse Drug Reaction (ADR) reporting mechanisms for practicing pharmacists.

********

**Karunakar (Karu) Sukuru**

Global Vice President-Pharma Product Development

& Head-Scientific Advisory, Pharma and Consumer Health

Catalent Pharma Solutions, USA

karunakar.sukuru@catalent.com

Karunakar Sukuru is a distinguished leader in the pharmaceutical industry, with over three decades of expertise in Drug Product and Technology Development. At Catalent,

ISBN: 978-81-980623-8-3

he oversees the development of small molecule Rx products, guiding a team of over 800 scientists across 14 sites on four continents. His role involves managing a robust pipeline of several new molecules, utilizing diverse drug delivery technologies to support successful product launches. Karunakar has a proven track record in product development and technical oversight of numerous Contract Development and Manufacturing Organizations (CDMOs) globally. He is renowned for pioneering innovative controlled-release platform technologies in softgel dosage forms. He holds several granted patents and has over 20 pending patent applications, particularly in modified shell, fill technologies and lyophilization techniques for biologic products. Before joining Catalent in 2016, Karunakar held key positions at Endo Pharmaceuticals, Banner Pharmacaps (in India and USA), and Natco Pharma in India, demonstrating his extensive leadership in the field. He is actively involved in professional organizations, including the American Association of Pharmaceutical Scientists (AAPS), Controlled Release Society (CRS), Society for Pharmaceutical Dissolution Science (SPDS), and serves as an expert committee member at the United States Pharmacopeia (USP), for the last 10 years where he contributes to setting pharmaceutical standards. Karunakar obtained his M.Pharm., Ph.D., in Pharmaceutical Technology from Indian Institute of Technology, Banaras Hindu University, India and his B.Pharm. from Gulburga University, India. He is also a registered Pharmacist (R.Ph.) in Delaware, USA.

**Topic: Challenges and Opportunities in Oral Delivery of Macromolecules in the AI Era**

Oral delivery of macromolecules remains one of the greatest challenges in pharmaceutical development. Enzymatic degradation, limited permeability, and instability under gastrointestinal conditions restrict the success of traditional approaches. Advances in enabling technologies such as lipid based formulation in softgel systems in combination with delayed release shell and lymphatic delivery have expanded formulation possibilities, allowing delivery through modified GI routes that improve bioavailability and patient compliance. Additionally, artificial intelligence is becoming a valuable tool in formulation and manufacturing, with data-driven models identifying correlations between excipient properties, processes, and product performance. This presentation examines the scientific barriers to oral macromolecule delivery, compares formulation and manufacturing learnings from fast-dissolve and softgel systems, and explores how AI-supported analytics can enhance development predictability, process robustness, and time-to-clinic.

********

**Twan Lammers**

Chair of Experimental Molecular Imaging; Full professor of medicine

Dept. of Nanomedicine and Theranostics, Institute for Experimental Molecular Imaging, RWTH Aachen University Clinic, Center for Biohybrid Medical Systems, Germany

Twan Lammers obtained a D.Sc. in Radiation Oncology from Heidelberg University in 2008 and a Ph.D. in Pharmaceutical Technology from Utrecht University in 2009. In the same year, he started the Nanomedicine and Theranostics group at RWTH Aachen University. In 2014, he was promoted to full professor of medicine at RWTH Aachen University Clinic. His group aims to individualize and improve disease treatment by combining drug targeting with imaging. To this end, image-guided (theranostic) drug delivery systems are being developed, as well as materials and methods to monitor tumor growth, angiogenesis, inflammation, fibrosis and metastasis. He has received multiple scholarships and awards, including ERC starting, consolidator and proof-of-concept grants, the CRS Young Investigator and Exceptional Leadership Awards, the Adritelf

ISBN: 978-81-980623-8-3

International Award, the Belgian Society for Pharmaceutical Sciences International Award, and the JNB Trailblazer Award. He was president of the Controlled Release Society in 2023-2024 and currently serves as secretary of the European Society for Molecular Imaging. He is a member of the editorial board of 10 journals, and acts as associate editor for JCR, DDTR and MIB. Since 2019, he is included in the Clarivate Analytics list of Highly Cited Researchers.

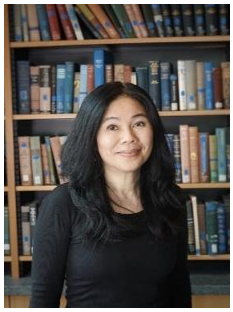
**Topic: Artificial intelligence and advanced imaging technologies to improve cancer nanomedicine clinical performance**

Nanomedicines are extensively used for cancer therapy. By delivering drug molecules more effectively and more selectively to pathological sites, they assist in improving the balance between drug efficacy and toxicity. The tumor accumulation of nanomedicines is traditionally ascribed to the EPR effect, which is highly variable, both in animal models and in patients. To address issues associated with EPR heterogeneity, and to facilitate cancer nanomedicine clinical translation, we are working on artificial intelligence tools and advanced combination ther-apy technologies to predict, monitor and modulate tumor-targeted drug delivery. In the present lecture, several of these strategies will be highlighted, including machine learning-optimized ultrasound interventions to image and prime the tumor microenvironment, and the use of gradient tree boosting-based tissue biomarkers to pre-select tumors and patients likely to respond to cancer nanotherapies. ltogether, our work aims to establish ra-tional and realistic ways forward towards improving the clinical impact of cancer nanomedicines.

********

**Joanne Chun, PharmD, PhD**

Director, Postgraduate Education Programs, Dean's Office, School of Pharmacy; Director, MS in AI and Computational Drug Discovery and Development (AICD3)



Bioengineering and Therapeutic Sciences, Schools of Pharmacy and Medicine, UCSF, CA, USA

Joanne.Chun@ucsf.edu

Dr. Joanne Chun, PharmD, PhD, is a faculty member in the Department of Bioengineering and Therapeutic Sciences at UCSF and the founding architect and Director of the Master of Science in Artificial Intelligence and Computational Drug Discovery and Development (AICD3) program. This first-of-its-kind program in the United States trains students to apply AI, machine learning, and advanced computational methods across the entire drug discovery and development spectrum. Dr. Chun also serves as Director of Postgraduate Education Programs, leading the design of innovative academic offerings that integrate cutting-edge research and technology into education. Her research interests include pharmacogenomics, pharmacokinetics/pharmacodynamics, precision medicine, cancer biology, and AI-driven computational methods for drug discovery and development. Dr. Chun earned both her PharmD and PhD at UCSF and completed a full-stack software engineering certification at UC Berkeley.

**Topic: AI in Pharmaceutical Education: Preparing the Next Generation for a Technology-Driven Future**

Artificial Intelligence (AI) is reshaping pharmaceutical sciences across drug discovery, development, and patient care. Preparing the next generation to lead in this transformation requires innovative educational models that integrate computational and data-driven skills with pharmaceutical training. This talk will highlight the design and impact of the UCSF Master of Science in Artificial Intelligence and Computational Drug Discovery and Development (AICD3) program — the first of its kind in the United States — and share strategies to equip students with the competencies needed to thrive in a technology-driven pharmaceutical future.

********

ISBN: 978-81-980623-8-3

**Professor Mahendra G Patel OBE**

Director, Centre for Research Equity

University of Oxford

A UK-wide pharmacy luminary and health equity advocate.

Mahendra played a leading role in landmark primary care COVID-19 trials, driving inclusive recruitment strategies that shaped policy nationally and internationally.

A Founding Director of the Centre for Research Equity at Oxford, he champions community-engaged research — showcased at the WHO and UN. Under his leadership, the Centre has built groundbreaking partnerships with Wales and Northern Ireland's governmental R&D departments supporting inclusive research and health equity.

Mahendra co-leads NIHR's Race Equity Incubator and is professional advisor to England's Chief Pharmaceutical Officer on inclusive practice and health inequalities. He is a member of the BMJ Commission on the Future of the NHS, and the UK Pharmacy Professional Leadership Advisory Board in helping create a Royal College of Pharmacy.

Honoured with an OBE and the RCGP's highest award for a non-GP, he continues to bridge disciplines and drive systemic change. Also, named among HSJ's 50 most influential black, Asian and minority ethnic healthcare professionals.

**Topic: Transforming Community Pharmacy: The NHS Pharmacy First Model and the Expansion of Clinical Practice in the United Kingdom**

Community pharmacy in the United Kingdom is undergoing a profound transformation, moving beyond traditional dispensing functions into a dynamic landscape of patient-centred clinical care. This presentation will showcase the development, implementation, and early impact of Pharmacy First, a nationally commissioned service designed to position community pharmacists as the first point of contact for a range of common and minor conditions.

Across the UK, minor ailment services have been part of community pharmacy practice for nearly two decades; however, national commissioning accelerated their scale and consistency—beginning in Wales (2016), followed by Scotland (2020), and most recently England (2024). These services enable patients to access timely, effective care for conditions that would otherwise burden general practice and urgent care pathways.

A major catalyst for this evolution is the expansion of pharmacist prescribing. From 2026 onward, all newly qualified pharmacists in Great Britain will be independent prescribers at the point of registration, marking a significant shift in workforce capability and patient care potential. This presentation will highlight emerging qualitative findings from our research on prescribing implementation within community pharmacy, exploring pharmacist readiness, operational challenges, professional identity, and the implications for interprofessional collaboration.

We will present initial results from the ongoing national evaluation of the Pharmacy First service in England, including insights into patient experience, clinical outcomes, and the capacity of community pharmacies to safely and effectively deliver frontline clinical care. By sharing the UK's journey toward a more autonomous and clinically driven pharmacy profession, this session aims to inspire and inform colleagues in India.

********

**M. Raj Rajasekaran, Ph. D**

Professor of Urology; Research Pharmacologist

UCSD; VA San Diego Healthcare System, CA, USA

ISBN: 978-81-980623-8-3

mrajasekaran@health.ucsd.edu

Dr. Rajasekaran is a Pharmacologist by training and he joined UCSD Urology in 1998. He has initially focused his research on urological disorders and established animal models for urinary continence function studies. He moved to Gastroenterology in 2006 and focused his research on pelvic floor muscle physiology in collaboration with Dr. Ravinder Mittal. His current areas of research include development of animal models for anal and urinary sphincter function, mechanism of skeletal muscle injury & repair and evaluation of novel pharmacological interventional agents for muscle regeneration. His current research is supported by funding from Veterans Health Administration Research & Development and American Society of Colon & Rectal Surgeons Research Foundation. As an accomplished Pharmacology Scientist for over 20 years, Dr. Rajasekaran has received national and international recognition for research. This includes prestigious awards, such as, the Uvnas prize for best publication in Immunopharmacology, and a national scholar award from the American Urological Association. As an academic researcher, he has also served as principal/co-investigator of industry funded projects working with Medicinova, Myogen, Actelion Pharmaceuticals, Vivus Inc, cook Urological and Pharmacia & Upjohn. Dr. Rajasekaran has authored over 50 articles in these areas, which have been published in journals including American Journal of Physiology, Diseases of Colon & Rectum, The Journal of Urology, Urology, the Journal of Andrology, and the International Journal of Andrology

**Topic: Engineered Silk Fibroin Hydrogels as a Controlled Release Platform for Sustained Antifibrotic Therapy: Targeting Biochemical and Biomechanical Modulation of Fibrosis in Multidimensional in vitro Models**

This invited lecture will present recent progress in our laboratory on the development of advanced biomaterials for antifibrotic therapy, focusing on an enzyme-responsive, sustained-release hydrogel system for the prevention of recurrent fibrosis. Fibroproliferative diseases, arising from dysregulated wound healing and aberrant tissue remodeling, are major contributors to organ failure and account for nearly 45% of global mortality. Current antifibrotic drugs, such as pirfenidone, have limited efficacy due to pharmacokinetic constraints and incomplete inhibition of fibroblast activity, resulting in persistent fibrosis and high recurrence rates, particularly in urethral tissues. To address these challenges, our laboratory has engineered an in situ injectable silk fibroin-based hydrogel incorporating pirfenidone within a cell-adhesion inhibiting polymer matrix. This hydrogel mimics native tissue stiffness (~5 kPa), discourages fibroblast proliferation, and provides sustained, enzyme-triggered drug release synchronized with disease progression. The system demonstrated significant antifibrotic efficacy in fibroblast and urothelial cell models, as well as in 3D urothelial spheroids, effectively reducing fibroblast hyperproliferation, reactive oxygen species, and the expression of collagen I and α-SMA.

It also blocked epithelial–mesenchymal transition, lowered fibrotic cell stiffness, and restored mitochondrial function, evidenced by a ~40% improvement in maximal respiration. This lecture will discuss how our enzyme-responsive hydrogel integrates biochemical and biomechanical regulation to inhibit extracellular matrix accumulation, suppress EMT, and normalize cellular mechanotransduction, offering a next-generation therapeutic strategy for preventing recurrent fibrosis and promoting tissue regeneration.

**Ranjit Barshikar**

CEO, QbD International, India

ranjitbarshikar@gmail.com

With a distinguished career spanning 54 years, Dr. Barshikar has amassed rich and

ISBN: 978-81-980623-8-3

varied experience in the pharmaceutical industry, particularly in Quality Management, R&D, Manufacturing, Regulatory affairs, and compliance with US FDA, EU, WHO, and other global standards. His major honors include the "Quality Champion – Gold" award, the highest quality award conferred by the Government of India through the Quality Council of India; "Lifetime Achievement" Awards from the International UNICEF Council (USA) and Eminence Business Media – Global Eminence Venture Group; and recognition as one of the "100 Most Impactful Healthcare Leaders – Global" by the World Health Congress / Economic Times. He has served as a Jury member for the Economic Times ET Healthcare Awards 2022, ET Now DataCon 2024, and TechNext 2025. Currently, he is the CEO of QbD International (Quality by Design / cGMP Consulting for Bio-Pharma and Pharma), a United Nations–MPP Geneva Advisor, and a member of the Editorial Board of the Journal of Generic Medicines, England. He is an expert in Artificial Intelligence applications in Pharma 4.0, ML, DL, quality data and automation, Quality by Design, data integrity, CAPA, quality culture, validations, continuous manufacturing, PAT, regulatory affairs, and multiple other cGMP subjects, and is an expert auditor of formulation (sterile and non-sterile) and API facilities. His global experience includes working as a Quality Expert with the World Bank, Washington DC, and collaborating with the Saudi Arabia FDA to develop regulations and train SFDA inspectors on behalf of the World Bank. He has delivered over 500 presentations worldwide as a Chairman, Keynote Speaker, or Speaker at conferences organized by ISPE FDA, Marcus-Evans, IQPC, IPC, CBI (USA), WHO, ISO, UNOPS, Government of India, CPHI, multiple state FDAs, and universities, and has addressed 164 webinars and conference talks since 2020 on COVID-19 and diverse pharmaceutical topics. His articles and interviews have been published in leading international journals and platforms such as Pharmaceutical Manufacturing (USA), Pharmaceutical Technology (Europe and Asia), Express Pharma, WHO ResearchGate, Journal of Generic Medicines (UK), and Hindustan Times. Earlier in his career, he worked with Pfizer Ltd., Ranbaxy Labs, Lyka Labs, and Cancer Research Mumbai, and retired in 2006 as Global Quality Head / Vice President.

**Topic: AI applications in Pharma Industry**

Emerging technologies like Artificial Intelligence (AI), Machine Learning (ML) & Robotic Process Automation (RPA) have revolutionized the pharma industry. These technologies are very useful from the perspectives of quality and compliance, based upon Industry 4.0/Pharma 4.0 concepts. AI / ML / RPA are no longer small operations as manufacturers are using these technologies to maximize quality and compliance for patients' safety. Several companies are already using AI to analyze huge scientific data in an effort to speed up and improve the drug discovery process. These technologies have new applications in diverse areas like regulatory/compliance, clinical trials, manufacturing, packaging operations for Primary, Secondary & Tertiary packaging, Supply chain- Block chain & Pharmacovigilance. Such AI tools, automatically handle manual, repetitive, time-consuming, and highly structured tasks such as data entry, reviews and back-office functions. RPA solutions can improve regulatory compliance because bots do not deviate from programmed steps and audit trail history can be tracked. They provide comprehensive, unchangeable, and time-stamped activity logs, reducing risks and errors through the automatic execution of repetitive and routine manual activities. Major advantages are Data Integrity compliance, Predictive Analytics, Speed of Developments & Operations, Predictive Quality, Predictive Maintenance, etc

********

**Shrenik Kole**
VP/Head - Sterile Product development
Micro Labs Limited,
#58/3, Kudulu Village,
Singasandra Post,
shrenikk@microlabs.in

ISBN: 978-81-980623-8-3

Shrenik Kole brings over 27 years of vast experience in the pharmaceutical sectors, particularly in drug product development of both conventional and speciality dosage forms, including solid oral, ophthalmic, sterile semisolids and complex injectable products. He is currently serving as Vice President/Head- Sterile Product Development at Micro labs advance Research centre, Bengaluru.

He possesses a comprehensive background spanning the entire product lifecycle, from initial concept to commercialization, with a proven track record in developing complex injectable Peptide, Iron complex and ophthalmic products. A significant strength lies in navigating the intricacies of global regulatory landscapes, having successfully managed and submitted regulatory dossiers for major markets including the USA and EU, as well as other international territories.

He has completed his bachelors from Kolhapur university and Master in pharmaceutical sciences from Rajiv Gandhi University of Health Sciences and undergone senior leadership programmes at IIM Ahmedabad and IIM- Nagpur.

Prior to joining Micro Labs Ltd, he held key leadership position at Lupin Research Centre and also worked in companies like Novartis and NPI, Oman.

Shrenik Kole has several achievements: He has inventorship in 9 patents and several applications on his credit and also developed and filed more than 50 ANDA's for the US and other regulated market, achieving a high approval rate.

**Topic: Changing Complex Generic Drug Product Development**

The generic drug industry faces unprecedented complexity in developing products for the US market, particularly in complex generic drug products (CGDPs) such as peptide injectables, nanotechnology-based formulations, and highly potent active pharmaceutical ingredients. Artificial intelligence and machine learning technologies have emerged as transformative tools to accelerate development timelines, reduce costs, and enhance product quality—critical factors in achieving competitive market positioning within narrow market exclusivity windows.

This presentation addresses the comprehensive integration of AI/ML throughout the pharmaceutical development lifecycle for generic drugs, with particular emphasis on GLP-1agonist formulations (semaglutide, tirzepatide), which represent a $50+ billion opportunity in the generic market by 2030. The US generic market, valued at over $180 billion annually with 90%+ of dispensed prescriptions being generics, demands innovation in complex formulation development where traditional approaches require 18-24 months and millions of dollars in R&D investment.

Key Topics Covered
AI Fundamentals and applications
Industry Standards AI tools and Platforms
GLP-1 Complex Generic Development
Current Industry Landscape and Business Impact
Regulatory and Implementation framework

**Topic: Future of AI**

Artificial Intelligence is rapidly transforming healthcare and pharmacy by enabling faster diagnosis, precision treatment, intelligent drug discovery, and improved patient care. In the coming years, AI will redefine education and industry by creating new skill pathways, automating complex workflows, and enhancing decision-making through data-driven insights. For healthcare professionals, these technologies open opportunities to personalise therapy, predict disease progression, and improve clinical efficiency. As AI becomes more accessible, students and institutions can leverage these tools to build future-ready competencies. This session will explore the expanding scope of AI and how the healthcare and pharmaceutical sectors can strategically adopt it to gain sustainable advantage.

Currently holds multiple distinguished visiting professorships.

gjagadeesh2000@gmail.com

Formerly (for 33 years), Senior Expert Pharmacologist, Office of Cardiology, Hematology, Endocrinology, and Nephrology, Center for Drug Evaluation and Research, US Food and Drug Administration, Silver Spring, MD, USA Distinguished Visiting Professor, College of Pharmaceutical Sciences, Dayananda Sagar University, Bengaluru; Visiting Professor at College of Pharmacy, Adichunchanagiri University, Karnataka; and College of Pharmaceutical Sciences, Manipal Academy of Higher Education, Manipal, India. Senior Consultant & Advisor, Auxochromofours Solutions Private Limited, Bengaluru, India Dr. Jagadeesh's distinguished career spans over fifty years, marked by significant contributions to pharmacy, pharmacology, toxicology, pharmacokinetics, and medical sciences. His journey began as a research fellow and progressed through academic ranks to become a respected professor at various institutions. This led to his nearly 33-year tenure as a senior expert pharmacologist at the CDER of the U.S. Food & Drug Administration. While at the FDA, he also served as an adjunct scientist at the National Institutes of Health in Bethesda, USA. His specialized expertise in cardiovascular and autonomic receptor pharmacology, the reninangiotensin-aldosterone system, and G protein-coupled receptors was essential to his FDA role, in which he reviewed preclinical studies to ensure drug safety. His extensive knowledge and experience have greatly contributed to the research and development of drug products, ensuring

ISBN: 978-81-980623-8-3

their efficacy and safety for the public. While at the FDA, he evaluated preclinical pharmacological, ADME, and toxicological studies submitted in support of INDs and NDAs to assess drug safety.

**Topic: The emerging trends in the US FDA's approval of new molecular entities and biologics over the past decade. Therapeutic targets and drug innovation.**

Drug discovery research concentrates on creating molecular-targeted therapies to treat diseases and disorders. These drugs must interact with specific target proteins and be relevant for addressing human illnesses. We present a map of the molecular targets of 465 FDA-approved drugs from 2015 to 2024: 29% were biologics, 71% were NMEs, 50% targeted orphan diseases, and 41% were first-in-class drugs with novel mechanisms. Analyzing drug target innovation reveals five key protein classes: enzymes (17%), kinases (16%), GPCRs (12%), transporter proteins (4%), and nuclear receptors (3.7%), emphasizing a focus on chronic and life-threatening diseases, especially orphan indications. Our analysis highlights trends in the approval of new drugs across the top four non-communicable diseases: CVD (8.6%), cancer (29%), respiratory disease (4.3%), and diabetes (3%). We examined drug approval trends by comparing regular and expedited reviews across therapeutic areas. The FDA's expedited review pathways have significantly increased access to new therapeutics (67%), particularly in oncology, where 90-100% of drug approvals have utilized at least one expedited pathway. Over 70% of expedited approvals were granted through a combination of two or more pathways, allowing quicker access to treatments for various malignancies. Of the 465 novel drugs approved, 61% received priority review, 37% fast track designation, 30% breakthrough therapy designation, and 22% accelerated approval. Priority review was the most common pathway, while accelerated approval was the least. A large portion of drugs approved each year employed at least one expedited pathway, with some utilizing multiple programs to speed development. Additionally, the review analyzed drug innovation by examining trends in first-in-class and orphan drug designations and their links to expedited review processes. Importantly, this review employed an extended analytical framework—the "quartet model"—to explore the complex relationships among drugs, target classes, therapeutic areas, and diseases in drug discovery. This multidimensional analysis aims to uncover subtle connections and provide a comprehensive understanding of drug development trends and innovations.

**Dr. Manish Diwan**

Head of Biofoundry

NCR Biotech Science Cluster and IVCOL

Biotechnology Industry Research Assistance Council (BIRAC)

sped.birac@gov.in

Head – Strategic Partnership & Entrepreneurship Development, & Make In India Facilitation Cell for Biotech sector. Leading large national programs for Government of India's efforts to nurture and empower the Biotech Innovation Ecosystem in India. Sectoral lead for National Missions especially Startup India, Make In India; contributes to Policy Reforms; Strategic collaborations including International partnerships; serves on National committees and Advisory Boards.

Leads national flagship schemes and programs of BIRAC promoting Startups, Entrepreneurs and Industry. Manages Risk Funding through Grant-in-aid, Equity, co-investments by Angels, VCs, AIFs (Fund of funds); setting up Incubation Centres for capacity building; Human Resource development through integrating a large partner pool of mentors, experts, peers and industry associations. Being a central enabler representative, contributes in Ecosystem gap identification and finding solutions. A few policy initiatives include establishment of the Technology Clusters with Pilot and manufacturing facilities for startups, Field validation for startup

ISBN: 978-81-980623-8-3

solutions, Access to Regulatory guidance, Scaling and Global integration through a strategic network of national and international partnerships.

Supports technology led Startups, Entrepreneurs, Incubation Centres, Knowledge Clusters of Academia and Industry enabling them to address unmet needs in the Healthcare, Medical Devices, Diagnostics, Industrial biotech, Agriculture, Waste management, Clean Energy and related areas through development of globally competitive, innovative products and technologies.

He has about 27 years of global R&D experience in Pharma/ Biotech sector from discovery research to product development, Science Administration and Project Management for Industry and Academia. Before moving into Public sector in 2017, he contributed to several Clinical Drug Candidates for global drug development at Daiichi Sankyo (India), Daiichi Sankyo (Japan), Ranbaxy, Dabur and University of Alberta (Canada). Also developed technologies during doctoral (ICGEB, NII India) and post-doctoral research (KAIST South Korea; University of Alberta) that were transferred to industry. Trained in Pharmaceutics, Molecular Pharmacology, Immunology, he has led large professional teams in First-In-Class and Best-In-Class Drug Discovery, Translational Preclinical Research and Early Clinical Development.

**Dr. Dipti Kakkar Thukral**

Scientist G

Anusandhan National Research Foundation (ANRF)

scientistg-ls@anrf.gov.in

Dr. Dipti Kakkar Thukral is a distinguished research scientist currently serving as a Scientist 'G' at the Anusandhan National Research Foundation (ANRF) under the Department of Science & Technology, Government of India. She has an extensive background spanning over two decades in advanced research, primarily focusing on nanomedicine, polymer chemistry, and biomedical sciences.

Prior to her role at ANRF, which she began in October 2022, Dr. Kakkar was a Senior Scientist at the Institute of Nuclear Medicine and Allied Sciences (INMAS), DRDO, for over 21 years. Her academic background includes a Ph.D. in Biomedical Sciences, an M.Tech. in Polymer Science & Technology, and an M.Sc. in Chemistry, all from IIT Delhi. She has held national fellowships from the CSIR and international fellowships, including a "Sandwich fellowship" from the French Embassy for research at the University of Bordeaux. She has also worked as a Senior Research Scientist and visiting research collaborator at Rutgers University and Princeton University in the US.

Dr. Kakkar's research focuses on creating nanoparticulate systems using polymers, lipids, and metal oxides for use in cancer therapy and anti-infection drug delivery (theranostics). She has published extensively in international journals on this topic and was recently elected as an INSA Women Associate by the Indian National Science Academy.

********

**Dr. Kailash Petkar**

Scientist-D

Department of Scientific and Industrial Research (DSIR), India

kailash.petkar@gov.in

Dr. Kailash Petkar is presently serving as a Scientist with the Department of Scientific and Industrial Research (DSIR), under the Ministry of Science and Technology, Government of India.

He is working towards advancing research and innovation ecosystems, with a strong focus on promoting R&D in Micro, Small, and Medium Enterprises (MSMEs), academia-industry collaboration through various schemes of DSIR. He is actively involved in

ISBN: 978-81-980623-8-3

formulation and implementation of science, technology, and innovation related schemes to create a conducive environment for individual innovators, startups, MSMEs and R&D-based enterprises thereby enhancing India's position as a global industrial hub through.

Dr. Petkar serves on review panels for a number of projects that are funded to national research and academic institutions as well as universities. He is a nominated member to the 'Testing and Calibration Advisory Committee' of Bureau of Indian Standards and 'Techno Economic Appraisal Committee of Micro & Small Enterprises Cluster Development Program (MSE-CDP)' under Ministry of MSME, Govt. of India. He is also involved in various inter-ministerial, cabinet and NITI-Aayog related matters

Dr. Petkar is an Alumni Advisory Panel Member of Commonwealth Scholarship Commission (CSC), UK ; Member of the Association of Commonwealth Scholars and Fellows in India (ACSF-India). He also serves on the editorial board of the official newsletter of ACSF-India, ACSF-Bulletin. In addition, Dr. Petkar serves as an editor to scientific journals and newsletters reflecting his commitment to disseminating scientific knowledge.

With the academic background in Pharmacy, Dr. Petkar obtained his PhD from the M. S. University of Baroda (India) and University College London, School of Pharmacy, London (UK). He pursued a postdoctoral-Industry fellowship at the Hebrew University of Jerusalem and Bionanosim Inc., Jerusalem, Israel. Dr. Petkar is having more than 15 years of administrative, academic and industrial research experience and has contributed to national and international research papers and book chapters to the scientific community.

**Ravleen Kaur Bakshi**

Scientist D

Division of Descriptive Research,

Indian Council of Medical Research, Department of Health Research, New Delhi, India

drravleen01@gmail.com

Dr. Ravleen Kaur Bakshi serves as Scientist D in the Descriptive Research Division at the Indian Council of Medical Research, under the Department of Health Research, Ministry of Health and Family Welfare, Government of India. She has 56 publications and her research interests focus on Reproductive and Child Health.

She was awarded the IJCM Ford Foundation Research Grant for 2023–24 and has been conferred the title of "Member Academy Medical Sciences" (MAMS) by the National Academy of Medical Sciences (NAMS), New Delhi. She also received a scholarship to attend the 1st South East Asia Regional Group Meeting of the International Epidemiological Association and the 24th Annual Academic Sessions of the College of Community Physicians of Sri Lanka held in Colombo from 19th to 21st September 2019.

**Topic: ICMR Funding Schemes: Opportunities for Researchers**

The Indian Council of Medical Research (ICMR) offers a diverse portfolio of funding schemes to support innovation, evidence generation, and capacity building in biomedical and public health research. This session provides an overview of major opportunities, including Small Grant and Intermediate Grant Proposals, Centres for Advanced Research (CAR), the First-in-World (FiW) Challenge, National Health Research Priority calls, and periodic Expressions of Interest (EOIs). By outlining eligibility, focus areas, evaluation criteria, and best practices for proposal development, the talk aims to equip early-career and established researchers with the knowledge required to effectively navigate ICMR's

ISBN: 978-81-980623-8-3

funding ecosystem and translate ideas into impactful research.

********

**Rahul Purwar**

Professor; Founder

IIT Bombay,
Immunoact, Mumbai,
India

purwarrahul@iitb.ac.in

Dr. Rahul Purwar is a professor at Department of Biosciences and Bioengineering at IIT Bombay. He holds a Ph.D. in Molecular Medicine from Hannover Medical School, Germany. Dr. Rahul's professional journey spans various prestigious institutions and roles. He started his post-doctoral fellowship at Harvard Medical School, Boston, USA. After his fellowship, he joined ImmunoGen, Inc. (Boston, USA), as a scientist before returning to India as a faculty member at IIT Bombay. His lab at IIT Bombay developed indigenous technology platform for CD19 CAR-T cell therapy, a type of gene therapy. Based on his research at IIT Bombay, Dr Purwar founded ImmunoACT in 2018, first cell & gene therapy company in India. Upon successful multiple clinical trials, ImmunoACT received market authorization of the country's first CAR-T cell therapy, and Honorable President of India dedicated CAR-T cell therapy to the nation on April 4th, 2024. This is the first of many planned milestones in democratizing access to advanced cell & gene therapies in India. Dr. Purwar's research work is well-recognized in the scientific community, with numerous publications to his credit in esteemed journals. His contributions to the field of Biosciences & Bioengineering are commendable and his work continues to inspire many in the scientific community.

**Topic: Journey of India's First Indigenous CAR-T therapy**

Cancer is a global problem; India ranks 2nd in cancer mortality and cancer incidences are on the rise in low- and middle-income countries (LMICs). Gene therapy, especially CAR-T cell therapy platform is an emerging therapeutic platform for cancer cure. Recent studies have shown remarkable success in curing blood cancers like leukaemia and lymphomas. However, this technology platform is exorbitantly expensive (500,000 USD/patient) and not available in India and in LMICs. Our objective is to ensure access of this technology platform to all patients, who might benefit from these therapies. Recently, we designed and developed a robust, safe and highly affordable technology platform. To validate the platform, first-in-human Phase I clinical trial (investigator-initiated trial) and a pivotal Phase II trial (ImmunoACT sponsored) are successfully concluded. The results of these trials showed excellent safety profile and efficacy profile. In fact, few patients are in long-term remission. Based on these extraordinary results, CD19 CAR-T is approved by CDSCO for commercial use in October 2023, and now over 300 patients are treated across the country. Overall, our affordable platform will ensure access of gene therapy, CAR-T cell therapy, to patients in India and in LMICs and save millions of lives.

**Mr. Sandip Kulkarni**

Founder and CEO

Image ProVision
Technology, USA

sandeep@imageprovision.com

Sandeep Kulkarni is a Mechanical Engineer from NIT and has completed a management program from IIM Ahmedabad, along with a specialized course in Image Processing from Duke University. With over 31 years of professional experience across diversified industries, he has held senior leadership roles and successfully set up and managed multiple greenfield manufacturing units. His expertise spans manufacturing operations, IT systems, and ERP implementations. After 22 years in the corporate world, he ventured into entrepreneurship and founded

ISBN: 978-81-980623-8-3

ImageProVision Technology Pvt. Ltd.—a pioneering company in the field of intelligent image analytics. Under his leadership, the company has grown into a trusted name in pharmaceutical image analytics, offering advanced solutions in microscopic particle analysis powered by AI and machine learning. Mr. Kulkarni has filed multiple patents in the domain of image-based particle analysis, reinforcing ImageProVision's innovation-led approach. The company has won several accolades, including the India Pharma Award for Most Innovative Product (CPhI 2015), Best Startup at Shark Tank Pune, and recognition among the Top 50 Emerging Tech Companies by NASSCOM. A passionate mentor and educator, he actively seeks opportunities to share knowledge and engage with professionals across disciplines. ImageProVision Technology Pvt. Ltd. operates from offices in Princeton (USA), Pune, and Hyderabad (India).

**Topic: Revolutionizing Particle Characterization through AI-Based Particle Morphology Analysis**

Accurate particle characterization forms the cornerstone of pharmaceutical research, impacting formulation development, bioavailability, stability, and regulatory compliance. Traditional methods such as laser diffraction and manual microscopy often fail to capture the true morphological complexity of heterogeneous particle systems limiting insight into parameters that govern performance-critical attributes. This presentation introduces an AI/ML-powered particle morphology characterization framework designed to deliver high-resolution, reproducible, and quantitative insights into particle size, shape, and texture. By combining deep learning with advanced image analytics, this approach enables automated detection and classification of irregular and agglomerated particles providing statistically significant data beyond conventional averages. We will present real-world case studies demonstrating how this technology supports a range of pharmaceutical applications, including:

- API and excipient particle uniformity assessment
- Suspension and emulsion stability evaluation
- Polymorphic form differentiation
- Solid-state deformulation and comparative batch analysis

Through adaptive learning models, the system continuously improves classification accuracy with every dataset, minimizing operator subjectivity and ensuring compliance with global standards such as USP <776>, <1776>. AI-based particle characterization is transforming analytical decision-making in R&D and QC by enabling predictive, data-driven insight into formulation behaviour empowering scientists to design more robust, reproducible, and regulatory-ready pharmaceutical products.

**Jyothi Tegginamath**

Managing Director - Nia Pharmaceuticals

Committee Member - Australia India Business Council

Teacher - Curtin University

Nia Pharmaceuticals, Australia

jyothi.kiran@niapharma.com.au

Founder Director at NiA Pharmaceuticals wherein I lead by example and strive to strike the right team spirit with a mission to map the company footsteps into new emerging and regulated pharma markets. I am passionate about pharmaceutical industry and I believe in learning and growing. My key knowledge areas include global regulatory requirements, regulatory filings and vertically integrated models. I spent my early career in pharmaceutical research, academia and clinical research. Ironically, I started all over again when I came to Australia wherein I was gravitated

ISBN: 978-81-980623-8-3

by the Australian pharmaceutical industry opportunities. My previous research approach had to change to fit in my new appetite for entrepreneurship and eventually I enrolled for MBA. Finally, I started NiA Pharmaceuticals, a company into pharmaceuticals, medical devices and pharmacy ownership. In this journey of self discovery, I set up Jyothi Kiran Foundation in Bengaluru, India - primarily focusing on rural girls education and empowerment. First project is on 22 blind girls - It feels good to bring a smile!

**Topic: Women and Entrepreneurship: Leading with Innovation and Purpose in a Transforming Pharma Landscape**

Entrepreneurship is not only about starting a business—it is about breaking barriers and driving innovation that empowers communities. At the 74th Indian Pharmaceutical Congress (IPC 2025) in Bengaluru, themed "AI & Technology in Pharma: Educate, Innovate, Empower," this talk explores how women entrepreneurs can harness education, technology, and leadership to shape the future of healthcare and pharmaceuticals.

I will share my personal journey from India to Australia—navigating cultural and professional landscapes to establish a company focused on quality, technology, and global collaboration to set up NiA Pharmaceuticals in Australia and a sister company Bes Pharma in Bangalore. My entrepreneurial experience reflects the broader transformation of women in science and business—women who are leveraging technology and global knowledge networks to build sustainable enterprises.

The session will explore the opportunities and challenges women face in entrepreneurship, particularly in science-driven industries. It will highlight how technology and AI can help bridge gender gaps by enabling access to knowledge, networks, and global markets. Drawing from personal experience, I will discuss the value of resilience, vision, and ethical leadership in scaling an enterprise while staying true to a mission of patient-centric innovation. Ultimately, this talk celebrates the spirit of women (everyone indeed) entrepreneurs who dare to innovate, empower others, and lead with purpose.

********

**Anant Ketkar**

Principal Scientist and Scientific Lead – India

Simulations Plus, Inc. (NASDAQ: SLP)

anant.ketkar@simulations-plus.com

Anant Ketkar is working with Simulations Plus, inc., as a Principal Scientist in the role of 'Scientific Lead – India'. He is involved in the application of PBPK/PBBM modelling and simulation to meet the objectives of various client projects. He also provides scientific input both in terms of software applications and project proposals to Indian distributors to support their marketing and sales efforts. In partnership with Indian distributors, Electrolab and Molecular Solutions, he supports Simulations Plus's many customers in India and serves as a thought leader to increase awareness and adoption of PBBM/PBPK modelling throughout the country. He delivers modelling and simulation projects to address client objectives and inform regulatory interactions. Anant earned his doctorate in Pharmaceutical Sciences from Poona College of Pharmacy (Bharati Vidyapeeth Deemed University), Pune, India. He carries around 25 years of experience in formulation research, including around 10 years of experience in PBPK-PBBM modelling for immediate release and extended-release solid orals of NCEs and generic compounds, and subcutaneous extended-release formulations. His expertise covers IVIVR and IVIVC, virtual bioequivalence (VBE), defining clinically relevant drug-product specifications (CRDPS) and helping formulation research scientists in gaining model-based insights for designing the drug product and bio-predictive in-vitro dissolution methods. Prior to joining Simulations Plus in 2022, Anant was Head of Technical Services at

ISBN: 978-81-980623-8-3

IQGEN-X Pharma, where he led a team of formulation team leaders and scientists for development of solid and liquid orals, and injectables for the global market. Prior to that he worked in positions of increasing seniority with pharmaceutical research companies, including Bioved Pharmaceuticals Inc., Ranbaxy (now Sun Pharma), Pfizer Animal Health (now Zoetis), Sandoz and Sun Pharma Advanced Research Company (SPARC). He has also served as a PBPK/PBBM modelling consultant for one of the leading Indian multinational pharma companies and worked as a freelance PBPK modeller for Indian generic pharma client on US-FDA submission of a PBPK modelling project.

**Topic: Basics of PBPK Modelling and Introduction to GastroPlus® X (GPX) and its Integration with AI**

In silico modelling and model informed drug development (MIDD) play a vital role in pharmaceutical drug product development. Use of in silico modelling tools, such as PBPK M&S (physiologically based pharmacokinetic modelling and simulation) and PBBM (physiologically based biopharmaceutics modelling) has been acknowledged and encouraged by regulatory agencies across the globe. The applications of these tools span from early discovery to clinical phases of drug development and frequently forms a part of the regulatory approval of drug products. These tools enable informed decision making at various stages of product development, be it for NCE (new chemical entity) research or for Generic drug product research. The presentation will follow an introduction to the interface of GPX™ i.e. GastroPlus®X2 (10.2), which is the latest version of a leading PBPK/PBBM modelling software offered by Simulations Plus, Inc. It is highly appreciated by researchers and regulatory agencies across the globe. The new interface will also integrate with AI through AssessmentPlus™ AI and GastroPlusChat™ to assist the user in building the baseline model and gaining insights into various underlying mechanistic processes and generating reports.

********

**Amol Kulkarni**

Scientist

CSIR-National Chemical Laboratory, India

aa.kulkarni@ncl.res.in

Dr. Amol A. Kulkarni is a Chief Scientist and Head of the Chemical Engineering & Process Development Division at the CSIR-National Chemical Laboratory (NCL), Pune (Since 2005). He is a chemical engineer by training (B.Chem.Eng.1998, M.Chem.Eng.2000, and Ph.D.2003, all from the Institute of Chemical Technology ICT- Mumbai, formerly UDCT Mumbai). He did his Post-Doctorate at MPI-Magdeburg (Germany) as a Humboldt Fellow and at Massachusetts Institute of Technology (MIT), USA as IUSSTF Research Fellow.

He works in the area of continuous flow synthesis, flow reactors and their applications for continuous syntheses of APIs, dyes, perfumery chemicals and nanomaterials. He has established the first of its kind microreactor laboratory and a mechanochemistry laboratory in India. He has developed several scalable continuous processes for organic compounds and inorganic functional materials including many solvent free synthesis protocols. He collaborates extensively with scientists from various disciplines.

His work has been recognized by many organizations viz. ICC D. M. Trivedi Lifetime Achievement Award (2022), Fellow, Indian National Academy of Engineering (2021), Shanti Swaroop Bhatnagar Award (2020) in Engineering Sciences, VASVIK Award (2016), CIPLA-Hameid Process Development award (2019,2023,2024), Young Scientist awards (INSA2009, INAE2009, CSIR2011, IASc2011, OPPI2015). He is a Selection Committee member of the Humboldt Foundation (2019-2026)

He has published over 125 papers in international journals, supervised 14 PhD students, filed 50 patents (32 granted) and designed several flow reactors that are licensed to Indian industries. He is on the Editorial Boards of many journals and he

ISBN: 978-81-980623-8-3

works with several industries on projects on continuous manufacturing at various scales.

**Topic: Continuous manufacturing in the pharmaceutical industry: Opportunities, Challenges and the path forward**

Scope-3 Emission Norms are going to be extremely pertinent and important for the Indian Chemical Industry, including the pharmaceutical industry. Considering sustainability as a significant driver, the pharma industry will also have to gear up for meeting newer challenges in the healthcare segment (viz. a visible movement towards biotransformation from the conventional chemical synthesis), the economic pressures from increasing import prices, challenges from the backward integration in Europe to become self-sustained in a few bulk drugs, forward integration in the Gulf countries to enter into new high value domain and a few unexpected scenario (viz. tariffs) over the next decade. Efforts need to be made to make manufacturing processes more energy efficient, smaller foot print, reduce or eliminate solvents, zero discharge approaches, using renewables etc. The conventional batch-oriented approach of manufacturing intermediates and drug molecules in the pharmaceutical industry is changing rapidly and the Indian industries are also visible in this change. This presentation will give an outlook of the continuous manufacturing relevant to the pharma industry at various scales of operation. A few case studies will be discussed followed by highlighting opportunities in this domain, realistic challenges and the way to mitigate them. The road ahead will focus on early stage adoption of flow chemistry, reduction in the excess reagents, use of passive cooling rather than direct contact heat transfer, designing catalysts that help reduce severity of reaction conditions, etc.

********

**Dr. Rajesh Kumawat**

Head - Medical Services & Clinical Development,

Himalaya Wellness Company, India

Dr. Rajesh Kumawat serves as the Head of Medical Services & Clinical Development at The Himalaya Wellness Company, where he oversees global medical and clinical development for the company's range of modern medicine generics, novel formulations, and herbal products.

Dr Kumawat holds MBBS from J.L.N. Medical College, Ajmer, and MD in Pharmacology from SMS Medical College, Jaipur. He has over 30 years of total experience in the public health & pharmaceutical industry, with key roles at Lupin, Fresenius Oncology, and Ranbaxy/Sun Pharma. He had spearheaded the pilot project of RNTCP as MOTC (Medical Officer Tuberculosis control) sponsored by WHO. His expertise includes various domains such as Clinical Development, Scientific Strategy, Medical Writing and Clinical Operations. He spearheaded many Phase I - IV , clinical development & multicentric clinical trials in multiple therapeutic domains for DCGI, USFDA, MHRA submissions. Privileged to be one among the expertise in India to have exposure of strategy & execution of Global Phase 1 study. Currently, he oversees medical and clinical development for Himalaya's global products and implementation of Pharmacovigilance in herbal industry. Dr. Kumawat has many publications in his name at various prestigious journals & also has participated as guest speaker at various national & International platforms.

**Title: AI and clinical trial optimization - Clinical trials of Herbal Products – A GCP approach**

Artificial Intelligence (AI) is redefining clinical research by enabling smarter, faster, and more efficient trial processes, AI offers transformative potential in optimizing

ISBN: 978-81-980623-8-3

clinical trials of herbal products. Herbal products & trials often face challenges & complexity such as variability in phytochemical composition, patient response, uniform Regulatory Framework, Global Acceptance etc. AI-driven solutions like predictive analytics for patient recruitment, adaptive trial designs, automated data capture, and real-time safety monitoring—can significantly enhance trial efficiency while ensuring compliance with Good Clinical Practice (GCP) standards. By integrating AI, it can accelerate timelines, improve data accuracy, and strengthen global acceptance of scientifically validated herbal interventions. The synergy between traditional medicine and advanced technology will position ancient wisdom at the forefront of innovation, delivering ethical, reliable, and globally compliant clinical evidence for herbal products.

**Prof. Pulok Kumar Mukherjee**

Professor

Jadavpur University,
Dept. of Pharmaceutical Technology, Kolkata - 700032, India

pulokm@gmail.com

Prof. Pulok Kumar Mukherjee is a globally acclaimed distinguished Pharmaceutical scientist and a Visionary Leader in Pharmaceutical Sciences whose work spans pharmaceutical education, natural product research, chemical biology, and translational drug discovery. Currently Professor at the Department of Pharmaceutical Technology and the School of Natural Product Studies, Jadavpur University, Kolkata. His work reflects a unique blend of traditional medicine with modern pharmaceutical sciences, establishing new paradigms in evidence-based drug development and natural health product research. With over 30 years of R&D experience, Prof. Mukherjee is globally recognized for contributions in ethnopharmacology, pharmacognosy, toxicology, metabolomics, and traditional medicine-inspired drug discovery. His pioneering work bridges traditional knowledge systems with modern pharmaceutical sciences, driving innovation in bio-prospecting, metabolomics, quality control, and safety assessment of natural health products. His "Farm to Pharma" approach has strengthened India's bioeconomy by validating traditional knowledge, improving value chains, and developing products and processes of national relevance. For his outstanding globally acclaimed contributions he has been recognised as a Fellow of the Royal Society of Chemistry (FRSC), National Academy of Sciences (FNASc), National Academy of Agricultural Sciences (FNAAS), and West Bengal Academy of Science and Technology (FAScT). As the Founder of the Society for Ethnopharmacology (India) and Past President of the International Society for Ethnopharmacology (Switzerland), his leadership has fostered global collaboration in natural product research. His global mission of "Globalizing Local Knowledge and Localizing Global Technologies" continues to inspire innovation and international collaboration.

**Topic: Bridging Heritage and Innovation: Omics and Artificial Intelligence in Advancing Traditional Medicine."**

Traditional Medicine (TM), including Ayurveda, Siddha, Unani, Sowa-Rigpa, Traditional Chinese Medicine (TCM), Kampo, and diverse Indigenous systems, continues to support the health needs of the global population. Despite this wide reach, global therapeutic integration is limited because of fragmented documentation, variability in raw-material quality, inconsistent species authentication, and insufficient mechanistic and clinical evidence. This lecture synthesizes advances in omics technologies, including genomics, transcriptomics, proteomics, metabolomics, and microbiomics, together with Artificial Intelligence (AI) methods such as machine learning, deep learning, natural language processing, and computer vision. The goal is to demonstrate how these tools can decode traditional knowledge, validate mechanistic pathways, and support the translation of TM into modern therapeutics. The convergence of nature, knowledge, and innovation symbolizes India's scientific renaissance in the pharmaceutical domain. The convergence of omics technologies and artificial intelligence is reshaping the landscape of traditional medicine research and practice. Across knowledge digitization, mechanistic exploration, quality assurance, ecological conservation, clinical evaluation, and safety monitoring, AI and omics can

ISBN: 978-81-980623-8-3

provide tools for rigor, reproducibility, and global interoperability making ancestral wisdom more accessible, analyzable, and actionable. Although omics and AI provide transformative opportunities for traditional medicine, several challenges remain. These include limited data interoperability, insufficient multi-omics biobanks, variable validation standards, and ethical concerns related to community-owned knowledge. To address these gaps, we propose a seven-pillar strategic framework built on ethical integrity, interoperable infrastructure, mechanistic rigor, safety and quality assurance, ecological stewardship, regulatory readiness, entrepreneurship development and community participation.

**Chakradhara Rao S Uppugunduri**

Assistant Professor

JIPMER Puducherry, India

uscrao@jipmer.ac.in

Dr. Uppugunduri holds a PhD Pharmacogenetics/Medical Pharmacology. He is currently working as an Assistant professor in Department of Medical Oncology, JIPMER, Puducherry. He completed PhD at Department of Pharmacology, JIPMER, Puducherry in 2010 during which he received the Indo-Swiss Research Fellowship. Following completion of PhD, he continued to work in pharmacogenetics/omics at CANSEARCH Research platform of pediatric oncology and hematology of University of Geneva and headed the experimental research division until May 2024. He is a recognized Clinical Pharmacologist from Swiss Society of Clinical Pharmacology and Toxicology (SSCPT). He is also serving as a visiting faculty at Department of Pharmacology, Kasturba Medical college, Mangalore and as a guest faculty at AIMSR, Hyderabad, India. His research focuses on pharmacogenetics and personalized medicine with contributions in elucidating drug responses, drug-drug interactions in relation to genetic variants. He founded the forum on personalized medicine on nature network in 2010 (currently available at www.personalizedmedicine.in). He is also an active member of a few national and international pharmacological and pharmacogenomic organisations including Clinical Pharmacogenomics Implementation Consortium (CPIC) and Pharmacogenomics Research Network (PGRN).

**Topic: Optimizing therapeutic outcomes in oncology using pharmacogenomics**

Past few decades, evidence has been generated for the utility of Pharmacogenomic (PGx)testing for pairs of many gene–one drug, or one gene-many drugs. However, practice is confined to a few domains such as oncology and cardiology that have shown a high impact. Pre-emptive PGx testing also demonstrated reductions in serious adverse events. Various studies across the globe have also demonstrated that each individual carries a number of actionable PGx variants ranging from one to many depending upon their ethnicity. Though most of the drug labels do not require or recommend PGx testing, having this genetic information preemptively could be of help in their lifetime for guided dosing of drugs where there is clear demonstrated benefit in terms of treatment outcomes and costs. Evidence generation for other relevant medication in use, development and novel approaches, e.g. immunotherapy, remains a work in progress. Continued education, expanding the list of guidelines for PGx guided dosing and therapies, electronic health record system implementation systems with integration of PGx information is the key to successful implementation of PGx testing in clinics.

**Dr. Murali .M**

Additional Professor

AIIMS Bhopal, India

murali.tmc@aiimsbhopal.edu.in

Dr. Murali M is an Additional Professor in the Department of Translational Medicine, AIIMS, Bhopal, with over 15 years of research experience in pharmacogenomics, clinical pharmacokinetics and translational research. He earned his Ph.D. in Pharmacogenomics (2004-2010) from AIIMS New Delhi, M. Pharm in Pharmaceutics from BIT, Mesra, Ranchi (1999-2001) and B. Pharm from JSS College of Pharmacy, Ooty, Tamilnadu (1995-1999). He has international postdoctoral research experience from Centre for Pharmacogenomics and Translational Research, College of Pharmacy, University of Florida, Gainesville, Florida, USA, where he worked on Genome-wide association studies on antihypertensive drug response, and at the Pharmacotherapeutics Unit, Faculty of Medicine and Health Sciences, University of Putra Malaysia, where he contributed to pharmacogenetic studies in oncology, with a focus on docetaxel response in metastatic breast cancer. He serves as a Principal Investigator and Co-Investigator on numerous national and international funded projects supported by ANRF, DHR-ICMR, DST-SERB, ISID-Pfizer (USA) and National Institute of Health (USA), spanning precision oncology, metabolomics, multi-omics biomarker discovery, environmental health assessment, public health pharmacy model for antimicrobial stewardship programme and pharmacogenomics-guided therapy optimization. He also serves as a grant reviewer for the Department of Biotechnology (DBT) India), Health Research Council (New Zealand), and King Abdulaziz City for Science and Technology (KACST), Saudi Arabia.

**Topic: From Bench to Bedside: Translating Pharmacogenomics (PGx) To Clinics.**

Translational research forms the cornerstone of personalized medicine, enabling a paradigm shift from the conventional "one-size-fits-all" treatment model to individualized therapeutic strategies based on a patient's molecular and genetic profile. In India, where the population exhibits significant genetic diversity, translational research holds immense potential to improve the understanding and clinical applications of personalized care in a wide spectrum of diseases. The rapid advancements in genomics, particularly pharmacogenomics have opened new avenues for precision healthcare. However, bridging the gap between laboratory discoveries into routine clinical practice remains a major challenge. This presentation will explore the journey from "bench to bedside," focusing on how pharmacogenomic profiling are translated into healthcare settings to improve drug efficacy, minimize adverse drug reactions and improve overall patient outcomes in the domain of A. Neuro-Oncology (Glioma): Exploring how polymorphisms in ATP-Binding Cassette (ABC) transporter genes can serve as predictive markers for temozolomide efficacy and treatment outcomes in glioma patients. B. Cardio-Oncology (Breast Cancer): Examining the genetic markers associated with anthracycline-induced cardiotoxicity, and how pharmacogenomic insights can help mitigate adverse outcomes in Indian breast cancer patients undergoing chemotherapy. Through these research studies, participants will gain valuable insights into the practical implementation of pharmacogenomic testing in Indian healthcare settings and the future directions of personalized drug therapy.

**Dr. Chung Yong-ji**

Founder and Chief Executive Officer (CEO)

Caregen Co. Ltd.,

ISBN: 978-81-980623-8-3

Dr. Chung Yong-ji is the Founder and Chief Executive Officer (CEO) of Caregen Co. Ltd., a leading South Korean biotechnology company specializing in the research, development, and commercialization of biomimetic peptides and growth factors. He founded Caregen in August 2001, focusing on peptide technology applications in cosmetics, medical devices, dietary supplements, and pharmaceuticals, and successfully listed the company on the KOSDAQ stock exchange in 2015. Dr. Chung holds a robust academic background, including a Ph.D. in Molecular Biology from Cornell University, a Master's degree in Biochemistry from the University of Texas at San Antonio, and a Bachelor's degree in Genetic Engineering from Sungkyunkwan University. Known as a pioneer and a self-made billionaire in the global peptide industry, he continues to drive innovation with a vision to develop new treatments for conditions like diabetes and macular degeneration, while expanding Caregen's global reach to over 130 countries.

********

**Pardeep K. Gupta**

Burroughs Wellcome Professor of Pharmaceutics, Director, Industrial Pharmacy Laboratory

Philadelphia College of Pharmacy, Saint Joseph's University, PA, USA

pgupta@sju.edu

Dr. Pardeep Gupta is a professor of pharmaceutics at the Philadelphia College of Pharmacy at Saint Joseph's University in Philadelphia. He also serves as the Burroughs Wellcome Endowed Chair and Director of the Industrial Pharmacy Laboratory. His areas of research interest include study of physical properties and delivery of peptide and proteins, and lipid-based delivery systems. He will be sharing some recent work from his laboratory in the area of molecular dynamics simulation of lipid self-assemblies.

**Topic: Coarse-Grained Molecular Dynamics Simulation of Lipid Self-Assembly Using the Martini Force Field: A Comparative Study of Liposomes, Niosomes, and Solid Lipid Nanoparticles**

Introduction: Lipid-based nanocarriers such as liposomes, niosomes, and solid lipid nanoparticles (SLNs) are widely explored in drug delivery due to their biocompatibility and capacity to encapsulate both hydrophilic and hydrophobic drugs. A molecular-level understanding of their self-assembly and structural stability is critical for rational formulation design. In this study, we employed Martini coarse-grained (CG) molecular dynamics simulations to investigate and compare the self-assembly behavior and drug–lipid interactions of these three vesicular systems.

Methods: CG models of phospholipids (DOPC, DOPS for liposomes), non-ionic surfactants (Span 60 for niosomes), and glyceride-based lipids (e.g., glyceryl monostearate for SLNs) were constructed using the Schrödinger Materials Science Suite. To study electrostatic interactions, negatively charged lipids such as DOPS were included for Minoxidil, which was modeled as a positively charged molecule. Paclitaxel, a hydrophobic drug, was also incorporated. Each simulation box contained ~900 lipid/surfactant molecules, ~60,000 water molecules, and 5 drug molecules. Simulations were run under NPT ensemble conditions at 300 K for 3000 ns with a 10 fs time step.

Results: The self-assembled morphologies differed significantly among the systems. Liposomes and niosomes formed bilayered structures, observed as either spherical vesicles or elongated cylindrical assemblies. In contrast, SLNs formed compact, amorphous nanoparticles lacking a bilayer organization, characteristic of solid lipid aggregates. The inclusion of negatively charged lipids in liposomes enhanced electrostatic interactions with cationic Minoxidil, promoting surface binding and partial insertion into the bilayer. Paclitaxel preferentially localized within the hydrophobic core regions of liposomes and SLNs. Structural metrics such as radius of

ISBN: 978-81-980623-8-3

gyration (Rg), RMSD, RDF, and cluster analysis confirmed the stability and integrity of the self-assembled structures over the simulation timescale.

Conclusion: This comparative CGMD study demonstrates that lipid architecture and charge play key roles in dictating nanocarrier morphology and drug interaction profiles. While liposomes and niosomes favor bilayer-based vesicular structures, SLNs self-assemble into non-bilayered nanoparticles. The Martini force field simulations provide mechanistic insight into the self-assembly and stability of lipid nanocarriers and support rational design strategies for drug delivery applications involving hydrophobic and charged drugs like Paclitaxel and Minoxidil.

**Rakesh Tekade**

Associate Dean (R&D),
Professor & Head,

Department of Pharmaceutics, NIPER Ahmedabad, India

rakeshtekade@gmail.com

Professor Rakesh K. Tekade, currently Associate Dean (R&D), Professor & Head, Department of Pharmaceutics at NIPER-Ahmedabad, is an academic-researcher with over 15 years of experience in teaching and research. He received his doctoral degree from Dr. Hari Singh Gour Central University of Sagar (India). He worked as a as a Postdoctoral fellow-I in University of Hawaii, USA; and as Postdoctoral fellow-II in University of Texas Southwestern Medical Center, USA.

He is a Recipient of several acclaimed awards, including Commonwealth Fellowship- UK, National Doctoral Fellowship (AICTE-India), IRISH Government Postdoctoral Fellowship (Ireland), CSIR Research Fellowship (CSIR-India), to name a few. He is a recipient of a British Council Split-site research Fellowship (awarded at the University of Central Lancashire, UK), and has served in industry (R&D, Ranbaxy, India).

He has been listed as a Top 2% Scientist in the field of Pharmacy and Pharmacology, by Stanford University, USA, successively from 2021 to 2025 (database published by Elsevier).

Dr. Tekade's research goal is to expand the research program through extramural funding, thereby translating preclinical findings into a clinical setting. Current research involves the development of fit-to-purpose, translational, and novel targeted specific nano-biomaterials for biomedical applications.

He co-authored > 450 publications in (>19500 citations; H-index: 68), including ACS-Chemical Reviews (Impact Factor 65.61); and Progress in Materials Science (Impact Factor: 48.21). He has EDITED 12 Books with ELSEVIER/SPRINGER/Taylor and Francis (as Editor-in-Chief), 05 invited editorial articles, and 12 Patents. He has successfully transferred one of his products to the Pharma Industry. To date, he has supervised #19 Ph.D students, #6 Postdoctoral Researchers, and over #80 Master's Dissertations. He has completed several extramural projects funded by DST,, DBT, ICMR, FRGS-Malaysia. Recipient of the Pharma Innova Award and Best Research Mentor Award by Troika Pharmaceuticals Ltd.

He is a reviewer for several international journals, serving as Grant reviewer for the Mitacs (France), FONDECYT FUNDS (Chile), National Science Centre (Poland), French National Research Agency (ANR), France, Khwarizmi International Award (KIA) (Iran), as well as an Editorial Board member and reviewer for several international journals.

**Topic: Next-generation platforms for targeted cancer treatment via technological transformation**

The paradigm of cancer therapy is undergoing a transformative shift driven by converging technological innovations across genomics, bioinformatics, nanotechnology, and AI-enabled diagnostics. Next-generation platforms for targeted cancer treatment are

ISBN: 978-81-980623-8-3

redefining precision medicine by integrating concepts such as drug targeting, gene therapy, laser therapy, 3D printing, and adaptive therapeutic delivery systems. These platforms leverage gene editing, smart nanoparticles, and AI-guided drug design to enhance specificity, minimize off-target effects, and personalize interventions at the molecular level. Furthermore, regulatory frameworks are evolving to accommodate these agile technologies, fostering accelerated approvals and collaborative innovation. This lecture explores the strategic convergence of these advancements, highlighting their potential to revolutionize oncology by making cancer treatment more predictive, preventive, and participatory

********

**Narasimha Murthy**

CSO

Topical Products Testing LLC, USA

Dr. S. Narasimha Murthy is the Chief Scientific Officer of Topical Products Testing (TPT) LLC, USA (www.TopicalProductsTesting.com). Dr. Murthy is a pioneer in topical and transdermal drug delivery technologies. His research programs are funded by NIH, USFDA, and Pharmaceutical companies. He is currently the Principal Investigator on a U01 grant and co-investigator on three U01 research projects funded by the USFDA. Formerly, Dr. Murthy served as a Professor of Pharmaceutics at the University of Mississippi School of Pharmacy for over 16 years. Dr. Murthy has published over 150 research papers and presented over 250 scientific posters at national and international scientific meetings. He has authored two books and over twenty book chapters. Dr. Murthy is also the Chief Scientific Adviser of Fitbac Pharma, USA.

Dr. Murthy has received several awards, such as the New Investigator award and Cumberland Researcher of the Year from the University of Mississippi, the Global Indus Technovator award from MIT, the Endowed Chair for Research at the Ohio Northern University, and was inducted as a Fellow of the American Association of Pharmaceutical Scientists in 2017. He was bestowed with the Distinguished Scientist award by the American Association of Indian Pharmaceutical Scientists in 2018. Dr. Murthy was honored with the prestigious 2022 AAPS Pharmaceutical Global Health Award. In 2023, the Academy of Pharmaceutical Sciences, UK, awarded him a Fellowship, the highest award given to a select few, recognizing his research accomplishments across the pharmaceutical sciences.

Dr. Murthy served as one of the subject-matter experts to the National Academies of Sciences, Engineering, and Medicine, USA, on the Assessment of the Safety and Effectiveness of Ingredients Used in Compounded Topical Pain Creams. Dr. Murthy is also one of the co-founders of a non-profit research organization in India, "The Institute for Drug Delivery and Biomedical Research (IDBR)" (www.IDBResearch.com), founded in 2013. The main goals of IDBR are to foster research in drug delivery and biomedical sciences to address unmet medical needs and to support aspiring scientists and students. The organization is also playing a significant role in several community service activities

**Topic: Novel Design Approaches In Microneedle-Mediated Drug Delivery**

Microneedle (MN) platforms have evolved from simple skin-piercing arrays to sophisticated delivery systems capable of overcoming multiple biological barriers. This presentation highlights a series of novel design strategies using polymer-coated polymeric microneedles (PCPM), dissolving MNs, adsorbent-integrated MNs for sampling, and ion-trapping MN systems. These approaches enable controlled drug deposition into the skin, ocular tissues, and mucosal surfaces, while modulating release via polymer grade, coating thickness, and formulation attributes. Additional advances in ungual microneedle delivery and a sublingual Microsert system reveal

ISBN: 978-81-980623-8-3

significant improvements in drug retention and systemic uptake. Collectively, these innovations showcase how rational MN engineering can expand therapeutic possibilities across topical, transdermal, ocular, ungual, and mucosal delivery pathways.

**Hemanth Kumar Nambari**

Scientist-B

Kalam Institute of Health Technology (KIHT), Visakhapatnam, India

dr.hemanthpharmd@gmail.com

Dr. N. Hemanth Kumar is a highly accomplished Doctor of Pharmacy with an MBA, recognized for his multidisciplinary expertise across pharmaceutical sciences, emerging technologies, and healthcare innovation. He holds over sixteen professional certifications in advanced domains such as Artificial Intelligence, Machine Learning, Blockchain, and the Internet of Things, awarded by globally reputed institutions including Google, IBM, the Blockchain Council, and the University of Maryland.

He is an accomplished innovator with more than thirteen national and international patents, reflecting his contributions to scientific and technological advancement. He has authored three books in the fields of Artificial Intelligence, Pharmacology, and related interdisciplinary areas.

With more than twelve years of diverse experience, Dr. Hemanth has built strong expertise in academia, clinical and preclinical research, regulatory affairs, and professional pharmacy practice. His work spans private, semi-government, and government organizations, contributing significantly to pharmaceutical education, scientific research, regulatory compliance, and patient-centered healthcare delivery.

**Topic: Artificial Intelligence in Healthcare Technology (From Innovation to Production)**

Artificial Intelligence (AI) is reshaping the landscape of healthcare technology by redefining the analysis of medical data, enhancing diagnostic precision, and optimizing patient care delivery. This presentation delves into the transformative journey of AI in healthcare, tracing its evolution from pioneering innovations to robust, production-ready solutions. We will explore state-of-the-art advancements, including AI-powered diagnostic tools, predictive analytics for patient outcomes, personalized treatment plans, and intelligent automation for clinical decision support. These technologies drive improvements in efficiency, diagnostic accuracy, cost-effectiveness, and equitable access to healthcare services. The talk will also address critical challenges in integrating AI into clinical workflows, such as ensuring ethical AI deployment, safeguarding data privacy, navigating regulatory frameworks, and mitigating algorithmic bias. By highlighting real-world case studies, emerging trends, and future opportunities, this presentation underscores how AI bridges the gap between cutting-edge innovation and scalable, production-level healthcare solutions, ultimately revolutionizing patient care and operational excellence.

**Dr. Basavaraj Nanjwade**

Chief Scientific Officer

Wexford Laboratories Pvt Ltd, Bangalore, India

nanjwadebk@gmail.com

Currently working as a Chief Scientific Officer at Wexford Laboratories Pvt Ltd, Tumkur-Bangalore, also working as a Scientific Advisor to Indian Patent Office, New Delhi, India, also worked as an Chief Technnical Officer at MRHM Pharma Pvt Ltd,

ISBN: 978-81-980623-8-3

Bangalore, also worked as a General Manager-Production and Operations at Search Foundation Rajajinagar, Bengaluru, also worked as a PMT Head at MRHM Pharma Pvt Ltd, Bengaluru, Also worked as Assistant Vice President and Plant Head at KJD Pharmaceuticals Pvt Ltd, Bidar in Production, QA, QC Regulatory Affairs, IPR and R&D, I have over 25 years of rich experience in pharmaceutical industry and Pharmaceutical Education and Research Project identification, initiation, development, production and commercialisation.

I have developed 170 products (26 Nutraceuticals, 10 Veterinary, 07 Equine, 05 Fishery, 07 Poultry, 40 Pharmaceuticals, 02 Biopharmaceuticals, 30 Cosmetics, 07 Homeopathic 06 Probiotics, 07 Prebiotics, 03 Dental, 05 Ophthalmic and 15 Ayurvedic) for Domestic and International market. Developed formulations and transferred successfully of tablets, capsules, liquids, ointment, cream, gel, dry powder and Injections of CNS, CVS, and Diabetic Class API. Formulation of Immediate and other release tablets, Capsules and Liquids, developing prototype formulations successfully for sublingual drops and formulation and development of Nutraceutical and Ayurvedic products are of my current interest.

I have a good experience right from brain Storming techniques, product identification, product selection, product development, scale up, production, QA & QC, co-ordinating with Clinical development of the new products. I also have experience in organising and conducting small business conferences with doctors in promoting the new products (Pharmaceuticals and Nutraceuticals). I always use to prepare product promotion literatures for preparing Leaflets and other product promotion materials. I have special interest in designing novel packaging concepts like pillow packs (Unit dosage forms) and newer delivery systems for all type of dosage forms.

**Topic: AI in medical device development**

Artificial intelligence and machine learning is a upcoming technology in medical device discovery and development for diagnostics, personalized medicine, drug discovery and development, robotic surgery, predictive analytics, manufacturing and quality control, verification and validation, patient monitoring. Drug device combination for medical devices are therapeutic or diagnostic products biologics and pharmaceuticals that involve a drug component of dose optimization, pharmacokinetics (PK) and pharmacodynamics (PD) modelling individualized dosing and regulatory submissions. Beyond combination products modelling and simulation can be applied to quantitative systems pharmacology, clinical trial design, and risk benefit assessment and dosing algorithms for devices. Medical devices integrated with drug eluting stents, digital therapeutics also integration with biologics and pharmaceuticals understanding the GMP and cGMP requirements of each component. AI based medical devices applications and benefits can be improved efficacy, enhanced safety, better patient outcomes and increased convenience, personalized and smart devices, predictive maintenance, improved functionality and adherence. AI based empowered medical device innovator will fulfil the regulatory demands of FDA, EU-MDR and ISO 13485 to GDPR and beyond to meet the highest standards. AI based in medical device development meet the requirements of both drug cGMP , GLP and device QS regulations.

Department of Pharmacology, AIIMS, Jodhpur

sr_ambwani@yahoo.com

Dr. Sneha R. Ambwani has 30 years of experience in teaching and clinical research. She received the Best Paper Award from the Indian Pharmacology Society at the IPS Conference in Ahmedabad in 2000 and a

ISBN: 978-81-980623-8-3

Certificate of Appreciation from the Principal, Dr. S. N. Medical College, Jodhpur, for her outstanding performance and dedication as a faculty member in 2013. She was awarded the FAIMER Fellowship in 2018. She currently serves as Chair of the Animal Ethics Committee at AIIMS Jodhpur and the Institutional Ethics Committee of IIT Jodhpur. She has also chaired the Drug Trial Committee and the Biomedical Waste Management Committee at AIIMS Jodhpur. Dr. Ambwani has more than 90 research publications in national and international journals. She has actively participated in numerous national and international conferences and workshops, presenting many papers and delivering several plenary lectures, particularly on Good Clinical Practice, Rational Use of Drugs, Research Methodology, and Medical Education. She is also involved in various research projects funded by multiple agencies.

**Topic: Artificial Intelligence: Ethical Issues, Bias, and Challenges in Therapeutics**

Artificial intelligence is increasingly integrated into therapeutic decision-making, clinical workflow, and drug development. Its deployment in healthcare requires careful appraisal of ethical safeguards, potential biases, and implementation challenges to ensure patient safety and equitable outcomes. Ethical concerns remain central, particularly around informed consent, transparency of algorithmic functioning, data provenance, privacy protection, and accountability. Current national guidance emphasises rigorous protocol review, participant comprehension, data quality checks, and mechanisms such as the right to be forgotten to preserve autonomy and confidentiality. Ensuring that clinicians and researchers understand the limitations of AI tools and retain supervisory authority is essential for maintaining trustworthiness.

Bias is a critical limitation of AI with direct implications for therapeutic decisions. Models trained on non-representative datasets may propagate or amplify disparities in diagnosis and treatment. Under-representation of demographic or clinical subgroups can lead to reduced accuracy and inappropriate therapeutic recommendations. Bias mitigation requires transparency in data sources, external validation across diverse populations, and continuous monitoring, as model performance may drift with evolving clinical contexts. These concerns are consistently highlighted in recent evaluations of algorithmic fairness in medicine.

Beyond ethics and bias, practical implementation challenges affect AI adoption in therapeutics. Inconsistent digital infrastructure hinders reliable deployment. The dynamic nature of AI systems complicates regulatory oversight, as updates may alter model performance without necessitating formal re-evaluation. Defining responsibility for adverse outcomes, including the roles of AI tool developers, hospitals, and clinicians, remains unresolved in many regulatory settings. Building and sustaining patient trust requires clear communication about the role of AI relative to human judgment, particularly when AI influences high-stakes treatment decisions.

A structured approach that addresses ethical processes, minimises bias, and anticipates implementation barriers is essential for safe and equitable use of AI-driven therapeutic tools in clinical practice, research, and drug development.

**Dr. Sanjay Jachak**

Professor and former Head,

Department of Natural Products

National Institute of Pharmaceutical Education and Research (NIPER), Sector-67, SAS Nagar (Mohali), India

sanjayjachak@niper.ac.in

Prof. Sanjay Jachak is a Professor in the Department of Natural Products at the National Institute of Pharmaceutical Education and Research (NIPER), SAS Nagar (Mohali). He has been a faculty member at

ISBN: 978-81-980623-8-3

NIPER since 1999 and has served as Professor since 2011. He holds a Dr.rer.nat. (Pharmacy) [Ph.D.] from the Institute of Pharmaceutical Sciences, Karl Franzens University, Graz, Austria (1997), and an M.Pharm. from Pune University (1994).

His work focuses on phytopharmaceutical and nutraceutical/functional food development, AYUSH medicines, ethnopharmacology of Indian medicinal plants, standardization of herbal drugs and formulations, and phytochemical analysis. His research also includes the discovery of anti-diabetic and anti-obesity natural products and natural product inhibitors of bacterial efflux pumps. Prof. Jachak holds 5 patents and has published over 125 peer-reviewed papers in international journals. His Google Scholar metrics include an h-index of 41, an i10-index of 75, and 6,132 total citations (as of 01-12-2025). He has guided 14 Ph.D. scholars (with 9 currently working under his supervision) and has mentored 134 master's students.

**Topic: Application of AI-Driven Ayurinformatics for Development of AYUSH Medicines and Phytopharmaceuticals**

The integration of artificial intelligence (AI) and data-driven technologies into traditional systems of medicine has given rise to a novel interdisciplinary field known as Ayurinformatics, which combines the wisdom of Ayurveda with modern computational and analytical tools. It also facilitates efficient, large-scale reverse pharmacological validation of the practices in Ayurveda [1]. Further considering wider interests in the field of in-silico analysis of medicinal plants and traditional medicine formulations, we have recently published Gupta and Jachak guideline for a Pre-Step analysis of medicinal plants for In Silico research (SAPPHIRE: Systematic assessment and Pre step protocol for herbal in silico research and evaluation) [2]. Keeping this in view, we at NIPER-SAS Nagar studied Ayurvedic formulations for their mechanism of action utilizing 'Ayurinformatics' approach. A case study of two such Ayurvedic formulations viz. Arogyamrit Kwath and Dashmoola Asthang Kwath developed by us in collaboration with Dhanwantary Ayurvedic College, Chandigarh; is being presented in this lecture [3]. Both the formulations were studied for metabolomics using LC-HRMS analysis, in vitro and in-silico studies. The study highlights the translational potential of these formulations toward modern antiviral therapy and demonstrates a significant step toward the global acceptance of Ayurvedic herbal solutions driven by AI and advanced technology. Artificial intelligence can be beneficial for development of phytopharmaceutical product development. In conclusion, the application of Ayurinformatics to Ayurvedic system of medicine is a novel approach and could unravel better and rationale use of Ayurvedic formulations.

**DBA Narayana**

CSO

Ayurvidye Trust, India

drandba50@gmail.com

D. B. Anantha Narayana is a pharmaceutical scientist who has led development and successful marketing of pharmaceutical, Oncology drugs, Ayurvedic & Herbal products, cosmetics & Nutraceutical/ Food Supplements for more than 4 decades. He has championed notifications of a number of new regulations namely Nutraceutical Regulations, Phytopharmaceuticals Regulations, and more recently Ayurveda Aahara Regulations. He serves in various Expert Committees of FSSAI , CSIR, CCRAS, IPC, and other organizations.

He has also supported and led generation of evidence of benefit for drugs, ayurvedic, food supplements. He has also led contemporary dosage form development and technology development for a large no, of Ayurvedic/ Herbal products. He is recipient of Patanjali Life Time Achievement award of IUFOST, 2019, Mumbai, Eminent Pharmacist Award of Indian Pharmaceutical Association 2007,

ISBN: 978-81-980623-8-3

and IPA-IRF Life Time Achievement Award, 2022.

He has authored and edited four books, has published more than 35 research and strategy papers, reviewer of research papers for number of Journals.

**Topic: Phytopharmaceuticals Emerging Botanical Drug Development for Opportunities for Indian Pharma Industry -Attention Drawer**

India is bestowed with long History of usage of botanicals in our TK, which often gets criticised as "needing more evidence ". In 2015, many years post US FDA publication of Guidance to Botanical Drugs, Government of India amended the Drug Regulations by Introducing Regulations that govern Phytopharmaceuticals. This opened up new drug development from "purified fractions of botanicals, characterised with analysis of four marker compounds" for full scientific data generated to get reviewed as a New Drug by CDSCO. Such drugs will be on line with any NCE based drug approved by CDSCO. Differences between the Traditional medicines like Ayuirvedic drugs, scientific requirements for submission of an IND file to CDSCO, Global developments in Botanical drugs approvals so far, Current scenario in this filed, progress by National laboratories, Challenges, and Suggestions for successful developments will be elaborated. Indian Pharma needs to take leads in this area for Atma Nirbhar and Viksit Bharat contributions in addition to current generic drug development.

**Dr. Raghavendra P Rao**

Senior Principal Scientist, Wellness,

Drug Discovery, AI/ML, and Healthcare Data Science

The Himalaya Wellness Company, India

Dr. Raghavendra P Rao currently holds the position of Senior Principal Scientist at The Himalaya Wellness Company in India, where he leads initiatives across Wellness, Drug Discovery, AI/ML, and Healthcare Data Science. He began this role in February 2015, bringing with him over 20 years of extensive post-doctoral research experience in the life sciences sector. Dr. Rao specializes in the scientific validation of natural and wellness products, as well as managing drug discovery projects with a specific focus on metabolic disorders like diabetes and liver conditions. He holds a Ph.D. in Biochemistry from the University of Mysore and completed further advanced training at institutions including the National Cancer Institute (NIH) in the US and the Indian Institute of Science. Recognized for his expertise in applying advanced data analytics and machine learning algorithms to healthcare R&D, he is an active speaker at industry conferences and contributes to various academic institutions.

**Topic: AI powdered Phytochemical screening and Lead Identification**

The identification and development of novel therapeutics from phytochemicals remain a cornerstone of innovative drug discovery. Despite the abundance of publicly available data detailing activity profiles of small molecules and phytochemicals, extracting meaningful patterns, and linking molecular structure to biological function continue to be a significant challenge. Conventional cheminformatics platforms, though valuable, often require substantial manual effort and are limited in their adaptability to the complexity and scale of contemporary phytochemical datasets.

Recent advancements in artificial intelligence (AI) and machine learning (ML) are transforming ligand-based drug discovery, providing sophisticated tools to unravel complex structure-activity relationships. These techniques—now accessible through user-friendly platforms—enable the automated mining of large, heterogeneous datasets, revealing subtle correlations that traditional analyses might overlook. In particular, prediction and clustering algorithms such as support vector

ISBN: 978-81-980623-8-3

machines, random forests, and various clustering methods play a important role in classifying molecules, predicting activity spectra, and prioritising potential leads. The adoption of agentic AI approaches further enhances this process, introducing intelligent agents that automate repetitive tasks, and deliver actionable insights for decision-making.

This talk covers key aspects of selecting and preparing datasets, as well as applying AI and machine learning algorithms—especially those used for prediction and clustering—in phytochemical screening and identifying drug leads. It will also explore how agentic AI techniques can be adapted to speed up the process of discovering new phytochemical drugs.

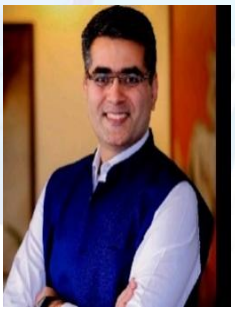
**Dr. Vikas Bansi**

OTC Business Head-India
Himalaya Wellness Company



Vikas Bansi is a highly focused and result-oriented executive serving as the OTC Business Head – India at Himalaya Wellness Company (formerly The Himalaya Drug Company). In this strategic leadership role, he oversees the overall business strategy, sales, marketing, and expansion of the company's Over-The-Counter (OTC) consumer healthcare portfolio in India—one of Himalaya's most critical global markets. Under his leadership, the India OTC division has emerged as one of the fastest-growing worldwide, consistently delivering growth rates more than three times the category average.

Bansi is the chief architect of Himalaya's OTX Business Model, a robust framework designed to build scientific credibility while ensuring deep market penetration. This model is anchored on three strategic pillars. The Ethical Channel focuses on engaging healthcare professionals to establish scientific rigor, with outreach to over 75,000 doctors exclusively for OTC products. The Trade Channel drives widespread availability, targeting distribution across nearly 200,000 retail outlets through general trade, modern retail, and e-commerce platforms. The Consumer Marketing Channel delivers integrated 360-degree campaigns leveraging digital media, influencers, and radio to build awareness, trial, and trust.

His strategic vision aligns closely with evolving consumer behavior, particularly the growing preference for preventive healthcare and wellness in the post-pandemic era. Bansi is actively integrating Himalaya's strong Ayurvedic heritage with modern scientific validation, while introducing innovative formats such as gummies, drink mixes, and organic variants tailored to contemporary lifestyles.

A respected industry voice, Bansi regularly contributes thought leadership on India's nutraceutical and consumer health landscape, emphasizing the importance of innovation, digital transformation, GMP compliance, and clinically validated quality standards to build sustainable and trusted wellness brands

gnsastry@bt.iith.ac.in

Dr. G. Narahari Sastry is a professor at the Department of Biotechnology, IIT Hyderabad. His research interests are working in the interdisciplinary areas of chemistry, biology, material science, software development and artificial intelligence. In the last decade, the GNS group was involved in developing indigenous software that aims to strengthen

ISBN: 978-81-980623-8-3

computational drug discovery called the Molecular Property Diagnostic Suite (MPDS), thereby working towards Aatma Nirbhar Bharat. Dr. Sastry has also made fundamental contributions in the field of non-covalent interaction, Bucky bowl chemistry, aromaticity, and pericyclic reaction. He has made a great contribution in open-source software development in the field of Computer-Aided Drug Discovery, databases, and web servers; all the resources developed by his group are freely accessible to the scientific community. Prior to joining IITH in 2024, Professor Sastry was the Director of CSIR-North East Institute of Science and Technology (NEIST), Jorhat, Assam from February 2019. Before working at CSIR-NEIST, he was the chief scientist and head of the Canter for Molecular Modelling Division at CSIR-IICT, Hyderabad from 2002-2019. Prior to that Dr. Sastry has served as a Lecturer, Department of Chemistry, Pondicherry University, Pondicherry. Dr. Sastry has obtained his Postdoc studies from Israel and Switzerland (1994-1997) and Ph.D. degree from University of Hyderabad, Hyderabad.

Dr. Sastry was awarded with Shanti Swarup Bhatnagar Prize in Chemical Sciences (2011), National Bioscience award, DBT (2009), (one of the highest for Life sciences in India), Swarnajayanti Fellowship (2005) (DST), B.M. Birla award (2001), Dr. B.C. Deb Memorial award (2009), CRSI Bronze Medal (2011), CRSI Silver Medal (2024) and Alexander von Humboldt Fellowship. He is also Sir J. C. Bose National Fellow. He was a visiting professor at IMS, Japan; LMU, Munich, Germany; Jackson State University, USA, and Kyushu University, Japan. He is a Fellow of INSA (FNA), National Academy of Sciences (FNASc), Fellow of the Indian Academy of Sciences (FASc), Fellow of Royal Society of Chemistry (FRSC), Fellow of Association of Biotechnology and Pharmacy, Telangana State Academy of Sciences (Founder Fellow), Andhra Pradesh Academy of Sciences (FAPAS) and also Fellow of Biotech Research Society, India (BRSI).

**Topic: Machine learning and AI Applications in Protein Structure-Function, Drug Discovery, and Healthcare**

The technological revolution being witnessed today largely owes to the emergence of Artificial Intelligence, and particularly machine learning, which has impacted both basic and applied sciences. The ability to ask scientific questions and probe the new technological space was greatly enhanced due to the new roads made by intelligent technologies. In this talk, I would like to focus on three areas: a) protein structure-function relationships, b) drug discovery and c) health care, and how these emerging technologies have metamorphosed the research practices in these fields. The impact of the AI-driven technologies in hit and lead identification, lead optimization, animal and clinical trials will be analyzed with some illustrative case studies. Examples will be given where the top-niche human skills are being slowly replaced by machine unusual correlations between these areas. Some of the fundamental questions on aging, metabolic disorders, degenerative diseases, and geriatric care will be addressed. Importantly, how these questions can be effectively addressed by using AI and ML approaches will be explained.

**Aarshit Mittal**

Chief Product Architect

Chief Technology Officer,

Aarth Software Pvt. Ltd. | Co-Founder, OCSR.ai

aarshit@aarth.io

Aarshit Mittal is a deep-tech entrepreneur and AI systems architect focused on transforming scientific discovery through intelligent automation. He leads OCSR.ai, the world's first unified scientific intelligence platform that digitizes R&D data and accelerates drug discovery from years to weeks.

His collaboration with the Institute of Chemical Technology (ICT) Mumbai led to India's first AI-designed dual COX-2/mPGES-1 inhibitors. His expertise spans

ISBN: 978-81-980623-8-3

cheminformatics, retrosynthesis, ADMET modeling, and large-scale knowledge graphs. building the next generation of AI infrastructure that unifies data, reasoning, and discovery into one intelligent ecosystem.

**Topic: Reimagining Drug Discovery with Unified Scientific Intelligence**

Modern drug discovery suffers from fragmented data, slow iteration, and high attrition. In this talk, Aarshit Mittal presents how OCSR.ai integrates multimodal AI.. combining document intelligence, chemical reasoning, retrosynthesis, protein modeling, and ADMET prediction.. into a single cohesive platform. By bridging silos between chemistry, biology, and knowledge graphs, OCSR.ai enables discovery timelines to shrink from years to weeks. The session highlights India's first AI-generated dual COX-2/mPGES-1 inhibitor series co-developed with ICT Mumbai, demonstrating how unified AI systems can accelerate innovation, enhance reproducibility, and unlock the true potential of R&D intelligence at scale.

**Praful R. Naik, Ph.D.**

Director & CEO

Prashak Techno Enterprises Private Limited

praful.naik@prashak.com

Praful Ramachandra Naik has Bachelors (1985), Masters (1987) and Doctorate (1992) degrees in Pharmaceutical Sciences from the Department of Pharmaceutical Engineering & Technology, Indian Institute of Technology, Banaras Hindu University. During 32 years of Industrial experience, Praful steered creation of diverse inventions resulting in over 50 globally granted patents & over 200 patent applications globally, in diverse industrial segments A proponent of innovations, Praful also steered the invention of path-breaking "nonClonableID (nCiD) Technology" which was formally launched by Late Respected Dr. A P J Abdul Kalam, Former President of India and got adjudged by CSIR as "Being the first disruptive technology from India to the world" based on outcomes of its sponsored national project. Praful founded Prashak Techno Enterprises Pvt. Ltd. in 2014 (www.prashak.com), which is engaged in development and deployment of revolutionary Habitech-NivaraTantra® Building and Onsite Sanitation technologies with Praful as an co-inventor, for creation of greener, cleaner, energy efficient, sustainable and affordable community housing clusters and buildings. Praful was nominated to various national & international committees, conferred awards and invited as speaker to several national / international conferences including being invited as speaker at the prestigious Science and Technology Forum 2010 at Kyoto, Japan.

**Topic: Integrated Innovations: Converging Pharma And AYUSH Sciences To Propel Next-Gen Divergent Innovations & Solutions For Unmet Medical Needs**

India stands at a unique crossroad in the global healthcare innovation landscape — possessing, on one hand, a robust modern pharmaceutical research ecosystem, and on the other, an unparalleled legacy of traditional AYUSH knowledge systems rooted in Ayurveda, Yoga & Naturopathy, Unani, Siddha, and Homeopathy. Despite their shared goal of restoring and maintaining health, these domains have historically evolved in isolation. The integration of their principles, methodologies, and technological strengths presents an extraordinary opportunity to create HYBRID, ADAPTOGENIC INNOVATIONS in a convergent, translational framework for holistic, affordable, and evidence-based healthcare. India's traditional systems of medicine (AYUSH) represent a vast repository of empirically validated phytochemical knowledge. However, these systems often remain disconnected from modern pharmaceutical discovery pipelines. This presentation introduces an integrated innovation framework that bridges this divide by

ISBN: 978-81-980623-8-3

uniting phytochemical wisdom with advanced pharmaceutical technologies such as molecular docking, NDDS, nano-formulation, personalized medicine and AI-based compound synergy mapping. The model focuses on (a) scientific validation of AYUSH actives, (b) formulation using advanced development pharmaceutics, (c) co-formulation with allopathic APIs to achieve multi-target efficacy, (d) sustainable extraction and manufacturing aligned with circular economy principles, and (e) translation of these technologies into accessible, affordable community healthcare solutions. Case illustrations include curcumin-based nanoemulsions for inflammatory disorders, adaptogenic formulations and co-formulations integrated into controlled-release delivery systems, botanical antioxidants paired with anti-diabetic APIs to minimize adverse effects and hybrid co-formulations for unmet medical needs with a special focus on Cancer, Viral, Blood Purification, Obesity, Neurological ailments. The integrative approach an Integrated Pharma–AYUSH Innovation Platform (IPAI), if done in a proper and systematic manner will enable advances in preventive and personalized medicines, strengthen India's R&D and regulatory frameworks, and position the Nation as a global leader in evidence-based holistic health innovations combining sustainability, innovation, and ancient wisdom into a unified health paradigm which in turn will substantially advance India's health innovation goals under the "Atmanirbhar Bharat" and One Health missions.

********

**Indiran Pather, D. Pharm**

Professor: Department of Pharmaceutical Sciences

Howard University, Washington DC, USA

indiran.pather@howard.edu

Dr. Pather holds B Pharm, M Pharm and Doctor of Pharmacy degrees. The research work for his terminal degree was done at the University of Missouri – Kansas City and at the pharmaceutical company, Marion-Merrell Dow, while it was awarded by the University of the Western Cape, South Africa. He has worked in retail pharmacy, hospital pharmacy and has been a founding member of a few start-up companies. He was also a founding faculty member and inaugural chair of the Pharmaceutical Sciences Department at an American University. Dr. Pather has extensive teaching experience both in South Africa and in the United States. He has also worked for 10 years in the US pharmaceutical industry, rising to the position of Director of Pharmaceutical Sciences, before returning to academia.

Dr. Pather's expertise is in novel delivery systems, particularly buccal and sublingual delivery. His work has covered basic science as well as the development of novel drug delivery products and he has, in a few instances, developed industrial test methods where no compendial or standard methods existed. He has developed novel tablet formulations, including effervescent, orally disintegrating, and externally lubricated tablets. He has also worked in the areas of emulsions, cosmetic formulation and development, and novel sunscreen formulations.

Dr. Pather played the lead role in the development of two FDA-approved products and has published several papers and book chapters. He co-edited a book, Oral Mucosal Drug Delivery and Therapy, and was the sole author of the recently published textbook, Pharmaceutics for Pharmacy Students (McGrawHill Professional). He has 21 US patents and several international patents to his credit. He has served as consultant to pharmaceutical companies both in the US and internationally (including India). He serves as an expert witness in patent infringement litigation.

**Topic: Some Contributions to Buccal and Sublingual Drug Delivery**

The presentation begins with a brief introduction to buccal and sublingual drug

ISBN: 978-81-980623-8-3

delivery and the advantages of this route over swallowed medication. This is followed by a description of some basic science issues, including the methods for the preparation and storage of animal buccal tissue for ex vivo experiments, that were investigated. The resolution of some of these issues contributed to science in this area of drug delivery. In some instances, widely accepted methods were found to be defective. The effects of temperature on drug absorption through the oral mucosa were also investigated and generalizable information, gleaned from this work, is described.

The development of novel buccal-and-sublingual drug delivery systems for specific molecules are then described. The advantages of these products over conventional medications are elucidated and their contributions to therapy are mentioned. One of these was recognized by the FDA as a new indication.

Beyond these areas of experimental investigation, there are some new directions that the presenter is exploring which could be used advantageously and they are also briefly presented. Some of the learnings from buccal and sublingual drug delivery have implications for an alternate, novel route of drug delivery and the presentation ends with a forward-thinking discussion of these implications.

********

**Muralikrishnan Dhanasekaran**

Professor &
Administrative Fellow,
Alumni Professor

Graduate School,
Auburn University,
Department of Drug Discovery & Development, Harrison College of Pharmacy, Auburn University, Hargis Hall, Auburn, AL, USA

dhanamu@auburn.edu

Dr. Muralikrishnan Dhanasekaran is an Alumni Professor and Administrative Fellow in the Graduate School at Auburn University, USA. He has mentored numerous undergraduates, Honors College, graduate, and professional (Pharm.D.) students, and has authored nearly 160 peer-reviewed international publications, over 500 scientific abstracts, and nearly 90 book chapters. He has also served as Editor for more than twelve scientific books and is an active reviewer for multiple international journals and grant agencies. Dr. Dhanasekaran's research laboratory specializes in preclinical neuropharmacology and drug development, with a focus on the neuroprotective and neurotoxic effects of natural bioactives and synthetic molecules. His current research aims to identify and develop novel therapeutic agents for epilepsy, Alzheimer's disease, and Parkinson's disease. As an Administrative Fellow, Dr. Dhanasekaran has served as both a member and leader on various college, departmental, and university committees. He is actively involved in national and international graduate student recruitment and is dedicated to enhancing the welfare, engagement, and professional development of postdoctoral associates. In recognition of his academic, research, and outreach contributions, he has received numerous prestigious national and international awards for teaching, mentorship, research, and service.

**Topic: Empowering Pharmacists in Bridging Global Healthcare Gaps: The Crucial Role of Outreach in the Subcontinent and Beyond**

Pharmacist-led outreach activities are pivotal in addressing critical global healthcare gaps within underserved populations, not only in India but also in neighboring countries such as the Maldives and Sri Lanka. In the subcontinent, silicosis is an irreversible occupational respiratory pathology which continues to affect countless manual workers exposed to silica dust yet remains a largely derelict public health challenge. As trusted and accessible healthcare professionals, pharmacists are uniquely positioned to drive early detection, patient education, prevention, and medication adherence for silicosis management. Through targeted outreach,

ISBN: 978-81-980623-8-3

pharmacists can initiate impactful awareness campaigns, conduct health screenings, and collaborate with community leaders to reduce the burden of this debilitating condition. Beyond silicosis, pharmacist outreach programs in the subcontinent have the potential to transform health outcomes by addressing a spectrum of unmet needs, from chronic disease management to health promotion in rural and peri-urban settings. In geographically isolated regions such as the Maldives, pharmacist-led initiatives serve as a vital bridge to healthcare, delivering medication management, education, and support to remote island communities. Empowering pharmacists as leaders in community outreach not only strengthens healthcare systems but also enhances community engagement, advances preventive care, and ensures equitable access to essential health services. As India continues to navigate its healthcare challenges, prioritizing and expanding pharmacist-led outreach is essential for achieving health equity and improving public health outcomes. This keynote will highlight the transformative impact of pharmacist outreach in the subcontinent and share insights for advancing these efforts in 2025 and beyond.

**Dr. Zeenat Iqbal**

Professor, School of Pharmaceutical Education & Research

Jamia Hamdard, New Delhi-110062, India

zeenatiqbal@jamiahamdard.ac.in

Dr. Zeenat Iqbal, Professor in the Department of Pharmaceutics at the School of Pharmaceutical Education & Research (SPER), Jamia Hamdard, is recognized for her outstanding contributions to Pharmaceutical sciences and academic leadership. A Gold Medalist in both B. Pharm and M. Pharm and a PhD in Pharmaceutics, from Jamia Hamdard, she has established a strong footprint in advanced drug delivery, nanotechnology-based therapeutics, topical formulations, and biofilm-targeted systems with current areas of research in cancer, (Women- Reproductive centric) vaginal and periodontal drug delivery. With over 239 peer-reviewed publications, 47 book chapters, and 8 patents to her credit, she exemplifies scholarly excellence and innovation in drug delivery research. She has consistently contributed high-impact work to pharmaceutical sciences. She has supervised 69 M. Pharm and 20 PhD researchers and led multiple government-funded projects from ICMR, SERB, CSIR, DBT, AYUSH, and AICTE. Current projects include immune-modulatory formulations (UNIM series) and nanofiber-based periodontal therapies, with significant grants exceeding ₹76 lakhs. She is also involved in consultancy collaborations with Ayurvedic and pharmaceutical industries for evaluating hepatoprotective, anti-diabetic, and permeation studies of herbal/UNANI products. She has organized more than 60 conferences, symposium and workshops.

**Topic: Quality by Design (QbD) approaches for periodontotherapy: Insights into biofilm disruption based advanced drug delivery systems**

Periodontotherapy has recently witnessed a paradigm shift from using traditional systemic antibiotics or mere mouth rinses or washes to loco-regional advanced drug delivery systems which are inserted into periodontal pocket ensuring prolonged drug release whilst reducing the undesirable effects. Plaque construction alongwith biofilm deposition is a challenging fallout of periodontitis which often compromises therapeutic outcomes. Our research team has formulated advanced drug delivery systems namely nanoencapsulated microparticles and nanofibers using QbD approaches. The current presentation would dwell upon the design , development and evaluation of such systems with a a focus on the associated attributes of biofilm disruption alongwith assessing the in vitro and in vivo success.

**Pranjal Chandra**

Associate Professor and Ramanujan Fellow, Coordinator

School of Biochemical Engineering, IIT BHU, India

pranjal.bce@itbhu.ac.in

Prof. Pranjal Chandra is an Associate Professor and coordinator / head at the School of Biochemical Engineering, Indian Institute of Technology (BHU), Varanasi, India. He earned his Ph.D. from Pusan National University, South Korea and did post-doctoral training at Technion-Israel Institute of Technology, Israel. His research focus is highly interdisciplinary, spanning a wide range in biotechnology, nanobiosensors, material engineering, and nanomedicine. He has designed several commercially viable biosensing prototypes that can be operated for onsite analysis for biomedical diagnostics. He has also been appointed as Advisor for the Biomedical Sensors Domain and Sensor Networks Systems at the Institution of Engineering and Technology (IET), Michael Faraday House, LONDON, United Kingdom. Prof. Chandra is author of over 210 high impact publications including research / reviews papers and invited book chapters. He has published 25 books on various aspects of biosensors/medical diagnostics / material engineering. His publications are cited over 11,000 times with the h-index of 65. Prof. Chandra is the recipient of many prestigious awards, coveted honours, and fellowships such as: Fellow of National Academy of Sciences (FNASc), Fellow of Royal Society of Biology (FRSB), Shakuntala Amirchand Award 2020 by Indian Council Of Medical Research; Fellow Indian Chemical Society (FICS), DST Ramanujan fellowship (Government of India); Early Career Research Award (ECRA) (DST, Government of India); BK -21 and NRF fellowship, South Korea; Technion Post-Doctoral Fellowship, Israel; Nano Molecular Society India Young Scientist Award; Biotech Research Society India Young Scientist Award; Young Engineers Award 2018; Highly Cited Corresponding authors in The Royal Society of Chemistry (RSC), Cambridge, London; Top 10% cited article in the General Chemistry Section RSC Journal, Cambridge, London, Gandhian Young Technology Innovation Award (GYTI) 2020, etc.

**Topic: Field Deployable Point-of-Care Sensing Technologies in Decentralized Diagnosis**

Robust, reliable and quantitative detection of biomarkers at ultra-low concentration is of great importance in clinical settings. Sensor, an analytical device used for sensitive and selective detection of biomarkers offers various advantages over the conventional clinical diagnosis, which is both time consuming and not suitable for point of care/onsite diagnosis. The bioreceptors embedded in the sensing chip include antibodies, aptamers, enzymes, bio bodies etc. for detection as well as providing the analytical signals. A revolution in the understanding and synthesis of nanomaterials in the last couple of decades has also contributed significantly to the development of the biosensors in terms of sensitivity, catalytic activity, biocompatibility, and robustness. Additionally, nanomaterial engineering helped in miniaturization of the sensing platform eventually helping in the commercial success of portable biosensing devices. Such platforms have tremendous promise in detecting various analytes including disease biomarkers, microbes, chemical compounds. This presentation is focused on the engineering design of sensor systems using engineered bioreceptors and nanocatalytic systems etc. Recently developed nanoscale materials-based transduction systems will be discussed with clinical biomarkers that can be further directed towards the detection of various biomarkers in clinical research. Recently reported signal transductions strategies, promising personalized smart phone assisted electrochemical sensing platform for disease diagnosis will also be discussed.

Keywords: Nanobioengineering; Disease; Biosensors; Human Heath, Material Engineering.

ISBN: 978-81-980623-8-3

**Dr. Pooja Goswami**

Director

RAMJA Genosensor Pvt Ltd. , India

poojagos@gmail.com

Dr. Pooja Goswami is an accomplished Clinical Scientist and Entrepreneur with a rich background in Molecular Biology, Clinical Research, and Infection Detection Technologies. With over 13 years of experience at the All India Institute of Medical Sciences (AIIMS) and her entrepreneurial journey since 2018. Dr. Pooja Goswami has made groundbreaking strides in the development of cutting-edge biosensor technologies for healthcare applications. As the Founder and Director of RAMJA Genosensor Pvt. Ltd., she has been pivotal in creating the world's first Point-of-Care Electrochemical DNA Biosensor for detecting microbial infections and antimicrobial resistance (AMR) in just 90 minutes. Her company has developed and validated several pioneering products such as NANOSHOT (Infection prevention nanoparticle solution stays for any surface for 4 days after one spray) and PRATHAMASESNE -infection detection in 90 minute, UTI, SEPSIS, PNEUMONIA Antimicrobial resistance. , which are now available in the market, providing critical solutions in infection prevention and detection. Recognized by multiple prestigious awards and grants, Dr. Goswami has played a vital role in advancing healthcare diagnostics and infection control, leveraging AI, patented technology, and innovative approaches.

**Topic: Accelerating the AMR Pipeline: How 90-Minute DNA Biosensing Re-defines Drug Discovery, Clinical Trials, and Antibiotic Repurposing**

The escalating crisis of Antimicrobial Resistance (AMR) demands a paradigm shift in both diagnostics and drug development. RAMJA Genosensor presents a transformative solution with its proprietary PRATHAMASENSE platform—a DNA biosensor that delivers gene-specific AMR profiles directly from clinical samples in just 90 minutes. This technology moves beyond the 24–72 hour delay of conventional methods, establishing a new foundation for precision medicine and pharmaceutical innovation.

The RAMJA Genosensor is not merely a diagnostic tool; it is a scalable foundation for a unified drug discovery and surveillance ecosystem. By bridging the critical gap between rapid detection and genomic intelligence, the platform offers the pharmaceutical industry an essential weapon to redefine its response to AMR.

**Mr. Vijaykumar Shivpuje**

Director– Intellectual Property Rights,

Patlex Business Solutions,

Co-founder, Pharma Literati, Mumbai, India

Mr. Vijaykumar Shivpuje is M. Pharm + LLB + MBA by qualification. He brings with him 20 plus years of experience in Pharma Corporates, Law firms, Knowledge Process Outsourcing firm. With experience in both innovation and generics with leading organizations like Sun Pharma (erstwhile Ranbaxy Research Laboratories), Wockhardt Research, Glenmark Pharmaceuticals, and Micro Labs, he started his entrepreneurial ventures Patlex Business Solutions and Pharma Literati. His team is guiding more than 100 academic institutions and 50 plus corporates for IPR strategy, patent filings and commercialization. With more 400 plus IPR filed and 150 plus IPRs granted, he has been instrumental in bridging the gap between MSMEs, Policy makers, Startups, Corporates and Academic Institutions.

**Topic: Breaking the Myths: What Pharma Innovators Should Really Know About Patents.**

ISBN: 978-81-980623-8-3

The talk covers significance of Patents in the pharmaceutical area both for academics and industries.

Patents are often surrounded by misconceptions that lead to missed opportunities, inadequate filings, and legal challenges. This session aims to clarify the fundamental principles of patentability in pharmaceutical inventions and guide pharma innovators in making informed, strategic decisions about patent filings.

The talk also covers opportunities for Academicians, MSMEs and Startups about commercialization of the patents and technology transfer related to the same and not just restricting the patents for NIRF/ NAAC or Investor pitches.

********

**Prof. Mirza R. Baig**

Program Director-M. Pharm

Department of Pharmacy Practice,

College of Pharmacy, Dubai Medical University, P.B 19099, Dubai, U.A.E

dr.mirzabaig@dpc.edu

Prof. Dr. Mirza R. Baig currently serves as the Program Director-Post Graduate studies at College of Pharmacy, Dubai Medical University. He earned his Ph.D. in Clinical Pharmacy from the esteemed Universiti Sains Malaysia (USM) and brings over 22 years of international experience in academia and research, having worked extensively in Malaysia, India, and the United Arab Emirates. Prof. Baig has been recognized among the top scientists globally in the 2024, 2025 in Scientific Index. His innovative research has led to the awarding of one German patent in 2022 and two U.S. patents in 2024, in collaboration with King Abdulaziz University, Saudi Arabia. He has coauthored seven books on Clinical Pharmacy, including a recent editorial contribution to a Springer publication titled Drug Development, released in April 2024. His scholarly work comprises more than 120 peer-reviewed research articles published in reputable international journals, with his latest paper appearing in Oct 2025. Prof. Dr. Baig is frequently invited to serve as a chairperson, speaker, and moderator at high-profile international conferences and seminars. He holds editorial board memberships in several prestigious journals and is a peer reviewer for multiple Elsevier publications. He has mentored numerous master's and Ph.D. candidates and served as an external examiner for postgraduate theses at both Indian and international universities. Throughout his distinguished career, Prof. Dr. Baig has been honored with numerous accolades, including the Distinguished Alumnus Award (2024) from KLE University, India; Best Research Project Awards at conferences hosted by Al Ain University (2023) and the University of Sharjah (2019); and the Best Professor in Clinical Pharmacy Award at the Middle East Educational Awards (2018). His presentations have earned top honors at major forums such as DUPHAT Dubai and the Indian Pharmaceutical Congress (IPC), and he was recognized as an Outstanding Scientist by a prominent research foundation in India (2016).

**Topic: Smart Simulations: Redefining Pharmacy Education for the AI-Driven Healthcare Era**

This presentation will focus on how advanced simulation techniques, including virtual patient simulations and AI-driven models, can revolutionize pharmacy education and training. By integrating these technologies into curricula, we can better prepare pharmacy students and professionals to navigate complex patient care scenarios, make data-driven decisions, and enhance therapeutic outcomes. This approach aligns with the broader theme of innovation and empowerment in healthcare and patient care.

********

ISBN: 978-81-980623-8-3

**Neelima Gupta**

Instructor

NUS, Singapore

neel@nus.edu.sg

Biomedical Educator and researcher with a neuroscience background, dedicated to transforming education through innovative pedagogies that bridge artificial intelligence, and medical learning. I strive to inspire curiosity, empower students to reach their full potential, and foster a lifelong passion for science and discovery. ACADEMIC EXPERIENCE INSTRUCTOR, DEPARTMENT OF PHARMACOLOGY, NUSMED. July 2024 – Present. Lead and contribute to teaching, student mentorship, curriculum development, and course coordination across interdisciplinary programs—including undergraduate life sciences, Master's in Medical Pharmacology, and medical and nursing education. Drive innovation in pharmacology education through learner-centered strategies and evidence-based practices.

**Topic: AI as a Teaching Partner: Shaping the Future of Pharmacology Education at NUS Medicine**

Artificial intelligence (AI) is redefining the educational landscape, offering novel possibilities for enhancing engagement, personalization, and competency-based learning. In pharmacology education, AI's potential extends far beyond automation — it can serve as a teaching partner that supports both educators and learners in transforming how complex biomedical concepts are understood, applied, and retained.

At the National University of Singapore (NUS) Yong Loo Lin School of Medicine, we have begun integrating AI-powered tools into pharmacology and precision medicine curricula to promote active learning and critical thinking. These include the use of generative AI for formative assessment design, automated feedback in concept-map assignments, and AI-based flashcard and case-simulation platforms that encourage retrieval practice and spaced repetition. By embedding these innovations within undergraduate and Master's-level modules, we aim to cultivate adaptive learners equipped to navigate data-rich and technology-driven healthcare environments.

This talk will share insights from our teaching innovations, student feedback, and preliminary outcomes showing improved learner engagement and knowledge retention. It will also discuss challenges such as ensuring academic integrity, ethical use of AI, and balancing human mentorship with technological facilitation.

Ultimately, this presentation envisions AI not as a replacement for educators, but as an empowering collaborator that enhances creativity, efficiency, and inclusivity in pharmacology education — shaping the next generation of scientifically grounded and AI-literate healthcare professionals.

**Karthik Raman**

Professor, Department of Data Science and AI

Wadhwani School of Data Science and AI, IIT Madras, India

kraman@dsai.iitm.ac.in

Karthik Raman is a Professor at the Department of Data Science and AI at the Wadhwani School of Data Science & AI (WSAI), IIT Madras. Karthik's research group employs a three-pronged strategy, combining networks, models and AI, to understand, predict and manipulate complex biological networks. Karthik's group has developed multiple scalable algorithms and computational frameworks, applicable across synthetic and systems biology. Key focus areas in his research encompass microbiome systems biology, in silico metabolic engineering, biological network design, and biological big data analysis. Karthik also co-ordinates the Centre for Integrative Biology and Systems mEdicine (IBSE) at IIT Madras, fostering interdisciplinary collaborations. Karthik's

ISBN: 978-81-980623-8-3

group has extensive collaborations with industry partners, exploring how data science and AI can deliver impactful insights for pharma, healthcare, and life sciences.

Alongside his research, Karthik is deeply invested in teaching and mentoring. At IIT Madras, he teaches first-year undergraduate courses in programming, data structures, and algorithms, as well as advanced courses in computational and systems biology. He has also authored a textbook on Computational Systems Biology.

Beyond his core research and teaching, Karthik is actively engaged with the emerging landscape of AI literacy and education. He has contributed to national AI curriculum development, including initiatives like AI Samarth, which aims to empower students across India to engage with AI meaningfully, safely and responsibly. He is also an advisor at the Office of Global Engagement, IIT Madras, where his team has enabled funding and smooth execution of several major international conferences at IIT Madras.

**Topic: AI, Models and Networks: A trifecta reshaping early-stage drug discovery**

Early drug discovery remains one of the most demanding stages in pharmaceutical development, where pivotal choices about targets, pathways, and candidate molecules largely determine future clinical outcomes. In this talk, I will argue that the integration of AI, networks, and models offers a powerful means to reduce uncertainty and guide discovery more systematically. I will begin with PURE, our recently developed framework for structure-constrained molecular generation. PURE combines self-supervised learning with policy-guided reinforcement learning to address limitations of current deep learning methods. By avoiding biases from task-specific metrics and working directly in the discrete molecular space, it produces novel, diverse molecules that balance structural similarity to reference compounds with desirable properties. Next, I will trace how complementary network- and model-based approaches broaden the possibilities of early discovery. Model-based analyses, as in our work on metabolic vulnerabilities in Candida albicans and on synthetic lethality in metabolism, show how mechanistic insights can inform target identification. Similarly, predictive models of cancer driver genes highlight how AI can uncover potential therapeutic targets. Taken together, these examples show how AI, networks, and models work in concert: AI learns from heterogeneous data, networks expose key relationships and structures, and models supply mechanistic grounding. This synergy has the potential to transform early discovery from a largely trial-and-error process into a more systematic, data-driven science.

**Debjani Paul**

Institute Chair Professor

Indian Institute of Technology Bombay, India

debjani.paul@iitb.ac.in

Prof. Debjani Paul is an Institute Chair Professor in the Department of Biosciences and Bioengineering at the Indian Institute of Technology Bombay, Mumbai. After obtaining a Ph.D. in Physics from the Indian Institute of Science, Prof. Paul did her postdoctoral research at the Curie Institute and the University of Cambridge. After a short stint at a pharma company in Mumbai, Prof. Paul started her research group at the Indian Institute of Technology Bombay. Her research group develops microfluidic technology platforms for different healthcare applications and to address research questions at physics-biology interface. ShapeDx, a patented sickle cell diagnosis technology, developed by her research group has recently been approved by the Indian Council for Medical Research. Prof. Paul is an Associate Editor of the journal Bioengineering and Translational Medicine. She is also a member of the Editorial Boards of the journals PLoS Global Public Health and NPJ Biomedical Innovations.

ISBN: 978-81-980623-8-3

**Topic: Microfluidic devices for healthcare and biomaterial applications**

Physical properties of cells, such as, size, shape and deformability have recently generated a lot of interest as potential biophysical markers for different diseases. For example, infection by the malarial parasites makes the infected red blood cells (RBCs) stiffer. Normally biconcave and deformable RBCs change their shapes and become stiffer in sickle cell anemia, thereby leading to blockage of blood flow. My research group uses microfluidic technology to probe physical properties of cells to diagnose different blood-related disorders. In my talk I will describe two technologies that measure different physical parameters of healthy and diseased red blood cells. The first technology can measure the Young's modulus of single red blood cells in a large, heterogeneous population [1]. The second technology is ShapeDx [2], a confirmatory test to distinguish between sickle cell disease and trait at the point of care.

**Saikat Chakrabarti**

Senior Principal Scientist & Deputy Head, Structural Biology & Bioinformatics

CSIR-IICB, India

saikat.iicb@csir.res.in

Expertise: We are actively involved in identification and subsequent analysis of important bio-molecular interactions involving proteins, DNA and other macro-molecules in systemic diseases like cancer and infectious diseases, like malaria, leishmaniasis, etc. Primary objectives and/or contributions of our research group are to develop robust and efficient approaches to understand the hidden properties of protein-protein interaction (PPI) systems leading to infection/systemic disease by a) integrating large scale "multi-omics" data through network biology/graph theoretical algorithms, mathematical modelling and machine learning techniques, b) in-depth analysis of molecular interaction patterns using state-of-the-art molecular modeling, docking and dynamics strategies, and c) experimental characterization/verification of the identified bio-markers and/or therapeutic targets. We utilize large-scale genomics, transcriptomics, proteomics, and metabolomics data to construct disease or context specific bio-molecular interaction networks and further study them to understand and decipher their biological significance using meta-interactome analysis. Our group also develops various computational tools, techniques and web servers, which are freely available for users and are beneficial to the scientific community throughout the world. We have also ventured into developing image processing and machine learning / deep learning based software packages to process and analyze brain MRI and CT images for detection of early features of Alzheimer's disease and stroke, respectively. These tools may have immense value in clinical and industry setting and hence we are preparing/filing patents for the developed tools and systems. Please visit our lab website (http://www.hpppi.iicb.res.in/saikatlab/) for more detailed overview and description of the previous and ongoing projects and to use various tools (servers and databases) that we have developed over the years. Research: Full time scientific research and providing guidance to PhD students and post-doctoral fellows. Teaching: Teaching PhD coursework and other skill

ISBN: 978-81-980623-8-3

development programs (115-120 hours per year). Supervising/Mentoring: Mentoring PhD students, Postdocs, and Masters Students in their scientific and educational endeavors. Administrative: Member of the various academic and administrative committees responsible for smooth functioning of the institute. Past and present membership and chairmanship in committees like student's affair committee, IT committee, computer division (deputy head), local purchase committee, PhD selection committee, recruitment committee, tender committee, disaster management committee, etc.

**Topic: AIDIAS: Artificial Intelligence based Diagnostic and Analytical Systems**

Machine learning (ML) and deep learning (DL) are two very critical components for development of an artificial intelligent system/apparatus. ML and DL are software and algorithms that need to be trained with existing data and information so that it can identify/predict and/or distinguish the categories for which they have been trained. However, based on the training and prediction if the system can take independent decisions related to the outcome of the prediction then it can be qualified as artificial intelligent system.

I will talk about potential of ML in identification of disease biomarker and correct molecular interaction pattern/pose for protein-protein and protein-small molecule interactions. Identification of novel biomarker and correct protein-protein and protein-small molecule interaction is very critical for drug development protocols. Hence, our approach and algorithms will be quite useful for new drug target and drug discovery initiatives.

********

**Santosh Dixit**

Chief Domain Expert (Healthcare and Life Sciences)

Innovation Labs, Persistent Systems, India

santosh_dixit@persistent.com

Dr Santosh Dixit is the Chief Domain Expert ( Healthcare and LifeSciences) at the Innovation Labs, Persistent Systems. In this capacity , Dr Dixit works with multi-disciplinary teams of clinicians , healthcare professionals, data scientists and technologists for developing AI/GenAI powered digital innovations for biomedical ecosystems with special focus on Oncology.

Dr Dixit has 20+ years of experience in Preclinical and Clinical Pharmacology, Translational R&D, Drugs/Diagnostics/Medical device development, Regulatory Affairs, Public health and Policy initiatives. Dr Dixit has a received his Ph.D. in Pharmaceutical Sciences from University of Cincinnati , USA and post-doctoral fellowships from Vanderbilt University , USA and University of Western Ontario , Canada.

**Topic: AI-Driven Image Analysis: Accelerating Pharmaceutical R&D and Precision Medicine**

Artificial Intelligence (AI) is transforming image analysis in pharmaceutical research, enabling faster and more accurate interpretation of complex and multimodal biomedical data. Traditional manual approaches to histopathology, microscopy, and radiology are often slow and prone to variability. AI-driven algorithms now automate segmentation, feature extraction, and anomaly detection, improving precision and accelerating workflows.

For pharmaceutical scientists, these capabilities support high-throughput screening, digital pathology, and biomarker discovery. Deep learning models trained on diverse imaging datasets can identify subtle morphological changes, predict therapeutic responses, and optimize trial design—advancing precision medicine and reducing drug development attrition.

However, adoption challenges remain. Data quality, algorithm transparency, and regulatory compliance require robust governance and continuous validation. Ethical considerations, including patient privacy, demand explainable AI and

ISBN: 978-81-980623-8-3

federated learning approaches. Regulatory bodies are increasingly recognizing AI's role, but frameworks for reliability and accountability are essential.

This talk will cover the key trends in AI-guided Image analysis for Pharmaceutical R&D applications with a reality check for regulatory compliant workflows and practical applications.

********

**Dr. H.B. Pushpalatha**

General Manager
Formulation Development (Pharma & Wellness)

The Himalaya Wellness Company, India

h.b.pushpalatha@himalayawellness.com

Dr. Pushpalatha H.B. is a highly accomplished pharmaceutical professional with over 26 years of extensive industrial experience, currently serving as the General Manager and Lead for Formulation Development (FD) across the Pharma, Animal Health, and Food divisions at Himalaya Wellness Company. Her career trajectory, beginning as a Junior Scientist in 1998, reflects significant leadership and technical ascension within the global, research-driven organization.

A core strength of Dr. Pushpalatha lies in her proven expertise in the Formulation and Development of both conventional and innovative herbal and unconventional dosage forms and wellness products. She has been instrumental in facilitating international regulatory acceptance for herbal medicines and wellness products in over 100 countries, showcasing deep expertise in navigating complex and dynamic global regulatory environments, including submissions for the US, EU, Middle East, and Asia Pacific markets. Her technical domain spans the development of diverse product formats, such as preservative-free tablets, capsules, liquids, gummies, effervescent tablets, probiotics, and functional foods, often challenging conventional approaches to ensure product safety and commercial value.

As a strategic leader, she manages a 27+ member multidisciplinary team and oversees the smooth functioning of the International Regulatory Affairs division. Her administrative and strategic acumen includes setting up world-class pilot facilities, managing annual budgeting and Capex, and driving cost optimization through Alternate Vendor Development and Formula Optimization. Furthermore, she champions R&D and operational process improvements, conceptualizing novel dosage forms and online documentation systems. Dr. Pushpalatha applies a Quality by Design (QbD) approach, leverages lean process management, and uses risk-based assessments to ensure fast-to-market strategies, underscoring her commitment to blending scientific excellence with business-focused outcomes.

**Topic: Development of Herbal Pharmaceuticals – An Approach from Academia to Industry**

The development of herbal pharmaceuticals provides a unique opportunity to bridge traditional knowledge with modern scientific innovation. This work presents an integrated approach that connects academic research with industrial requirements to create safe, effective, and standardized herbal products. The academic framework emphasizes phytochemical profiling, mechanistic understanding, and early-stage proof-of-concept studies. These scientific insights enable the identification of bioactive markers, optimization of extraction processes, and establishment of robust analytical methods.

Transitioning to industry brings additional challenges including large-scale manufacturing, regulatory compliance, stability, and quality control across diverse botanical sources. This abstract outline a structured pathway in which academic findings are translated into scalable formulations using QbD principles, validated analytical procedures, and GMP-aligned processing. The collaboration also highlights the importance of supply-chain

ISBN: 978-81-980623-8-3

authentication, standardization of raw materials, and the integration of sustainability-driven practices.

Overall, this approach demonstrates how strong academia–industry partnerships can accelerate the development of evidence-based herbal pharmaceuticals, enhance quality and global acceptance, and support commercialization with scientific credibility.

**Dr. Muthu Dhandapani**

Vice President – Quality & Regulatory Compliance

Tricog Health,
Bangalore, India

muthu@tricog.com

Dr. Muthu Dhandapani is the Vice President – Quality & Regulatory Compliance at Tricog Health, Bangalore, where he leads regulatory strategy, digital health compliance, quality management, and governance initiatives for AI-enabled medical technologies. With over a decade of experience spanning digital health, medical devices, regulatory science, and healthcare quality systems, he has significantly contributed to advancing safe and effective technology adoption in clinical practice.

Dr. Dhandapani has played a key role in shaping regulatory pathways for AI-based diagnostic solutions in India and globally. His work focuses on building robust frameworks for algorithm validation, real-world performance monitoring, clinical risk management, and post-market surveillance for digital health products.His areas of expertise include SaMD (Software as a Medical Device), AI/ML in healthcare, QMS implementation, medical device regulations, data integrity, and digital health policy.He continues to contribute to capacity-building initiatives and interdisciplinary collaborations aimed at strengthening India's digital health and medical device landscape.

**Topic: From Algorithm to Bedside: Ensuring Quality, Safety, and Regulatory Compliance in Real-World Deployment of AI Healthcare Solutions**

Artificial Intelligence has moved rapidly from research labs into frontline healthcare, yet its safe and effective deployment in real-world clinical settings remains a complex challenge. This talk will explore the end-to-end journey of translating AI healthcare solutions—particularly Software as a Medical Device (SaMD)—from development to bedside implementation. Drawing from practical experience in scaling AI-enabled cardiac diagnostics across diverse healthcare environments, the session will discuss core elements of quality-by-design, clinical risk management, and regulatory preparedness. Key considerations such as data variability, model drift, workflow integration, human–AI interaction, and post-market performance monitoring will be highlighted. The talk will also outline the role of global standards, emerging regulatory frameworks, and robust quality management systems in enabling trustworthy, compliant, and clinically meaningful AI systems. By bridging technological innovation with regulatory rigor, this session will offer actionable insights for innovators, clinicians, and policymakers working to build scalable digital health solutions that deliver measurable patient impact.

********

**Dr. Prakash NS**

Associate General Manager, Analytical Development, R&D,

Himalaya Wellness Company,

Bengaluru

prakash.ns@himalayawellness.com

Dr. N.S. Prakash is a Principal Scientist in the Research and Development department at The Himalaya Wellness Company in Bengaluru, India, where he applies his extensive expertise in analytical chemistry to ensure the quality and efficacy of the company's herbal products. A recognized expert in the field, Dr. Prakash specializes in advanced analysis methodologies such as

ISBN: 978-81-980623-8-3

HPTLC and HPLC for characterizing herbal ingredients, guiding product development and ensuring regulatory compliance. He is a published researcher with a focus on scientifically validating the therapeutic properties of various herbs. Dr. Prakash actively contributes to the scientific community, speaking at academic institutions and conferences on the latest advancements and challenges in the analysis of natural healthcare products.

**Title: Digitalization of Lab Notebook (e-LNB) with Integrated LIMS: A Paradigm Shift in R&D**

The integration of an e-Lab Notebook application with the Laboratory Information Management System (LIMS) in the R&D division represents a significant advancement in laboratory digitalization. The primary objective was to enhance operational efficiency, data integrity, data retrieval and global collaboration through a unified digital platform. The implementation involved deploying digitalization of LNB and LIMS to enable centralized data management, workflow automation, real-time inventory tracking, secure digital archival, and live status monitoring. Post-implementation indicated substantial improvements in data handling, reduced manual interventions, minimized errors, optimized resource utilization, and enhanced transparency across projects. Furthermore, the system facilitated seamless collaboration among geographically dispersed teams, accelerating decision-making processes. In conclusion, this initiative establishes a new benchmark for the pharmaceutical industry by reinforcing scientific excellence, compliance, and innovation-driven growth through digital transformation.

********

**Dr. Rafiq Mohamad**

Head, Discovery Sciences Group

Research & Development Centre

Himalaya Wellness Company

dr.rafiq@himalayawellness.com

Dr. Rafiq is presently serving as Head-Discovery Sciences Group at R&D Center, Himalaya Wellness Company, Bangalore. He comes with more than 26 years of rich experience in the field of pharmacology, cell & molecular biology pertaining to the discovery & development of new pharmaceutical/ wellness products. His area of expertise is leveraging the rich traditional knowledge and applying modern technologies to bring products which are not just AYUSH compliant, but also of marketed as suppliements and functional foods across the globe. Instrumental in bringing out researched pharmaceutical products, and has vast experience in applying modern technologies to contemporize traditional wisdom to promote wellness. Dr. Rafiq is incharge of driving consumer technical insights (CTI) of personal care and wellness products with a responsibility of claims and claims substantiation along with consumer testing program of relevant products. He provides a critical link between the R&D, Legal and Marketing teams with respect to product claims. He has more than 50 research publications to his credit, published in a reputed national/ international peer-reviewed journal. Also, he holds 2 global patents, apart from being a part of various scientific & professional bodies, he is also in the editorial board of a few peer-reviewed journals. Dr. Rafiq is also currently discharging the responsibilities as Deputy-Head, GLP- Toxicology and also serving as senior Study Director at the GLP test facility of Himalaya Wellness Company. He has attended training programs conducted by various professional and regulatory bodies on this aspect including the National GLP Compliance Monitoring Authority (NGCMA), Government of India.

**Topic: Regulatory Framework of Product Label Claims: Design and Compliance**

The regulatory landscape governing product label claims in India is evolving rapidly to ensure consumer safety, transparency, and compliance. This presentation examines the design and substantiation of claims across

ISBN: 978-81-980623-8-3

three critical categories—OTX supplements, AYUSH drugs, and cosmetics—within the framework of national regulations.

For nutraceuticals and health supplements, the Food Safety and Standards Authority of India (FSSAI) mandates adherence to the Food Safety and Standards (Health Supplements, Nutraceuticals, Food for Special Dietary Use) Regulations, emphasizing approved ingredients, dosage limits, and prohibition of therapeutic claims.

AYUSH products are regulated under the Drugs and Cosmetics Act, 1940, with specific provisions under Rules 158B and 106-A, alongside restrictions imposed by the Drugs and Magic Remedies (Objectionable Advertisements) Act, 1954 to curb misleading claims.

Cosmetic products, governed by the Cosmetics (Amendment) Rules, 2025, require clear labelling, standardized definitions, and compliance with BIS norms to prevent consumer deception and enhance safety. The session will also address global best practices, claim substantiation strategies—including clinical, instrumental, and consumer studies—and emerging compliance challenges such as clean labelling, QR-based transparency, and harmonization with international standards. By integrating regulatory insights with practical design principles, this talk aims to guide stakeholders in creating compliant, credible, and consumer-centric product claims.

********

**Dr. Samba Reddy, PhD, RPh,**

Regents Professor & Director

Texas A&M University College of Medicine, Bryan, TX 77807, USA

sambareddy@tamu.edu

Dr. Samba Reddy is Regents Professor and Director of Institute of Pharmacology and Neurotherapeutics at Texas A&M University School of Medicine, Texas, USA. He obtained B. Pharmacy from Kakatiya University (1992) Warangal Telangana, M. Pharmacy (1994) and Ph.D. degrees (1998) from Panjab University Chandigarh, and then completed postdoctoral fellowship at the NIH in Washington-DC, USA. He is a board-certified pharmacist & renowned pharmacologist developing new medicines for epilepsy and brain disorders. He is the PI of multiple NIH-funded projects focusing on novel neurosteroid treatments for epilepsy and neurotoxicity. He directs multiple US DOD-funded projects on brain injury and chronic illness. His seminal contributions include the "discovery of a neurocode for treating epilepsy" and launching "novel neurosteroid therapy" to treat epilepsy and women's brain disorders. His transformational contributions led to developing two new medicines: ganaxolone (Ztalmy), the first neurosteroid for epilepsy, and brexanolone (Zulresso), the first FDA-approved drug for postpartum depression in women, which are now used worldwide to treat patients. Dr. Samba Reddy is the first Indian scientist to discover 2 new medicines from an academic setting. In addition, his research paved the way to zuranolone, the first FDA-approved oral neurosteroid for postpartum depression. He developed a novel chemical antidote as lifesaving medicine for pesticide neurotoxicity.

**Topic: AI & Neurosteroid-based New Drug Development: FDA Approval of Brexanolone and Ganaxolone for Complex Brain Disorders**

New drug discovery and development is a complex and tedious process with high risks and rewards. In this talk, the speaker Dr. Samba Reddy will highlight the intricate landscape of AI & new drug discovery and development, focusing on the challenges and prospects associated with FDA approval, particularly in the realm of complex brain medicines. His pioneering work unveils a revolutionary neurosteroid platform, crafted to unlock novel molecules for brain disorders. Neurosteroids, a class of naturally occurring steroid molecules, emerge as compelling therapeutic agents for neurological disorders, leveraging their robust capacity to regulate neuronal

ISBN: 978-81-980623-8-3

excitability and confer neuroprotection. Over a span of 25 years, Dr. Reddy has significantly advanced our understanding of the mechanistic functions of neurosteroids in the brain. This journey has unraveled critical insights into extrasynaptic GABA-receptor--neurosteroid pathways. Notably, his groundbreaking research has led to the identification of the neurocode for treating epilepsy and the invention of "neurosteroid replacement therapy" for conditions such as premenstrual syndrome and post-partum depression. The pinnacle of these two-decades work and achievements manifests in the FDA approval of two groundbreaking new medicines: Brexanolone (allopregnanolone) for post-partum depression in 2019 and Ganaxolone for seizures in pediatric epilepsy in 2022. The neurosteroid-based products are making significant strides in improving global healthcare, including thousands of patients in India, USA and Europe. A new anticonvulsant product from his lab is currently in advanced clinical trials for the life-threatening brain condition called status epilepticus. But the research pursuit continues, to discover and develop better and efficacious new medicines from the AI and neurosteroid platform. Challenges such as biopharmaceutical and formulation hurdles persist, inspiring his team to discover "second-generation" neurosteroids with improved therapeutic profile. This opens doors to potent treatments for chronic brain disorders such epilepsy, depression, brain injury and dementia, offering hope for millions worldwide. The AI based new generation drug research is rewriting the future of brain health.

********

**B. S. Shankaranarayana Rao**

Professor, Department of Neurophysiology

National Institute of Mental Health and Neuro Sciences (NIMHANS), India

bssrao.nimhans@gmail.com

Dr. BS Shankaranarayana Rao obtained his MPhil. and PhD degree in Neurophysiology NIMHANS, Bengaluru. After completing his Postdoctoral training at National Center for Biological Sciences and specialized training in Electrophysiology from Woods Hole, USA, he joined NIMHANS as Faculty in 2002. He has several administrative positions including Registrar of NIMHANS, Professor and Head of Neurophysiology and Basic Neurosciences Departments, and coordinator of Neurobiology Research Centre. Dr. Rao's research has led to the discovery of the cellular and molecular mechanisms of rewiring and remodeling of developing and adult brain circuits in neurodegenerative and cognitive disorders such as stress, anxiety, depression, epilepsy, mental retardation and aging by invasive and noninvasive brain manipulative procedures including activation of resident stem cells in the adult brain by employing contemporary neurophysiological techniques at multiple levels of neural organization. The discovery of cellular and molecular mechanisms of activation of brain circuits are helping in the designing of new drugs for the prevention and restoration of cognitive deficits in neurological and psychiatric disorders.

**Topic: Novel Strategies of Treat Temporal Lobe Epilepsy-induced Cognitive Deficits and Abnormal Synaptic Plasticity**

Epilepsy is one of the most common neurological disorder affects all age groups. Epilepsy is the third leading contributor to the global burden of disease for neurological disorders and affects approximately 65 million people worldwide. Epilepsy is characterized by an enduring predisposition to generate epileptic seizures and the associated cognitive, psychological and social consequences. Temporal lobe epilepsy (TLE) is a chronic neurological disorder characterized by recurrent, unprovoked focal seizures that originate in the temporal lobe of the brain, specifically from the hippocampus. TLE is the most common form of epilepsy with focal seizures and constitutes about 40% of adult epilepsies and most often refractory to medication. Spontaneous recurrent seizures (SRS) are the hallmark of TLE and are often associated

ISBN: 978-81-980623-8-3

with neurodegeneration and cognitive impairments. The mechanisms of generation of SRS, epileptogenesis and associated abnormal sleep wake behaviour, synaptic plasticity and cognitive deficits are yet to be understood. Accordingly, we have used an animal model of TLE to assess the seizure characteristics, neurodegeneration, spatial learning, sleep, synaptic plasticity, memory and depressive-like behaviour. We have also evaluated the effect of levetiracetam (LEV) treatment, exposure to enriched environment (EE) and the combination of EE and LEV on TLE-induced deficits. Epileptic rats were video-monitored using phenotyper to behaviourally characterise seizure frequency and duration followed by analysis of EEG and field potentials from the hippocampus, somatosensory and parietal cortices. TLE was associated with increased SRS, altered EEG coherence, hippocampal neurodegeneration, abnormal synaptic plasticity, gliosis and cognitive deficits. Interestingly, enriched environment, levetiracetam and combination therapy reduced SRS in TLE rats. The epilepsy results decreased basal synaptic transmission and enhanced paired-pulse facilitation (PPF) ratios with abnormal hippocampal long-term potentiation (LTP). The epileptic rats subjected to EE showed partial restoration of basal synaptic transmission, PPF and LTP. We observed an increased hyperexcitable behavioral response and decreased sociability in epileptic rats and 14 days of enriched environment reversed behavioral hyperexcitability and improved sociability. In epileptic rats, there was reduced REM duration and decreased density of parvalbumin positive interneurons in the hippocampus and amygdala. However, EE partially restored REM sleep and the density of parvalbumin-positive interneurons.

********

**Dr. Arnab Barik**

Assistant Professor

Centre for Neuroscience, Indian Institute of Science (Bengaluru), India

arnabbarik@iisc.ac.in

Arnab earned his B.Tech in Biotechnology from SRM University, Chennai, and completed his PhD in Neuroscience under the guidance of Dr. Lin Mei at the Medical College of Georgia. His doctoral work focused on the cellular and molecular mechanisms that govern the development and maintenance of neuromuscular junctions. Seeking to understand somatosensation, he joined Dr. Alexander Chesler's lab at the National Institutes of Health. There, he discovered a population of parabrachial nucleus neurons critical for affective pain responses. In 2020, Arnab became an Assistant Professor at the Center for Neuroscience, where he now investigates the molecules, cells, and circuits underlying pain and itch.

**Topic: Pain & Itch: The good, the bad, & the ugly**

Pain and itch protect us from potential injury and diseases from our immediate surroundings. However, pain and itch lose their protective purpose in chronic disorders such as peripheral neuropathy and psoriasis. Moreover, patients with these chronic disorders often suffer from stress and anxiety, which in turn can make the pain and itch worse. In my talk, I will elaborate on two stories. First, I will talk about a novel circuitry between the brainstem and thalamus, that is instrumental in driving the defensive behaviors and aversiveness associated with pain. Second, we find a novel circuit mechanism for how the aversiveness associated with the itch is encoded in the brain. We employed fluorescent gene-carrying viral vectors to interrogate the anatomy, optogenetic/ chemogenetic tools to manipulate the activity, and record from the circuits of interest. Together, we shed light on the molecular, cellular, and circuit mechanisms that underlie the emotional distress caused by chronic pain and itch.

**Dr. Deependra Singh**

Professor

University Institute of Pharmacy

Pt. Ravishankar Shukla University, India

deependraiop@gmail.com

**Panelist for NEP session**

Dr. Deependra Singh is presently working as Professor at University Institute of Pharmacy, Pt. Ravishankar Shukla University, Raipur, Chhattisgarh, India. He is a central council member and chairman of the education regulation committee, Pharmacy Council of India. He is governing council member- Life Sciences Sector Skill Development Council (LSSSDC); Mentor-QCI (Quality council of India) and invited member- HECI (Higher Education council of India). He is also serving in various administrative positions in University such as Chairperson International relation cell, NAAC Core committee, co-cordinator-Innovation and incubation centre, PRSU etc.

He has received the highest acclaim as being featured among the top 2% scientists across the world in the field of pharmacy and pharmacology since 2020 to date by Stanford University, USA, Elsevier for 5 years consecutively. He has around 21 years of teaching and research experience. His prime research area includes formulation of multiple bioactive delivery systems for chronic wound management, advanced statistical and mathematical modelling methods, and designing novel delivery systems. He has around 165 research and review papers, 41 book chapters published in national and international journals. His five books are published with Elsevier and CRC press and two are in press with CRC and Bentham. He has citations of more than 7500, with an h-index of 39 and i10 index of 97 (Google Scholar) and Scopus h-index 34, with 4419 citations. He has two international, three Indian patents granted and three published. He has completed several projects and several in pipeline funded by university grants commission UGC, AICTE, ICMR, DST, IBITF (IIT Bhilai Technology foundation), ITC Bangalore and ANRF amounting to 1298 lakhs. He also provides consultancy services to various start-ups in dosage form designing and stability studies.

He is the recipient of the prestigious APTI CJ Shishoo Award for research in pharmaceutical sciences 2023, the Department of Health Research-ICMR Young Indian Biomedical Scientist Award 2019,

ISBN: 978-81-980623-8-3

UGC RAMAN International Award 2014, and UGC Research Award 2012 by the University Grants Commission, New Delhi, India. He has also won a number of prestigious awards at the state level for excellence in research, namely the Young Scientist Award of the state of Chhattisgarh 2006 in medical sciences, SPSR Life time achievement award 2025, Indira Gandhi Sadbhawana award 2014, Bharat Shiksha Ratan Award 2012, Eklavya Award 2024 in Global interdisciplinary Conference organized by International council for education, Research and Training India and USA, Next Gen Pharmacist Award, in Pharma meet 2020 by IPA and CG society of pharmaceutical science. He is a state evaluator and trainee for the National Children Science Congress. He is a life member of various professional bodies such as Indian Pharmaceutical Association (IPA), Association of Pharmacy Teachers of India (APTI), Indian Society of Pharmacognosy (ISP) and serving as vice president, central zone APTI (elected); vice president, central zone IPGA (elected); Founder secretary, Chhattisgarh state branch IPA.

********

**Dr. Atmaram Pawar**

Principal

Bharati Vidyapeeth (Deemed to be University), Poona College of Pharmacy, Pune, India

dratmarampawar@gmail.com

**Panelist for NEP session**

Presently serving as Principal and Professor of Pharmaceutics at Poona College of Pharmacy (PCP) Pune, a Grant-in Aid institute of Govt. Of Maharashtra. I have earned Doctoral degree in pharmacy from Pune University and nurtured a career in academics at alma mater PCP. The 33 years of educational experience in the institute of repute has provided me an opportunity to develop myself as a teacher, a researcher, administrator and a pharmacist.

I have actively pursued research in the area of particle engineering and targeted anticancer drug delivery systems, where have credit of 15 Granted Indian patents, 160 international & 43 national peers reviewed research papers with Cumulative Impact factor of 300+, Google Scholar h- index 45 and 64003 citations and listed in top 2% scientist by Elsevier Sept 2022 to 2025. I have guided 13 PhD students and 7 more are registered under me.

I have particular interest in incorporating new concepts in teaching and modernization of the curriculum. I have incorporated modern concepts in teaching of Dispensing Pharmacy with practice based experiments from 2004. For that, he has been awarded with IJPER Prof. BM Mithal national Award 2007. Acceptance of 12 books that authoured by me is reflected by inclusion of new subject by many Indian universities on name of my book entitled 'Modern Dispensing Pharmacy' in the UG curriculum. To promote and ease implementation of NEP 2020, I have been delivering talks since 2021with You Tube Series NEP Parayan.

I have served as Member Scientific services at various Indian Pharmaceutical congress and Chairman Scientific services 19th APTICON and in organization of at IPC, APTICON, IAPC & SFEC conferences. Also served as Member, Pharm.D. committee and Member B.Pharm. syllabus committee of Pharmacy Council of India, and as Dean BVDU; BOS member at more than 10 universities.

I have been designing programmes to reach out to society to explain and uplift the image of pharmacy profession. In the wake of this, I have published 03 books in Indian languages, published more than 75+ articles in leading newspapers. I participated in 03 panel discussions and 8 expert opinions on TV media; and from Sept 2018, I have launched YouTube Channel 'Yes, I am Pharmacist" addressing the patient related concerns about drugs.

Through more than 150+ invited talks at national and international conferences/seminars and 250+ talks at institutes, community pharmacists and

ISBN: 978-81-980623-8-3

common men I could promote pharmacy profession. During my President-ship of IPA Pune, I started mega celebration of NPW, initiated 'IPA Pune Life Time Achievement Award'

I am recipient of 11 prestigious awards that includes an international award – Healthcare Leadership award by World Health & wellness congress Feb 2020, 4 national awards viz. Best Teacher Award of 54th IPC Trust 2005, Prof. BM Mithal national Award 2007, APTI's Teacher for the Year Award 2015, IPA Fellowship Award 2018, Maharashtra Sahiytya Parishan Award 2021, Dr. K. M. Parikh IASTAM Award 2022 and in house awards like Outstanding Teacher 2011 & Best Researcher Award 2015 of Bharati Vidyapeeth University.

**Dr. Vishal Gupta**

Dean (Academics)

JSS Academy of Higher Education and Research, Mysuru

Dr. Vishal Kumar Gupta is a senior academic leader and pharmaceutical scientist with over nineteen years of experience spanning higher education governance, academic administration, research, and international capacity building. He currently serves as Dean (Academics) at JSS Academy of Higher Education & Research (JSS AHER), Mysuru, and is a Professor of Pharmaceutics at JSS College of Pharmacy, Mysuru. In these roles, he provides strategic oversight for curriculum development, accreditation, internationalization, digital learning systems, student enrolment, and institutional quality assurance across multidisciplinary health and life science programs.

Dr. Gupta has played a pivotal role in global public health training initiatives as Nodal Officer for World Health Organization (WHO) training programs, coordinating landmark international cGMP and blood safety programs that trained thousands of professionals across India and WHO South-East Asia Region countries. Notably, he was instrumental in implementing the world's first WHO-led online cGMP capacity-building initiative, collaborating with WHO headquarters, international regulatory agencies, government ministries, and pharmaceutical industry bodies. He has also contributed to international regulatory training for Ethiopian FDA officials and coordinated the establishment of JSS AHER, Mauritius, including governance frameworks, academic programs, and international accreditation.

His leadership has been central to securing prestigious ACPE (USA) certification for Pharm. D and pharmacy programs in India and Mauritius, marking several global firsts. An accomplished researcher, Dr. Gupta has published extensively, holds patents in advanced drug delivery systems, and has guided numerous postgraduate and doctoral scholars. His contributions have been recognized through international honors, including the Outstanding Services Award from the Asian Association of Schools of Pharmacy, alongside multiple national academic distinctions.

**Subham Banerjee**

Associate Professor

NIPER Guwahati, India

subham@niperguwahati.in

Dr. Subham Banerjee currently working as an Associate Professor in the Department of Pharmaceutics, National Institute of Pharmaceutical Education and Research (NIPER)-Guwahati, Assam. He is also a Visiting Staff Faculty of the University of Texas (UT) at Austin, USA. In addition, he also

ISBN: 978-81-980623-8-3

served as a coordinator cum co-principal investigator in the National Centre of Pharmacoengineering (State-of-the-art-facility) funded under the Drugs Pharmaceuticals Research Programme (DPRP), DST, Govt. of India. Dr. Banerjee did his doctoral degree from Birla Institute of Technology (BIT), Mesra in collaboration with Defence Research Laboratory (DRL), DRDO, Tezpur, Assam in the year 2015. After completion of his doctoral degree he was selected as an "Innovation Awardee in Devices" at Translational Health Science & Technology Institute (THSTI), NCR-Biotech Science Cluster, Faridabad. In the same year, he received "Fast-Track Young Scientist Research Grant" by Science & Engineering Research Board (SERB), Govt. of India.

Dr. Banerjee's research area focuses on Pharmacoengineering including Pharmaceutical Additive Manufacturing (AM)/3D & 4D Printing, New Materials for Pharmaceutical AM, Drug Delivery, and Cutting-edge Translational Pharmaceutical Research.

**Topic: Additive manufacturing mediated platform technology in pharma: Educate, Innovate, Empower**

Additive manufacturing (AM), or 3D/4D printing, creates three-dimensional solid objects of practically any shape from 3D model design files in layer-by-layer manner. The implementation of 3D/4D printing using various platform technologies has gained immense potential in the pharmaceutical sector. In pharmaceuticals, 3D/4D printing has been used not only to produce customized drug delivery systems/devices but also to fabricate personalized medicine for individual patient-centric needs. The most popular platform technologies in AM technique used in pharmaceuticals are fused deposition modeling (FDM)/fused filament fabrication (FFF), vat-photopolymerization (VP)/stereolithography (SLA), selective laser/powder-bed sintering (SLS), semi-solid extrusion (SSE), direct powder extrusion (DPE), etc. With the advent of these cutting-edge advanced platform technologies, numerous efforts have been made in the pharmaceutical segment to create both personalized & customised next-generation future medicines in order to improve quality of life. This approach is equally important for paediatric, visually impaired and geriatric patients, as well as for certain medicines that require exact tailoring (e.g., narrow therapeutic index drugs). A major benefit of 3D printing/AM is that it enables 3D printed tablets to be designed, each with tailored aesthetics (shape, size, flavor and color), drug release, dose content and multiple drug combinations, enabling a truly personalized treatment approach for patients. Implementation of AM or 3D/4D printing technology can realize the long-due dreams of personalized patient-specific requirements.

Standards (BIS). He has been selected as the 3D GEM Ambassador, 2025, IISC, Bangalore. He has also featured as an RSC Journal of Materials Chemistry B 2024 Emerging Investigator. He is a member of the American Association of Pharmaceutical Scientists. (AAPS), American Society of Biochemistry and Molecular Biology, Society for Biomaterials, Tissue engineering & regenerative medicine (TERMIS), Member of the Royal Society for Biology. (MRSB). Dr Roy's research area focuses on Tissue Engineering, 3D Microphysiological Disease models, biomaterials, 3D organoids and 3D Bioprinting.

**Topic: 3D Microphysiological Disease Modeling and Tissue Engineering: Drug screening to personalized therapy**

The Caco-2 monolayer model, recognized as a gold standard by the FDA, was optimized by culturing cells on transwell inserts for 21 days. The barrier integrity, evidenced by elevated transepithelial electrical resistance (TEER), reduced paracellular flux of impermeable markers (Lucifer Yellow, Dextran-40K), and enriched expression of tight junction proteins (zonula occludens-1, occludin). To validate functional performance, drugs spanning all four Biopharmaceutics Classification System (BCS) classes were assessed, representing low (<50%), moderate (50–84%), and high (≥85%) absorption profiles. Further, different formulations, including nanocrystals, co-crystals, and drug–polymer premixes, were tested to evaluate formulation-dependent permeability differences. The model demonstrated improved predictive accuracy for oral bioavailability, underscoring its translational relevance. Expansion to coculture systems (Caco-2/HT-29, and Caco-2/HT-29 with THP-1) further enabled simulation of intestinal biology under inflammatory conditions, supporting broader applications in inflammatory bowel disease (IBD) drug development.

**Kaushik Chatterjee**

Professor, Departments of Materials Engineering & Bioengineering; Chair, Department of Bioengineering

Indian Institute of Science, Bangalore, India

kchatterjee@iisc.ac.in

Dr. Kaushik Chatterjee received his Ph.D. in Bioengineering from the Pennsylvania State University. He worked as a postdoctoral fellow jointly at the National Institute of Standards and Technology and the National Institutes of Health. He then joined the Indian Institute of Science, where he is currently a Professor in the Department of Materials Engineering and the Department of Bioengineering. He also serves as the Chair of the Department of Bioengineering at IISc and an Associate Editor for the Journal of Materials Chemistry B and Materials Advances. His research group focuses on materials for biomedical applications and particularly on the use of 3D printing and additive manufacturing technologies for healthcare.

**Topic: 3D and 4D Bioprinting for Advancing Healthcare**

Recent advances in additive manufacturing and 3D printing have opened transformative pathways for creating implants and tissue scaffolds with intricate architectures tailored to individual patient needs. In this talk, I will discuss emerging trends in harnessing 3D printing for the processing of biomaterials across diverse biomedical applications. I will highlight our recent work on fabricating patient-specific implants and scaffolds with complex geometries aimed at regenerating both soft and hard tissues. By integrating smart materials and responsive design principles, these technologies can be extended to develop deployable and functional biomedical devices. Finally, I will present our ongoing efforts to utilize 3D printing for constructing in vitro tissue models that recapitulate native organization, enabling deeper insights into disease

**Indu Pal Kaur**

Professor & Dean
Faculty of Pharmaceutical Sciences

University Institute of Pharmaceutical Sciences (UIPS),

Panjab University, Chandigarh

dripkuips@gmail.com

Professor Kaur is currently Dean, Faculty of Pharmaceutical Sciences and Professor of Pharmaceutics, UIPS Panjab University (PU). She has held eminent positions, viz. Chairperson, UIPS (2020–2023); Director, Sophisticated Analytical Instrumentation Facility, PU (2012-15); DPIIT-IPR Chair Professor (2023-2025) and Secretary, Indian Pharmaceutical Association, Punjab Branch (2017-25). She is amongst top 2% most cited scientists worldwide in the area of Pharmacy and Pharmcology, according to data promulgated by Stanford University, USA (2019-20 to 2024-25). Her research forte is enhancing the bioperformance of drugs, plant extracts/phytochemicals, and biomolecules, viz., siRNA, proteins, peptides, and probiotics, using active-tailored solid lipid nanoparticles (SLNs), nanovesicles, and electrospun scaffolds as novel platform nanotechnologies. Emphasis of her work lies on Industrial and clinical translation and is reflected through licensing of 4 of her technologies to the industry and 22 granted patents (including one US) out of 44 filed applications. She has produced 27 (+7 currently guiding) PhDs and 70 (+7 currently guiding) postgraduates and has received funding of around 100 million INR from the Government and Industry. She has delivered >80 Invited Talks and published around 175 articles with an h-index of 58, 8 books, 4 journal volumes, and >25 book chapters to her credit. She is a US-Fulbright fellow (2017-18), & has received National Intellectual Property Award 2021 & 2022 for Top Indian Individual for Patents Filing, Grant & Commercialization; World Intellectual Property Organisation (WIPO) Medal for Inventors (2023), Best Pharmaceutical Scientist (Association of Pharmacy Teachers of India, APTI 2023 & Organisation of Pharmaceutical Producers of India, OPPI 2018); Technology Awards (BIRAC Regional Innovation Centre (BRIC) 2019 & 2020, Grand Innovation Challenge by Indian Pharmaceutical Alliance (2021); Leadership in Research Excellence Award, 2023 and Researcher of the Year award (2019 & 2022), by Sunpure Research Incubation centre.

**Topic: WomaniaPharmayan: A Journey of God's Grace, Courage, and Unconventional Reinvention in Pharma**

WomaniaPharmayan captures my journey from a 17-year-old with little awareness of professional possibilities to a scientist driven by the mission of "Innovation to Reality." My evolution was shaped by a powerful blend of influences—my intellectual Punjabi writer-mother who taught me the art of weaving stories into science; my logical, rational father whose Ardaas (prayer) and disciplined thinking grounded me in clarity, sincerity, and purpose; and later my husband who helped me recognise my inherent beauty and confidence Together, they seeded in me a fearless curiosity, an unconventional mind, and the courage to take risks and tread paths less travelled. I did not begin with ambition; I began with small, unsure steps—but each step was strengthened by prayer and guided by providence. What I prepared for with sincerity, God completed with grace. These values propelled me from being a computer-illiterate generation till graduation to becoming an innovator navigating AI-driven pharmaceutical science. My 44 patents (22 granted) and 4 successful technology transfers stand testimony to a journey led by bold thinking and relentless perseverance. At IPC 2025, I hope to inspire women to trust their path, embrace reinvention, and lead fearlessly in the transformative era of AI and technology. "Learn boldly. Lead authentically. Let both technology and grace expand what you believe is possible."

**Dr. Md Azeemuddin**

Principal Scientist,

Preclinical Pharmacology, Discovery Sciences Group, R&D

Himalaya Wellness Company, Bengaluru

mohd.azeemuddin@himalayawellness.com

Dr. Mohammed Azeemuddin M. currently holds the position of Principal Scientist in the R&D department at The Himalaya Wellness Company in Bengaluru, India, a role he assumed in April 2022. Working as a Principal Scientist in the Pharmacology Department of Discovery Sciences Group of R&D, he is responsible for the evaluation of efficacy and safety of herbal medicine/ phytopharmaceuticals by performing pharmacology and toxicology studies. His areas of research interest include metabolic disorders, GIT disorders, neurological disorders, etc.

He brings a wealth of experience in preclinical pharmacology and toxicology, having spent over 16 years with the company, starting as a Senior Research Scientist in 2006. Dr. Azeemuddin holds a Ph.D. in Pharmacology from the Manipal Academy of Higher Education (2021) and a Master of Pharmacy (M.Pharm) in Pharmacology from the Rajiv Gandhi University of Health Sciences (2005). His research background includes work on Sarcopenia and Cancer cachexia, and he is a published academic researcher with contributions to peer-reviewed journals focusing on the pharmacological activities of traditional medicinal plants.

**Topic: Preclinical Pharmacology and Toxicology Assessment of Herbal Products**

The understanding of the approach of nutraceutical/herbal drug manufacturers in the development of new products or new herbal entity (NHE). The process of establishing the efficacy and safety of herbal drugs/NHE, which should be at par with synthetic/modern medicine. The importance of pharmacodynamic and pharmacokinetic studies in deriving the human equivalent dose and mechanism of action of herbal drugs. The role of preclinical pharmacology studies and dose range finding studies in the extrapolation of preclinical dose to human equivalent dose. Though the herbal drugs are considered to be safe but a through safety profile should be established by performing different short term and long-term toxicity studies, following global guidelines like OECD in the good laboratory practice (GLP) approved lab. The advantages of adopting holistic approach against the reductionist.

**Dr. Chandrika Mahendra**

General Manager - Personal Care and Baby Care R&D

ISBN: 978-81-980623-8-3

The Himalaya Wellness Company, India

chandrika.m@himalayawellness.com

With over twenty years of expertise in the development of natural dermaceutical and cosmeceutical formulations, I have worked extensively across the full spectrum of derma and personal care products. My professional journey has been distinguished by a focus on transforming scientific knowledge into formulations that are not only stable and effective but also cater to the needs of the consumer. This includes creating advanced skin-delivery systems and high-performance products for both derma and personal care applications.

Throughout my career, I have played a pivotal role in driving major innovations within the industry. I have influenced product strategy and contributed significantly to elevating the importance of natural science in contemporary topical formulations. My efforts have helped to shape and redefine categories, ensuring that scientific advancements translate into tangible benefits for consumers.

**Topic: Designing of Herbal Dermaceuticals: Overcoming Challenges through Science, Standardization and Scalable Innovation**

The development of herbal dermaceuticals presents unique scientific and operational challenges—including variability in phytochemical composition, limited solubility and bioavailability of herbal actives, complex absorption pathways, and the need for consistent large-scale supply with stringent standardization. In this talk, how our organization has systematically addressed these challenges by integrating contemporary pharmaceutical technologies with evidence-based botanical research will be deliberated.

Our approach combines advanced phytochemical characterization, standardized extract development, and innovative delivery systems to enhance solubility, penetration, and dermal efficacy of herbal actives. We employ robust sourcing frameworks supported by traceable supply chains, sustainability practices, and high-precision analytical methods to ensure batch-to-batch consistency at commercial scale. Through multidisciplinary formulation science—spanning biopolymer matrices, and synergistic botanical blends—we translate traditional herbal wisdom into clinically relevant, consumer-centric dermaceutical solutions.

This session will highlight our development model, key technologies, case studies, and the scientific principles that enable us to design differentiated herbal dermaceutical products with reproducible quality, safety, and performance. It will also outline the strategic roadmap required for the next generation of advanced, standardized, and globally competitive phytoderma innovations.

**Vasundhra Bhandari**

Assistant Professor &
Faculty in charge,
Department of
Pharmacoinformatics

NIPER Hyderabad, India

vasundhra.b@niperhyd.ac.in

Dr. Vasundhra Bhandari, PhD (Biological Sciences), serves as the Faculty Incharge of the Department of Pharmacoinformatics at the National Institute of Pharmaceutical Education and Research (NIPER), Hyderabad. With more than ten years of post-doctoral research experience, she has built a strong scientific profile in the areas of antimicrobial resistance—particularly involving ESKAPE pathogens—host-directed therapeutics, pharmacogenomics, and drug discovery. Her research integrates a multidisciplinary approach, leveraging microbiology, immunology, genomics, and computational biology to address critical challenges in infectious disease management.

Her research contributions are reflected in an impressive publication record of over 75 international peer-reviewed articles and various extramural grants. She holds an H-index of 27 and an i10-index of 41, underscoring the significant impact and global reach of her work. Dr. Bhandari's excellence has been recognised through several prestigious awards, including the DST INSPIRE Faculty Award (2015), the Fast Track Young Scientist Award from DST-SERB (2014), the Sri Ramachari Young Scientist Award (2012), and an International Travel Grant from the European Commission under FP7 (2010). She was also selected by TWAS to participate in the International Conference for Young Scientists on Infectious Diseases in 2017.

In addition to her research achievements, Dr. Bhandari contributes to the scientific community as an editor for leading international journals, including those of the American Society for Microbiology, PLoS Pathogens, and BMC Microbiology. Her work continues to advance innovation in infectious disease research and therapeutic development.

**Topic: Precision Antimicrobial Strategies Through Host-Pathogen Multi-Omics**

Acinetobacter baumannii is a high-priority risk pathogen with limited treatment options. It causes mortality and morbidity and is associated with respiratory tract, ventilator-associated, and nosocomial infections. Due to the emergence of multidrug resistance (MDR), new alternative treatments are warranted. Multidrug-resistant pathogens use various strategies to evade host defenses and ensure their survival in the host. One of the mechanisms is to alter host histone acetylation by upregulating histone deacetylases (HDACs), creating an immunosuppressive environment. However, the detailed mechanism by which carbapenem-resistant A. baumannii (CRAB) evades host immunity, and the impact of HDAC inhibition on this process, remain unclear.

In this study, we used comparative transcriptomic analysis to explore host cell signaling changes during A. baumannii infection and after treatment with SAHA, a pan-HDAC inhibitor. Our results reveal that CRAB promotes immune suppression by modulating signaling pathways to support its persistence. We also found that the expression of ACOD1, a gene associated with immunometabolism, was upregulated during infection. Treatment with SAHA reduced the expression of key inflammatory and immune-related genes, including IDO1, ACOD1, IL10RA, IL10, TNFα, IL6, IFNB1, and CCL3L3. Moreover, SAHA induced autophagy by enhancing phagosome maturation, antigen processing, and autophagosome-lysosome fusion through the regulation of autophagy-related and SNARE proteins,

ISBN: 978-81-980623-8-3

leading to bacterial clearance. Overall, our findings highlighted the key mechanism modulated by A baumannii and provided insights into several new drug targets to tackle MDR bacteria using next-generation technologies.

**Jubie Selvaraj**

Associate Professor

JSS College of Pharmacy, Ooty, India

jubie@jssuni.edu.in

Dr. S. Jubie, M. Pharm., Ph.D. currently serves as Associate Professor in the Department of Pharmaceutical Chemistry at JSS College of Pharmacy, Ooty, under JSS Academy of Higher Education & Research, Mysuru. With over 23 years of academic and research experience, she has established herself as a leading pharmaceutical researcher specializing in the discovery and design of novel anticancer chemical entities, scaffold/drug repurposing, and computational drug design. She holds a B.Pharm (1999), M.Pharm (2002), and Ph.D. (2014) from JSSAHER. Her intellectual property portfolio includes seven granted Indian patents, additional published patents, five authored books, and nine book chapters. She has secured major research funding from agencies including AICTE, ICMR, DST, Shaqra University (Saudi Arabia), and multiple internal grants as Principal or Co-Investigator. She is an active academic leader, serving as Academic Coordinator and contributing to institutional quality frameworks such as NAAC, NBA, NIRF, and ACPE. She has guided six Ph.D. scholars to completion, supervised numerous postgraduate and undergraduate research projects, and currently mentors additional doctoral candidates. A frequent invited speaker, she has participated in more than 60 scientific conferences and delivered lectures in national and international academic platforms. Dr. Jubie is a life member of professional bodies including IPA, APTI, APP, IFERP, and SBTI, and holds Associate Fellowship in the Antiviral Research Society of India. Her work has earned multiple recognitions, including Pharmacy Woman of the Year (APTI, 2023), Pharmacy Woman Teacher Award (2023), Young Researcher Award (2019), and Research Excellence Award (2025). Featured in Famous India: Nation's Who's Who, she continues to inspire future scientists and healthcare professionals with her philosophy rooted in the belief: "The mind is everything. What you think, you become."

**Topic: Precision Oncology in the AI era: From biomarker discovery to Targeted Therapeutics**

Cancer therapy is shifting from conventional, broad-spectrum treatments to biomarker guided precision oncology, where therapeutic decisions are made by the unique molecular features of each patient's tumor. Biomarkers such as gene mutations, differential protein expression, disrupted signaling pathways, and immune microenvironment signatures now help determine which targets should be modulated to achieve better clinical outcomes. Translating these complex datasets into effective therapeutic strategies is greatly enhanced by Artificial Intelligence (AI), which has become a central driver in modern drug discovery. AI-powered molecular modelling enables accurate prediction of drug–target interactions, assessment of mutation impacts on binding affinity, and rational optimization of molecular structures. Alongside this, AI integrated network pharmacology helps reveal interconnected pathways and combination therapy opportunities, while drug repurposing models supported by machine learning accelerate the identification of already-approved compounds with new relevance in oncology. Furthermore, stimuli-responsive and tumor-microenvironment–specific delivery systems enhance therapeutic precision by ensuring that drugs act selectively at the disease site. By combining biomarker intelligence with AI-driven modelling, researchers can now prioritize targets more effectively, design and refine molecules faster, predict resistance mechanisms early, and tailor therapeutic choices to individual

ISBN: 978-81-980623-8-3

patient profiles. Looking ahead, this integrated approach has the capacity to transform oncology drug discovery by enabling the development of therapies that are more precisely targeted, clinically effective, and economically sustainable, thereby improving patient survival and quality of life while easing the overall burden on healthcare systems and society.

**Siddhesh Kamat**

Professor

IISER Pune, India

siddhesh@acads.iiserpune.ac.in

Siddhesh S. Kamat is a Professor of Biology at the Indian Institute of Science Education and Research (IISER) Pune, where he leads a multidisciplinary research program focused on lipid biochemistry, enzymology, and chemical biology. He obtained his Ph.D. in Chemistry from Texas A&M University and completed postdoctoral training at Scripps Research as the 9th Irving S. Sigal ACS Postdoctoral Fellow. Since establishing his laboratory at IISER Pune in 2016, his group has made significant contributions to understanding lipid-signaling pathways, metabolic enzyme function, and host–pathogen interactions. Professor Kamat is a SwarnaJayanti Fellow and recipient of several major recognitions, including the Infosys Prize in Life Sciences (2024), EMBO Young Investigator Award, the INSA Young Scientist Medal and the Tarun Tejankit Award. His research has been featured on multiple journal covers and spans fundamental mechanistic biochemistry to metabolomics and disease-relevant lipid biology. He serves on the editorial boards of the British Journal of Pharmacology and the Journal of Biological Chemistry, and contributes to national scientific committees within India's DBT and ANRF. Beyond research, he is deeply involved in scientific training, outreach, and community-building, organizing courses and mentoring young investigators across India.

**Topic: An Integrated Chemoproteomics and Metabolomics Approach Towards Enzyme Function Annotation**

Our research group is interested in assigning functions to proteins involved in diverse aspects of mammalian metabolism and physiology. To achieve their goals, the group integrates aspects of chemical biology, biochemistry, molecular and cell biology, immunology, animal and/or cellular models, in conjunction with mass spectrometry (LC-MS) based metabolomics and proteomics techniques. The long-term goal is to identify and understand as-of-yet uncharacterized signalling and metabolic pathways in vivo, annotate enzymes and receptors that regulate their biology and provide new insights and therapeutic paradigms for various human diseases. In this talk, I will discuss an integrated LC-MS based chemical proteomics and metabolomics approach towards mapping function to an enzyme involved in phagocytosis.

**Rachit Agarwal**

Associate Professor

IISc Bangalore, India

rachit@iisc.ac.in

Rachit Agarwal is an Associate Professor in the Department of Bioengineering at the Indian Institute of Science (IISc), Bengaluru, where he has been a faculty member since June 2017, first as Assistant Professor and now as Associate Professor since 2023. He completed his Ph.D. in Biomedical Engineering at the University of Texas at Austin under Prof. Krishnendu Roy, focusing on the effect of nanoparticle shape on cellular internalization, and subsequently pursued postdoctoral research with Prof. Andres J. Garcia at Georgia Institute of Technology. His research integrates biomaterials, drug delivery, and

ISBN: 978-81-980623-8-3

bioengineering strategies to develop innovative therapies for infectious and inflammatory diseases, including tuberculosis and osteoarthritis, with a strong focus on nanoparticle-based delivery systems, bacteriophage therapeutics, and hydrogel models for disease. Dr. Agarwal has received numerous national and international recognitions, including the OPPI Young Scientist Award (2024), the Har Govind Khorana Innovative Young Biotechnologist Award (2019), and the Ramanujan Fellowship (2017), and has served on editorial boards of prominent journals such as the *Journal of Biomedical Materials Research Part A*. He has authored over 50 peer-reviewed articles, contributed to book chapters and review articles, and holds multiple patents in the field of biomaterials and drug delivery. In addition to research, Dr. Agarwal is actively involved in teaching undergraduate and graduate courses on bioengineering and drug delivery, mentoring students, and serving as a reviewer for national and international funding agencies and scientific journals.

**Topic: Long acting injectables for the treatment of tuberculosis**

Tuberculosis (TB) claimed 10.7 million cases and 1.23 million lives in 2024. The approved WHO treatment includes a rigorous oral 4 to 6-month regimen involving several drugs for drug-susceptible TB. Owing to the short half-lives of first-line TB drugs, frequent daily dosing is required. Associated side effects and inability to carry on with everyday life result in a high rate of non-compliance amongst the patients, leading to drug resistance, increased treatment duration and economic burden. This renders the need for sustained-release drug formulations that maintain constant therapeutic concentrations and reduce dosage frequency, thereby increasing patient compliance, evident. In this talk, I will talk about my laboratory efforts in formulating long acting injectables of rifapentine and moxifloxacin. We developed injectable, extended-release, dissolution-controlled depots of nanocrystalline rifapentine with loading levels exceeding 85%, reducing the dosage frequency for patient-compliant treatment. Our injectable RPT nanocrystal formulation (CRPT) maintains RPT levels above 2 µg/mL in serum for over a week with a single intramuscular (IM) administration. A single IM injection administered in mice at 60 mg/kg once a week or once every two weeks showed non-inferior efficacy compared to the clinically used daily oral administration of rifapentine at a dose of 20 mg/kg.

********

**Dr. Sahadev A. Shankarappa**

Professor
Ramaiah University of Applied Sciences,
Bangalore, India

sahadev.bt.ls@msruas.ac.in

Dr. Sahadev is a neuroscientist by training, specializing in neurobiology, neurophysiology, and drug delivery research. With postdoctoral training in the laboratories of Professors Robert Langer at MIT and Daniel Kohane at Boston Children's Hospital, Harvard Medical School, his research focuses on understanding the impact of neural inputs on complex cellular systems with applications in tissue engineering and chronic lifestyle disorders.

His lab explores how neural inputs, both secreted and electrical, modulate non-neuronal cell functions. Results from these studies aim to be translated into human studies for tissue engineering and disease-specific applications. Sahadev holds a Ph.D. in Neurosciences from Loyola University Chicago, an MPH from the University of North Carolina at Chapel Hill, and an M.B.B.S. from Bangalore University. A recipient of the Ramalingaswami reentry fellowship from the Department of Biotechnology, Government of India, Sahadev is not only passionate about neuroscience, but also practices meditation and enjoys long-distance running.

**Topic: Drug Delivery Using Neural Pathways: Nanoparticle Design for Axonal Transport**

ISBN: 978-81-980623-8-3

Delivering nanoparticles to the nervous system is promising for treating neurological disorders but is limited by vascular barriers. This study exploits axonal transport as an alternative route for intraneuronal delivery. Isolectin B4 (IB4)-functionalized gold nanoparticles were designed to selectively target sensory neurons, and their uptake and axonal transport were evaluated using in vitro and in vivo models with confocal microscopy, SEM, microfluidic systems, and ICP-AES. In parallel, a membrane-stretching method was used to generate non-spherical polymeric nanoparticles to probe how geometry affects entry into high-curvature structures such as axons. Non-spherical particles showed enhanced uptake compared to spherical counterparts, indicating that both neurotropic ligand targeting and shape modulate internalization in high-curvature neuronal membranes. Overall, the work demonstrates that axonal transport of ligand-functionalized and shape-optimized nanoparticles provides a viable strategy for targeted neuronal drug delivery and informs the design of nanomedicines for neurological disorders.

********

**Prof Sanjay Garg**

Professor

School of Pharmacy and Biomedical Sciences,

Adelaide University,

City West Campus,
Bradley HB6-11, Adelaide, SA, Australia

sanjay.garg@unisa.edu.au

Professor Sanjay Garg is a globally recognized pharmaceutical scientist and a pioneer in translational research. As Director of the Centre for Pharmaceutical Innovation (CPI), Adelaide University, Professor Garg is dedicated to advancing drug discovery, development, and delivery for both human and animal patients. His innovative work spans critical areas, including anti-cancer drug targeting, nanotechnology, and novel antimicrobial compounds to combat resistant infections (AMR). A testament to his innovation is his role in developing patented formulations, notably Acidform, which led to the US FDA-approved contraceptive Phexxi. With a staggering 101 patents and technology transfer for 15 products, Professor Garg bridges cutting-edge science with practical, patient-centric solutions, shaping the future of pharmaceutics.

**Topic: Transforming Patient Care Through Technology-Driven Pharmaceutical Innovation**

Improving patient compliance has been a defining challenge in modern healthcare, motivating a long-standing research focus on translation-ready technologies that simplify treatment, reduce burden, and enhance clinical outcomes. The presentation will exemplify a structured progression, i.e. from idea generation and technology development to real-world outcomes and societal impact.

The Long-Act™ platform originated as a conceptual solution to counteract poor adherence, fluctuating drug exposure, and limitations of frequent dosing. Through systematic development within the Pharmaceutical Innovation and Development Group (PIDG), this idea evolved into a versatile in-situ forming delivery system capable of accommodating virtually any drug, irrespective of physicochemical properties. The platform supports hydrophilic and hydrophobic molecules, offers customisable release profiles from days to weeks, and can be tuned to achieve disease- or patient-specific therapeutic objectives.

One flagship success is Long-Act™ loaded with Omeprazole, a once-weekly formulation delivering rapid onset and long-lasting relief. With over 200,000 doses administered globally across horses, dogs, and cats; and emerging potential for human translation. This technology exemplifies measurable societal benefit through improved convenience and reduced treatment fatigue.

Similarly, Long-Act PD™, engineered for levodopa/carbidopa, addresses the critical unmet need in Parkinson's disease by

ISBN: 978-81-980623-8-3

enabling week-long release and potential self-administration, significantly reducing dosing frequency while maintaining therapeutic stability. Collectively, these advances position Long-Act™ as a strong contender within the US$50B+ long-acting delivery market.

**Dr. Matam Vijay-Kumar**

Professor (Tenured),

Dept. of Physiology and Pharmacology,

Dept. of Medical Microbiology and Immunology,

The University of Toledo College of Medicine & Life Sciences, Toledo, Ohio, USA

matamvijay.kumar@utoledo.edu

Dr. Matam Vijay-Kumar is a highly distinguished and tenured Professor in the Department of Physiology and Pharmacology, with a joint appointment in the Department of Medical Microbiology and Immunology, at The University of Toledo College of Medicine & Life Sciences, Ohio, USA. He also serves as the Director of the UT Microbiome Consortium (UT-MiCo). Dr. Vijay-Kumar is a world-renowned scientist in the fields of gut microbiota, nutrition, metabolism, and immunology, known for his groundbreaking discoveries on the interplay between intestinal inflammation and metabolic disorders like type 2 diabetes and obesity. He holds a Ph.D., completed a tenure-track position at the Pennsylvania State University, and moved to the University of Toledo in 2018, where he was promoted to full professor in 2020. His research, which has garnered multiple R01 grants from the NIH and resulted in numerous high-impact publications, explores topics such as the potential carcinogenic effects of certain dietary fibers, the role of innate immunity in gut homeostasis, and neutrophil extracellular traps (NETs) in gastrointestinal infections. He is the recipient of several national and international honors, including the prestigious Outstanding Research and Scholarship Award from the University of Toledo in 2023.

********

**Dr. Dharmendra Ahuja**

Dean Faculty of Pharmaceutical Science at Jayoti Vidyapeeth Women's University, Jaipur, India

Dr. Dharmendra Ahuja, Ph.D. in Pharmacology, is a distinguished academician, mentor, and researcher with over 25 years of experience in the pharmaceutical domain. He serves as the Principal Mentor for Experimental Pharmacology Software under the Bureau for Health and Education Status Upliftment, India, and is a Guest Professor of Pharmacology at Rajasthan University of Health Sciences, Jaipur. Dr. Ahuja is a Patron Member of the Indian Pharmaceutical Association and a Member of the Board of Management at JV Women's University, Jaipur. He is empanelled as an Assessor with the National Assessment and Accreditation Council (NAAC), Government of India, and as an Inspector with the Pharmacy Council of India (PCI), Government of India. He has also served as a Fellow with the Department of Planning, Government of Rajasthan, and the Ministry of Human Resource Development, Government of India. Dr. Ahuja has been recognised and honoured by several dignitaries, including the Health Minister and the Women and Child Development Minister of the Government of Rajasthan, as well as the Mayor of Jaipur. He holds multiple patents and publications, reflecting his significant contributions to pharmaceutical education, research, and policy.

**Medam Venkata Komali**

Medam Venkata Komali is a pharmacist, researcher, and student leader with a strong commitment to professional service and academic excellence. A proud daughter of Indian Naval personnel, she embodies discipline, integrity, and leadership in her professional journey. She currently serves as the President of the IPA–SF National Executive Committee (2025–2026) and has demonstrated sustained leadership within IPA-SF at state and national levels. Her IPA-SF journey includes key roles as IPA Divisional Head, Liaisons Subcommittee (2024), Projects Subcommittee Member (2023), Contact Person for the IPA-SF Goa State Chapter, and Secretary, IPA-SF KLE Belagavi Student Chapter, where she actively contributed to chapter establishment, membership growth, national conferences, and professional outreach initiatives. She is also the Assistant Editor of IPA-CPD e-Times and has coordinated and led a student team for IPA-CPD projects under the guidance of Dr. Raj Vaidya. Academically, she holds a Master of Pharmacy (Pharmaceutical Chemistry) from KLE College of Pharmacy, Belagavi (August 2025) and a Bachelor of Pharmacy from Goa College of Pharmacy, Panaji (September 2023). Her research work spans medicinal chemistry, computational drug design, and synthesis of heterocyclic compounds, supported by research grants, conference presentations, and publications in progress. She was awarded the Best Outgoing Female M. Pharm Student 2025 at KLE College of Pharmacy, Belagavi. She is among the 85 pharmacists in India trained as a Vaccinator Trainer under the FIP–IPA Vaccination Project, and maintains a strong interest in sports, including swimming, water polo, table tennis and basketball.

## SMART FARMING BEYOND EARTH: ARTIFICIAL INTELLIGENCE IN MICROGREEN PRODUCTION FOR SPACE EXPLORATION

Vaidehi Bajaj, Shubhada Mangrulkar, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
vaidehibajaj.099@gmail.com

Space farming is rapidly evolving to support long-duration human missions by enabling fresh food production in extraterrestrial environments faced with drastic resource constraints. Microgreens—young, nutrient-dense plants harvested at the cotyledon or first true leaf stage—are increasingly favored in space farming due to their short growth cycles, minimal resource requirements, and ability to enhance both the physical and psychological health of astronauts. Their high levels of vitamins, minerals, and phytonutrients as well as their appealing flavors and ease of cultivation make them a valuable component in controlled environment agriculture (CEA) systems. However, substantial challenges in space farming persist, including microgravity-related issues affecting air circulation, irrigation, and plant physiology, as well as the need for precise and autonomous management of environmental parameters and food safety. Current solutions leverage advances such as IoT-based automation for real-time monitoring and control, but manual intervention and system optimization remain limiting factors. Here, artificial intelligence (AI) presents transformative possibilities: AI-driven systems can automate image capture, quantify plant growth, estimate biomass, and predict yield and nutrient content at early stages. Machine learning enables early detection of plant and human pathogens, forecasts optimal harvesting times, and fine-tunes irrigation, lighting, and nutrient supply, significantly reducing the need for human supervision and mitigating risks of error or contamination. In controlled microgreen production, AI can synthesize high-throughput sensor data to maintain ideal growth conditions, improve resource efficiency, and adapt dynamically to the unpredictable constraints of space. Integrating AI into space farming systems is thus essential for developing reliable, autonomous, and resilient food production solutions vital for future space exploration missions.

**Keywords:** Artificial intelligence, space farming, microgreens, controlled environment agriculture, IoT, sustainability.

## AWARENESS OF AI IN EARLY DETECTION AND MONITORING OF PARKINSONS DISEASE

Hamsalekha NV, Ekta Singh
Department of Pharmacy Practice, Aditya Bangalore
Institute of Pharmacy Education and Research, Bangalore, Karnataka, India – 560064

Parkinson's disease (PD) is a progressive neurodegenerative disorder where early detection and continuous monitoring are critical for better management. With the growing role of Artificial Intelligence (AI) in healthcare, this study assessed knowledge and perceptions of AI in PD through a cross-sectional survey of 200 participants. The findings showed that 53.9% had heard of PD, but only 46% were aware of its symptoms, and just 35.5% believed it could be detected early. In contrast, awareness of AI was considerably higher, with 89.5% reporting familiarity and 82.9% having prior exposure to AI applications. When asked about healthcare uses, 47.4% felt AI could aid early diagnosis of PD, while 40.8% highlighted its role in continuous symptom monitoring. Concerns raised by participants included privacy risks (40.8%) and accuracy of results (39.5%). Despite this, over half agreed that AI could assist doctors, with 50.8% expressing trust in AI-based tools. Additionally, 55.3% emphasized the need for greater education on both PD and emerging healthcare technologies. Overall, the study reveals moderate awareness of PD but high optimism toward AI, suggesting that targeted education and ethical safeguards are essential for responsible AI integration in PD care.

**Keywords:** Parkinsons, Artificial Intelligence, healthcare

## ARTIFICIAL INTELLIGENCE IN DETECTION, MONITORING AND EMPOWERMENT OF INDIVIDUALS WITH DEPRESSION

Jaishika BL, Ekta Singh
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India-560064
jaishikapoojari23@gmail.com

Depression is a common health disorder, characterised by persistent feeling of sadness or loss of interest in everyday activities. The objective of the study aimed to access knowledge, attitude and practice (KAP) to detect, monitor and empower individuals using Artificial Intelligence (AI) who are facing challenges of depression. Online survey was conducted using Google form and response from 150 Participants were analysed. Knowledge assessment showed that about 66.7% of participants have heard about AI used to manage depression and about 33.3% are not aware. Attitude response showed that about 81.9% of the participants agree that AI can provide timely support during emotional crisis when human help is not available immediately. In practice, 28.9% of the people have used AI-based mental health app or chatbot and about 67.3% suggest their friends or family to use AI to overcome depression. The study concluded that depression could be overcome by using AI by Integration of AI into pharmacy and clinical practice and helpful for people living in remote areas who unable to access mental healthcare, empower people by following exercise and activity which is monitored regularly by AI and early detection of symptoms. Therefore, AI in detecting, monitoring and empowering individuals with depression would severe as the major tool in management of depression among general population.

**Keywords:** Artificial intelligence, Depression.

## ARTIFICIAL INTELLIGENCE IN PHARMACY BALANCING ADVANTAGES, LIMITATIONS AND FUTURE DIRECTIONS

K. Gokulapriya, P. Ranjitha
Department of Pharmaceutical Chemistry, Pallavan Pharmacy College, Kanchipuram, India – 631502
gokulapriyakandasamy24@gmail.com

Artificial Intelligence (AI) is revolutionizing pharmaceutical sciences, particularly in drug discovery, medicinal chemistry, and formulation development. Its applications in target identification, molecular docking, lead optimization, and predictive toxicology have accelerated research timelines and reduced costs, positioning AI as a transformative tool in pharmacy. However, while the advantages of AI are widely discussed, its limitations demand equal attention. AI-driven models heavily rely on the quality and quantity of available datasets, and incomplete or biased data can lead to misleading predictions in drug design. The lack of experimental validation and overdependence on in-silico models may compromise translational efficiency from bench to bedside. Moreover, issues such as algorithmic opacity ("black-box" problem), reproducibility challenges, regulatory uncertainties, and ethical concerns regarding patient data privacy present significant barriers to clinical acceptance. In pharmaceutical chemistry, AI can generate theoretically promising molecules that may not be synthetically feasible or pharmacokinetically viable, leading to resource-intensive dead ends. Thus, while AI holds great promise, it must be integrated cautiously with experimental pharmacology, medicinal chemistry insights, and clinical validation. The future of pharmacy depends not on AI replacing traditional research, but on synergistic collaboration between computational intelligence and scientific expertise to achieve safe, effective, and ethically sound drug development.

**Keywords:** Black-box, target, medicinal chemistry, datasets.

**AI-05**

## AI-DRIVEN DEVELOPMENT AND OPTIMIZATION OF A LEVOSULPIRIDE ORAL FORMULATION FOR NON-ULCER DYSPEPSIA

Sujata Patel, Mukul Sharma
Sri Aurobindo Institute of Pharmacy, Indore (Madhya Pradesh)-453555
sujatapatel1542000@gmail.com

Non-Ulcer Dyspepsia, NUD is a widespread functional gastrointestinal disorder characterized by persistent upper abdominal discomfort without detectable structural abnormalities. Levosulpiride, a dopamine D2 receptor antagonist with prokinetic properties, has shown therapeutic value in NUD management. However, variability in clinical response and formulation performance presents ongoing challenges in optimizing treatment. This study investigates the application of Artificial Intelligence (AI) in the development and optimization of Levosulpiride

ISBN: 978-81-980623-8-3

oral formulation. Machine learning algorithms-including Random Forest and Gradient Boosting were applied alongside a Design of Experiments (DoE) approach to model and predict the impact of key formulation parameters, including excipient ratio, polymer type, and granule size, on drug release and stability. *In silico* tools, such as physiologically based pharmacokinetic (PBPK) modeling, were used to simulate gastrointestinal behavior and absorption profiles of the optimized formulations.The AI-assisted methodology enabled the identification of optimal formulation conditions with reduced experimental workload and accelerated development timelines. Selected formulations showed strong correlation with predicted profiles in in vitro dissolution and stability studies.This research demonstrates the value of AI-driven approaches in pharmaceutical formulation, offering a more efficient, data-informed pathway to develop effective treatments for functional gastrointestinal disorders such as NUD. The integration of machine learning into formulation design supports the creation of patient-centric and performance-optimized drug delivery systems.

**Keywords:** Artificial Intelligence, Non-Ulcer Dyspepsia, Machine Learning, PBPK Modeling, Optimization.

## ROBOTIC PROCESS AUTOMATION: DRIVING EFFICIENCY AND COMPLIANCE IN THE PHARMACEUTICAL INDUSTRY

Karna Anirudh, Brahmaiah Bonthagarala
Department of Pharmaceutics, Shri Vishnu College of Pharmacy (Autonomous), Vishnupur, Bhimavaram-534202, Andhra Pradesh, India.
anirudhkarna0183@gmail.com

Robotic Process Automation (RPA) is emerging as a transformative tool in pharmaceutical manufacturing, aligning with the principles of Industry 4.0 to enhance efficiency, accuracy, and compliance. By automating repetitive, rule-based tasks such as data entry, batch record management, regulatory documentation, and quality assurance processes, RPA reduces human error and accelerates production timelines. In manufacturing environments, RPA enables seamless integration with existing enterprise systems, supports predictive maintenance, and facilitates real-time monitoring of operations. This leads to improved productivity, cost-effectiveness, and compliance with stringent regulatory standards such as FDA and EMA guidelines. Furthermore, RPA complements advanced technologies like artificial intelligence (AI), machine learning (ML), and the Internet of Things (IoT), creating a smart manufacturing ecosystem. Overall, the adoption of RPA in pharmaceutical manufacturing strengthens operational agility, supports digital transformation, and ensures consistent product quality for global healthcare needs.

**Keywords:** Robotic Process Automation (RPA), Pharmaceutical Technology, Artificial intelligence.

**AI-07**

## LABELGUARD – AN AI POWERED SOLUTION FOR DRUG LABEL COMPLIANCE

Ameya Raut, Vinita Kale, Suankit Harne, Milind Umekar
Department of regulatory affairs, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur- 441002.
rautamey69@gmail.com

The primary objective of Label-Guard AI is to deliver a comprehensive, intelligent, and automated digital framework that addresses the increasing complexity of drug label compliance within the pharmaceutical industry. Drug labeling plays a pivotal role in regulatory submissions, ensuring that patients, healthcare professionals, and regulatory bodies receive accurate, safe, and legally compliant information. Traditional manual review processes, however, are often time-consuming, resource-intensive, and prone to human error, thereby increasing the risk of regulatory setbacks. To overcome these challenges, Label-Guard AI leverages advanced artificial intelligence models in combination with curated regulatory knowledge bases to enable real-time analysis, verification, and risk assessment of drug label content. The platform is designed to proactively identify potential inconsistencies, misbranded statements, ambiguous terminology, or non-compliant phrasing that may compromise regulatory acceptance. Beyond compliance verification, Label-Guard AI provides an interactive compliance dashboard, secure document management capabilities, and automated reporting tools, thereby enhancing efficiency, transparency, and traceability across pharmaceutical regulatory workflows. Its scalable design ensures adaptability to diverse global regulatory standards such as FDA, EMA, and ICH guidelines. By integrating modern web technologies with AI-driven insights, Label-Guard AI aspires to reduce regulatory risks, accelerate time-to-market, and support pharmaceutical organizations in maintaining high standards of safety and compliance. Ultimately, the solution represents a reliable and future- ready innovation that strengthens global pharmaceutical labeling practices while optimizing resource utilization in an increasingly complex regulatory environment.

**Keywords:** Drug Label Compliance, Pharmaceutical Labeling, Regulatory Submissions, Global Regulatory Standard (FDA, EMA, ICH), Artificial Intelligence in Pharma, Labeling Workflow Automation.

## DEVELOPMENT OF A PREDICTIVE MODEL FOR SEASONAL OVER-THE-COUNTER MEDICINE DEMAND THROUGH MACHINE LEARNING

Chorasiya Nayankumar T., Rajvee Patel, Akashkumar P. Mathuria, Sandipkumar P. Bhatt
Department of Pharmacology & Pharmacy Practice, K.B. Institute of Pharmaceutical Education and Research, Kadi Sarva Vishwavidyalaya University, Gandhinagar, Gujarat, India-382023
nayanchorasiya786@gmail.com

OTC medicines reflect seasonal disease trends, yet systematic evaluation of demand fluctuations is limited. AI-driven data mining and visualization reveal hidden patterns, enabling smarter pharmacy stocking and improved public health outcomes. The objective behind the study is to identify seasonal usage trends in OTC drugs (antihistamines, analgesic, cold meds). A dataset comprising 36,00,085 pharmacy transactions (2023-2024-2025till July) was analysed. Data preprocessing and aggregation were conducted in Python using Pandas & matplotlib. Pyplot Monthly sales per drug class were computed and descriptive statistics (mean, standard deviation, minimum & maximum) were calculated. Seasonal peaks were further identified using temporal grouping. Data visualization techniques were applied to illustrate demand variation across months. The results were compared using ANOVA that shows total unit sales exhibited a seasonal peak in Q1 (Jan–Mar, mean-370; Jan-639), predominantly due to Antihistamines, while the lowest values occurred in Q2 (Apr–Jun, mean-78). Cold Medications demonstrated a distinct surge in Mar 2025, and Analgesics showed relatively higher sales during mid-2023. This developed predictive model gives us valuable insights into seasonal OTC medicine trends, enabling evidence-based inventory planning, minimizing stock imbalances, and improving patient care through timely availability of essential drugs.

**Keywords:** AI, Python, Data Visualization, OTC, Seasonal Trends.

**AI-09**

## ARTIFICIAL INTELLIGENCE–DRIVEN PREDICTIVE ANALYSIS OF HEALTH RISKS FROM LONG-TERM PACKAGED FOOD CONSUMPTION

Vikas L
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India - 560064
vikaslgowda1519@gmail.com

The increasing reliance on packaged food products has raised significant concerns regarding their long-term complications for human health. These foods, often rich in additives, preservatives, and unhealthy fats, are strongly associated with chronic conditions such as metabolic disorders, cardiovascular diseases, and organ dysfunction. This study explores the potential of Artificial Intelligence (AI)–driven predictive analysis as a tool to evaluate and forecast health risks linked to continuous packaged food consumption. A cross-sectional survey was conducted using a structured Google Form, with responses obtained from 200 participants across urban and rural populations. Knowledge assessment revealed that 80% of urban participants and 50% of rural participants were aware of packaged food products. Consumption patterns showed that 87% of urban residents and 28% of rural residents frequently consume packaged foods. While 70% of participants acknowledged the long-term health risks associated with high-fat packaged food, only 40% reported checking nutrition labels regularly. Notably, only 20% were aware of usage of AI tools for health prediction, yet 78% expressed willingness to use AI for assessing their health risks.

ISBN: 978-81-980623-8-3

The findings conclude that AI-driven predictive tools can play a pivotal role in enhancing awareness, supporting informed dietary decisions, and ultimately reducing the burden of chronic lifestyle-related diseases.

**Keywords:** Packed food products, Artificial Intelligence, AI tools.

**AI-10**

**POLYHERBAL GUAVA LEAVES-EXTRACT BASED JELLY FOR ORAL MUCOSITIS: AN AI-INTEGRATED APPROACH USING NETWORK PHARMACOLOGY**

Huma Dalwai, Aaliyah Firfiray, Aiman Dukka, Taufiq Kachchi, Shahid Ahmed, Jayshree Patil
Anjuman I Islam's Kalsekar Technical Campus School of Pharmacy, Panvel, Navi Mumbai, Raigad, Maharashtra, India - 410206.
dalwaihuma@gmail.com

Oral mucositis is a painful and inflammatory condition of the oral mucosa that significantly affects quality of life by impairing nutrition, speech, and overall wellbeing. Current therapeutic strategies provide only limited relief, highlighting the need for safer and more effective alternatives. Guava (Psidium guajava) leaves extract, rich in flavonoids and phenolics, exhibits anti-inflammatory and wound-healing properties, making it a promising candidate for mucosal protection and repair.In this study, a polyherbal jelly formulation was developed incorporating guava leaves extract along with supportive botanicals. The formulation was optimized for texture, stability, and organoleptic acceptability.To investigate the mechanistic basis, AI-driven network pharmacology was applied. Phytochemical–target mapping revealed interactions with inflammatory signaling pathways, with NFKB1 and MAPK3 identified as key genes associated with mucosal inflammation and healing. These results provide computational evidence supporting the potential role of guava leaf-based formulations in managing oral mucositis.This study demonstrates the integration of traditional phytopharmaceutical development with artificial intelligence approaches. As a future scope, molecular docking studies and in vivo validation are planned to further study the predicted compound–target interactions and therapeutic potential.

**Keywords:** Oral mucositis, guava leaves extract, polyherbal jelly, network pharmacology, AI in pharmaceuticals.

**Development of a Predictive Model for Seasonal Over-The-Counter Medicine Demand Through Machine Learning**

Chorasiya Nayankumar T., Rajvee Patel, Akashkumar P. Mathuria, Sandipkumar P. Bhatt
Department of Pharmacology & Pharmacy Practice, K.B. Institute of Pharmaceutical Education and Research, Kadi Sarva Vishwavidyalaya University, Gandhinagar, Gujarat, India-382023
nayanchorasiya786@gmail.com

OTC medicines reflect seasonal disease trends, yet systematic evaluation of demand fluctuations is limited. AI-driven data mining and visualization reveal hidden patterns, enabling smarter pharmacy stocking and improved public health outcomes. The objective behind the study is to identify seasonal usage trends in OTC drugs (antihistamines, analgesic, cold meds). A dataset comprising 36,00,085 pharmacy transactions (2023-2024-2025till July) was analysed. Data preprocessing and aggregation were conducted in Python using Pandas & matplotlib. pyplot. Monthly sales per drug class were computed and descriptive statistics (mean, standard deviation, minimum & maximum) were calculated. Seasonal peaks were further identified using temporal grouping. Data visualization techniques were applied to illustrate demand variation across months. The results were compared using ANOVA that shows total unit sales exhibited a seasonal peak in Q1 (Jan–Mar, mean-370; Jan-639), predominantly due to Antihistamines, while the lowest values occurred in Q2 (Apr–Jun, mean-78). Cold Medications demonstrated a distinct surge in Mar 2025, and Analgesics showed relatively higher sales during mid-2023. This developed predictive model gives us valuable insights into seasonal OTC medicine trends, enabling evidence-based inventory planning, minimizing stock imbalances, and improving patient care through timely availability of essential drugs.

**Keywords:** AI, Python, Data Visualization, OTC, Seasonal Trends.

**AI-12**

**AI-ENABLED PORTABLE SMART HEALTH RECORD (Z CARD) FOR EMERGENCY ACCESS AND MEDICATION SAFETY.**

Channabasappagouda Subedar, Ragini Katti
RME's College of Pharmacy Balaji Nagar, Kalaburagi, Karnataka, 585102.
manojsubedar0@gmail.com

Fragmented patient health data which is difficult to access during emergencies and hospital visits often leads to delays in care and preventable medication errors in Indian hospitals. This study introduces the Z Card, an AI-enabled smart health record card integrating NFC and QR technologies to provide secure offline/online access to critical patient data and medical history. The objective is to assess the perceived need and clinical value of this system among healthcare providers. Methodology: This ongoing cross-sectional study is being conducted among consultants and postgraduates in tertiary care hospital in Kalaburagi. A pilot survey of 20 healthcare professionals (14Postgraduates and 6consultants) is conducted. A structured questionnaire assessed frequency of incomplete data leading to errors in prescribing and willingness to adopt AI-driven portable health records. Descriptive analysis is used. Results:85% of respondents reported frequent delays in retrieving records; 75% reported duplication or errors due to incomplete histories. 90% expressed willingness to use a portable smart health record, and 80% rated AI-based drug-drug interactions and toxicity alerts as highly beneficial. In simulation, median past history record-lookup time fell from 7.5min to 1.8min, participants rated usability 4.3/5.Conclusion: preliminary data confirm strong clinical need for an AI–assisted card. The complete study is expected to demonstrate remarkable potential to improve continuity of care, reduce medical errors and support emergency decision-making.

**Keywords:** Smarthealth record; AI; Medication safety.

**AI-13**

**ARTIFICIAL INTELLIGENCE IN PHARMACEUTICAL TECHNOLOGY AND DRUG DELIVERY DESIGN**

N. Anjaneyulu. Narapusetti
Department of Pharmaceutical Analysis, Geethanjali College of Pharmacy, Cheeryal (V), Keesara (M), Telangana 501 301, India
rautamey69@gmail.com

Artificial intelligence (AI) has emerged as a formidable instrument that leverages anthropomorphic knowledge to deliver swift solutions to intricate problems. Significant progress in AI technology and machine learning offers a transformative opportunity in the realms of drug discovery, formulation, and the testing of pharmaceutical dosage forms. By employing AI algorithms that scrutinize vast biological datasets, including genomics and proteomics, researchers are able to pinpoint disease-related targets and forecast their interactions with prospective drug candidates. This facilitates a more efficient and focused strategy for drug discovery, thereby enhancing the probability of successful drug approvals. Additionally, AI can play a role in minimizing development expenses by streamlining research and development processes. Machine learning algorithms aid in experimental design and can anticipate the pharmacokinetics and toxicity of drug candidates. This functionality allows for the prioritization and refinement of lead compounds, thereby diminishing the necessity for extensive and expensive animal testing. Personalized medicine strategies can be advanced through AI algorithms that evaluate real-world patient data, resulting in more effective treatment outcomes and improved patient compliance. This comprehensive review examines the extensive applications of AI in drug discovery, drug delivery dosage form designs, process optimization, testing, and pharmacokinetics/pharmacodynamics (PK/PD) studies. This review presents an overview of various AI-driven methodologies employed in pharmaceutical technology, emphasizing their advantages and limitations. Nonetheless, the ongoing investment in and investigation of AI within the pharmaceutical sector presents promising opportunities for enhancing drug development processes and patient care.

**Keywords:** Artificial intelligence (AI); machine learning; drug discovery; formulation; dosage form testing; pharmacokinetics; pharmacodynamics; PBPK; QSAR.

**AI-14**

**INNOVATING PCOD MANAGEMENT: A SMART APP FOR SYMPTOM TRACKING AND EARLY DETECTION**

Diya Sudha Ramji Pande

ISBN: 978-81-980623-8-3

Polycystic Ovary Syndrome (PCOS) is one of the most common endocrine disorders among women, but its wide range of symptoms—like irregular periods, weight fluctuations, and skin issues—makes it difficult to manage and often leads to late diagnosis. Current ways of tracking symptoms, like using paper journals or basic apps, are disjointed and don't give a clear picture of someone's health over time. This creates a big gap between patients and doctors. Designing a mobile app would help to tackle this problem. The goal is to create a single, easy-to-use platform where users can log their daily symptoms, complete quick weekly check-ins, and automatically generate clean, simple reports to share with their doctors. A key feature would be allowing users to scan and upload their lab results, putting all their health information in one place. It would focus heavily on user experience to make sure it's accessible for everyone, not just tech-savvy users. The main idea behind this app is empowerment. It's about giving women the tools to better understand their own bodies and providing doctors with consistent, reliable data. By making symptom tracking effortless, we can help with earlier detection and more personalized treatment plans. The idea is to create an app using cloud-based technology to keep data secure and synced across devices. In conclusion, this project is about using technology to make a real difference in women's healthcare. With proper development and this app can become a valuable tool for managing PCOS, leading to better health outcomes and making the daily lives of those affected just a little bit easier.

**AI-15**

**KNOWLEDGE, ATTITUDE, AND PRACTICE OF POSTGRADUATES AND CONSULTANTS TOWARDS ARTIFICIAL INTELLIGENCE IN PREVENTING ADVERSE DRUG REACTIONS AND DRUG-DRUG INTERACTIONS.**

Ragini Katti,Channabasappagouda Subedar
RME's College of Pharmacy Balaji Nagar Old Jewargi Road, Kalaburagi, Karnataka585102.
kattiragini@gmail.com

Adverse drug reactions (ADRs) and Drug-Drug Interactions (DDIs) are major contributors to preventable morbidity, mortality and healthcare expenditure. AI is increasingly recognized for its potential to strengthen pharmacovigilance by predicting and preventing ADRs/DDI. However, successful adoption relies heavily on knowledge, attitude, and practices of healthcare professionals. Methodology: This ongoing cross-sectional study is being conducted among consultants and postgraduate trainees in tertiary care hospital Kalaburagi. This survey assesses demographic data, awareness of AI in pharmacovigilance, attitude towards its integration and current practices. Data are being analysed using descriptive and analytical statistics. Results: Pilot data from 40 participants (26PGs and 14consultants) reflected trends in AI deployment in healthcare. Only 18% of the participants showed sufficient knowledge about relevance of AI in pharmacovigilance application, despite 67% of participants reported awareness of AI.75% reported a positive attitude towards utilising AI to prevent DDI/ADRs, citing improved accuracy and patient safety as the main benefits. Actual practice, however, limited, with only 12% reporting routine use of AI enabled tools. These preliminary findings mirror patterns observed in earlier studies, where enthusiasm for AI is not matched by adequate knowledge or utilization. The complete study is expected to provide more comprehensive insights to guide structured training and institutional strategies for effective AI integration in pharmacovigilance.

**Keywords:** Artificial Intelligence, Pharmacovigilance, Drug-Drug Interactions.

**AI-16**

**TOOLS FOR FRAMEWORK MODELING AND SIMULATION**

Jahnavi Satya Priya Amalakota, Swathi Varri
Department of Pharmaceutical Sciences, VJ's College of Pharmacy, Andhra Pradesh, India – 533296.
amalakotajahnavisatya@gmail.com

Framework modeling and simulation are essential approaches for analyzing, designing, and predicting the performance of complex systems in fields such as engineering, computer science, and pharmaceuticals. These methods enable researchers to construct conceptual or mathematical representations of real-world processes and evaluate their behavior under different conditions. A variety of tools are employed for this purpose, including MATLAB/Simulink, widely used for dynamic system modeling; ANSYS and COMSOL Multiphysics, which support finite element analysis and multiphysics simulation; Arena and AnyLogic, commonly applied for discrete-event and agent-based simulations; and Modelica, an open-source platform for object-oriented modeling. These tools provide visualization, optimization, and predictive capabilities, thereby enhancing decision-making, reducing experimental costs, and improving system reliability. With growing computational power, framework modeling and simulation continue to evolve as indispensable tools for research and industrial applications.

**AI-17**

**LEVERAGING ARTIFICIAL INTELLIGENCE FOR EARLY DETECTION AND MECHANISTIC INSIGHTS INTO HEPATOTOXICITY: A TRANSLATIONAL APPROACH IN PHARMACEUTICAL SCIENCES**

Ajay Verma, Heena Khan
Department of Pharmacology & toxicology, Chitkara College of Pharmacy, Chitkara University, Rajpura, Punjab India

Background: Hepatotoxicity, which causes between 15% and 20% of drugs removals worldwide, is a major hurdle for clinical research & drug discovery. Time, expense, and low prediction accuracy are the drawbacks of traditional techniques like histology and biochemical testing. Computation toxicity & artificial intelligence (AI) provide novel methods for identifying, forecasting, and mechanistically explaining hepatotoxicity, which lowers medication attrition and enhances patient safety. Materials and Methods: By combining machine learning methods like Random Forest and Deep Neural Networks with publically accessible hepatotoxicity datasets (DILIrank, FAERS, and DrugBank), an AI-driven framework was devised. The identification of mechanistic biomarkers involved the incorporation of multi-omics data, including transcriptomics, proteomics, and metabolomics. Furthermore, experimental validation techniques were described utilizing liver-on-chip models , zebrafish bioimaging, with AI-assisted picture analysis to identify hepatotoxic signals. Results: When compared to conventional in vitro methods, the AI-based prediction models showed improved accuracy (up to 85–90%) in detecting hepatotoxic chemicals. Strong relationships between drug-induced oxidative stress, immune-mediated damage, and dysfunction of mitochondria or anticipated hepatotoxic profiles were found via mechanistic insights. AI's therapeutic usefulness was shown by case studies that showed it could accurately forecast the hepatotoxic risk of a number of licensed medications that were later removed owing to liver damage. Conclusion: AI-enabled approaches represent a transformative innovation in hepatotoxicity research. By integrating predictive modeling with experimental validation, this framework enhances early detection, uncovers mechanistic pathways, and reduces drug development failures. In line with the conference theme *"AI & Technology in Pharma: Educate, Innovate, Empower"*, this work emphasizes how AI can educate researchers through data-driven learning, innovate drug safety assessment methods, and empower pharmaceutical sciences to deliver safer and more effective therapies

**Keywords:** Hepatotoxicity; Artificial Intelligence; Drug-Induced Liver Injury (DILI); Machine Learning; Predictive Toxicology; Computational Pharmacology; Zebrafish Models.

**AI &ML: BEYOND THE TRADITIONAL DRUG DEVELOPMENT IN NEURO-FIELD**

Chaitali Mallick, Somasri Shannigrahi, Sk. Abdul Amin
Department of Pharmaceutical Technology, SoHMS, Adamas University, Barasat, Kolkata-700126, India
chaitalim18@gmail.com

Advancements in artificial intelligence (AI) and machine learning have revolutionized the landscape of biomedical research, particularly in the development of novel approaches to disease treatment. One promising avenue involves the integration of AI-driven algorithms with chemical modification techniques to accelerate drug discovery and optimize therapeutic efficacy. Chemical modification, a cornerstone of medicinal chemistry, allows for the fine-tuning of molecular structures to enhance target specificity Like KMO, bioavailability, and metabolic stability. When combined with machine learning models trained on large datasets of chemical and biological interactions, the therapeutic potential of modified compounds can be predicted with unprecedented accuracy.

ISBN: 978-81-980623-8-3

Recent breakthroughs have demonstrated that AI can not only identify promising lead compounds but also propose specific chemical modifications to improve their pharmacological profiles. This synergistic approach has proven especially valuable in tackling complex diseases such as cancer, neurodegenerative disorders Specially Alzheimer, Parkinson disease etc. and antibiotic-resistant infections. Moreover, machine learning models are increasingly being used to simulate disease pathways, enabling a deeper understanding of disease mechanisms and identifying novel therapeutic targets. The convergence of AI, chemical modification, and data-driven insights represents a transformative shift in personalized medicine and precision drug design. As these technologies mature, they promise to reduce the time and cost associated with traditional drug development while significantly increasing success rates in clinical applications. This interdisciplinary framework marks a critical step toward the realization of smarter, faster, and more effective disease treatments.

**Keywords:** KMO (Kynurenine monooxygenase), AI, ML, Neurodisease.

**AI-19**

**INNOVATIONS IN VIRTUAL CLINICAL TRIALS USING ARTIFICIAL INTELLIGENCE**

Apoorva Kulkarni
Rajiv Memorial Education society's College of pharmacy, Kalburgi, Karnataka, India-585102
apoorvakulkarni08@gmail.com

Virtual clinical trials are research studies conducted remotely through digital technologies such as telemedicine, mobile applications, wearables, and artificial intelligence (AI). They enable patient recruitment, monitoring, and data collection without requiring participants to visit physical trial sites. The objective of this study is to identify the key innovations and technological advancements driving AI-enabled virtual clinical trials and to discuss the advantages of AI integration in enhancing trial efficiency, diversity, and patient engagement. The integration of AI has emerged as a key driver of this transformation, providing innovative solutions to challenges such as recruitment, efficiency, data management and patient interaction.AI-powered algorithms enhance recruitment rapidly analyzing electronic health records, demographic profiles and social data to identify eligible participants with greater accuracy and diversity, Studies indicate that AI can reduce patient recruitment timelines by nearly 40%compared to traditional methods. Machine learning models support adaptive trial design, optimize sample sizes, and predict trial outcomes, thereby lowering failure rates and reducing developmental costs. Real time patient monitoring is facilitated through wearable sensors, mobile health applications and telemedicine platforms, with AI ensuring accurate data capture and anomaly detection. Natural language processing and conventional AI tools further improve patient engagement, adherence, and reporting of adverse events. Innovations in virtual clinical trials using AI can redefine drug development by creating faster, safer and more inclusive research models while maintain transparency, equity, and patient trust.

**Keywords:** Virtual clinical trials, Artificial intelligence, Innovation, Drug development.

**AI-GUIDED FORMULATION OF MRNA-BASED NANOPARTICLE SYSTEMS IN CANCER IMMUNOTHERAPY**

Urmila Murlidhar Tiwaskar, Nusrat B. Sayyad, L. R. Gandhi
Shri Gurudatta Shikshan Prasarak Sansthas Institute of Pharmacy, Akola, Maharashtra, India-444004
urmilatiwaskar425@gmail.com

Messenger RNA (mRNA) therapeutics hold great promise in treating infectious diseases and cancer immunotherapy using lipid nanoparticles (LNPs) as the most efficient delivery system. Ionizable lipids of LNPs are key to efficient delivery but are typically optimized by laborious and expensive experimental screening. To address this problem, artificial intelligence (AI) and virtual screening are used to design ionizable lipids in a rational approach by forecasting two key parameters: apparent pKa and mRNA delivery efficiency. AI-driven design has been virtually tested using approximately 20 million lipids in two iterations, creating new molecules with higher performance. In vivo testing revealed lipids from the second round were comparable to or superior to the control DLinMC3-DMA, and one of them with similar efficacy to SM-102. Concurrently, AI and bioinformatics assisted in developing more efficacious mRNA vaccines by forecasting the structures of tumor-associated neoantigens and codons that optimize expression and LNP formulation stability. These strategies provided better pharmacokinetics and pharmacodynamics and more efficient immune activation with shorter development time and at a lower expense. The combination of AI, bioinformatics, and nanotechnology leads to dramatic changes in customizing cancer immunotherapy, allowing for swift, secure, and more successful design of mRNA vaccines.

**Keywords:** Messenger RNA (mRNA) Therapeutics, Lipid Nanoparticles (LNPs), Ionizable lipids, Artificial intelligence (AI), Cancer immunotherapy.

**AI-21**

**AL-DRIVEN NANOPARTICLE DELIVERY OF BEE VENOM PEPTIDES: A NOVEL STRATEGY FOR HIV TREATMENT**

Shruti Ganesh Umak L. R. Gandhi, Urmila M. Tiwaskar
Shri Gurudatta Shikshan Prasarak Sansthas Institute of Pharmacy, Akola, Maharashtra, India-444004
shrutiumak09@gmail.com

Human Immunodeficiency Virus (HIV) continues to pose a significant worldwide health concern, since existing antiretroviral treatments are unable to eradicate viral reservoirs. Bee venom, especially its active peptide melittin, shows strong antiviral activity by disrupting HIV replication and gene expression. Nevertheless, the toxicity it poses to healthy cells restricts its application as a direct treatment. Artificial intelligence (AI) provides promising solutions to overcome these limitations. AI algorithms can modify melittin's structure to reduce toxicity while maintaining antiviral action. Deep learning tools can also design new melittin analogs and antimicrobial peptides (AMPs) with greater selectivity for HIV viral envelopes. AI enhances the design of nanoparticle-based delivery systems that transport bee venom peptides safely to cells infected by pathogens, such as HIV. By modeling key features—like nanoparticle size, shape, electrical charge, and surface modifications—AI enables researchers to develop formulations that achieve targeted delivery, controlled drug release, and minimized immune response. In addition, predictive AI models can study peptide–virus interactions, anticipate resistance, and reduce the need for trial-and-error experiments. Personalized therapy is another important application. By analyzing patient-specific data such as viral load and immune response, AI can guide dosage adjustments, select the best peptide–nanoparticle combinations, and predict treatment outcomes. This evaluation underscores the synergistic promise of bee venom-derived compounds and AI-driven advancements, presenting a new strategy to enhance HIV treatment and address the shortcomings of traditional therapies.

**Keywords:** Human Immunodeficiency Virus (HIV), Bee venom, Melittin, Artificial Intelligence (AI), Nanoparticle drug delivery.

**AI-22**

**SURVEY BASED ON PERCEPTION AND AWARENESS REGARDING ON AI IN ADVERSE DRUG REACTION AMONG THE GENERAL POPULATION**

Chandana Bs
Department of Pharmacy practice, Aditya Bangalore Institute of pharmacy education and Research, Bangalore, Karnataka, India.
chandana060bs@gmail.com

A survey exploring public perception and awareness of artificial intelligence circumstance of adverse drug reaction aims to assess who individual understand and accept. The integration of AI into Pharmacovigilance has the potential to enhance ADR detection and reporting. However, patient acceptance and understanding of AI application of AI in this domain remains unexplored. To assess patient awareness, perceptions, and concerns regarding the use of AI in ADR detection and reporting. A cross-sectional survey was administered using a structured google form and Responses from 160 participants were analyzed. The questionnaire evaluated participants' awareness of ADRs, understanding of AI applications in healthcare, and attitudes towards AI-driven pharmacovigilance. Out of 160 respondents, 65% were aware of the term "adverse drug reaction," but only 30% had heard of AI applications in healthcare. When informed about AI's role of AI in ADR detection, 70% expressed interest in its potential benefits (accuracy

ISBN: 978-81-980623-8-3

and efficiency) the study conclusion of patient demonstrated positive transparency towards AI in ADR detection This aligns with the current literature, emphasizing the importance of patient engagement and education for adopting AI technologies in healthcare.

**Keywords:** patient perception, digital health, adverse drug reaction, detection.

**AI-ASSISTED SPECTRAL INTERPRETATION OF LEAVES OF *MOMORDICA DIOICA* FOR PREDICTION OF BIOFILM INHIBITORY ACTIVITY**

Khushee Jaiswal,
(Pharmacognosy and Phytochemistry), Bombay College of Pharmacy, Mumbai
khushee.mpharm@gmail.com

Biofilm development is a significant contributor to microbial resistance and chronic infections. Natural phytoconstituents from medicinal plants are being investigated as possible biofilm inhibitors. In this study, an active phytoconstituent, *Momordica dioica* (momordicin) was examined using ChemDraw, an analytical tool for structure prediction based on spectroscopic data. The structure-activity relationship was also predicted using AI. The IR spectrum showed distinct peaks at 3390-3277 $cm^{-1}$ (O-H stretching), 1737 $cm^{-1}$ (C=O stretching), 1636 $cm^{-1}$ (C=C stretching), and 1259-1024 $cm^{-1}$ (C-O stretching), showing the presence of hydroxyl, carbonyl, aromatic, and ether functionalities. The $^{1}H$ NMR spectrum exhibited aromatic multiplets at δ 6.0-7.8, broad phenolic -OH signals at δ 9.0-10.5, and sugar-related resonances between δ 3.2-5.5, while the $^{13}C$ NMR displayed signals at δ 160-175 (C=O/C-O), δ 145-160 (aryl C-O), δ 100-130 (aromatic carbons), and δ 95-105 (anomeric carbon). These spectral patterns are compatible with flavonoids, tannins, and phenolic glycosides, all of which are known to have antibiofilm capabilities. Thus, ChemDraw-assisted spectral interpretation indicates that *M. dioica* leaves contain bioactive phytoconstituents with potential biofilm inhibitory effect, bolstering its pharmacognostic value as a source of natural antimicrobials.

**Keywords:** *Momordica dioica*, ethanolic extract, ChemDraw, IR, NMR, biofilm inhibition, pharmacognosy.

**AI-DRIVEN ANALYSIS OF GOOGLE TRENDS AND REAL-WORLD PHARMACY DATA ON DRUGS USED IN WEIGHT LOSS IN INDIA.**

Karvy Chavda, Akashkumar P. Mathuria and Sandipkumar P. Bhatt
Department of Pharmacology and Pharmacy Practice, K. B. Institute of Pharmaceutical Education and Research, Kadi Sarva Vishwavidyalaya, Gandhinagar, Gujarat, India -382023
Karvychavda@gmail.com

In India, obesity is a growing public health concern. This study employed an AI-driven Python script to analyse Google Trends data (2019–2025) and real-world pharmacy dispensing patterns. An awareness survey was also conducted among 312 obese patients. Global Google Trends showed high online interest for Ozempic (25.95 ± 18.33) and Mounjaro (9.47 ± 12.33). According to local pharmacy data revealed Metformin (82 ± 11), Orlistat (29 ± 9), and Phentermine (14 ± 5) were most dispensed. Patient awareness was highest for Metformin (64%) and Orlistat (38%), but low for newer agents: Ozempic (27%), Wegovy (12%), Mounjaro (8%). A moderate correlation ($r=0.64$, $p<0.05$) existed between search trends and dispensing data. Findings highlight a disparity between online interest and patient awareness, underscoring the need for pharmacist-led education.

**Keywords:** Google Trends, Patient survey, Healthcare analytics, Anti-obesity drugs, pharmacoepidemiology.

**AI ASSISTED EXTRACTION AND PURIFICATION OF SNAIL MUCIN**

Suyash Gupta, Ruchi Khobragade, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
suyanshgupta007@gmail.com

The pharmaceutical and cosmetic industries are rapidly evolving through technological integration. Artificial intelligence is transforming pharmaceutical manufacturing by enhancing efficiency, quality assurance, and predictive maintenance, while snail mucin has gained attention as it provides effective therapeutic and cosmetic resource with an expanding market. This study sees opportunities for innovation by integrating AI with snail mucin research and production. Traditional extraction methods are limited by inefficiency, ethical concerns, quality difference, contamination risks. AI offers solutions through real-time monitoring, predictive yield analysis, automated extraction, and welfare-friendly systems.A literature review was conducted on snail mucin's dermatological and medical applications, supported by economic market reports and evidence on AI in pharmaceutical manufacturing. Findings indicate that AI improves monitoring, defect detection, packaging, and equipment maintenance, resulting in higher productivity and safer processes. Snail mucin demonstrates antimicrobial, wound-healing, antitumor, and drug-delivery potential, alongside cosmetic benefits such as hydration, scar reduction, antiaging, and pigmentation control. Even so, challenges include ethical ways of extraction, contamination risks, difference in quality of extract due to differences in methods of extraction. The integration of AI and snail mucin production ensures sustainable, ethical, and efficient innovation, promoting advancement in pharmaceuticals and cosmetics.

**Keywords:** Snail muchin, Artificial intelligence, predictive yield analysis, real time monitoring, dermatological applications, pharmaceuticals and cosmetics advancement.

**AI-27**

**BRIDGING PCI STANDARDS AND DIGITAL HEALTH THROUGH AI CODE SYNTHESIS**

Akanksha J. Dubey, Mansi K. Patel, Tarachand Lalwani
KB Institute of Pharmaceutical Education and Research, Gandhinagar, Gujarat, India
akankshadubey889@gmail.com

The Pharmacy Council of India (PCI) prioritizes patient-centric services like medication management, counselling, monitoring, and documentation based on global best practices in clinical pharmacy. Adoption in India and similar countries is still low due to restricted awareness, poor training, poor digital integration, and absence of standard tools, resulting in variable care and inefficient utilization of pharmacist skills. AI-assisted code synthesis can be used as a new approach to speed up the development of PCI-compliant digital solutions and make them more available for training, education, and clinical use. Objective is to create a method for AI-assisted code synthesis that builds PCI-compliant digital solutions for training, education, and clinical use. An AI-assisted code synthesis framework was designed using Google Apps Script and modular web-forms like Medication Management, Patient counselling and Education, Monitoring and Follow up etc. were developed in alignment with PCI competencies .The system allowed easy generation of PCI-compliant digital forms without manual coding ,reduced development time and training requirements and enhanced accessibility and standardization of clinical pharmacy services.AI-assisted code synthesis fills the gap between regulatory requirements and computer-based practice, providing a scalable, easy-to-use, and globally applicable model for the improvement of clinical pharmacy services and education. System Development is currently

ISBN: 978-81-980623-8-3

ongoing. Final results will be presented at conference.
**Keywords:** PCI guidelines, Clinical pharmacy, AI-assisted code synthesis, Web-forms.

**AI-28**

**ARTIFICIAL INTELLIGENCE IN PHARMACEUTICAL RESEARCH AND DEVELOPMENT**

Prathamesh Patil, Deepak Mohale
Department of Pharmaceutical Quality Assurance, Sinhgad College of Pharmacy, Vadgaon (Bk), Pune, Maharashtra, India-411002
prathamesh.patil2116@gmail.com

Artificial Intelligence (AI) is transforming the pharmaceutical research and development (R&D) by speeding up drug discovery, lowering the cost, and making personalized medicine a reality. Conventional drug development is expensive and time-consuming, taking sometimes over a decade and billions of dollars. AI technologies such as machine learning, deep learning, and natural language processing solve these issues by screening large amounts of data, predicting drug-target interactions, and optimizing molecules. In initial discovery, AI accelerates target identification and virtual screening and generative models create new molecules with desired pharmacological properties. Preclinically, AI enhances ADME prediction and minimizes late-stage failure, minimizing the use of animal studies. Clinical trials are optimized by AI-aided patient recruitment, adaptive trial design, and real-time monitoring, maximizing efficiency and safety. In production, AI facilitates process optimization, predictive maintenance, and automated quality control, enabling consistency and conformity. AI also allows personalized medicine through the application of genomic and clinical data to customize treatments, optimizing efficacy and minimizing side effects. Although all these are advancements achieved, issues of data quality, regulatory uncertainty, model interpretability, and ethics remain critical. Future progress will depend on explainable AI, federated learning, and partnerships among pharma companies, technology firms, and regulators. By and large, AI possesses the transformative potential to fast-track timelines, condense costs, and accelerate therapeutic innovation, thus transforming world healthcare's future.
**Keywords:** Artificial Intelligence, Drug Discovery, Clinical Trials, virtual screening, Pharmaceutical Manufacturing.

**AI-29**

**REAL-TIME, PYTHON-BASED TRACKING APPLICATION FOR BEHAVIORAL PHENOTYPING**

Somasri Shannigrahi, Suhas Das, Shreyas Saha, Mainak Chakraborty
Department of Pharmaceutical Technology, School of Health and Medical Sciences
Adamas University, Kolkata, West Bengal, India – 700125.
somasri26@gmail.com

Rodent Path Tracking Application (RPTA) is a python-based, real-time animal tracking system that can showcase the movement of rodents in a laboratory setup without the aid of physical markers. The program is built using object tracking algorithms – OpenCV CSRT (Channel and Spatial reliability Tracker) along with PIL(Pillow) and Matplotlib that facilitates plotting and visualization of trajectories for AI based behavioral analysis. It can track live position and behavioral state of multiple rodents in an intuitive GUI using webcams, providing an open, customizable, and user- friendly tool for laboratory studies. The captured video and annotations are saved in a timestamped protected subfolder – a PNG image of the path plot, annotated MP4 video recording, and a detailed excel spreadsheet of the tracking data. We applied RPTA to various behavioral models to evaluate its accuracy in target recognition and tracking over different time periods. It was also tested by different users to ensure its adaptability, efficacy and ease of execution. RPTA high performance and reliability makes the program usable for real time applications. Although the current tracking is based on classic computer vision, the app is structured to allow easy extensions for generative AI and integrated deep learning-based tracking – DeepLabCut, YOLO, or OpenCV-DNN modules or plug in behavioral classifiers that can further automate and enhance rodent behavior phenotyping. The system provides a reliable and open-source solution for real-time laboratory applications.
**Keywords:** Tracking Application, OpenCV CSRT, PIL, Matplotlib, DeepLabCut.

**ROBOTICS FOR MINIMALLY INVASIVE SURGERY: A DESIGN AND CONTROL APPROACH IN NEUROSURGERY**

Gunji Naga yashwanth
Department of pharmacy practice, Ratnam Institute of Pharmacy, Nellore, Andhra Pradesh - 524346
gunjinagayashwanth714@gmail.com

This presents NAOTRAC, an autonomous surgical navigation robot integrating artificial intelligence, machine vision, and robotic assistance, designed to improve neurosurgical accuracy, safety, and operational efficiency. Neurosurgical procedures demand high precision and efficiency, with navigation accuracy and workflow optimization being critical for patient outcomes. Traditional navigation systems often involve complex, time-consuming registration processes and reliance on radiographic markers. NAOTRAC employs Surface Mapping Auto-registration Technology (SMART) for fast, non-contact, frameless patient registration. Its robotic arm recognizes surgical instruments and follows pre-planned, 3D vision-based trajectories, merging preoperative imaging with real-time data to guide instrument placement. Clinical validation studies assessed registration time, navigational accuracy, and safety across various procedures, including brain tumor biopsy, deep brain stimulation, and external ventricular drainage. Average patient registration time was approximately 71 seconds with a mean spatial accuracy of 0.28 mm. NAOTRAC demonstrated safe, precise support for stereotactic biopsies, DBS electrode placement, and catheter navigation, reducing manual workflow and operative time. Regulatory approvals (FDA, CE, TFDA) have confirmed clinical readiness and safety standards. NAOTRAC offers a robust technological advance in neurosurgical navigation, elevating accuracy, streamlining workflow, and supporting a broad range of minimally invasive procedures. Its rapid registration, autonomous navigation, and high safety profile establish NAOTRAC as a valuable innovation for neurosurgical practice worldwide.

**DETECTION OF GLAUCOMA USING FUNDUS IMAGES BY DEEP LEARNING.**

Vallapalli manasa, M.Sowjanya , Y.prapurnachandra.
Department of clinical pharmacy, Ratnam institute of pharmacy, pidathapolour,Nellore, Andhra pradesh, India,524346.
vallapallimanasa@gmail.com

Glaucoma is a progressive optic neuropathy and a major contributor to irreversible blindness worldwide. Because visual damage caused by glaucoma cannot be reversed, timely detection and intervention are essential to preserve vision. Traditional diagnostic practices often rely on clinical judgment and manual analysis of fundus or OCT images, which may be time-consuming and prone to variability. This study presents a computer-aided system that applies deep learning techniques to retinal fundus images for automated identification of glaucoma. The dataset used consisted of 5,000 retinal images, evenly divided between normal and glaucoma-positive cases. The MobileNet architecture was implemented due to its lightweight design and strong performance in image classification tasks. On the initial validation, the model achieved 97.25% accuracy, 99.52% area under the curve (AUC), 96.88% precision, and 97.64% recall. A second evaluation further supported its robustness, with results of 91.67% accuracy, 96.56% AUC, 88.93% precision, and 95.19% recall. These outcomes emphasize the model's ability to reliably distinguish between healthy and glaucomatous eyes. In summary, the proposed MobileNet-based framework demonstrates considerable potential as a clinical decision-support tool. By integrating such systems into ophthalmic practice, clinicians may benefit from more consistent and rapid assessments, enabling earlier treatment decisions. Ultimately, this approach could help reduce the global burden of preventable blindness linked to glaucoma.
**Keywords:** Glaucoma detection, Fundus imaging, MobileNet, Deep learning, AI-assisted screening.

**AI'S ROLE IN OPTIMIZING PHARMACOGENOMICS**

Bindu Sri. Ch, T. Srinavas M. Pavani

ISBN: 978-81-980623-8-3

SIMS College of Pharmacy, Mangaldas Nagar, Guntur, Andhra Pradesh, India

Pharmacogenomics, the science of discovering how genetic variation affects drug reactions among various individuals, stands at the center of the vision of individualized medicine. It can potentially maximize treatments, reduce drug side effects, and maximize overall treatment responses. However, with swift advances in genomic sequencing and pharmacogenomic guideline availability, translation of this information into routine clinical practice remains limited. Major hurdles include the interpretability challenge, multi-layered genomic and clinical data complexity, and regulatory barriers to adoption. The paper proposes an **AI-based pharmacogenomic decision engine** that is intended to bridge this gap by transforming raw genomic and clinical data into useful clinical insights. The engine assists clinicians in making drug selection and dosing approaches specific to the individual genetic profile of each patient through the application of complex techniques of machine learning, predictive modeling, and electronic health record-integrated genomic sequencing data. Importantly, the model is constructed with interpretability and evidence-based decision-making, thus providing AI recommendations that are as transparent as possible and clinically credible. We describe the methodological underpinnings of this paradigm, including data pipelines, model architectures, and validation strategies. Clinical case studies from actual use cases demonstrate its potential to reduce the frequency of adverse events while raising therapeutic selectivity in therapeutic categories such as oncology, psychiatry, and cardiology. We discuss the key challenges—anything from data privacy to regulatory approval—and present a guide for clinical translation. By harnessing the capability of pharmacogenomics combined with artificial intelligence, this decision engine is a significant step towards converting personalized medicine into an attainable reality of everyday healthcare.

**Keywords**: Pharmacogenomics, personalized medicine, artificial intelligence, decision engine, predictive modeling, clinical translation, drug response, adverse drug reactions, genomic sequencing, precision medicine.

## ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING IN DRUG DISCOVERY: TRANSFORMING MODERN PHARMACOTHERAPY

Ramavath Bindu Bai, Peddineni Mounika
MAM College of Pharmacy, Kesanupalle, Narasaraopet, Andhra Pradesh, India – 522601
bindubairamavath@gmail.com

Introduction: Drug discovery is traditionally a time-consuming and costly process, often spanning over a decade with high rates of failure. Artificial Intelligence (AI) and Machine Learning (ML) have emerged as transformative tools in pharmaceutical research by enabling rapid prediction of drug-target interactions, molecular properties, and clinical outcomes. Their integration significantly reduces development timelines and enhances precision in identifying novel therapeutic candidates. The primary objective of this study is to explore the applications of AI and ML in drug discovery, emphasizing their role in accelerating target identification, optimizing lead compounds, predicting toxicity, and improving clinical trial efficiency. Additionally, this study aims to highlight the potential of AI-driven platforms in reducing costs and improving success rates in drug development. A systematic review of published literature, databases, and case studies was conducted to evaluate the impact of AI and ML in drug discovery. Tools such as deep learning, natural language processing, and reinforcement learning were analyzed in relation to their effectiveness in molecular modeling, high-throughput screening, and repurposing of existing drugs. Findings demonstrate that AI-based models significantly improve predictive accuracy in molecular docking, reduce attrition rates in clinical trials, and aid in the discovery of new therapeutic entities. Notably, AI has shown remarkable success in repurposing drugs for rare diseases and pandemic preparedness, such as COVID-19. AI and ML are pivotal in reshaping drug discovery by enhancing efficiency, reducing costs, and providing person therapeutic solutions. Their integration is expected to revoiutionize futuru pharmaceutical research and development

## AI-DRIVEN DIGITAL TWIN FOR PERSONALIZED STEM CELL THERAPY: A COMPREHENSIVE FRAMEWORK FOR REGENERATIVE MEDICINE

K. Avinash Goud, T. Srinivas
SIMS COLLEGE OF PHARMACY, Department of Pharmaceutics
B.Pharmacy

Stem cell therapy is a game-changer in the future of medicine with wide-ranging possibilities to heal, regrow, and reconstruct damaged tissues and organs. From cardiovascular conditions to neurodegenerative diseases, its healing potential is endless. However, translational science is hampered by the fact that the nature of challenges that arise as a combination of response variability in the patient population, unpredictable patterns of differentiation, risk of immune rejection, and even tumorigenesis. These are uncertainties that require new approaches that bridge biology and computational science. This article introduces the concept of an **AI-driven digital twin**—an active, patient-individual computational model designed to replicate and predict stem cell therapy responses before actual use in the clinic. Through the integration of multi-omics data, sophisticated computational biology models, and machine learning models, the digital twin platform provides a digital laboratory for optimizing therapy. Pharmacogenomic analysis further enhances its predictability, allowing clinicians to predict drug–gene interactions and tailor interventions to individual patients. We establish the methodological foundations of this approach, including data integration pipelines, simulation platforms, and predictive modeling techniques. Future use spans preclinical safety analysis to personalized therapy design and extended monitoring of treatment trajectories. While potential is enormous, challenges exist as well, e.g., data standardization, model certification, ethics considerations, and regulatory frameworks.Lastly, the convergence of stem cell biology with artificial intelligence presents a blueprint towards safer, more precise, and patient-specific regenerative medicine. The digital twin concept, although still in its nascent stages, has the potential to change the nature of how we design, evaluate, and deliver stem cell therapies in the future.

**Keywords:** Stem cell therapy, regenerative medicine, digital twin, artificial intelligence, computational biology, pharmacogenomics, personalized medicine, predictive modelling, multi-omics, machine learning.

## FROM TRANSPARENCY TO ACCOUNTABILITY BY OVERCOMING THE SHADOWS OF GENERATIVE AI: ENSURING FAIRNESS, PRIVACY, AND TRANSPARENCY IN HEALTHCARE APPLICATIONS

Chetana lalasa Singamsetty, Sowjanya
Department of Artificial Intelligence and data analytics, Ratnam Institute Of Pharmacy, Nellore, Andhra Pradesh - 524346
chetanalalasasingamsetty@gmail.com

Generative Artificial Intelligence (GenAI) in healthcare has a significant potential, clinical decision making, increased diagnostic tools and personalized patient care. Although, this progression in GenAI introduced many complex problems in case of ethical, privacy, algorithmic bias and limited explainability that which mitigated the trust and equity in healthcare. This study mainly focuses on the risks of using GenAI in healthcare and suggests some possible ways to overcome them. The research involved in interview the healthcare practitioners, literature review, tools like IBM AI Fairness 360, and SHAP. PRISMA Guidelines were used for screening and peer-reviewing of articles of MEDLINE, Embase, PsycINFO, Philosopher's Index, JMAI. These all involved in analysis of ethical, privacy, bias, and explainability risks. The research showed that the GenAI in healthcare can sometimes gives biased results that mainly affecting age, gender, minority groups and bias audits showed that disparities of 11-15%, which is reduced to below 4% by using fairness algorithms and explainability tools like SHAP. Healthcare practitioners wanted GenAI to be safe, transparent, ethical and supported by strong rules like EU AI Act that ensures safe and fair use. GenAI involves in great improvement in healthcare through better decision making and personalised treatment but it also shows risks likes bias, privacy and transparency issues. The fairness tools, explainable AI methods, strong ethical rules with continuous monitoring and physician involvement helps for safe, fair, transparency and trustworthy in

**AI –DRIVEN PREDICTIVE TOXICOLOGY: TOWARDS SAFER AND MORE EFFICIENT DRUG DEVELOPMENT**

Devika Aratakatla
Department of Pharmaceutical Technology, Vignan Institute of Pharmaceutical Technology, Visakhapatnam, Andhra Pradesh-530046, India.
devika.aratakatla@gmail.com

Drug development is challenged by increasing cost burdens and declining approval rates, and significant attrition, with toxicity being primary reason for clinical trail failure and post-marketing termination. Conventional in vitro and in vivo toxicity assessments are expensive, extended timelines, ethically challenging and thus prompt interest in Machine-learning approaches for predictive toxicology. Such approaches like decision tree, naïve Bayes, support vector machines, and neutral networks are applied and deliver notable results across endpoints as in hepatotoxicity, mutagenicity, and carcinogenicity. Deep learning (DL) models provide further benefits by via default features from diverse datasets such as chemical structures, toxicogenomics, molecular descriptors, and large-scale bioactivity data. New approaches like TargeTox, which integrate drug target identity, functional impact scores, and biological network information, highlight the ability of AI to recognize idiosyncratic toxicity and strengthen reliable drug design. Restricted range and quality of accessible datasets, hinders in model legibility and lack of regulatory acceptance limit extensive use and managing the large-scale biodata impose computational difficulties – could remain as challenges. Aligning ML and DL with conventional methods can deliver enhanced predictive frameworks, and allow uses like drug-drug interactions prediction and uncommon subset toxicity assessment. These approaches decrease dependence on animal testing, increase patient safety, cut costs, and exhibit capacity to revolutionize predictive toxicology.

**Keywords:** Drug development, Machine learning (ML), Deep learning (DL), Predictive toxicology.

**AI-37**

**FROM GENOMICS TO CLINICAL DECISIONS: AI-DRIVEN ADVANCES IN PRECISION MEDICINE**

Kilani Sarwa Mangala
Department Pharmaceutical Chemistry Of Vignan Institute Of Pharmaceutical Technology, Visakhapatnam, Andhra Pradesh, India – 530049.
ksarwamangal@gmail.com

Bioinformatics and artificial intelligence (AI) have emerged as transformative technologies in drug development, addressing many shortcomings of traditional methods. With rapid technological progress, the integration of AI, machine learning (ML), and bioinformatics now enables advanced protein screening and analysis across diverse “omics” fields such as genomics, transcriptomics, proteomics, metabolomics, and epigenomics. These integrative models allow prediction of disease risk, pathogenicity, and individual drug responses, while also supporting drug repurposing through sensitivity analysis using multi-omic data. Such approaches are creating new opportunities for precision medicine and guiding informed clinical decision-making. Precision medicine leverages a patient’s molecular profile, clinical history, and diagnostic information to design personalized treatment strategies. AI and bioinformatics further enhance individualized care by analyzing phenotypes, family history, and medication adherence. Radiogenomics provides an additional layer, predicting mutations at the cellular level to refine diagnosis and therapy. Machine learning algorithms play a critical role in predicting disease risk, monitoring progression, and tailoring therapeutic options. Combined with deep learning, these technologies can rival expert human diagnostic abilities, particularly in medical imaging. Together, they accelerate drug discovery, development, and repurposing while improving patient outcomes. The convergence of AI, ML, natural language processing, and bioinformatics marks a new era in precision medicine—delivering the “right treatment, at the right time, to the right patient.”

**Keywords:** Precision Medicine, Artificial Intelligence, Bioinformatics, Multi-omics, Drug Development.

**HARNESSING AI AND TECHNOLOGY TO INNOVATE DIABETES CARE: FROM PREDICTION TO PERSONALIZED MEDICINE**

Susmita Mandal, Sandip Sonwane
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education and Research (Deemed to be University), Sawangi (Meghe), Wardha, Maharashtra,
India- 442001.
susmita23mandal@gmail.com

Diabetes mellitus is a global health burden, affecting over 530 million people worldwide. Conventional diagnostic and therapeutic strategies often fail to predict disease onset, progression, and complications. AI and advanced technologies are emerging as transformative tools to address these gaps. We conceptualized an AI-driven framework for diabetes research and management by integrating multi-omics datasets, electronic health records, continuous glucose monitoring data, and pharmacological databases. Machine learning models (Random Forest, SVM, Deep Neural Networks) were employed for early prediction of diabetes risk, drug response profiling, and complication forecasting. Validation was considered through clinical datasets and animal models such as zebrafish for translational insights. Preliminary AI models achieved predictive accuracies of 85-92% in identifying high-risk diabetic patients. Integration of omics and pharmacogenomic data improved drug response predictions, particularly for metformin and insulin analogs. AI-enabled retinal imaging demonstrated high sensitivity for detecting diabetic retinopathy. Case studies showed how AI could uncover novel therapeutic targets (e.g., GLP-1 receptor pathways) and support repurposing of existing drugs. AI and technology have the potential to revolutionize diabetes research and management by enabling early detection, personalized therapy, and innovative drug development strategies. This aligns with the conference theme *“Educate, Innovate, Empower”* by educating researchers through data-driven insights, innovating predictive and therapeutic approaches, and empowering clinicians and patients with precision healthcare tools.

**APPLICATION OF ARTIFICIAL INTELLIGENCE IN COMPLETE MANAGEMENT OF DRUG COMPLICATIONS AND ADRS TAILORED TO PATIENT CONDITION**

D.Sushma Sai Krishna Sree, A. Giridhar, K. Sumanth Kumar
Department of pharmacology, Ratnam Institute of Pharmacy, Nellore, Andhra Pradesh, India–524004
dssks042002@gmail.com

Drug safety remains a cornerstone of healthcare, yet adverse drug reactions (ADRs) continue to contribute significantly to patient harm and healthcare costs. Traditional pharmacovigilance systems, which depend on spontaneous reporting and manual review, are often limited by underreporting, delayed signal detection, and insufficient attention to patient-specific differences. The integration of Artificial Intelligence (AI) offers a promising shift toward more efficient, precise, and personalized management of ADRs.AI techniques such as machine learning, deep learning, and natural language processing can evaluate extensive datasets, including electronic health records, pharmacovigilance databases, clinical notes, and patient-generated reports. These methods reveal associations and patterns that conventional approaches may miss, enabling earlier identification of safety concerns. At the same time, digital tools—mobile applications, wearable devices, and AI-powered chatbots—facilitate real-time symptom reporting and monitoring, allowing patients to play an active role in drug safety. This continuous flow of information helps bridge the gap between patients and healthcare professionals. The patient-centered application of AI extends beyond detection, supporting predictive modeling to identify individuals at higher risk for ADRs. Such insights enable targeted interventions, personalized monitoring, and improved communication, thereby strengthening shared decision-making. While obstacles remain, including issues of data quality, algorithm transparency, and regulatory

ISBN: 978-81-980623-8-3

acceptance, these challenges can be addressed through interdisciplinary collaboration. In summary, the incorporation of AI into pharmacovigilance represents a transition from passive surveillance to proactive, patient-specific ADR management. This paradigm not only enhances drug safety but also promotes a more responsive and inclusive healthcare system.

**Keywords:** Artificial Intelligence, Pharmacovigilance, Adverse Drug Reactions, Patient-Centered Care, Decision making Predictive Modeling, Drug Safety.

**ARTIFICIAL INTELLIGENCE IN HERBAL DRUG DISCOVERY: BRIDGING TRADITION WITH TECHNOLOGY**

Aryan Upadhyay
Danteswari College of Pharmacy, Borpadar, Jagdalpur, Bastar, Chhattisgarh, India-494001
upadhyayaryan1404@gmail.com

Herbal medicines have played a vital role in healthcare for centuries, particularly in India through Ayurveda and traditional medical practices, but the discovery of novel bioactive compounds from plants remains a slow, costly, and labor-intensive process. Artificial Intelligence (AI) offers a revolutionary approach by integrating computational tools with traditional knowledge to accelerate herbal drug discovery. AI techniques such as machine learning, molecular docking, and predictive modeling can efficiently identify active phytochemicals, forecast pharmacological activities, predict toxicity, and evaluate drug-likeness properties, thereby reducing both time and cost compared to conventional experimental methods. Case studies demonstrate this potential; for instance, AI models have predicted the anticancer activity of curcumin from turmeric, the anti-inflammatory properties of withanolides from ashwagandha, and the antimicrobial action of azadirachtin from neem. These examples highlight how AI can transform herbal research into a systematic, data-driven process that bridges tradition with innovation. While promising, challenges such as the scarcity of curated herbal databases, lack of global standardization, and the need for advanced computational infrastructure remain significant barriers to large-scale adoption. Nevertheless, the synergy of AI and herbal drug discovery paves the way for sustainable, affordable, and globally acceptable therapeutics, offering opportunities for personalized medicine and enhanced recognition of traditional systems of healthcare.

**"SMART SAFETY: INTEGRATING AI WITH THE MATERIOVIGILANCE SIGNALING TOOL FOR ENHANCED MEDICAL DEVICE MONITORING"**

Pallavi P, Dilip C
Department of Pharmacy Practice, Al Shifa College of Pharmacy, Perinthalmanna, Malappuram, Kerala, India-679325
pallavipalasseri95@gmail.com

The increasing use of medical devices raised concerns regarding their safety and the potential for adverse events. This study aimed to develop and validate a Materiovigilance Signaling Tool, enhanced by an integrated AI-driven Dashboard, to improve the monitoring and analysis of disposable invasive medical device-related issues in the future. A pilot study involving 30% of the target population (N=100) assessed the feasibility of the tool. Content validity was evaluated by a panel of 12 experts, leading to modifications that resulted in a final tool of 11 items scored on a five-point Likert scale. An AI-driven Dashboard will be developed to visualize data trends, automate scoring, and facilitate real-time analysis. The final application of the tool showed that 100% of cases related to IV cannulas were categorized as PROBABLE, while 14 out of 23 cases of Foley catheters were deemed as PROBABLE and remaining POSSIBLE. The tool demonstrated strong content validity (Aiken's V = 0.85) and reliability (Cronbach's alpha ranging from 0.68 to 0.77). Thus, it can be concluded that the Materiovigilance Signaling Tool, complemented by an AI-driven Dashboard, will be a validated instrument that effectively identifies adverse events associated with medical devices and will significantly enhance patient safety and overall quality of healthcare delivery.

**Keywords:** Materiovigilance, Adverse events, Signaling tool, AI.

**AI DRUG DISCOVERY AND DEVELOPMENT: ACCELERATING INNOVATION TOWARDS PRECISION MEDICINE**

Tejasvini Thave, Amol Tatode, Rashmi Trivedi, Milind Umekar
Department of Pharmaceutical Quality Assurance, Smt. Kishoritai Bhoyar College of Pharmacy, Nagpur, Maharashtra, India – 441002
tejasvinithave07@gmail.com

Artificial intelligence (AI) have emerged as a central force for change in drug discovery and development, changing a historically lengthy process, into a faster, more efficient, and less risky process. AI applications encompass the drug process fully - mining genomic data to identify disease targets, machine-learning design of new drug molecules, predicting some of the properties of compounds such as efficacy and side effects before human selection. In-silico trials, driven by artificial intelligence, can quickly simulate the interactions of drug candidates, and the biological responses of interacting compounds at the molecular level (and the patient level), allowing rapid virtual screening of compounds and developing personalized treatment predictions without clinical studies. Quantum computing and multimodal AI models will enhance accuracy of protein folding simulations and drug-target predictions enabling us to better understand complex disease mechanisms. The emergence of cellular thermal shift assays (CETSA) has reinforced the validation of drug-target interactions by providing rapid and quantitative evidence of engagement in live cells and tissues. These are transforming the field of precision medicine through curative-directed therapies for diseases involving cancers, genetic disorders, and immune pathologies, moving the field towards addressing the root cause instead of just the symptom. Ultimately, AI-driven drug discovery in 2025 will lead in a new era of smarter, faster and more individualized medicine, potentially revolutionizing pharmaceutical R&D and patient treatment experiences across the globe.

**Keywords:** Artificial intelligence (AI), Drug discovery, Drug development, In-silico trials, Drug-target prediction, Quantum computing, Multimodal AI, Cellular Thermal Shift Assay (CETSA).

**AI-43**

**AI-DRIVEN LIPOSOMAL MAGNETIC NANOPARTICLES: A MAJOR DEVELOPMENT TOWARDS SMARTER CANCER TREATMENT**

Divyani Ghawat, Swati Lade, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India-441002
ghawatdivyani@gmail.com

Cancer is a genetic disorder that results from genetic or epigenetic alterations in the somatic cells and has abnormal cell growth, which may be spread to other body parts. There are various types of cancers that affect humans. The impact of cancer is increasing significantly day by day. There are different types of magnetic nanotechnology used in cancer treatments such as Superparamagnetic iron oxide (SPIONs), Superparamagnetic magnetite ($FeO_4$), Maghemite ($\gamma$-$FeO_3$) nanoparticles, Ferrite, FePt (iron- platinum), Gold coated, Silica coated are used in advanced imaging modalities and are widely used as targeted medication carriers. One fascinating strategy for smarter cancer treatment is the combination of magnetic liposomal nanoparticles and artificial intelligence. These multifunctional nanotechnologies facilitate precise tumor targeting even in the presence of external magnetic fields by combining the responsive magnetic characteristics of iron oxide nanoparticles with the biodegradability and targeted drug delivery ability of liposomes. AI-driven algorithms improve targeting specificity, control release kinetics, and enhance drug loading by increasing lipid and other nanoparticle characteristics, such as lipid composition, particle size, and surface functionality. Additionally, the magnetic responsiveness provides controlled hyperthermia treatment and improved imaging-guided therapy, preventing damage to healthy tissues. AI models provide real-time prediction of nanoparticle behaviour in vivo, reducing experimental trial-and-error and improving clinical development. By using liposomal magnetic nanoparticles with AI's predictive ability, this novel platform opens the door to highly successful, adaptable, and patient-specific cancer treatments.

**Keywords:** Liposomes, magnetic nanoparticle, AI technology, smarter cancer treatment.

ISBN: 978-81-980623-8-3

**AI-BASED SPECTRAL BARCODING FOR HERBAL AUTHENTICATION AND ADULTERATION DETECTION**

Pallavolu Sravya, K. Sumanth Kumar, Y. Prapurna Chandra
Department of Pharmacognosy, Ratnam Institute of Pharmacy, Nellore, Andhra Pradesh, India – 524004
sravyapallavolu@gmail.com

The authenticity and quality of medicinal herbs are essential for their therapeutic effectiveness, regulatory compliance, and consumer safety. However, standard authentication methods such as morphological inspection, microscopy, and chromatographic analysis are often time-consuming, destructive, and prone to variability. To overcome these limitations, this study introduces an AI-based spectral barcoding framework for reliable herbal authentication and adulteration detection. Spectral profiles of selected botanicals were collected using Fourier-transform infrared (FTIR), near-infrared (NIR), Raman spectroscopy, and hyperspectral imaging (HSI). Data pre-processing techniques including Savitzky–Golay smoothing, standard normal variate (SNV), and derivative transformations were applied to enhance signal quality and reduce background noise. Machine learning algorithms—support vector machines (SVM), random forest (RF), extreme gradient boosting (XG Boost), least-squares SVM (LS-SVM), and convolutional neural networks (CNNs) were applied to classify authentic and adulterated samples and to generate unique spectral barcodes. Among them, CNNs achieved the highest classification accuracy (>98%), while regression models such as LS-SVM and CNN effectively quantified adulteration levels ($R^2 > 0.98$). The framework demonstrated high reproducibility, robustness against subtle spectral differences, and rapid analysis (<2 minutes per sample). Importantly, the proposed approach is scalable and suitable for industrial quality control, supply chain monitoring, and field-level testing. Portable spectroscopy devices integrated with embedded AI models could further enable efficient real-time screening of herbal materials at farms, markets, and processing facilities. Overall, AI-driven spectral barcoding provides a robust and scalable framework for ensuring herbal authenticity, minimizing fraudulent practices, strengthening regulatory monitoring, and improving global consumer safety and long-term trust in botanical medicines.

**Keywords:** Artificial Intelligence, Spectral Barcoding, Herbal Authentication, Adulteration Detection, Machine Learning.

**AI ETHICS AND REGULATORY CHALLENGES IN THE PHARMACEUTICAL INDUSTRY**

Ramana. R
Department Of Pharmaceutics, Aditya Banglore Institute Of Pharmacy Education & Research, Yelahanka, Kogilu-560064, Karnataka, India.
ramana98865@gmail.com

Artificial Intelligence (AI) is transforming pharmaceutical research and healthcare delivery by enabling accelerated drug discovery, optimized clinical trials, and personalized treatments. However, the integration of AI raises significant ethical dilemmas and regulatory challenges that must be addressed to ensure safe, fair, and responsible applications. Key ethical concerns include data privacy, algorithmic bias, transparency, accountability, and informed consent. Regulatory frameworks are evolving to address these issues while balancing innovation with patient safety and data security. This article reviews the main ethical and regulatory challenges in pharma AI, current approaches to governance, and proposes pathways for responsible AI integration.The pharmaceutical industry is increasingly leveraging AI technologies to analyze large biomedical data, streamline drug development, and optimize patient care. Despite its immense potential to improve therapeutic outcomes, AI introduces complex ethical and compliance issues. The ethical principles of autonomy, nonmaleficence, beneficence, and justice must guide AI use to avoid harm and ensure equitable treatment. At the same time, regulatory agencies like the FDA and EMA strive to develop guidelines and frameworks appropriate for adaptive AI systems. ethical challenges: data privacy and security**:** AI requires access to extensive patient data, raising concerns about confidentiality breaches and misuse. Strict protocols and patient consent mechanisms are necessary to protect sensitive information. Algorithmic Bias and Fairness: AI models trained on unrepresentative data can perpetuate biases, leading to unfair treatment and disparities in drug development outcomes and patient therapies. Continuous bias detection and mitigation are crucial. Transparency and Explainability**:** Many AI algorithms operate as "black boxes," making decision explanations difficult. Explainability is essential for trust, clinical adoption, and regulatory approval. Accountability: Defining liability for AI errors or adverse outcomes remains a challenge, necessitating clear accountability frameworks in clinical settings.

**AI IN CLINICAL DECISION SUPPORT SYSTEM**

Atharva Shende, Anil Pethe
Datta Meghe Institute of Higher Education and Research, Sawangi (Meghe), Wardha.
atharvashende1003@gmail.com

Modern healthcare is changing as a result of the incorporation of Artificial Intelligence (AI) into Clinical Decision Support Systems (CDSS), especially in the domains of risk assessment and preventative care. Large volumes of patient data can be analysed using AI-powered CDSS to find those who are at high risk for chronic illnesses including diabetes, heart disease, and cancer. These systems can reveal hidden trends in genetic data, lifestyle data, and electronic health records (EHRs) by utilizing machine learning algorithms. This enables early intervention techniques. By predicting the course of diseases and suggesting individualized preventative strategies, predictive analytics helps physicians make well-informed judgments. AI also improves the speed and accuracy of diagnostic processes, which lessens the workload for medical staff and improves patient outcomes. By supporting ongoing risk monitoring and informing physicians of early warning indicators, the integration of AI tools in primary care settings helps to move the emphasis from reactive to proactive healthcare. AI has the ability to improve public health and streamline clinical operations, despite obstacles including data privacy issues and the requirement for regulatory frameworks. With healthcare systems throughout the world shifting to value-based care, AI-powered CDSS is leading the way in facilitating population health management and precision medicine.

**ROLE OF AI IN EARLY CANCER DETECTION USING IMAGING TECHNIQUES**

Gaurav Raghuwanshi, Anil Pethe
Datta Meghe Institute of Higher Education and Research, Sawangi

ISBN: 978-81-980623-8-3

(Meghe), Wardha.
gauravraghuwanshi0712@gmail.com

By enabling quicker, more precise, and early cancer detection through sophisticated image processing, artificial intelligence (AI) is revolutionizing medical imaging and radiology. Artificial intelligence (AI) algorithms, especially those built on convolutional neural networks (CNNs) and deep learning, are trained to identify minute patterns in imaging data that might be invisible to the human eye. AI is essential in detecting early indications of cancer, including microscopic lesions, tissue anomalies, and aberrant growth patterns, in modalities like MRI, CT, mammography, PET, and ultrasound. For cancer patients, early identification greatly enhances prognosis and increases therapy options. Computer-aided detection (CAD) systems powered by artificial intelligence (AI) can automatically evaluate vast amounts of imaging data, rank high-risk cases, and help radiologists diagnose patients more quickly and reliably. In addition to lowering interobserver variability and human error, these solutions significantly lessen the increasing burden in radiology departments. Notable achievements include the early identification of liver lesions in MRIs, breast cancer in mammograms, and lung nodules in CT images. AI also makes it easier to perform radiomics, which is the process of extracting quantitative information from pictures to help tumor classification, risk stratification, and individualized treatment planning. AI has enormous potential to improve early cancer detection, notwithstanding obstacles with regard to data consistency, regulatory approval, and model interpretability. For implementation to be safe and successful, data scientists, clinicians, and regulatory agencies must work together and conduct ongoing research.

**DIGITAL PATHOLOGY WITH AI FOR CANCER GRADING**

Harpritkaur Bagga, Anil Pethe
Datta Meghe Institute of Higher Education and Research, Sawangi (Meghe), Wardha.
harpritbagga75@gmail.com

By improving diagnostic precision, effectiveness, and repeatability, artificial intelligence (AI) is transforming pathology, especially histopathology. The basis for AI integration is provided by digital pathology, which entails the digitalization of histology slides. Artificial intelligence (AI) systems can now help pathologists analyze whole-slide images (WSIs) with high precision by utilizing sophisticated machine learning and deep learning methods. AI-driven technologies in cancer diagnostics are especially useful for tumor grading, which is a crucial stage in establishing prognosis and directing treatment plans. Compared to human observers alone, these technologies are more reliable at quantifying histological aspects that are crucial for tumor grading, such as nuclear atypia, mitotic figures, gland development, and tissue architecture. By pre-screening slides, emphasizing areas of interest, and offering quantitative evaluations that aid in clinical decision-making, AI improves workflow efficiency. Additionally, AI helps standardize grading standards across institutions and lowers interobserver variability. According to recent research, AI models can grade malignancies like colon, breast, and prostate cancer just as well as or better than skilled pathologists. The use of AI in digital pathology signifies a revolutionary move toward precision medicine, notwithstanding issues with data privacy, algorithm interpretability, and regulatory approval. In order to characterize cancer holistically, future advancements will probably concentrate on multimodal integration, integrating histology with genetic and clinical data.

**Keywords:** Artificial Intelligence, Digital Pathology, Machine Learning, Precision Medicine.

**NEURAL INTELLIGENCE SYSTEM: LEVERAGING AI FOR INTEGRATIVE ENHANCED ALZHEIMER'S DISEASE DIAGNOSIS AND THERAPEUTIC OPTIMIZATION.**

Shrawni Bhagat, Nusrat B Sayyad, Lokesh Gandhi
Shri Gurudata Shikshan Prasarak Sansthans, Institute Of Pharmacy, Akola, Maharashtra, India – 444004
shrawni623@gmail.com

Alzheimer's Disease (AD) presents a significant challenge in neurogenerative research and clinical practice due to its intricate etiology and escalating nature. Artificial Intelligence (AI) has the potential to revolutionize patient care for dementia patients by using AI for diagnosis, treatment, and prognostic modelling of AD. Alzheimer's Disease (AD), the most prevalent neurodegenerative illness, is characterized by brain accumulation of specific pathological proteins, accompanied by cognitive impairment. Improvement in the assessment of medication response is done by using AI algorithms to analyse patients' clinical and neuroimaging data. New advanced methods, such as digital phenotyping, offer prospective screening. Similarly, multimodal integration of neuroimaging, cognitive testing and fluid-based biomarker variables had a significant impact on classification capability, meeting a specific benchmark of 97% accuracy. Utilizing AI-based techniques for the initiation of personalized Alzheimer's Disease therapies that aim to improve the daily life of both patients and their caregivers. There are challenges related to data standardization, ethical governance, and clinical adoption, demanding integrative research with the ultimate goal of unlocking AI's full potential to enable beneficial and precise detection for Alzheimer's Disease. Time ahead emphasizes transparent, explainable algorithms for real-world performance, framing AI as a catalyst for precision-based Alzheimer's detection strategies.

**Keywords:** Alzheimer's Disease (AD), neuroimaging, artificial intelligence (AI), multimodal biomarkers, digital phenotyping.

**DEEP LEARNING APPROACHES FOR EARLY AND RELIABLE SKIN CANCER DETECTION**

Safiya Khan, Anilkumar Vadaga, V.D Sundar, M.D Dhanaraj
Department Of Pharmaceutics, School Of Pharmacy, Godavari Global University, Rajahmendharavam, East Godavari, Andhra Pradesh

The increasing global incidence of melanoma and other skin malignancies highlights the need for accurate, efficient, and accessible diagnostic systems. This study presents Dermalytics, a deep learning–based framework designed to enhance automated skin cancer detection and classification using convolutional neural networks (CNNs) The system employs advanced architectures including Xception, DenseNet201, DenseNet169, ResNet50, VGG16, and InceptionV3, trained on a curated dataset from the International Skin Imaging Collaboration (ISIC) Archive. To improve robustness, extensive preprocessing and data augmentation techniques were applied. Dermalytics was deployed through a Flask framework integrated with SQLite/MySQL, enabling seamless interaction, user accessibility, and real-time diagnostic support. Results showed that CNN models achieved high accuracy in distinguishing benign from malignant lesions, with DenseNet169 and ResNet50 providing robust and reliable outcomes. Furthermore, architectures such as Xception, DenseNet201, and InceptionV3 demonstrated strong potential in feature extraction, supporting progress toward achieving an overall classification accuracy of 95% or higher Dermalytics illustrates the efficiency of CNNs combined with transfer learning and balanced datasets for automated skin cancer diagnosis. The framework offers a non-invasive, scalable, and clinically relevant tool to aid dermatologists in early detection. Future enhancements, including advanced parameter tuning, federated learning for data privacy, and will further strengthen its applicability across diverse healthcare settings.

**Keywords:** Deep learning, Convolutional neural networks (CNNs), Skin cancer detection, Melanoma classification, Artificial intelligence in dermatology.

**AI-52**

**INTEGRATION OF AI TOOLS FOR PERSONALIZED MEDICATION ADHERENCE IN CHRONIC DISEASE MANAGEMENT**

Guru Prasad M, Mekkanti Manasa Rekha, Shobha Rani R.H
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India – 560064
ksarwamangal@gmail.com

The non-adherence to medications is a significant obstacle to chronic disease management that leads to poor outcomes and increased costs. Personalized interventions through the use of Artificial Intelligence will help to enhance adherence by analyzing the behavior of patients, clinical

ISBN: 978-81-980623-8-3

data, and lifestyle patterns. To compare the efficacy of an AI-based individualized medication adherence intervention with patients with chronic conditions such as diabetes, hypertension, and tuberculosis in the real-life clinical environment. A prospective interventional trial of 250 chronic disease patients in North Bangalore primary health centers compared an AI-assisted mobile application that provides personalized notifications, adherence, and proactive notifications. At baseline and 12 weeks, the Morisky Medication Adherence Scale-8 was used to measure medication adherence. Blood pressure, HbA1c, and symptom control were used as secondary outcomes. Paired t -tests and repeated measures ANOVA were used to analyze the data in SPSS 25 in order to determine the improvements in adherence and clinical parameters. MMAS-8 base to post-intervention means improved significantly, (5.2 +/- 1.3) to (7.6 +/- 0.9) respectively ($p < 0.001$). Patients showed better clinical results, such as the mean systolic blood pressure was decreased by 8.5 mmHg, and HbA1c was decreased by 0.9%. The predictive alerts in the AI tool predicted 78 percent of possible non-adherence incidents, which allowed healthcare providers to act on time. AI-based personalized adherence tools enhanced medication adherence and clinical outcomes in the management of chronic diseases. These results propose AI-based interventions as extensible solutions in pharmacy practice and patient care. These promising results need further validation and strengthening, which is suggested to be done in larger studies, with multiple centers involved.

**Keywords:** AI, Medication adherence, Chronic disease, Digital health, Morisky scale.

## PREDICTIVE HEALTHCARE ANALYTICS POWERED BY ARTIFICIAL INTELLIGENCE

Vavveti Harish Kumar
Department of ai and data analytics,
Ratnam Institute Of Pharmacy, Nellore, Andhra Pradesh– 524346
Harishhasini9@gmail.com

Predictive analytics powered by artificial intelligence (AI) is rapidly transforming healthcare by enhancing patient outcomes and reducing treatment errors. By identifying patterns and risk factors in large volumes of health data, predictive models support early diagnosis and prevention of diseases, ultimately making healthcare more proactive, personalized, and cost-effective. AI technologies such as machine learning, deep learning, natural language processing (NLP), and advanced predictive modeling can efficiently analyze both structured and unstructured medical data. These models can detect hidden patterns, assess patient risk levels, and forecast disease progression with a high degree of accuracy. One of the most impactful applications is in the early detection and management of chronic diseases such as cardiovascular conditions, cancer, and diabetes. AI-driven algorithms also improve diagnostic accuracy in medical imaging by enabling faster and more precise interpretation of scans. Decision support systems powered by AI provide real-time insights during clinical workflows, helping healthcare professionals make evidence-based decisions. These systems can predict disease onset, estimate patient outcomes, assist in diagnoses, and even suggest personalized treatment plans tailored to an individual's unique medical profile. Additionally, AI integration in hospital systems enables real-time alerts for critical conditions like strokes or heart attacks, supporting faster intervention and improved patient care. In summary, AI is not just optimizing current healthcare practices—it is redefining the future of healthcare delivery by making it smarter, faster, and more responsive.

**Keywords:** predictive analytics, AI-driven diagnosis, deep learning, hospital AI integration, clinical support systems.

## DEEP LEARNING-BASED GENERATIVE MODELS FOR PREDICTIVE DESIGN OF PI3K PATHWAY INHIBITORS IN BREAST CANCER THERAPY

Srimathi. R, Pradeep. R
Department of Pharmaceutical Chemistry, Sri Ramachandra Faculty of Pharmacy, SRIHER (DU), Porur, Chennai-600 056
drsrimathi.r@sriramachandra.edu.in

Breast cancer, the most common cancer among women worldwide, is projected to increase by 38 percent in global incidence by 2050. The annual mortality is also expected to rise by 68 percent over the same period, according to reports from the International Agency for Research on Cancer (IARC) and the World Health Organization (WHO). The most frequently mutated gene, PIK3CA, occurs in 30–40% of cases and encodes the p110α catalytic subunit of phosphoinositide 3-kinase (PI3K), a crucial enzyme regulating cellular growth, survival, and metabolism pathways. Currently approved drugs, Alpelisib, Copanlisib, Duvelisib, Idelalisib, Leniolisib, and the recently approved Inavolisib (2025), face significant limitations, including suboptimal patient selection, drug-related toxicities, and variable efficacy. The widening mortality-incidence gap underscores the urgent need for innovative strategies to improve prediction of treatment response and accelerate the development of more effective PI3K-targeted therapies. In this study, we collected PI3Kα inhibitors (~2400 inhibitors) from the BindingDB and exported them into an Excel sheet. Chemical descriptors were calculated with RDkit using the Jupyter Notebook environment to extract molecular features for subsequent analysis. The descriptors that contribute to improved pharmacological activity were assessed for statistical compliance using the support vector machine algorithm. Systematic design by elucidating the Structure Activity Relationship (SAR) guided design of novel scaffolds and validated using molecular docking and dynamic simulations. Small-molecule inhibitors targeting PI3Kalpha were developed through novel generative AI-integrated deep learning methodology focusing on improved structural attributes.

**Keywords:** Deep learning, Dataset, Modeling, SAR, docking, dynamics.

## AI BASED CHECKLIST SOFTWARE FOR REGULATED PHARMACEUTICAL INDUSTRIES

Alok M. Rajput, Vinita V. Kale, Suankit A. Harane, Milind J. Umekar
Department of Regulatory Affairs
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee-441002
alokrajput2002@gmail.com

The pharmaceutical industry operates under some of the strictest regulatory frameworks in the world, where adherence to regulatory standards is paramount to ensure product safety, efficacy, and overall public health. Traditional methods of compliance management, particularly manual checklists and paper-based systems, have long been the backbone of regulatory adherence. However, as the industry becomes increasingly complex and the volume of regulatory requirements grows, these outdated practices pose significant challenges in terms of accuracy, efficiency, and scalability. This paper explores the implementation of AI-based checklist software tailored for regulated pharmaceutical industries, offering a modern and dynamic approach to compliance management. AI-based checklist software utilizes advanced artificial intelligence, machine learning, and automation technologies to streamline and optimize compliance processes across various pharmaceutical operations, including manufacturing, quality assurance, auditing, and documentation. Through intelligent algorithms and predictive analytics, the software automates checklist creation, task management, and compliance tracking in real-time, significantly reducing human error and ensuring accurate documentation for audit purposes. Furthermore, it supports seamless integration with existing enterprise systems, enabling a unified approach to regulatory compliance management that enhances operational efficiency. This paper delves into the benefits and applications of AI-based checklist software, highlighting its ability to improve audit readiness, facilitate regulatory reporting, optimize batch record management, and ensure the timely maintenance of critical equipment in adherence to regulatory guidelines. It also explores how the software enables proactive risk management by identifying non-compliance patterns, automating corrective actions, and supporting continuous quality improvement initiatives. Additionally, AI-based checklists are designed to adapt to ever-evolving regulatory landscapes, ensuring that pharmaceutical companies remain compliant with global standards set by bodies such as the FDA, EMA, and ICH. The methodology for the development and implementation of AI-driven checklist systems in regulated environments is discussed in detail, including requirement gathering, AI model design, system integration, and validation testing.

## IMPACT ON ARTIFICIAL INTELLIGENCE IN PHARMACEUTICAL MANUFACTURING: ENHANCING QUALITY CONTROL AND DECISION MAKING.

Urmi Rohit
Smt. B.N.B. Swaminarayan Pharmacy College Salvav -Vapi, Gujarat, India -396191
urmirohit2002@gmail.com

The convergence of Artificial Intelligence (AI) and pharmaceutical manufacturing signifies a pivotal juncture in the industry's evolution, offering unprecedented opportunities to bolster quality control and refine decision-making processes. This provides a succinct overview of a comprehensive. research paper that delves into the profound applications, benefits, challenges, and future trajectories of integrating AI into pharmaceutical manufacturing, with a specific focus on augmenting quality control measures and optimizing decision-making. Against the backdrop of stringent quality standards and regulatory demands inherent to pharmaceutical production, the infusion of AI technologies introduces a paradigm shift. This paper elucidates the manifold applications of AI, spotlighting its contributions to fortifying quality control mechanisms while empowering data-driven decisions. AI's impact on quality control is profound, notably through cutting-edge image recognition and computer vision systems. These innovations imbue visual inspection processes with unprecedented precision, detecting imperfections and anomalies that often elude human scrutiny. Augmented by real-time monitoring enabled by Internet of Things devices, AI ensures continuous adherence to rigorous quality benchmarks, safeguarding product integrity. The transformative potential of AI extends to optimizing decision-making by harnessing the analytical prowess of data. Furthermore, AI's predictive capabilities are harnessed to forecast and mitigate risks. stemming from supply chain dynamics, regulatory shifts, and quality deviations. In predicting batch. release probabilities, AI accelerates the decision-making process, circumventing delays inherent to conventional manual testing. However, the adoption of AI in pharmaceutical manufacturing is not devoid of challenges. The efficacy of AI hinges upon the availability and quality of diverse datasets, underpinning accurate model training.

## BIOSENSING PLATFORM WITH AI-POWERED ANALYSIS FOR GLUCOSE MONITORING

Munuganti Bharath, Kakani Anil Kumar, Achanti Suneetha, Vijaya Lakshmi Marella, Y.Sharon Sathvika Christina
Department of Pharmaceutics and Biotechnology, KVSR Siddhartha College of Pharmaceutical Sciences, Vijayawada-520010, Andhra Pradesh, India.
bharathmunuganti@gmail.com

The development of a point-of-care glucose monitoring system by combining gold nanoparticle (AuNP)–based colorimetric sensors with artificial intelligence (AI)–assisted image analysis. AuNPs were synthesized using the citrate reduction method and were subsequently functionalized with glucose oxidase to enable specific interaction with glucose molecules. Upon exposure to varying concentrations of glucose, the functionalized nanoparticles exhibited visible color changes, forming the basis of a simple diagnostic platform. To quantify these changes, images of the sensors were captured using a smartphone under standardized lighting conditions. The RGB values extracted from the images were processed and applied to predictive models. Linear regression and convolutional neural network (CNN) algorithms developed in TensorFlow were trained to correlate image data with glucose concentration. The predicted values were validated against glucose levels measured using standard glucometers. The colorimetric sensors produced reproducible and concentration-dependent responses within physiologically relevant glucose ranges. The AI models successfully translated image data into quantitative glucose values, with CNNs outperforming linear regression by providing greater accuracy and stability, even when slight variations in imaging conditions were present. Overall, the study demonstrated that the integration of AuNP-based colorimetric sensors with AI-driven image analysis created a reliable, low-cost, and portable platform for glucose monitoring. The system utilized smartphones not only for image acquisition but also as analytical tools, eliminating the need for complex laboratory infrastructure. These findings highlighted the potential of combining nanotechnology and AI to deliver accessible diagnostic solutions for managing chronic diseases such as diabetes.

**Keywords:** Gold nanoparticles (AuNPs); Colorimetric sensor; Glucose detection; Point-of-care diagnostics; Artificial intelligence (AI); Image analysis; Convolutional neural networks (CNN); Biosensing; Digital health; Diabetes monitoring.

## AI ASSISTED EVALUATION OF NEUROPROTECTIVE PHYTOCHEMICALS IN BERBERIS ARISTATA

Neelam Methwani
Department of Pharmaceutical Sciences, Jayoti Vidyapeeth Women's University, Jaipur, Rajasthan, India- 303122
neelammethwani03@gmail.com

Berberis aristata DC. is a widely used medicinal plant in traditional systems of medicine. This medicinal plant is having many bioactive phytoconstituents with promising therapeutic potential. Systematic identification of neuroprotective compounds becomes more challenging due to complex structure of natural products. In this study, an AI based approach was employed to explore the neuroprotective potential of key phytoconstituents from Berberis aristata. Some advanced computational tools which integrating molecular docking, network pharmacology and machine learning based prediction models were utilized to identify bioactive compounds and their therapeutic targets associated with neurodegenerative pathways. The analysis revealed the presence of phytoconstituents like alkaloids, flavonoids, polyphenols and related derivatives exhibited strong interactions with targets involved in oxidative stress, neuroinflammation and neurotransmitter regulation. The findings provide information about the potential of neuroprotective compounds which are promising in Berberis *aristata* supporting its relevance as a candidate for future drug development. This Phytointelligence explores development in herbal drug discovery and bridging traditional knowledge with modern computational intelligence.

**Keywords:** Artificial Intelligence, *Berberis aristata*, Neuroprotection, Phytoconstituents.

## AI IN POLYCYSTIC OVARY SYNDROME: REVOLUTIONIZING DIAGNOSIS AND MANAGEMENT

Jayshree B. Sanap
Department of Pharmacology, Samarth College of Pharmacy, Deulgaon Raja, Buldana, Maharashtra, India-443204

Polycystic Ovary Syndrome (PCOS) is an endocrine disorder common among 4–20% of women in reproductive age. Reproductive, metabolic, and psychological implications of the syndrome are high. Present approaches for diagnosing PCOS have several issues associated with subjectivity, variability, and delayed diagnosis through clinical examination, biochemical investigations, and imaging. The rise of AI technology has made it a game changer in dealing with the problems related to diagnosis and provides enhanced diagnostic precision and speed through ML and DL models. This paper reviews the contribution of AI technologies in PCOS prediction and diagnosis. AI models, supervised as well as unsupervised, perform better than conventional approaches with large, complex data sets. Random forests and ANNs have reached high diagnostic accuracies over 90%, and patients are clustered into phenotypes for treatment tailored by unsupervised clustering techniques. They embrace clinical, genetic and imaging data with non-invasive diagnosis, early diagnoses and cost-effective interventions. SHAP and LIME are two other forms of AI structures of explanatory methods for added model explainability and increased clinician trust. When it comes to prediction of risk of developing PCOS by using AI the genetic factors, lifestyle parameters, and a family history of PCOS is used accurately up to 96 percent.

**Keywords:** Polycystic Ovary Syndrome, Diagnostic Criteria, Artificial Intelligence, Data Privacy, Global Applicability

**AI-60**

ISBN: 978-81-980623-8-3

**AI DRIVEN DRUG DISCOVERY AND CHEMICAL PLATFORMS**

Yagna Sri Thoraati, Swathi Varri
Department of Pharmaceutical Sciences
VJ's College of Pharmacy, Diwancheruvu, Rajahmundry, Andhra Pradesh, India–533296.

AI Driven drug discovery and chemical platforms are revolutionizing the pharmaceutical industry by integrating advanced computational techniques like machine learning, deep learning, and generative AI to address the high costs, lengthy timelines, and low success rates of traditional methods. These platforms leverage vast chemical and biological datasets, including genomics, proteomics, and scientific literature, to analyze complex patterns and predict molecular behavior with unprecedented speed and accuracy. AI is transforming drug discovery by reducing time, cost, and failure rates in the development of new medicines. The major AI platforms include the following like Insilico (AI-designed molecules and drug candidates), Synthace (Automation of compomplex experiments), BioNTech and Instadeep (AI for personalized immunotherapies & vaccines), NVIDIA Clara Discovery (GPU- powered AI tools for chemistry, biology & simulation) together, they represent the next generation of AI-driven drug pharmaceutical innovation, making drug development faster, cheaper, and more precise.

**Keywords:** AI-driven drug discovery, Pharmaceutical Innovation, Machine learning, Chemical & Biological Datasets, Platforms.

**VARIOUS ROLE AND APPLICATION OF ARTIFICIAL INTELLIGENCE IN PHARMACEUTICAL SCIENCE**

Amol G. Jadhao
Gawande College Of Pharmacy, Sakharkherda, Tq. Sindkhed Raja, Dist. Buldana, Maharashtra, India- 443202.
Jadhaoamolsv@Gmail.Com

Artificial Intelligence (AI) emerged as an intervention for data and number-related problems. This breakthrough has led to several technological advancements in virtually all fields from pharmacy, engineering to architecture, education, accounting, business, health, and so on. AI also optimizes supply chains, automates tasks, and provides data-driven insights to reduce costs and improve efficiency across the pharmaceutical lifecycle, and also roles in data and information storage and management-such as patient medical histories, medicine stocks, sale records, and so on; automated machines; software and computer applications like diagnostic tools such as MRI radiation technology, CT diagnosis and many more have all been created to aid and simplify healthcare measures. Machine learning optimizes trial design by creating predictive models that forecast patient response and potential outcomes, which helps in selecting the most effective trial protocols. They provide valuable insights into the relationship between artificial intelligence (AI) and Human Resource Management (HRM). Artificial intelligence (AI), a branch of computer science, has been of growing research interest since its introduction to healthcare disciplines. Research has demonstrated that the application of such technologies has allowed for greater task accuracy and efficiency in medical disciplines such as diagnostics, treatment protocols and clinical decision-making. Application in pharmacy practice is reportedly narrower in scope; with greater emphasis placed on stock management and day-to-day function optimization than enhancing patient outcomes.

**Keywords:** Artificial Intelligence (AI), Machine learning, Pharmacovigilance, Clinical Trails, Drug discovery.

**AI-62**

**DEVELOPMENT AND EVALUATION OF AN AI-DRIVEN CHATBOT FOR COMMUNITY-BASED SURVEILLANCE OF OTC DRUG SAFETY**

Chandan M S R, Mekkanti Manasa Rekha, Shobha Rani R.H
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India – 560064
chandanms2002.a@gmail.com

Background: Over-the-counter (OTC) medicines are common in self-care but irrational use and under-reporting of adverse events (AEs) remain major public health concerns. Traditional surveillance fails to capture real-time community data. Artificial intelligence (AI)-based chatbots provide a potential solution to enhance drug safety monitoring and improve patient education effectively. Purpose: This paper will design and test an AI-enabled chatbot to administer community-based OTC drug safety surveillance. Methods: A pilot chatbot was created based on natural language processing and implemented in a mobile interface in the chosen urban and semi-urban neighborhoods. The tool was coded to record self-reported AEs, recognize unsafe self-medication behavior, and to offer safety advice. Data were compared by descriptive statistics, chi-square to categorical variables and paired t-test to contrast the knowledge pre- and post-intervention. Results: A total of 520 participants were recruited, with 92.3% completing follow-up. The chatbot documented 148 adverse events: 42.5% from OTC analgesics, 27.0% from antacids, and 21.6% from cough/cold preparations. Safe-use knowledge improved significantly after intervention (mean ± SD: 11.2 ± 3.5 vs. 15.6 ± 2.8, $p<0.001$). Concordance between chatbot responses and pharmacist advice was 94%. User satisfaction was high, with 88% rating the chatbot as easy to use and trustworthy. Conclusion: The AI-enabled chatbot enhanced OTC drug safety surveillance, improved community awareness, and enabled rapid AE reporting. Its wider adoption could strengthen pharmacovigilance networks and promote rational medicine use, particularly in low-resource settings.

**Keywords:** Over-the-counter drugs, chatbot, pharmacovigilance, community surveillance, artificial intelligence, drug safety.

**AI-63**

**AI-DRIVEN INNOVATION IN NEUROSCIENCE: IDENTIFYING NOVEL THERAPEUTIC TARGETS FOR NEUROLOGICAL CONDITIONS**

Mujibullah Sheikh, Anil M. Pethe
Datta Meghe College of Pharmacy DMIHER (Deemed to be University), Wardha, Maharashtra, India 442001.
mujib123sheikh@gmail.com

Neurological disorders, such as Alzheimer's disease, Parkinson's disease, and epilepsy, represent a growing global health burden with limited therapeutic options. Traditional approaches to identifying therapeutic targets reliant on fragmented data from genomics, proteomics, and electrophysiology have struggled to address the complexity and heterogeneity of neural systems. Artificial intelligence (AI), a transformative force poised to revolutionize neuroscience by decoding intricate neural mechanisms, accelerating biomarker discovery, and enabling precision drug development, has been developed. This review critically examines the role of AI-driven methodologies including machine learning, deep learning, and generative AI in overcoming these challenges. We explore how AI integrates multiomics data, neuroimaging, and electronic health records to uncover novel therapeutic targets, repurpose existing drugs, and stratify patients for personalized interventions. Case studies, such as DeepMind's AlphaFold for protein structure prediction and In silico Medicine's generative models for CNS drug design, highlight AI's potential to bridge the gap between computational predictions and clinical translation. However, technical limitations, including data quality issues and the "black-box" nature of AI, alongside ethical concerns such as algorithmic bias and patient privacy, remain significant hurdles. We argue that the future of AI in neuroscience lies in fostering interdisciplinary collaboration, improving model interpretability, and establishing regulatory frameworks for AI-driven therapies. By synthesizing recent advances and unresolved challenges, this review provides a roadmap for researchers and clinicians to harness AI's potential in transforming the landscape of neurological disease treatment.

**Keywords:** Artificial intelligence, neuroscience, therapeutic targets, neurological disorders, precision medicine.

The development of eco-friendly nanoparticles through plant-based synthesis offers a sustainable alternative to chemical methods, but their safe application depends on proper toxicity evaluation. In this work,

ISBN: 978-81-980623-8-3

silver nanoparticles (AgNPs) and zinc oxide nanoparticles (ZnONPs) were produced using aqueous extracts of neem (Azadirachta indica) and tulsi (Ocimum sanctum). The synthesized nanoparticles were examined for their physicochemical features, including size distribution by Dynamic Light Scattering (DLS), morphology through Transmission Electron Microscopy (TEM), and surface charge via zeta potential analysis. To reduce the dependence on extensive experimental assays, and machine learning approaches were employed for toxicity prediction. Data were compiled from Nano Commons and published literature, focusing on parameters such as particle size, shape, and surface charge. Classification models, specifically Random Forest and Support Vector Machines (SVM), were trained and tested in Python. These models demonstrated strong accuracy in assigning nanoparticles to distinct cytotoxicity categories. Validation was carried out using MTT assays on Vero and MCF-7 cell lines. The experimental outcomes aligned closely with computational predictions, confirming the effectiveness of AI-assisted toxicity screening. This combination of predictive modeling and laboratory validation established a reliable workflow for nanotoxicity assessment. The study showed that green synthesis can be paired with AI-based prediction to produce nanoparticles with well-defined toxicity profiles while minimizing redundant in vitro testing. Such integration fosters responsible innovation, supports sustainable nanotechnology practices, and highlights the role of artificial intelligence in advancing predictive toxicology.

**Keywords:** Transmission Electron Microscopy, surface charge, zeta potential, nanotoxicity, toxicity evaluation, predictive toxicology, artificial intelligence, AI, machine learning, Random Forest, Support Vector Machine.

## ADOPTION OF CHATGPT AS A DRUG INFORMATION RESOURCE: A COMMUNITY-BASED STUDY AMONG PHARMACISTS

Srikar Tejas R , Muchukota Sushma, Shobha Rani R.H
Department of Pharmacy Practice Aditya Bangalore Institute Of Pharmacy Education and Research (ABIPER),
Bangalore, Karnataka, India.
Srikartejas02@Gmail.Com

Background: Access to accurate and timely drug information is crucial for safe and effective patient care. Pharmacists frequently rely on digital resources; however, limitations in conventional databases include subscription costs, time-intensive searches, and restricted accessibility. Emerging AI-powered tools like ChatGPT provide real-time, conversational, and user-friendly solutions for drug information, including dosing, interactions, and evidence-based updates. Despite its growing popularity, limited research exists on how pharmacists use ChatGPT in clinical and community practice. Aim and Objectives: To evaluate the extent and purpose of ChatGPT utilization among pharmacists for drug information. To assess the perceived accuracy, reliability, and impact of ChatGPT on clinical decision-making and patient counseling. Methodology: A community-based cross-sectional study was conducted among 300 pharmacists working in hospital, community, and academic settings. A validated questionnaire captured data on demographics, frequency of ChatGPT use, types of queries (dosing, ADRs, interactions, guidelines), satisfaction, and challenges. Responses were analyzed using descriptive statistics, and associations between practice setting and utilization trends were assessed using chi-square tests. Results: Out of 300 pharmacists, 72% reported using ChatGPT for drug-related queries, with the highest use in community practice (45%), followed by hospital (35%) and academia (20%). The most common queries included dosage adjustments (41%), drug–drug interactions (28%), and adverse drug reaction management (22%). 68% perceived ChatGPT as time-saving, 61% rated its accuracy as moderate-to-high, 55% reported improved patient counseling confidence. However, 32% expressed concerns regarding reliability and lack of source citations. Pharmacists suggested combining ChatGPT with standard references for safe practice. Conclusion: ChatGPT is increasingly utilized by pharmacists as a quick-access tool for drug information, particularly in community settings. While it enhances efficiency and supports patient counseling, concerns about reliability highlight the need for cautious integration with verified databases. With proper validation and training, AI-powered assistants like ChatGPT can complement traditional resources and reshape drug information access in pharmacy practice.

**Keywords:** ChatGPT, Pharmacists, Drug information, Artificial Intelligence, Community-based study, Patient counseling.

## ARTIFICIAL INTELLIGENCE–ASSISTED DOSING OPTIMIZATION IN RENAL IMPAIRMENT PATIENTS: A PROSPECTIVE OBSERVATIONAL STUDY

Rohith Gowda BR, Muchukota Sushma, Shobha Rani R.H
Department of Pharmacy Practice Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER),
Bangalore, Karnataka, India.
brrohitgowda@gmail.com

Background: Renal impairment significantly alters drug pharmacokinetics, increasing the risk of sub-therapeutic dosing, drug accumulation, and adverse drug reactions (ADRs). Traditional dose adjustments rely on manual calculations using creatinine clearance (CrCl) or estimated glomerular filtration rate (eGFR), which may not always account for patient-specific variations. Artificial Intelligence (AI) tools such as DoseMeRx®, Clinical Dose Calculator AI®, and IBM Watson® for Drug Safety can integrate laboratory data, comorbidities, and pharmacogenomic profiles to provide individualized, real-time dosing recommendations. Aim and Objectives: To evaluate the role of AI in optimizing drug dosing among renal impairment patients. To assess the impact of AI-guided dosing on therapeutic outcomes, ADR reduction, and clinical pharmacist interventions. Methodology: A prospective interventional study was conducted on 120 patients with moderate-to-severe renal impairment (eGFR < 60 ml/min/1.73 $m^2$) admitted to a tertiary care hospital. AI-powered dosing platforms (DoseMeRx®, IBM Watson®) were integrated with electronic health records (EHRs) to recommend individualized dose adjustments for commonly used renally excreted drugs (e.g., aminoglycosides, vancomycin, anticoagulants). The intervention group (n=60) received AI-guided dosing validated by pharmacists, while the control group (n=60) followed conventional dosing adjustments. Outcomes measured included therapeutic drug monitoring (TDM) levels, ADR incidence (graded using CTCAE v5.0), and pharmacist interventions. Results: AI-assisted dosing improved therapeutic target attainment to 88% compared to 65% in the control group ($p < 0.01$). ADR incidence was reduced by 30% in the intervention group, with fewer cases of nephrotoxicity and bleeding complications. Pharmacist workload for manual dose adjustments was reduced by 40%, and documentation efficiency improved significantly. Importantly, AI models provided dosing recommendations within seconds, enabling faster clinical decision-making and better patient safety outcomes. Conclusion: AI-driven dosing tools enhance precision in drug therapy for renal impairment patients by reducing ADRs, improving therapeutic target achievement, and supporting pharmacist-led interventions.

**Keywords:** Renal Impairment, Artificial Intelligence, Dose Optimization, Therapeutic Drug Monitoring, Pharmacist Interventions, ADRs.

## "ARTIFICIAL INTELLIGENCE - DRIVEN ANALYTICS IN MODERN PHARMACEUTICAL METHOD DEVELOPMENT"

Bhavsar Hiral Jitendra
Smt. B.N.B. Swaminarayan Pharmacy College
Salvav-Vapi

The pharmaceutical method development arena is in the midst of a transformative shift. Conventional labor-intensive trial-and-error strategies are progressively being replaced by more agile, data-driven, and AI-infused methods. The incorporation of artificial intelligence technologies—i.e., machine learning, predictive analysis, and automated optimization gives new opportunities to expedite method development, enhance analytical accuracy, and improve reproducibility while decreasing costs and time demands. In addition to the automation of repetitive processes, the newest tools ensure adherence to increasingly stringent and dynamic global regulatory requirements. Platforms powered by AI are redefining the enterprise of making informed data-intensive decisions in a wide range of applications. These technologies play a critical role in the optimization of chromatographic conditions, execution of robust spectral analyses, contaminant monitoring, and predictive experimental trial design. By appropriately

ISBN: 978-81-980623-8-3

drawing upon vast datasets and advanced analytical techniques, researcher are able to quickly simulate, calibrate, and verify experimental parameters to minimize the consumption of resources and variability in experimental results. Such breakthroughs hold great promise to cause the facilitation of interdisciplinary collaborations, aid in the ongoing education in analytical methods, and permit customized, on-demand processes for the development and production of drugs. Such a confluence of advanced analytics and lab automation with artificial intelligence is a landmark development in the pharmaceutical area that establishes a new paradigm allowing for the more expedient and reliable introduction of safer, higher-quality, and more efficient therapeutic deliverables. Such a shift is remodeling the pharmaceutical innovation landscape by making pharmaceutical method development more complex, robust, and dynamic in responding to the challenges of global healthcare networks.

## REVOLUTIONIZING TB TREATMENT: A QBD AND AI-INTEGRATED APPROACH FOR DEVELOPING ADVANCED DELAMANID-LOADED MICROSPHERES WITH ENHANCED SOLUBILITY AND EFFICACY

Nikhil Rajnani, Nalini Kurup
Department of Pharmaceutics, Principal K. M. Kundnani College of Pharmacy, Cuffe Parade, Mumbai – 400 005
nrajnani@gmail.com

This study presents a comprehensive Quality by Design (QbD) and artificial intelligence (AI)-integrated approach to overcome the significant aqueous solubility challenges (0.024 ± 0.003 mg/mL) of Delamanid, a critical BCS Class II anti-tubercular drug. The systematic QbD framework was implemented through Ishikawa diagram-based risk assessment identifying critical material attributes (CMAs) and critical process parameters (CPPs), followed by Design of Experiments (DoE) using a Central Composite Design (CCD) with three factors and three levels. The QbD approach began with AI-enhanced molecular docking using PyRx software, which identified Tween 80 (binding energy: -6.1 ± 0.2 kcal/mol) and ethyl cellulose (binding energy: -7.9 ± 0.3 kcal/mol) as optimal excipients based on their superior binding affinity with Delamanid. Drug-excipient compatibility studies conducted over 7 days under accelerated conditions (40°C/75% RH) showed no changes in FTIR spectra and no physical incompatibility, confirming formulation stability. Through QbD optimization, critical process parameters including stirring speed (800-1200 rpm), polymer concentration (1-3% w/v), and emulsification time (10-30 minutes) were systematically optimized against critical quality attributes. The optimized formulation demonstrated exceptional characteristics: particle size of 1.15 ± 0.05 µm (PDI: 0.18 ± 0.02), zeta potential of -32.4 ± 1.2 mV, and entrapment efficiency of 88.7 ± 2.3%. The QbD-driven formulation achieved a remarkable 50-fold enhancement in aqueous solubility (~0.1 mg/mL) compared to pure Delamanid (~0.002 mg/mL). *In-vitro* dissolution studies across physiological pH conditions (1.2, 4.5, 6.8, 7.4) demonstrated sustained release characteristics which was pH dependent. MIC studies showed reduction in minimum inhibitory concentration against Mycobacterium tuberculosis H37Rv strain when compared to plain drug. Microscopic characterization through SEM revealed spherical particles with smooth surfaces, while TEM confirmed the core-shell structure and uniform size distribution.

## AI-SUPPORTED EVALUATION OF SELF-MEDICATION PRACTICES IN MIGRAINE AND HEADACHE DISORDERS: A PROSPECTIVE OBSERVATIONAL STUDY

Amulya.C, Muchukota Sushma, Shobha Rani R.H
Department of Pharmacy Practice,Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Bangalore, Karnataka,India.
amulya07c@gmail.com

Background: Migraine and headache disorders are among the most common neurological conditions, significantly impairing quality of life and productivity. Widespread availability of over-the-counter (OTC) medications and delayed physician consultation drive patients toward self-medication, which often leads to medication overuse headache (MOH), adverse drug reactions (ADRs), and suboptimal disease control. Artificial Intelligence (AI)-driven mobile health applications, such as Migraine Buddy®, Curelator Headache®, and Ada Health®, have emerged as innovative tools for tracking headache patterns, drug use, and predicting potential overuse, thereby supporting both patients and healthcare providers in optimizing care. Aim and Objectives: To assess the prevalence and patterns of self-medication in migraine and headache disorders using patient-reported data integrated with AI-based headache management apps. 2.To evaluate the role of AI-assisted monitoring in early detection of ADRs, medication overuse, and improving patient counseling outcomes by clinical pharmacists. Methodology: A prospective observational study was conducted on Results: 180 patients with migraine or headache disorders over six months at a tertiary care hospital. Participants were asked to log headache characteristics, medication use, and lifestyle triggers into AI-based apps (Migraine Buddy®, Ada Health®). Data were collected on demographics, drug classes used (NSAIDs, paracetamol, triptans), frequency of self-medication, and procurement sources. AI algorithms flagged potential medication overuse and possible ADRs in real-time. Clinical pharmacists reviewed AI-generated reports, counselled patients on rational use, and documented outcomes. Statistical analysis was performed using descriptive and inferential tests (Chi-square, t-test). Of the 180 patients, 61% engaged in self-medication, with NSAIDs (47%), paracetamol (36%), and triptans (17%) being the most common drugs. Conclusion: The AI-based applications identified medication overuse in 19% of patients and flagged ADR risks (gastritis, dizziness, fatigue) in 15%, which were subsequently validated by pharmacists. Patients monitored through AI apps demonstrated 32% better adherence to safety counseling and a 25% reduction in headache frequency compared to non-users ($p < 0.05$).

## AI-OPTIMIZED POLYMERIC NANOPARTICLES FOR SUSTAINED DRUG RELEASE

Meda Saidu babu,Kakani Anil Kumar, Kunderu Ravi shankar,Samanasi Siva Sri,Kanaka Druga Devi Nelluri
Department of Pharmaceutics and Biotechnology, KVSR Siddhartha College of Pharmaceutical Sciences, Vijayawada-520010, Andhra Pradesh, India.
medasaidubabu@gmail.com

Polymeric nanoparticles (PNPs) using PLGA and related polymers were developed to achieve sustained drug release, thereby enhancing therapeutic efficacy and patient compliance. Conventionally, optimization of polymer ratios and processing parameters required extensive experimentation, which was both time-consuming and resource-intensive. To reduce this limitation, artificial intelligence (AI) models were integrated into the formulation process to predict key characteristics such as particle size and drug release kinetics. In this study, PNPs were prepared using the solvent evaporation method with varying polymer-to-drug ratios (1:1, 2:1, 3:1), stirring rates, and solvent types. The nanoparticles were systematically characterized for particle size and polydispersity index (PDI) using dynamic light scattering, morphology using scanning electron microscopy, drug loading and encapsulation efficiency, and in vitro drug release in phosphate-buffered saline over a period of 24 to 48 hours. Regression models including multiple linear regression (MLR) and Random Forest were implemented in Python to predict release profiles and particle size, and their outputs were validated against experimental results. The formulations produced nanoparticles with narrow size distribution, high encapsulation efficiency, and well-defined sustained release behavior. AI predictions demonstrated a strong correlation with laboratory findings, with Random Forest outperforming MLR in terms of predictive accuracy. The integration of AI with formulation development significantly reduced the need for repetitive optimization trials, saving both time and resources. Overall, the study demonstrated that the combination of advanced drug delivery systems with AI-assisted predictive modeling provided a

ISBN: 978-81-980623-8-3

powerful Quality by Design (QbD) strategy for developing sustained release nanoparticles with desired therapeutic profiles.

**Keywords:** Polymeric Nanoparticles (PNPs), PLGA, Sustained Drug Release, PDI (DLS), Drug Loading & Encapsulation Efficiency, In vitro Release (PBS), AI-assisted Formulation, Regression Models (Random Forest, MLR), Quality by Design (QbD).

**ROLE OF AI IN HOSPITAL, COMMUNITY AND CLINICAL PHARMACY**

Aditya Kumar Sahu, Tanisha Mandhan
Amity University, Amity Institute of Pharmacy,
Raipur, Chhattisgarh
adityakumarsahu142@gmail.com

Pharmacies play a vital role in modern healthcare by ensuring that patients receive the right medicines safely and effectively. This project focuses on three major branches of pharmacy—Hospital Pharmacy, Community Pharmacy, and Clinical Pharmacy—and explains how each contributes to improving patient care. Hospital pharmacy deals with the supply, storage, and dispensing of medicines in hospitals. Pharmacists here work closely with doctors and nurses to make sure patients admitted to the hospital get the right drugs at the right time. Their role is especially important in critical care units, surgeries, and emergency situations where accuracy and safety are essential. Community pharmacy is the part of pharmacy that most people interact with directly. Community pharmacists provide over-the-counter medicines, explain how to take prescribed drugs, and guide people on common health problems. They also raise awareness about healthy living, vaccinations, and the safe use of medicines. By being easily accessible, they act as a bridge between the healthcare system and the public. Clinical pharmacy is more patient-centered and focuses on optimizing drug therapy. Clinical pharmacists join healthcare teams to review treatments, monitor outcomes, and prevent side effects. Their goal is to make sure every patient receives maximum benefit from their medicines with the least possible risk. Together, these three areas of pharmacy create a complete support system. When hospital, community, and clinical pharmacy work hand in hand, they improve treatment outcomes, reduce medication errors, and make healthcare safer, more effective, and more patient-friendly.

**Keywords:** Hospital Pharmacy, Community Pharmacy, Clinical Pharmacy, Patient Safety, Drug Use, Healthcare System.

**AI-ENABLED POLYPHARMACY MANAGEMENT: PREDICTION AND PREVENTION OF MULTIPLE-DRUG SIDE EFFECTS**

Muppala Sirisha
Department Of Pharmacology, Narayana Pharmacy College,
Nellore, A.P, India- 524004
sirisharajumuppala@gmail.com

Polypharmacy (PP), prescription or use of over-the-counter drugs by more than 1 medication is growing expertise in elderly and chronic disease patients. Useful as it is, however, it greatly increases the risk of ADRs, drug–drug interactions and hospitalization. Classical types of medication review are based on subjective clinical judgment, static criteria and incomplete patient information. AI is a revolutionary technique in plays an important to predict the high-risk drug combinations based on extremely large amount of data including EHRs, pharmacological databases, and so forth. Machine-learning algorithms can recognize intricate interactive patterns which physicians may often miss in the course of daily practice and deliver individualized risk assessment. According to several recent studies, AI-aided clinical DSS tools can significantly reduce medication errors, enhance compliance and enhance therapeutic effects. Challenges remain to be resolved, including data integration, model transparency and clinical adoption. Leveraging AI for the management of polypharmacy would revolutionize patient safety, reduce healthcare spending, and change how personalized pharmacotherapy is practiced.

**Keywords:** Polypharmacy, Artificial Intelligence, clinical decision support, Adverse Drug Reactions, drug–drug interactions, machine learning, personalized pharmacotherapy.

**AUGMENTING PHARMACY EDUCATION WITH ARTIFICIAL INTELLIGENCE AND IMMERSIVE TECHNOLOGIES FOR BETTER CONCEPTUAL CLARITY FROM THEORY TO PRACTICe**

Deepak Shamrao Khobragade, Mrunali D. Khobragade
Datta Meghe College of Pharmacy, DMIHER (DU), Sawngi Meghe
Wardha, Maharashtra 442001
ksdeepak31@gmail.com

The incorporation of Artificial Intelligence (AI) and immersive technologies like Augmented Reality (AR) and Virtual Reality (VR) can transform pharmacy education by bridging the gap between theory and practice. Traditional teaching and learning approaches have limitations in delivering clarity for complex pharmaceutical concepts. AI-driven platforms enable personalized adaptive learning, feedback, and predictive analytics, while AR and VR provide interactive 3D environments that simulate real-world scenarios of pharmaceutical processes, compounding techniques, and clinical settings. These innovations enhance visualization, foster experiential learning, and develop problem-solving and decision-making skills among pharmacy students. Additionally, immersive technologies support remote and collaborative learning, improving accessibility and engagement. This paper focuses on innovative strategies, implementation frameworks, and evidence demonstrating the impact these technologies have on teacher-learner engagement, conceptual understanding, and competency-based outcomes. Adoption of AI and immersive tools aligns with Education 4.0, preparing future pharmacists for an increasingly technology-driven healthcare ecosystem for better outcomes.

**NEW DRUG APPLICATION**

Arpitha N
HARSHA COLLEGE OF PHARMACY

The New Drug Application (NDA) process is a crucial regulatory requirement for the approval of new pharmaceutical products in the United States and India. This project work highlights the regulatory framework, historical evolution, and procedural aspects of NDA submission. The study emphasizes the role of the Food and Drug Administration (FDA) and the Central Drugs Standard Control Organization (CDSCO) in ensuring the safety, efficacy, and quality of new drugs before marketing authorization.

The report discusses the aims and objectives of NDA, the importance of regulatory documentation such as the Common Technical Document (CTD), and the relevance of bioequivalence studies in establishing drug performance. Key topics include dossier preparation, patent information, drug master files, approval process, and challenges in drug development. The methodology relied on both primary sources (guidance documents, regulatory body websites) and secondary sources (literature, articles, online databases). The findings underline that a comprehensive and well-structured NDA dossier is essential for timely approval and safeguarding public health. Deficiencies in submission may lead to delays or rejection, making adherence to guidelines critical. Overall, this project provides an overview of regulatory expectations and the significance of harmonized procedures in facilitating faster availability of safe and effective medicines.

**Keywords:** Central Drugs Standard Control Organization, dossier, regulatory, New Drug Application, Common Technical Document.

**AI-75**

**DEVELOPMENT AND VALIDATION OF AN AI-DRIVEN FRAMEWORK FOR PRESCRIPTION ANALYSIS: STRENGTHENING RATIONAL DRUG UTILIZATION**

Subodh S Satheesh, Vinay R Srihari, Akash Gajanan Prabhune
Department Of Pharmaceutical Management, Institute Of Health Management Research, Bangalore
Drsubodhsatheesh@Gmail.Com

Irrational drug usage is a major global health concern, with its prevalence specifically in developing countries. Practices like polypharmacy, misuse of antibiotics, and inappropriate fixed drug combinations remain common. Auditing traditional prescriptions is always time-consuming and poses challenges in scalability. This highlights the need for an advanced approach that can systematically evaluate prescribing patterns. In this study, we developed and validated

ISBN: 978-81-980623-8-3

an AI-driven framework that automatically analyzes prescriptions in alignment with indicators recommended by the WHO. A dataset of 378 prescriptions was collected from open-source platforms, clinics, and hospitals in Bengaluru. The prescriptions selected were labelled as per WHO indicators, like polypharmacy, antibiotic prescriptions, and prescription of generic drugs. The collected data set was split into training (70%), validation (15%), and testing (15%). Various machine learning models like Sequential, Resnet_50, EfficientNet, MobileNet_V2, and VGG16 were selected, trained, and tested to analyze the prescriptions that were labelled as per WHO indicators. Resnet_50 achieved the best outcomes with a validation accuracy of 83% and an F1 score of 81% on test data. The Model achieved an overall accuracy of 89% in identifying generic prescriptions, 87% in detecting polypharmacy, and 90% in identifying antibiotic prescription patterns. The ability of this model to generate real-time feedback on trends in prescriptions aids the health care professionals in detecting and addressing irrational prescription patterns. This study underscores the potential of an AI-based tool in improving prescription analysis and thereby curtailing irrational drug usage and enhancing clinical decision-making.

**Keywords:** Artificial Intelligence, Rational Drug Use, Prescription Analysis, Polypharmacy, Machine Learning.

## AI-SUPPORTED PAPER STRIP KIT FOR RAPID URIC ACID SELF-DETECTION

Chandrashekhar Patil, Ganesh Sonawane, Kajal Pansare, Sunil Mahajan
Department of Pharmacology, Divine College of Pharmacy, Satana, Maharashtra, India - 423301.
cdpatil1000@gmail.com

Hyperuricemia is a major risk factor for gout, kidney disorders, and metabolic syndrome, and early detection is critical for disease prevention. Conventional diagnostic methods are expensive, time-consuming, and laboratory-dependent, limiting accessibility in rural and resource-limited settings. To avoid these concerns we developed a low-cost, paper strip–based uric acid self-testing kit integrated with AI support, aimed at empowering individuals with rapid, point-of-care diagnostics. The strip is coated with uricase enzyme, which catalyzes uric acid to produce hydrogen peroxide. In the presence of peroxidase and chromogenic agents, a visible color change occurs. A mobile application enabled with AI-based image processing quantifies the color intensity captured through the smartphone camera, translating it into uric acid concentration with higher accuracy. The kit is designed to be user-friendly, portable, and affordable, requiring minimal technical knowledge. The AI-supported self-test kit provides rapid, reliable, and cost-effective uric acid detection within minutes. This innovation bridges laboratory diagnostics and personal healthcare, enabling continuous self-monitoring and early medical intervention. By combining AI technology with low-cost biosensor strips, this approach represents an innovative diagnostic tool in pharma. Such self-testing solutions have the potential to transform patient-centered healthcare, especially in underserved populations.

**Keywords:** Artificial Intelligence, Diagnosis Kit, Paper Strip, Self-Detection, Uric Acid.

**AI-77**

## SMART NEBULIZERS WITH AI ASSISTED DOSING FOR RESPIRATORY DISEASES

Muthumula Sai Lakshmi
Department of Pharmaceutical sciences, Narayana pharmacy college, Nellore, A.P, India, 524004
lasyareddymuthumala@gmail.com

Respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD) require long-term inhalation therapy, yet poor adherence and incorrect dosing significantly compromise treatment outcomes. Conventional nebulizers lack the ability to personalize therapy or monitor patient usage effectively. The integration of Artificial Intelligence (AI) into smart nebulizer systems provides a novel approach to optimize inhaled drug delivery. This study presents the development of a smart nebulizer prototype equipped with real-time sensors and AI-assisted algorithms to regulate dosing based on patient-specific parameters, including breathing patterns, disease severity, and historical adherence data. The system was designed to monitor inhalation flow rates, detect improper technique, and adjust aerosol output dynamically. Preliminary simulations and pilot testing demonstrated improved drug deposition efficiency and reduced dosing variability compared to standard nebulizers. Additionally, AI-enabled feedback allowed real-time patient guidance and secure data sharing with healthcare providers for remote monitoring. Smart nebulizers with AI-assisted dosing represent a transformative step in respiratory care by enhancing adherence, minimizing wastage, and supporting precision therapy. Large-scale clinical validation is warranted to assess long-term efficacy and integration into routine clinical practice Adequate asthma and COPD management is frequently compromised by non-adherence and errors in dosing with traditional nebulizer systems. Connected smart nebulizers working in combination, with Artificial Intelligence, can even use breath patterns to identify and manage the correct doses and concentration of drugs for patients. For the purposes of this work, an AI-enabled nebulizer system with integrated sensors was developed to monitor inhalation, identify errors, and personalize dosing. Initial testing showed that drug deposition was improved as well as within-device variability and patient guidance compared to that from standard devices.

**Keywords:** AI Assisted Dosing, Digital Inhalation Therapy, Smart drug nebulization, Dose Optimization.

## AI GUIDED DEVELOPMENT OF NANOSTRUCTURED HYDROGEL SYSTEMS FOR COSMETIC APPLICATIONS

Shubhangi N Gurjar1, Pravina N Gurjar2, Narendra D Phuphate1
1Sudhakarrao Naik College of Pharmacy, Pusad, Yavatmal, MS, 445204
2Jagdamba Institute of Pharmacy & Research, Kalamb, Yavatmal MS
Shubhangigurjar.pusad@gmail.com

The use of artificial intelligence (AI) in cosmetic formulation science is changing how advanced delivery systems like nanostructured hydrogels are made. These hybrid platforms bring together the high water content, biocompatibility, and viscoelasticity of hydrogels with the better stability, penetration efficiency, and controlled release properties of nanocarriers. AI powered modeling, predictive analytics, and machine-learning algorithms make it possible to systematically improve these systems by finding the best polymer compositions, crosslinking densities, and nanocarrier architectures for specific cosmetic effects. AI speeds up the process of choosing materials, predicting how they will behave in terms of flow, and simulating how they will release over time. This leads to products that work better and take less time to develop. Nanostructured hydrogels have become promising ways to deliver actives like antioxidants, peptides, botanical extracts, and anti-aging molecules in cosmetics. They penetrate the skin more deeply with less irritation. AI-enhanced computational tools help customize how nanostructures interact with skin, predict how stable they will be in different environments, and reduce batch variability. Also, predictive toxicology models help make sure safety and follow the rules by testing polymer-nanoparticle combinations before they are made. Recent improvements in AI-guided optimization, such as generative models, neural networks, and digital twins, make it possible to make personalized cosmetic formulations that work with each person's skin type and environmental conditions. Combining AI with nanostructured hydrogels is a major step forward in the field of cosmetology. It makes it easier to create high performance, long-lasting, and customer-focused products. In general, AI-guided formulation is a game-changing way to create next-generation cosmetic hydrogels that work better, last longer, and make users happier.

**Keywords:** Nanostructured Hydrogels, Artificial Intelligence (AI) in Cosmetic Formulation, Controlled Drug Delivery using AI

## ARTIFICIAL INTELLIGENCE IN PHARMACEUTICAL DEVELOPMENT AND NEURODEGENERATIVE DISEASES

Simran M. Nagle, Tanmay S. Markandeywar, Atul T. Hemke
S.K.B. College of Pharmacy, Gada, Kamptee, Nagpur, Maharashtra, India - 441002
simrannagle794@gmail.com

Artificial Intelligence (AI) is revolutionizing pharmaceuticals by accelerating drug discovery, reducing development costs, and minimizing failure rates. Utilizing machine learning (ML), deep learning (DL), and natural language processing (NLP), it enhances predictive

ISBN: 978-81-980623-8-3

modeling, target identification, and virtual screening. AI also optimizes lead compounds through pharmacokinetic and toxicity predictions and enables personalized medicine by analyzing clinical data to tailor treatments, improving patient adherence and therapeutic outcomes. In the context of neurodegenerative diseases, AI has shown considerable promise. For Huntington's Disease (HD), marked by the mutation of the Huntingtin gene and characterized by cognitive and motor decline, AI techniques allow for early detection through brain imaging and predictions of disease progression, enhancing personalized care. In Amyotrophic Lateral Sclerosis (ALS), which lacks a definitive diagnostic test, AI helps identify patterns from clinical data, improving diagnostic accuracy and treatment strategies. For Parkinson's Disease (PD), AI improves diagnosis and treatment through the analysis of speech, movement, and handwriting, aiding in the detection of early symptoms and assessment of disease severity. Lastly, in Alzheimer's Disease (AD), AI-enabled neuroimaging and biomarker analysis support early diagnosis and intervention while facilitating drug repurposing and prognostic modeling. Overall, AI provides a promising pathway for overcoming complex challenges in pharmaceutical development and neurodegenerative disease management. To maximize its potential in advancing global healthcare, ongoing innovation, ethical governance, and regulatory alignment are essential.

**Keywords:** Artificial Intelligence, Huntington's Disease, Amyotrophic Lateral Sclerosis, Parkinson's Disease, Alzheimer's Disease.

## AI, EMOTIONAL INTELLIGENCE, AND PHARMACEUTICAL PROCESSING IN IVF: EDUCATE, INNOVATE, EMPOWER FROM TRADITIONAL NARRATIVES TO MODERN SCIENTIFIC ADVANCEMENTS

Itishree Mohanty,
Kanak Manjari Institute of Pharmaceutical Sciences, Chhend, Rourkela
Odisha University of Health Sciences, Odisha
itushree9a@gmail.com

Advances in pharmaceutical sciences and reproductive medicine have transformed in vitro fertilization (IVF) into a globally accessible treatment. Artificial intelligence (AI) now plays a critical role in embryo selection, cycle prediction, and pharmaceutical dosing, while Emotional Intelligence (EI) shapes patient–clinician communication, stress management, and decision-making in infertility care. The discussion emphasizes how AI-driven embryo viability models and pharmaceutical innovations must be balanced with EI-driven counseling and patient empowerment to ensure ethical, effective, and compassionate fertility solutions. The field of assisted reproductive technologies (ART), particularly in vitro fertilization (IVF), has undergone a paradigm shift with the integration of artificial intelligence (AI) and advanced pharmaceutical technologies. The journey of human fertility practices reflects a remarkable transition from traditional narratives and cultural beliefs to modern technological interventions. In Indian mythology, stories such as those of Kunti and Agastya highlight symbolic and divine approaches to reproduction, representing early recognition of external assistance in fertility. Today, in vitro fertilization (IVF), supported by pharmaceutical innovations and artificial intelligence (AI), offers scientifically precise and ethically complex solutions to infertility. Emotional Intelligence (EI) provides the human-centered dimension, ensuring compassionate care and patient empowerment. This paper explores the continuum from tradition to modernity through the Educate–Innovate–Empower framework, integrating mythology, science, and emotional well-being in reproductive medicine.

## AI AND ADVANCEMENTS IN TAILOR MADE PERSONALIZED MEDICINES PHARMACOGENOMICS

Swathi Nandimandalam
Department Of Pharmaceutical Sciences, Narayana Pharmacy College,
Nellore, Andhra Pradesh, India - 524004
Swathisagar3105@Gmail.Com

Pharmacogenomics, is a study of how an individual's genetic makeup influences their response to drugs, revolutionizing personalized medicine by enabling more precise and effective treatments. Recent advancements in Pharmacogenomics have made it possible to tailor drug therapies to individual genetic profiles, minimizing ADR's and Optimizing therapeutic efficacy. This topic highlights the latest developments in Pharmacogenomics research, focusing on key innovations such as, biomarkers for drug selection and predictive models for drug responses. This explores recent breakthroughs in Pharmacogenomics, highlights key research findings and examines the growing role of genetic testing. Tailor drug therapies leads to more precise and effective patient care. Technologies such as Genetic Profiling, Drug-gene testing panels, Oncology Precision Medicine, Psychiatric Pharmacogenomics helps in transforming humanized therapies from “One-size-fits-all” to “tailor-made solutions”, offering safer, more effective, and personalized treatments. Genetic testing can predict how individuals metabolize certain drugs. Thus, it can be concluded this study can be beneficial leading to better targeted therapies.

**Keywords:** Personalized medicines, Genetic profiling, Optimized therapeutic drugs, Pharmacogenomics.

## PHARMABOT: AN AI-POWERED LITERATURE SURVEY COMPANION - FOR THE STUDENTS, BY THE STUDENTS

Arfat Rauf Dongre, Shahid Shagird Maner, Rida Tanvir Dhamaskar
Anjuman-I-Islam’s Kalsekar Technical Campus, School of Pharmacy
arfatdongre99@gmail.com

In the evolving era of digital healthcare and education, access to reliable and authentic information is essential for both learners and practitioners. To bridge this gap, we have developed PharmaBot, an AI-driven chatbot designed for the students, by the students. The tool enables quick and seamless access to information related to diseases, drugs, treatments, and dosing by simply entering a prompt such as a drug name or disease condition. Uniquely, PharmaBot not only provides summarized drug data but also integrates references from authentic sources like PubChem, ensuring transparency and credibility. This makes the tool versatile, catering to pharmacy students, clinical pharmacists, doctors, and even laypersons seeking basic drug-related knowledge. PharmaBot’s simplicity and evidence-based design position it as a practical learning and clinical aid. Future developments will include voice-enabled interaction, a personalized dosing assistant tailored to age groups, and multilingual capabilities to enhance accessibility and engagement across diverse populations. This initiative demonstrates how student-led innovation can empower the academic and healthcare community by creating digital tools that are both practical and socially impactful.

**Keywords:** AI, Chatbot, Pubchem.

## AI USE IN DETECTION OF ADRS IN PHARMACOVIGILANCE

Mule Imran,Yelam V.Kapse,
Shivlingeshwar College Of Pharmacy, Almala
muleimran42@gmail.Com

Artificial intelligence (AI) is revolutionizing pharmacovigilance (PV) by addressing the growing complexity and volume of safety data. Through machine learning (ML), deep learning, and natural language processing (NLP), AI can analyze vast structured and unstructured datasets, including electronic health records (EHRs), clinical trial data, medical notes, and even social media posts, to efficiently detect adverse drug reactions (ADRs) and drug–drug interactions. Unlike traditional approaches, AI enables real-time surveillance, early detection of safety signals, and predictive modeling of patient-specific risks. Advanced techniques, such as neural networks and random forests, can generate personalized ADR risk profiles by integrating genomic, lifestyle, and historical health data, supporting tailored prescribing and improved outcomes, particularly in fields like oncology and chronic disease management. AI models can operate within international pharmacovigilance networks using privacy-preserving methods, allowing collaboration across regions without sharing raw patient data, which is especially valuable for identifying rare ADRs across diverse populations. Despite challenges related to data quality, algorithmic bias, and regulatory alignment, AI holds transformative potential to shift PV from passive monitoring to proactive, predictive, and patient-centered safety management. By enhancing efficiency, accuracy, and global collaboration, AI-powered pharmacovigilance ultimately strengthens drug safety surveillance and contributes to improved patient

ISBN: 978-81-980623-8-3

safety worldwide.

**REMOTE MONITORING OF PATIENTS THROUGH WEARABLE DEVICES + AI**

Dhiraj Jawale, Yelam Vidya (Kapse)
Shivlingeshwar College Of Pharmacy, Almala
Jawaledhiraj296@Gmail.Com

Remote monitoring of patients through wearable devices + AI. The traditional clinical trial paradigm, reliant on intermittent site visits and manual reporting, is limited in capturing the dynamic and continuous nature of disease progression and therapeutic response. The integration of Artificial Intelligence (AI) with remote patient monitoring (RPM) technologies offers a transformative framework for decentralizing and modernizing clinical trials. By leveraging multimodal data from wearable sensors, implantables, digital diaries, and connected devices, high-resolution, longitudinal digital phenotypes of participants can be developed. Advanced AI methods, including deep temporal convolutional networks and unsupervised representation learning, enable the conversion of dense, heterogeneous data streams into objective, granular, and clinically meaningful endpoints. Recent studies on adherence reveal that while older adults demonstrate high single-day adherence, sustained longitudinal engagement remains challenging. Nonetheless, reliable activity data for critical measures can be obtained with shorter device usage periods, underscoring the feasibility of AI-enhanced trial designs. Beyond data collection, AI-driven wearables extend functionality toward predictive, context-aware, and personalized care, enabling proactive risk mitigation and optimized therapeutic interventions. Despite significant promise, realizing the full potential of AI-enabled RPM in clinical research requires addressing technical, operational, and ethical challenges, including data quality, algorithmic bias, user engagement, and privacy concerns. Ultimately, AI integration within decentralized clinical trials has the potential to reduce costs, improve efficiency, and enhance patient-centricity, thereby reshaping healthcare delivery toward a more proactive and personalized model.

**Keywords:** Remote monitoring, clinical trials, personalized care, patient engagement.

**ADDRESSING MOBILE ADDICTION AND SLEEP DISTURBANCES USING ARTIFICIAL INTELLIGENCE: AN INTERVENTIONAL APPROACH TO ENHANCING COGNITIVE WELL-BEING**

Nigel Viju Thomas, Muchukota Sushma, Madhuvan H.S, Shobha Rani R.H Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Department of General Medicine, 2Akash Hospital, Bangalore, Karnataka, India.
nigelthomas2002@gmail.com

Background: Rising dependence on mobile devices has led to increased sleep disturbances, impairing memory, focus, and mental health. Prolonged screen exposure, blue light, and digital addiction disrupt sleep patterns. Artificial Intelligence (AI)-based interventions, including personalized monitoring and digital detox strategies, offer promising solutions to improve sleep and cognitive function. Aim and Objectives: This study aims to evaluate the effectiveness of AI-assisted interventional approaches in reducing mobile addiction and improving sleep quality to enhance cognitive well-being. The objectives include identifying the prevalence of sleep disturbances due to mobile overuse, implementing AI-driven interventions such as usage tracking, behavior prediction, and sleep hygiene reinforcement, and analyzing their outcomes on cognitive performance. Methodology: A prospective interventional study was conducted among 500 participants with mobile-related sleep disturbances. Participants were randomized into an intervention group receiving AI-assisted monitoring and counseling (using free apps: Sleep Cycle, Rescue Time, Headspace, and Digital Wellbeing) and a control group following routine lifestyle. Sleep quality and cognitive performance were assessed using standardized questionnaires, actigraphy, and cognitive tests at baseline and post-intervention. Data were analysed using paired t-tests and ANOVA. Results: The intervention group demonstrated a significant improvement in sleep duration and quality ($p < 0.01$), with reduced late-night screen exposure as predicted and managed by AI tools. Sleep Cycle and Digital Wellbeing users showed higher adherence to sleep schedules, while Rescue Time effectively reduced compulsive phone usage. Cognitive function scores, particularly in memory retention and attention span, improved markedly compared to the control group. Participants reported reduced mobile cravings, better mindfulness, and enhanced daytime productivity. Statistical analysis revealed a strong correlation between AI-guided interventions and improved cognitive outcomes. Conclusion: The findings suggest that AI-assisted interventions using freely available applications like Sleep Cycle.

**Keywords:** Artificial Intelligence, Sleep disturbances, Cognitive function, Mobile addiction, Actigraphy, ANOVA.

**SCREENING AND EVALUATION OF AI-DRIVEN NANOPARTICLE-BASED ANTIMICROBIAL PEPTIDES**

Lade Keerthana, Kakani Anil Kumar, Teja sri Vudumula, Minakshi Kommoju, Kanaka Druga Devi Nelluri
Department of Pharmaceutics and Biotechnology, KVSR Siddhartha College of Pharmaceutical Sciences, Vijayawada-520010, Andhra Pradesh, India.
keerthanalade2004@gmail.com

Antimicrobial peptides (AMPs) are promising alternatives against antibiotic-resistant bacteria but are costly to synthesize and test indiscriminately. AI models can predict the antimicrobial potential of peptide sequences, reducing costs before wet-lab formulation. Chitosan nanoparticles (CNPs) enhance peptide stability and sustained delivery, creating an effective nanobiotechnological solution. Main Objectives of research includes Use AI to screen peptide sequences for antimicrobial activity, Formulate AMP-loaded CNPs for enhanced antibacterial activity and Validate AI predictions through in vitro testing. By Using the Antimicrobial Peptide Database (APD3) to collect peptide sequences and associated antimicrobial activity data. Extract physicochemical features (charge, hydrophobicity, molecular weight, amphipathicity). In this studies AI Integration of Train classification models using Python (scikit-learn) to predict antimicrobial activity, Algorithms: Random Forest, SVM, and XGBoost and Validate the model with test datasets and select top-performing peptides. Formulation designed by Using ionic gelation to prepare chitosan nanoparticles loaded with selected peptides, optimizing Chitosan: TPP ratio, Peptide concentration, pH conditions and Characterization studies of Size and PDI (DLS), Morphology (TEM) and Encapsulation efficiency.In Vitro Testing Evaluated antibacterial activity using disc diffusion and MIC against E. coli and S. aureus and correlate *in vitro* results with AI predictions. Significantly This work proved competence in designing AI models for screening therapeutic peptides, bridging in silico predictions with nanotechnology, crucial for antimicrobial resistance research and created effective peptide-loaded CNPs with enhanced stability and antibacterial properties, pre-screening and exposure of peptide research, nanobiotech, and AI integration

**Keywords:** Antimicrobial peptides (AMPs), Artificial intelligence (AI), Machine learning, Chitosan nanoparticles (CNPs), Ionic gelation, Nanobiotechnology, Antibacterial activity, Drug delivery, Minimum Inhibitory Concentration (MIC), Antibiotic resistance.

**LEVERAGING CLAUDE AI FOR ADVANCED ADR DETECTION AND PHARMACOVIGILANCE: INNOVATIONS IN PHARMACY PRACTICE**

Chethana Mv, Muchukota Sushma, Shobha Rani R.H
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Kogilu Main Road, Yelahanka, Bangalore-560064, Karnataka, India.
chethanamadhan@gmail.com

Background: Adverse Drug Reactions (ADRs) are a significant challenge in clinical pharmacy, contributing to hospitalizations, increased healthcare costs, and patient morbidity. Traditional ADR detection methods rely on manual reporting, which is often delayed and underreported. Claude AI, a state-of-the-art language model, offers an innovative solution by enabling real-time ADR detection, predictive pharmacovigilance, and AI-powered patient counseling. This study explores how Claude AI can enhance ADR identification and optimize drug safety monitoring in pharmacy practice. Aim and Objectives: To

ISBN: 978-81-980623-8-3

evaluate the role of Claude AI in detecting ADRs using predictive analytics and natural language processing (NLP). To assess the effectiveness of Claude AI in real-time ADR reporting and documentation. To analyze the impact of AI-driven pharmacovigilance on patient safety and clinical decision-making. Methodology: A prospective observational study was conducted on 220 Patients in collaboration with hospital pharmacists. The AI system was integrated into electronic health records (EHRs) to analyze patient data, medication history, and reported symptoms. AI-powered chatbots engaged patients in ADR self-reporting, while Claude AI cross-referenced symptoms with pharmacovigilance databases to identify potential ADRs. Pharmacists validated AI-generated ADR alerts and recorded intervention outcomes. Results: Claude AI successfully identified and detected ADRs with 85% accuracy, reducing detection time by 60% compared to manual reporting. AI-assisted counseling improved adherence to safety protocols by 40%, and pharmacists reported a 50% improvement in efficiency for ADR documentation and risk assessment. Clinical decision-making and patient outcomes improved significantly due to faster identification and intervention. In 220 patients, AI integration with EHRs enabled continuous monitoring of medication history and reported symptoms. Pharmacists validated AI-generated alerts in real-time, ensuring accuracy and timely interventions. Conclusion: Claude AI revolutionizes ADR detection and pharmacovigilance by enabling real-time monitoring, predictive analytics, and automated reporting. Its integration into pharmacy practice enhances patient safety, reduces ADR-related hospitalizations, and supports evidence-based medication management.

## NANOROBOTS: THE NEXT-GEN SOLDIERS IN TARGETED DRUG DELIVERY

Vaishnavi Thengadi, Vinita Kale, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee Nagpur- 441002.
vaishnavithengadi100@gmail.com

Targeted drug delivery has emerged as a critical challenge in modern therapeutics due to issues such as systemic toxicity, poor bioavailability, and lack of site specificity. Conventional drug delivery systems often expose healthy tissues to drugs, leading to adverse effects and reduced therapeutic efficacy. Nanorobots, which are nanoscale programmable machines, offer a novel strategy to overcome these limitations. These nanodevices can be engineered using DNA origami, magnetically controlled nanoparticles, or biological hybrids, enabling them to selectively recognize diseased cells, navigate complex biological environments, and release therapeutic agents in a controlled and localized manner. Importantly, nanorobots can cross physiological barriers such as the blood–brain barrier, expanding treatment possibilities for neurological disorders. Recent advancements, including DNA nanorobots for vascular occlusion in tumor therapy and magnetically powered nanorobots for targeted antibiotic delivery, have demonstrated their promising potential in oncology, neurology, and cardiovascular medicine. While significant challenges remain in terms of biocompatibility, large-scale manufacturing, cost, and regulatory approvals, nanorobotics represents a revolutionary step toward intelligent, site-specific, and personalized drug delivery systems.

**Keywords:** Nanorobots, Targeted drug delivery, Precision medicine, Theranostics.

## OPTIMIZING MEDICATION ADHERENCE USING AI TECHNOLOGIES: A PATIENT-CENTERED APPROACH TO SMART HEALTHCARE

Ayesha Mahreen
Department of PharmD, Vaageswari College of Pharmacy, Karimnagar, Telangana, India.
ayshamahrinn@gmail.com

Medication adherence – taking medications as prescribed – is critically low in chronic diseases. Globally only about 50% of patients adhere to long-term therapies, and rates in Type 2 diabetes (T2DM) are even lower (e.g. ~34% reported in India). This leads to poorer glycemic control, more complications, hospitalizations and enormous costs (an estimated 125,000 preventable deaths and $100 billion/year in the US alone). Conventional solutions (SMS reminders, pillboxes, apps) yield only modest gains (typically ~10–20% absolute improvement) and often fail to sustain engagement or address individual patient needs. Artificial Intelligence (AI) offers a breakthrough: by learning each patient's behavior and tailoring support, AI can personalize reminders, predict non-adherence and adapt in real time. We propose MedBuddy AI, a hybrid agentic–generative AI system: an agentic component autonomously engages patients (scheduling tasks, monitoring data) while a generative component crafts personalized messages and education. This dynamic platform continuously tracks disease status, medication schedules, and behavior. Early evidence suggests AI-based interventions can boost adherence by up to ~20–30%. We outline a quantitative study design, present a patient-centered intervention model (addressing psychological, behavioral and literacy factors), and show how AI tools (predictive analytics, real-time monitoring) can make interventions adaptive and precise. Finally, we describe a scalable, low-cost deployment plan for India – e.g. voice-based prompts in local languages for rural, low-literacy populations– aiming to significantly improve T2DM adherence and outcomes.

**Keywords:** Medication adherence, Artificial Intelligence (AI), Type 2 diabetes (T2DM), Personalized intervention, Digital health.

**AI-90**

## AI-DRIVEN DRUG REPURPOSING: TRANSFORMING PHARMACEUTICAL INNOVATION

Luqman Bin Fahad
Department of PharmD, Vaageswari College of Pharmacy, Karimnagar, Telangana, India.
luqmannord@gmail.com

The traditional drug discovery process is time-intensive, costly, and marked by high attrition rates, often requiring over a decade and billions in investment for a single approved drug. This research explores artificial intelligence (AI)-driven drug repurposing as a strategic solution to these limitations. The objective was to assess how AI methodologies—such as machine learning, deep learning, natural language processing, and knowledge graphs—can identify novel therapeutic applications for existing drugs, drastically reducing development time and costs. Case studies, including Sildenafil, Thalidomide, and Aspirin, were analysed to understand historical success patterns, while modern examples like Baricitinib and DeepDrug validated AI's predictive capabilities. An implementation framework was constructed, outlining a four-phase strategic workflow: hypothesis generation, preclinical validation, clinical development, and IP strategy. AI-enabled systems demonstrated success in processing multi-omics data, analysing adverse event reports, and integrating real-world evidence from EHRs to reveal hidden drug-disease links. The study concludes that AI-driven repurposing transforms pharmaceutical innovation from serendipity to system, offering a cost-effective, time-efficient, and patient-centric approach to therapeutic development, with significant implications for precision medicine and global health equity.

**Keywords:** Artificial intelligence, drug repurposing, machine learning, side effect mining, pharmaceutical innovation.

## AI-INTEGRATED TELEPHARMACY FOR PERSONALIZED MEDICATION COUNSELLING IN INDIAN PUBLIC HOSPITALS: A CONCEPTUAL FRAMEWORK TO ADDRESS POLYPHARMACY AND IMPROVE ADHERENCE

Shivika Parsai, Divy Kandare, Chanchal Jain, Reenu Yadav
Department of Pharmacy, Prestige Institute of Management and Research, Bhopal,
Madhya Pradesh, India - 462021.
shivikaparsai@gmail.com

India's public healthcare system is struggling with a severe shortage of trained clinical chemists which leads to various healthcare issues like non-compliance to medication, adverse reactions and polypharmacy especially among the elderly and those with chronic diseases. While telepharmacy is a big solution, it is often devoid of real time clinical decision support and personalization. This proposal presents a telepharmacy model integrated with AI to address the needs of public hospitals in India. This model enhances telepharmacy based medication

ISBN: 978-81-980623-8-3

management by using patient Electronic Health Records (EHRs) and AI algorithms to provide real time alerts for drug-drug interactions and polypharmacy, personalized counseling through voice assistants, chatbots or SMS and AI driven medication adherence alerts. The model is designed to be interoperable with existing digital healthcare ecosystem like eSanjeevani and Ayushman Bharat Digital Mission (ABDM) so that pharmacists can spend more time on senior consultations and triaging and follow up to AI. The model proposes improved medication safety, identification of drug related risks at an early stage, patient adherence with automated tailored follow ups and reduction of workload for pharmacists in high volume settings. The AI-telepharmacy framework provides a structured and scalable solution to optimize drug use and address the chemist shortage in India's healthcare infrastructure. Future implementation will require addressing regulatory standards, prototyping and stakeholder engagement to ensure deployment and acceptance. This is a step forward towards personalized, efficient and technology driven pharmaceutical care in India's public health system.

**Keywords:** Telepharmacy, artificial intelligence, polypharmacy, public hospitals, clinical decision support.

**THE CANS PLATFORM: AN AI-GUIDED, CLOSED-LOOP MICRONEEDLE SYSTEM FOR PERSONALIZED NOOTROPIC DELIVERY**

Daisy P.A, Kavitha Vasudevan, Reenimol M, Mariya Meenu
St. Joseph's College of Pharmacy, Cherthala, Kerala, India, 688524
daisy.augustine007@gmail.com

The Chrono-Adaptive Nootropic System (CANS) represents a paradigm shift in cognitive enhancement technology, moving beyond static, passive transdermal patches to a fully integrated, closed-loop bio-optimization platform. The system is built upon a flexible, biocompatible micro-moulded silicone substrate that houses a suite of non-invasive biosensors and a digitally-actuated drug delivery mechanism. Real-time physiological data, including electrodermal activity and sweat cortisol levels, are continuously monitored to assess the user's stress, arousal, and circadian state. This data is processed by a proprietary chronobiological algorithm that interprets deviations from the user's personalized baseline rhythm. In response, the algorithm triggers the on-demand release of specific nootropic agents from an array of gold-coated, dissolvable microneedles. The payload, featuring microencapsulated L-Tyrosine, Caffeine, and L-Theanine, is delivered with high spatiotemporal precision to reinforce natural cognitive peaks and mitigate troughs. By fusing real-time biosensing with adaptive, chronologically-aware pharmacology, the CANS offers a novel, data-driven approach to sustainable cognitive performance. This platform technology establishes a new category of personalized health devices capable of active, intelligent biological modulation, moving beyond passive tracking to dynamic intervention. The system's architecture, requiring a combination product regulatory pathway, provides a significant competitive moat against conventional supplement-based products.

**Keywords:** Nootropics, Transdermal drug Delivery, Smart Patch, Cognitive enhancement, Biosensors.

**AI-93**

**ARTIFICIAL INTELLIGENCE IN DIAGNOSIS OF POLYCYSTIC OVARY SYNDROME (PCOS)**

Puja Hansaraj Bisankar, Minakshi Krushnakumar Desai,
Upadesh B. Lade Sir
Chhatrapati Shivaji College Of Pharmacy Deori, Dist. Gondia -441901
pujabisankar@gmail.com

Polycystic ovary syndrome (PCOS) is one of the most common reproductive endocrine disorders in women underline indication of ovarian cysts. Polycystic ovary syndrome is an endocrine gynecology disorder affecting females aged between 12 and 45 years. The persistent hormonal imbalance leads to the complexities such as numerous cysts, an irregular menstrual cycle that ultimately leads to infertility among females. Many candidate genes have been identified to be one of the causes of PCOS. According to World Health Organization (WHO) estimation revealed over 116 million women (3.4%) are affected by PCOS worldwide. The predisposing risk factors include genetics, absent menstrual cycles, pigmentation,decrease in hair volume, particularly elevated androgens and insulin resistance, neuroendocrine, lifestyle/environment and obesity that contributes to the development of PCOS. The treatment in PCOS is mainly symptomatic and involves lifestyle interventions and medication such as Metformin, Oral contraceptives and anti-androgens. However, the management of PCOS is challenging and current interventions are not able to deal with outcomes of this syndrome. This review encompasses the latest pharmacotherapeutic and non-pharmacotherapeutic interventions currently in use to tackle various symptomatic contentions in PCOS. Our focus has been mainly on novel therapeutic modalities for treatment/management of PCOS. Probability based inference systems are designed to estimate and stage the degree of the PCOS condition in the patient.

**Keywords:** PCOS, pathophysiology, diagnostic criteria, metabolic disease, lifestyle intervention.

**APPLICATIONS AND BENEFITS OF ARTIFICIAL INTELLIGENCE (AI) AND MACHINE LEARNING (ML) IN HEALTHCARE**

Prabhakar Reddy Veerareddy
University College of Pharmaceutical Sciences, Palamuru University, Mahabubnagar, Telangana
vpreddyindia@gmail.com

AI technologies are used in the healthcare industry as a driving force to improve healthcare-related products and services like computer vision (CV), natural language processing (NLP) and machine learning (ML). Artificial intelligence (AI) and machine learning (ML) to the R&D, production, and distribution of products and services.AI/ML technologies can enhance business agility and improve strategies by increasing fast, accurate decision-making, reducing costs. AI/ML brings changes to the entire product lifecycle in drug discovery, clinical trials and product launch. The use of AI is being explored in the pre-clinical phase to understand disease biology and drug candidates, in the clinical phase to help target populations and to design intervention studies and in the development of digital therapeutics and devices to enable continuous monitoring. The pharmaceutical industry is poised for significant transformation in the coming years with the rise of AI. AI will improve operation efficiency, reduce operational costs, and help organizations comply with regulations. An AI can manage all supply chain management operational aspects by tracking demand variations, minimizing waste, and avoiding drug shortages. AI will streamline the

ISBN: 978-81-980623-8-3

drug development process by speeding up clinical trials, automating data analysis, and assisting in decision-making with predictive analytics. Artificial intelligence (AI) has the potential to bring about a paradigm shift in the way drug are researched, developed and marketed. AI is changing the pharmaceutical industry by looking at data science, drug discovery, clinical trials, marketing and R&D. Applications of AI are improving healthcare delivery in preventive care, disease diagnosis and prediction, treatment plans and administrative work, benefiting both the patients and healthcare providers. Implementation of AI in India with 1.4 billion people is a essential to improve the healthcare system. India was the founding member of the Global Partnership on AI (GPAI) alliance since 2022–23 has adopted a measured approach for the integration of AI.

**REVOLUTIONIZING PHARMA: THE ROLE OF ARTIFICIAL INTELLIGENCE IN DRUG DISCOVERY AND DEVELOPMENT**

Chinimilli Esther Rani,
Shri Vishnu College of Pharmacy, Vishnupur, Bhimavaram, West Godavari District, Andhra Pradesh, 534202

The application of artificial intelligence (AI) is revolutionising pharmaceutical research by transforming the landscape of drug discovery and development. Traditional drug development is frequently time-consuming, expensive, and resource-intensive, but AI-powered alternatives are speeding up the process using predictive modelling, virtual screening, and advanced data analytics. Machine learning algorithms analyse massive biological, chemical, and clinical datasets to find new drug prospects, optimise molecular design, and predict pharmacological features with greater accuracy. In clinical development, AI improves patient selection, trial design, and real-time monitoring, resulting in increased trial efficiency and lower failure rates. Additionally, by customising medications to each patient's unique genetic and clinical profile, AI-powered solutions enable personalised medicine by providing more focused and efficient treatments. AI not only boosts productivity in the pharmaceutical sector but also opens the door for safer, quicker, and more patient-centered healthcare innovations by increasing accuracy, reducing on timelines, and lowering prices.

**Keywords:** Artificial Intelligence (AI), Drug Discovery, Machine Learning, Predictive modeling.

**AI-97**

**INTEGRATING ARTIFICIAL INTELLIGENCE WITH OPEN-SOURCE PROGRAMMING IN PHARMACEUTICAL RESEARCH AND DEVELOPMENT: A COMPREHENSIVE STUDY**

Gopika Nath C, Sarath Chandran C, Rahul K, Abhijith K Shaji
College of Pharmaceutical Sciences, Govt. Medical College, Kannur, Pariyaram- 670 503
Kerala University of Health Sciences, Thrissur-680 541
Manipal College of Pharmaceutical Sciences, Manipal Academy of Higher Education, Manipal-576 104
gopikanathc@gmail.com

Integrating artificial intelligence (AI) with open-source programming languages such as Python and R can transform pharmaceutical research and development. These computational methods can complement and enhance traditional experimental research. In this study, we developed and evaluated the potential of AI-assisted Python and R-based programming for selected pharmaceutical applications. AI-assisted Python codes were developed for paediatric dose calculations using Young's, Fried's, and Dilling's equations and for laboratory-level wet granulation process calculations. The results from both studies were consistent with manual calculations and commercial software outputs. RStudio (version 4.3.3) was used in the Response Surface Methodology (RSM) for a $2^3$ full factorial design to optimize an oral formulation. Optimized conditions (8% w/v cryoprotectant, 100 mg drug loading, 15 min trituration) resulted in 98.25% drug content, 16.28 mg/ml solubility, and 44.604% drug release within 10 min. The *in vitro–in vivo* correlation (IVIVC) of rosuvastatin–hydroxypropyl-β-cyclodextrin inclusion complexes was studied using RStudio. The Loo–Reigelman deconvolution method showed that nonlinear polynomial regression provided a better fit for the predicted values ($R^2$ = 0.8698, RMSE = 0.1420, MAE = 0.1271) compared to linear regression. The absorption rate constant (ka= 0.0845) is consistent with the established pharmacokinetics of rosuvastatin. In both studies, RStudio generated outputs similar to those of commercial software. The findings of these studies indicate that AI-assisted Python and R can generate precise outputs in pharmaceutical calculations, formulation optimization, and IVIVC modelling. Hence, the potential of AI assisted open-source programming languages should be explored for affordable and robust pharmaceutical research and development.

**Keywords:** Artificial Intelligence, Open-Source Programming, Pharmaceutical Research and Development, Python, R.

**AI-98**

**ADVANCEMENTS IN ARTIFICIAL INTELLIGENCE (AI) FOR THE DESIGN AND OPTIMIZATION OF SOLID DOSAGE FORMS**

Devraj Pandey, Shubham Kamble, Tirupati Rasala
The Royal Gondwana Collage of Pharmacy, Nagpur

Artificial Intelligence (AI)-driven formulation development is an emerging approach that holds significant promise for accelerating drug product development. AI offers a versatile suite of algorithms applicable across diverse pharmaceutical contexts. Solid dosage forms—such as tablets, capsules, powders, and granules—remain the most common modes of drug administration. Their development is influenced by multiple factors, including critical material attributes (CMAs) and processing parameters, which can impact key product characteristics such as dissolution rate, physical and chemical stability, particle size distribution, and dry powder aerosol performance. Traditional trial-and-error methods for formulation design are often inefficient, resource-intensive, and time-consuming. Recently, AI has gained recognition as a transformative tool in pharmaceutical formulation science. This review outlines: (1) an overview of AI in pharmaceutical sciences with regulatory guidance, (2) strategies for database generation for solid dosage formulations, (3) data preparation and processing techniques, (4) a comparative discussion of AI algorithms, and (5) applications and case studies relevant to solid dosage forms. Additionally, the review highlights the role of deep learning-based image analytics in pharmaceutical applications. Leveraging AI enables scientists to better predict and optimize formulation properties, leading to more efficient and targeted drug product development.

**Keywords:** Artificial Intelligence, AI algorithms, solid dosage forms, tablets, capsules, powders, granules, pharmaceutical formulation development, critical material attributes (CMAs), processing parameters, dissolution rate, stability, particle size distribution, aerosol performance, trial-and-error.

**AI-99**

**IMMERSIVE VR FOR PHARMACY EDUCATION: FROM SKILLS GAP TO SCALABLE SIMULATION**

T.N. Hemendra, R. Shruti, S. Sanjay Kumar, Srikanth Jeyabalan
Sri Ramachandra Faculty Of Pharmacy, Sri Ramachandra Institute Of Higher Education And Research (Deemed To Be University), Porur, Chennai – 600116, Tamil Nadu, India

Introduction: The project addresses a persistent challenge in pharmacy education—limited access to live experimental training due to ethical, regulatory, and logistical constraints. Traditional lab-based pharmacology education lacks scalability and standardization, creating a skills gap in graduating students. We propose a Virtual Reality (VR) solution aligned with the Pharmacy Council of India (PCI) curriculum, offering procedural simulations with real-time feedback so students can safely practice mandated experiments. This supports competency-based education, reduces training costs, promotes accessibility, and aligns with SDG 3, 4, and 9. Practical pharmacology training in India is still heavily dependent on animal models, but ethical restrictions and infrastructural limitations prevent many institutions from providing sufficient hands-on practice. As a result, students often receive uneven exposure and limited repetition of critical experiments. A scalable VR-based alternative can bridge these gaps and strengthen national goals for high-quality healthcare education. A pilot VR module was developed using Unity 3D, with inputs from faculty and laboratory coordinators. Key features include step-wise guidance, interactive elements such as pipetting and dose selection, instant feedback, and performance analytics. Testing was conducted using Oculus Quest 2 and Android-based VR kits. A validation study with 30 students and 5 faculty members showed significant skill

ISBN: 978-81-980623-8-3

improvement (38.6%, p = 0.002), with 91% of students reporting higher procedural confidence. Cost analysis suggested up to 60% savings over three years compared to maintaining physical labs. VR simulations provide ethical, repeatable, and accessible learning while reducing dependence on animal experimentation. Future goals include expanding to all PCI-mandated experiments, adding instructor dashboards, integrating multilingual support, and partnering with 50+ colleges by 2026.

**AI-100**

**ARTIFICIAL INTELLIGENCE IN PHARMACY: BRIDGING INNOVATION AND PRACTICE IN DRUG DEVELOPMENT AND CLINICAL OPERATIONS**

Shifa Sheikh, Shubham Kamble, Tirupati Rasala
The Royal Gondwana College Of Pharmacy, Nagpur

This systematic review critically examines the transformative influence of artificial intelligence (AI) across various dimensions of pharmacy practice. As the pharmaceutical industry grapples with persistent challenges—ranging from supply chain disruptions and clinical trial inefficiencies to complexities in drug discovery—AI emerges as a powerful enabler of innovation and optimization. The study synthesizes findings from a broad selection of peer-reviewed literature, revealing how AI technologies, including supervised and unsupervised learning models, enhance predictive analytics, target identification, and drug development pipelines. AI applications in virtual clinical trials, wearable health monitoring, and data-driven drug repurposing not only reduce time and cost but also elevate precision and patient-centric care. Furthermore, AI-driven insights facilitate rapid screening of molecular structures, toxicity prediction, and efficient design of bioactive compounds, reshaping the traditional research and development workflow. The review also highlights AI's growing role in automating clinical trial data analysis and optimizing real-world data for regulatory decisions and pharmacovigilance. Despite its vast potential, the study acknowledges critical limitations, such as data bias, cybersecurity risks, and the need for human oversight in interpreting AI-generated outcomes. As the pharmaceutical sector adapts to post-pandemic demands, the integration of AI tools presents both opportunities and responsibilities. The review concludes that sustainable advancement in pharmacy practice hinges on continued investment in AI infrastructure, ethical governance, and interdisciplinary collaboration to fully realize its potential. Future research must aim at refining AI methodologies and expanding their real-world implementation for enhanced global healthcare delivery.

**AI-101**

**ARTIFICIAL INTELLIGENCE IN DRUG DESIGN AND DEVELOPMENT**

Iqra Tamboli, Swapnil Dounde
MCESS Allana College Of Pharmacy

The integration of Artificial Intelligence (AI) into drug discovery and development is revolutionizing the pharmaceutical industry worldwide, with profound implications for India's rapidly growing pharma sector. AI-driven technologies, such as machine learning (ML), deep learning, and natural language processing, are accelerating target identification, molecular design, and predictive modeling of drug behavior. These innovations significantly reduce the time, cost, and attrition rates associated with traditional R&D pipelines. In silico methods powered by AI are enabling de novo drug design, virtual screening, and lead optimization with increased precision. Predictive algorithms are also enhancing ADMET (Absorption, Distribution, Metabolism, Excretion, and Toxicity) profiling and facilitating drug repurposing strategies — a particularly valuable approach in resource-constrained environments. For Indian pharmaceutical companies, the adoption of AI offers an opportunity to leapfrog traditional bottlenecks and establish leadership in generics, biosimilars, and novel therapies. AI can also support compliance with global regulatory standards through automated quality control, process optimization, and pharmacovigilance. However, challenges such as data quality, regulatory uncertainty, limited technical expertise, and the need for robust digital infrastructure persist. Collaboration between academia, startups, and the pharmaceutical industry, alongside supportive policy frameworks, will be essential to fully realize AI's potential in India. This explores key applications, recent advancements, and future directions of AI in drug design and development, highlighting case studies relevant to the Indian context. As AI matures, it promises to transform drug development from a linear process into an agile, data-driven, and patient-centric paradigm.

**AI CHATBOTS FOR PATIENT COUNSELING IN COMMUNITY PHARMACY**

Aman Shaikh, Swapnil Dounde
Mces Dr. P.A. Inamdar University, Allana College Of Pharmacy

Artificial Intelligence (AI) is rapidly transforming the healthcare sector, including community pharmacy practice. This project explores the development and educational use of an AI-based chatbot designed to assist in patient counseling byaddressing basic drug-related queries. Aimed at second-year pharmacy students, the chatbot prototype functions as a virtual assistant capable of answering common questions regarding drug dosage, indications, side effects, storage, and possible interactions. Built using a simple rule-based logic and natural language processing framework, the chatbot offers responses inan easy-to-understand format aligned with pharmacy standards. This hands-on prototype enables students to simulate real-life counseling scenarios, helping them improve their communication skills and pharmacological understanding. It also introduces future pharmacists to digital innovations in healthcare, preparing them for tech- integrated practice. Theuse of such tools can improve medication adherence, reduceerrors, and support better health outcomes in the community. The project highlights the potential of AI in bridging the gap between academic learning and real-world pharmacy practice. With future improvements, the chatbot can be expanded to handle more complex queries and multiple languages, making it a valuable tool for both learning and patient support.

**Keywords:** AI Chatbot, Patient Counseling, Community Pharmacy, Pharmacy Education, Drug Use.

**ARTIFICIAL INTELLIGENCE IN DRUG DISCOVERY**

Saloni Lalchand Sahare, Upadesh B. Lade
Chhatrapati Shivaji College of Pharmacy Deori, dist- Gondia (M.H) 441901
salonisahare604@gmail.com

Drug development is a process that demands huge investment of resources and time with only 1 drug candidate successful in reaching market among 10,000 screened taking time duration of 10-15 years and millions of dollars. This high attrition rates discourage investors and researchers. The pharmaceutical industry is shifting its attention away from de novo drug research and towards discovering novel targets and indications for already-approved drugs. In order to accelerate the drug development process with reduced risk of failure and relatively lower costs, pharmaceutical companies have adopted AI-driven drug discovery. A combination of synthesis planning and ease of synthesis is feasible and more and more automated drug discovery by computers is expected in the near future. This field is driven particularly by artificial neural networks like deep neural networks or recurrent networks. It plays a crucial role in drug screening by predicting ADME properties (absorption, distribution, metabolism, and excretion), physicochemical properties, and more. AI enhances the drug design process by improving the efficiency and accuracy of predicting drug behavior, interactions, and properties. Artificial intelligence in DE NOVO design drives the generation of meaningful new biologically active molecules towards desired properties. Artificial intelligence (AI) has the potential to revolutionize the drug discovery process, offering improved efficiency, accuracy, and speed.

**Keywords:** Drug design, Drug development, Neural networks, Drug screening, Toxicity prediction, ADME properties, DE NOVO design.

**INTEGRATING AI WITH PHARMACOGENOMICS TO OVERCOME TREATMENT CHALLENGES IN BREAST CANCER: AI-DRIVEN PHARMACOGENOMICS IN CLINICAL MANAGEMENT TUMOR HETEROGENEITY AND DRUG RESISTANCE IN INVASIVE DUCTAL CARCINOMA (IDC).**

ISBN: 978-81-980623-8-3

Divyesh Sondarva, priya patel
Department of pharmaceutical sciences saurashtra university
rajkot,Gujrat 360005
divyeshsondrva18@gmail.com

IDC is a malignant tumor that begins in the milk ducts of the breast and invades the surrounding breast tissue. BRCA1 and BRCA2 are tumor suppressor genes, which means their normal function is to repair DNA damage and maintain genetic stability and when these genes are mutated, they lose their DNA repair function, allowing harmful mutations to accumulate in breast cells, which can lead to cancer development. Breast cancer is the most common cancer among Indian women. IDC accounts for ~80% of all breast cancer cases in India. The age-standardized incidence rate (ASIR) of breast cancer in India is approximately 25–30 per 100,000 women. Ai base pharmacogenomic are clinical management of tumor heterogeneity, tumor mutation burden, and chemotherapy resistance such as MDR, DNA repair, Apoptosis resistance and hormone therapy mutation such as ER mutation and targeted mutation are HER2-positive breast cancer and epigenetic changes. AI-based pharmacogenomics integrates genomic data with machine learning to predict which patients are likely to experience severe toxicity — enabling safer, personalized cancer treatment. AI-Based Pharmacogenomics Works in Personalization of IDC Treatment in Patient-Specific Genomic & Transcriptomic Profiling, Personalized Drug Selection, Personalized Dosing Strategy, Monitoring and Adaptive Therapy. Ai base pharmacogenomic can help multi-omics data integration, identification of resistance markers, drug sensitivity prediction, targeting CME components and real time monitoring & adaptation. The monitor AI based pharmacogenomic Tool in IDC: set up continuous data feeds, key biomarkers to monitor in IDC, ai model monitoring metrics, dashboards and visualization tools, feedback loop & Decision Making.

## PHARM PROBE: AN AI-DRIVEN APP FOR STRUCTURED ADR REPORTING AND REAL-TIME PHARMACOVIGILANCE

Mustafa Mushala, Swapnil Dounde
Allana Collage of Pharmacy, azam campus, Pune, 411042
mushalamustafa@gmail.com

Pharm Probe is an iOS pharmacovigilance application built with Swift UI that streamlines Adverse Drug Reaction (ADR) reporting to enhance public healthcare safety. Designed for pharmacists and citizens, the app enables structured ADR submission through guided digital forms capturing essential data, including patient age, drug details, dosage, symptom onset, manufacturer, and location. The platform automatically categorizes and organizes reports in real-time by drug type, adverse effects, geographic location, and demographic groups, providing clear insights for pharmaceutical companies and regulatory bodies monitoring drug safety. An integrated AI chatbot powered by DeepSeek API offers users personalized advice by analyzing their symptoms, age, and medication information, delivering accessible guidance in simple language. Emphasizing user-first design, Pharm Probe bridges the critical gap between ADR experiences and actionable healthcare insights. The app empowers both rural and urban pharmacists with efficient reporting tools while enabling citizens to receive timely medical guidance. Its accessibility-focused approach ensures diverse populations can contribute to medication safety monitoring. By creating structured feedback loops between patients, healthcare providers, and regulatory stakeholders, Pharm Probe transforms traditional ADR reporting into a comprehensive, real-time safety network. This streamlined approach promotes safer medication practices across communities while providing pharmaceutical companies and government agencies with valuable data for evidence-based decision-making.

**Keywords:** Pharmacovigilance, Adverse Drug Reaction, Mobile Health Application, SwiftUI, DeepSeek AI, Geolocation-based Reporting, Drug Safety Monitoring, Healthcare Accessibility, Digital Health Solution.

## AUTOMATION AND ROBOTICS IN ANALYTICAL METHOD DEVELOPMENT: REDUCING HUMAN ERROR AND ENHANCING COMPLIANCE

Smita S. Waghmare (Bedis), Sonali R.Devne, Neelam S.Bhagdevani
Dnyanvilas College of Pharmacy, Alandi, Dudulgaon

This poster highlights the transformational role of automation and robotics in analytical method development. It details how these technologies reduce the potential for human error, support rigorous compliance, and foster efficient, high-quality method establishment. Use cases and industry examples will demonstrate the tangible benefits of this technological shift, emphasizing its key role in delivering safer, more reliable pharmaceuticals to market.Method development done manually is often prone for variability, inconsistencies, and inadvertent mistakes which can compromise data integrity and delay progress in new drug development. Automation and robotic solutions address these challenges by delivering precise and repeatable operations, including sample handling, reagent dispensing, instrument tuning, and data acquisition. Automated platforms standardize procedures leads to highly reproducible results and robust analytical methods. Robotics works round-the-clock to unattended operation, ensuring consistent application of protocols while significantly boosting laboratory productivity. Additionally, these technologies timelessly integrate with digital records, and compliance software, facilitating real-time tracking, audit trails, and electronic documentation—essential requirements for meeting stringent regulatory guidelines.

## AUGMENTING PHARMACY EDUCATION WITH ARTIFICIAL INTELLIGENCE AND IMMERSIVE TECHNOLOGIES FOR BETTER CONCEPTUAL CLARITY FROM THEORY TO PRACTICE

Deepak Shamrao Khobragade1, Mrunali D. Khobragade2
1: Datta Meghe College of Pharmacy, DMIHER (DU), Sawngi Meghe Wardha, Maharashtra
2: Mauli Institute of Pharmacy and Research Center, Washim, Maharashtra

The incorporation of Artificial Intelligence (AI) and immersive technologies like Augmented Reality (AR) and Virtual Reality (VR) can transform pharmacy education by bridging the gap between theory and practice. Traditional teaching and learning approaches have limitations in delivering clarity for complex pharmaceutical concepts. AI-driven platforms enable personalized adaptive learning, feedback, and predictive analytics, while AR and VR provide interactive 3D environments that simulate real-world scenarios of pharmaceutical processes, compounding techniques, and clinical settings. These innovations enhance visualization, foster experiential learning, and develop problem-solving and decision-making skills among pharmacy students. Additionally, immersive technologies support remote and collaborative learning, improving accessibility and engagement. This paper focuses on innovative strategies, implementation frameworks, and evidence demonstrating the impact these technologies have on teacher-learner engagement, conceptual understanding, and competency-based outcomes. Adoption of AI and immersive tools aligns with Education 4.0, preparing future pharmacists for an increasingly technology-driven healthcare ecosystem for better outcomes.

**Keywords:** Artificial Intelligence, Augmented Reality, Virtual Reality, Pharmacy Education, Conceptual Clarity, Education 4.0.

## AI-DRIVEN BIOMARKER INTELLIGENCE FOR PREDICTING TOXICITY AND QUALITY OF LIFE IN CERVICAL CANCER PATIENTS UNDERGOING CONCURRENT CHEMOTHERAPY – A PROSPECTIVE INTERVENTIONAL STUDY

Muchukota Sushma
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Kogilu Main Road, Yelahanka, Bangalore-560064, Karnataka, India.
sushma.banthi@gmail.com

Cervical cancer patients on concurrent chemotherapy often face severe toxicities and reduced quality of life (QoL). Conventional monitoring identifies complications late, limiting timely care. Novel biomarkers (IL-6, CRP, GST, XRCC1) offer predictive value, and integrating Artificial Intelligence (AI) with biomarker data enables real-time forecasting of toxicity and QoL decline, supporting precision oncology and proactive pharmacist-led interventions. 1. To integrate novel biomarkers (IL-6, CRP, GST polymorphisms) with AI-assisted predictive modelling for early identification of high-risk patients prone to chemotherapy-related toxicities. 2. To compare the effectiveness of AI-supported pharmacist

ISBN: 978-81-980623-8-3

interventions in improving QoL recovery and reducing toxicity incidence between Group A (Carboplatin) and Group B (Paclitaxel + Carboplatin). A prospective interventional study was conducted on 342 patients (Stage I–IVA cervical cancer) divided into two groups: Group A (N=178) received Carboplatin 300 mg/m², while Group B (N=164) received Paclitaxel 175 mg/m² + Carboplatin. Biomarker levels (IL-6, CRP, GST polymorphisms) were assessed at baseline, mid-cycle, and post-treatment. AI-assisted platforms (scikit-learn–based BioMarkerNet® and OncoPredict AI®) integrated biomarker trends with QoL scores (EORTC QLQ-C30 & CX-24) and toxicity grading (CTCAE v5.0) to generate real-time risk alerts. Pharmacists acted on AI alerts through dose modifications, supportive therapy, and personalized patient counseling. Group A (Carboplatin): AI predicted hematological toxicities with 90% accuracy. High IL-6 and CRP correlated with anemia and thrombocytopenia. AI-guided interventions led to a 30% reduction in Grade 3/4 hematological toxicities and an 18% improvement in post-treatment QoL recovery compared to standard monitoring. Group B (Paclitaxel + Carboplatin): AI achieved 94% accuracy in predicting gastrointestinal and neuropathic toxicities.

**Keywords:** Cervical cancer, Concurrent chemotherapy, Artificial Intelligence, Novel biomarkers, IL-6, CRP, Quality of Life, Toxicity, Precision Oncology.

**AI-109**

## SMART AI HEALTH CARD: A GLOBAL APPROACH TO INTEROPERABLE AND AI-ENABLED HEALTHCARE IDENTITY

Sanjana Gupta, Azeem Bagwan,
Shivlingeshwar College of Pharmacy, Latur, Maharashtra, India.
Department of Pharmacy Practice
guptasanj2626@gmail.com

Healthcare systems worldwide remain fragmented, with national health IDs (e.g., ABHA, NHS, EHIC) lacking global interoperability, predictive intelligence, and offline emergency readiness. This gap creates challenges for cross-border care, medical tourism, and emergency response. We propose a Smart AI Health Card (Global Version)—a universally interoperable, AI-enabled health identity system. Designed with HL7 FHIR, ICD-11, SNOMED CT, and LOINC standards, the card integrates patient demographics, medical history, diagnostics, and prescriptions. It ensures security through blockchain-based audit trails and patient-controlled consent compliant with GDPR, HIPAA, and global data regulations. The system embeds AI-driven models for predictive healthcare, including early disease risk detection, adherence monitoring, and adverse drug reaction (ADR) alerts. Its emergency-first design supports QR/NFC-based offline access to critical health data, with multilingual translation for global usability. Pilot implementations across multiple countries will test interoperability, emergency utility, insurance validation, and patient experience. Expected outcomes include reduced duplication of investigations, improved emergency response, enhanced continuity of care, and a framework for universal health identity adoption under global agencies like WHO.

**Keywords:** Global Health Identity, Interoperability, Blockchain, Predictive Analytics, Emergency Readiness, Continuity of Care.

## ARTIFICIAL INTELLIGENCE IN PHARMACOVIGILANCE: AN OVERVIEW

M. Thilagavathi, K. Kanista, T. Shri Vijaya Kirubha
Department of Pharmacy Practice, Mother Terasa College of Pharmacy
Illuppur, Pudukkottai, Tamil Nadu - 622 102
thilagavathimakali25@gmail.com

Pharmacovigilance is essential for monitoring, detecting, and preventing adverse drug reactions (ADRs) to ensure drug safety and protect public health. Conventional approaches rely on manual data review and reporting, which can be labor-intensive and slow in identifying potential safety signals. AI techniques, especially machine learning (ML) and natural language processing (NLP), allow for the rapid analysis of large and diverse datasets, such as electronic health records, spontaneous reporting systems, literature databases, and social media. These technologies can automate case triage, improve signal detection, and support predictive modeling for ADR risk assessment. As healthcare data grows exponentially, AI has become a powerful tool to improve pharmacovigilance efficiency and accuracy. Additionally, near real-time surveillance is made possible by AI-driven systems, which promotes better decision-making and early interventions. Implementation issues still exist, nevertheless, including data heterogeneity, algorithm transparency, regulatory approval, and patient privacy ethics. The present state of AI in pharmacovigilance, its real-world uses, and its possible future paths are described in this overview. Drug safety monitoring might become a more proactive, accurate, and patient-centered procedure with the integration of AI, robust regulatory frameworks, and interdisciplinary cooperation. AI is predicted to play a bigger part in pharmacovigilance as it develops, promoting global medication safety and enhancing patient outcomes.

**AI-111**

## EMERGING OF ARTIFICIAL INTELLIGENCE AND TECHNOLOGY IN PHARMACEUTICALS REVIEW

R.Pradeepa, P.Manoj prabhakar, T.Shri Vijaya Kirubha
Department of pharmaceutics, Mother terasa college of pharmacy
Illuppur, Pudukkottai, Tamil Nadu-622 102
Pradeepar751@gmail.com

Background: This review examines the growing role of artificial intelligence (AI) in drug development, outlining recent breakthroughs achieved through its integration into pharmaceutical research. Advances in computing have revolutionized all scientific fields – from engineering to medicine- positioning AI as a vital tool in pharmaceutical chemistry and healthcare innovations. Main body: AI-driven drug development has increasingly replaced traditional methods, offering faster timeliness and greater precision in drug design. Through efficient identification of target proteins, AI enhances the success rate of new therapeutics. Its application spans every stage of the drug design pipeline, reducing development costs and minimizing preclinical health risks. By harnessing extensive pharmaceutical datasets and employing machine learning algorithms, I provide powerful data-mining capabilities, enabling deeper insights and more effective decision- making in modern drug discovery.

**Keywords:** Artificial intelligence, drug development, pharmaceutical research, computing medicine, HealthCare innovation

**AI-112**

## RECURABOT: AI-POWERED SYMPTOM ASSESSMENT AND CLINICAL COUNSELLING TOOL FOR PHARMACY AND HEALTHCARE PRACTICE

Sujal Pariyakar, Dulendra P. Damahe, Priti Singh, Sachin B. Narkhede
Smt. B.N.B. Swaminarayan Pharmacy College, Salvav-Vapi, Gujarat, India – 396191
sujalpariyakar04@gmail.com

Artificial intelligence (AI) is transforming pharmacy and clinical practice by making healthcare more accessible and patient-focused. RecuraBot is an innovative AI-powered healthcare assistant designed for use in pharmacies, clinics, and rural health programs. Based on patient-reported symptoms and optional CBC (Complete Blood Count) data, RecuraBot provides a quick and structured primary assessment that highlights possible diagnoses, underlying causes, preventive steps, and therapeutic options aligned with real-world pharmacy practice. The platform is built on a Flask-based Python backend, powered by a hybrid AI engine that combines a medical knowledge base with generative AI. Its dual workflow sets it apart; the first layer delivers concise, evidence-based recommendations for rapid triage, while the second layer offers an intelligent counseling mode that uses the patient's existing case data to provide deeper, conversational guidance clarifying treatment approaches and addressing patient concerns without repetition. RecuraBot supports offline use, PDF export, and multiple UI modes, making it highly adaptable for busy pharmacies, outreach clinics, and training institutions. It focuses on pharmacy-relevant information such as medicine classifications, over-the-counter options, and expert counseling points, unlike generic symptom checkers. Pilot studies have demonstrated high usability, precise condition mapping, and improved patient satisfaction through smooth transitions between quick triage and in-depth counseling. Aligned with India's National Digital Health Mission, RecuraBot delivers a scalable and affordable AI solution that bridges digital diagnostics with personalized pharmacy care, strengthening the role of pharmacists and clinicians as frontline health providers across urban and rural communities.

**Keywords:** AI healthcare assistant, CBC integration, patient counselling, pharmacy support, telemedicine.

ISBN: 978-81-980623-8-3

**HARNESSING AI AND ML TO TRANSFORM CLINICAL RESEARCH: ENHANCING SPEED, ACCURACY, AND PATIENT-CENTRICITY**

Sanil Kumar.P
Accenture Solutions Private Ltd, Bangalore, India.
Sanilmpharm@gmail.com

Artificial Intelligence (AI) and Machine Learning (ML) are reshaping the landscape of clinical research by offering innovative solutions to longstanding challenges across the trial lifecycle. From accelerating drug discovery to improving patient engagement, these technologies are enabling more efficient, data-driven, and patient-centric approaches. In early-stage research, AI expedites target identification and drug candidate screening by analyzing large-scale genomic, proteomic, and chemical datasets. ML models simulate compound behavior, reducing reliance on extensive lab testing and minimizing early-stage attrition. In trial design, AI supports adaptive methodologies, control arm simulation, and protocol optimization—leading to cost-effective and faster trials. Patient recruitment and retention, a persistent bottleneck, are significantly enhanced by AI tools that leverage electronic health records (EHRs), registries, and natural language processing to identify suitable participants. Predictive analytics help proactively address dropout risks, thus maintaining participant engagement throughout the study.AI also enables real-time data monitoring, automated anomaly detection, and advanced analytics for timely insights. Integrated with wearables and digital health platforms, AI allows continuous patient monitoring and remote data capture. In pharmacovigilance, ML algorithms detect adverse events from diverse data sources, improving safety signal identification and regulatory compliance. Additionally, AI strengthens inspection readiness by ensuring structured, validated, and traceable data systems aligned with Good Clinical Practice (GCP) and regulatory expectations. This presentation will explore real-world applications, success metrics, and implementation strategies that demonstrate how AI/ML are driving digital transformation in clinical research. It aims to provide attendees with practical insights to adopt and scale AI in their own clinical development environments.

**Keywords:** Artificial Intelligence (AI), Machine Learning (ML), Clinical Research, Patient Recruitment, Digital Transformation.

**AI-ENABLED SELFIE MEDICINE: A NOVEL APP FOR REAL-TIME MEDICATION ADHERENCE VERIFICATION**

Vishal B. Wadekar a,Aachal Mulgir
Shivlingeshwar college of pharmacy almala, latur -413520
wadekarvishal162@gmail.com

Medication non-adherence remains a critical barrier to effective treatment outcomes in chronic and infectious diseases such as tuberculosis, HIV, and hypertension. Traditional solutions like Directly Observed Therapy (DOT) improve adherence but are resource-intensive, intrusive, and difficult to scale. Digital adherence technologies, including reminder apps and smart pill bottles, provide partial solutions but often fail to guarantee that the medication is ingested. To design and prototype a mobile application that ensures adherence by combining automated reminders with live selfie verification, where the reminder will not stop until the patient uploads a real-time photo/video confirming ingestion.

**Keywords:** Medication adherence, Selfie medicine, Artificial intelligence, Digital therapeutics, Mobile health, Patient monitoring.

**AI-115**

**AI-POWERED PERSONALIZED MEDICINE: REDEFINING THE FUTURE OF PHARMACY PRACTICE.**

Aliya Rayyesa Mirzaa*1, B. Maheshwari Reddy*2
1 Department Of Pharmacy Practice, Joginpally B R Pharmacy College, Yenkapally, Moinabad, Hyderabad, 500075
2 Department Of Pharmacology, Joginpally B R Pharmacy College, Yenkapally, Moinabad, Hyderabad, 500075
Myrzaalyt26@Gmail.Com

Artificial intelligence (AI) is emerging as a transformative force in personalized medicine, offering new possibilities for safer, more effective, and patient-specific therapies. By combining genomics, big data, and predictive analytics, AI enables pharmacy practice to move beyond “one-size-fits-all” treatment and towards truly individualized care. This topic highlights the role of AI in interpreting genomic data, predicting drug responses, and optimizing pharmacotherapy for each patient. Machine learning algorithms are accelerating drug discovery pipelines, while clinical decision-support systems are assisting pharmacists in tailoring drug selection, dose adjustments, and therapy monitoring. Educationally, AI-driven platforms are training future pharmacists in precision medicine, fostering genomic literacy, and equipping professionals with the skills required to integrate advanced technologies into patient care. From academic learning to real-world practice, AI empowers pharmacists to bridge the gap between technology and therapeutic decision-making. On the patient side, AI enhances empowerment through mHealth applications, wearable devices, and tele pharmacy services, allowing real-time monitoring, medication adherence tracking, and personalized health recommendations. These innovations strengthen patient engagement, improve safety, and expand access to care across diverse populations. The also addresses challenges including data privacy, ethical implementation, and equitable access, emphasizing the need for responsible integration of AI into healthcare systems. By redefining pharmacy through AI-powered personalized medicine, this presentation demonstrates how innovation can translate into global health equity, professional empowerment, and improved patient outcomes.

**AI-116**

**ARTIFICIAL INTELLIGENCE IN DIABETES MANAGEMENT: ADVANCEMENTS, OPPORTUNITIES AND CHALLENGES**

S.V. Mounika, P. Sravani
Department of Pharmacology, V. V. Institute of Pharmaceutical Sciences, Gudlavalleru, Andhra Pradesh, India-521356
mounikasaladhi18@gmail.com

The increasing prevalence of diabetes, high avoidable morbidity and mortality due to diabetes and diabetic complications, and related substantial economic burden make diabetes a significant health challenge worldwide. A shortage of diabetes specialists, uneven distribution of medical resources, low adherence to medications, and improper self-management contribute to poor glycemic control in patients with diabetes. Recent advancements in digital health technologies, especially artificial intelligence (AI), provide a significant opportunity to achieve better efficiency in diabetes care, which may diminish the increase in diabetes-related health-care expenditures. Here, we review the recent progress in the application of AI in the management of diabetes and then discuss the opportunities and challenges of AI application in clinical practice. Furthermore, we explore the possibility of combining and expanding upon existing digital health technologies to develop an AI-assisted digital health-care ecosystem that includes the prevention and management of diabetes.

**Keywords:** diabetes, artificial intelligence, digital health, management.

**FORMULATION AND EVALUATION OF AI-ASSISTED NANOEMULSION FOR ENHANCED DRUG DELIVERY**

Rajitha Lanka,Kakani Anil Kumar, Tattukolla Bhargavi Krishna, Bhavana Alaparti, Kanaka Durga Devi Nelluri
Department of Pharmaceutical sciences and biotechnology, KVSR Siddhartha College of Pharmaceutical sciences, Vijayawada-520010, Andhra Pradesh, India.
rajithaalanka@gmail.com

Poorly water-soluble drugs pose a challenge in pharmaceutics due to low bioavailability, necessitating novel delivery systems like nanoemulsions. Nanoemulsions enhance drug solubility, stability, and bioavailability through nanometer-sized droplets. However, conventional formulation involves trial-and-error, consuming time and resources. AI models like Random Forest and Artificial Neural Networks (ANNs) can predict outcomes like droplet size, PDI, and entrapment efficiency by learning from formulation data, enabling rational design. Formulated stable nanoemulsions using ultrasonication for a poorly soluble drug and Build AI models to predict droplet size, PDI, and % entrapment based on formulation variables to minimize experimentation by using predictive

ISBN: 978-81-980623-8-3

modeling. Developed Formulation using curcumin or itraconazole, Choose oil (caprylic triglyceride), surfactant (Tween 80), and co-surfactant (ethanol). Prepare nanoemulsions via ultrasonication, varying Oil: surfactant:co-surfactant ratios, Ultrasonication time and amplitude and Stirring speed. Characterized by Droplet size and PDI using Dynamic Light Scattering (DLS), Entrapment efficiency via centrifugation and UV-spectrophotometry and Stability assessment over 30 days.Significantly This project equips with skills in formulation design, nanotechnology, and practical AI integration, preparing them for advanced research and industry roles in formulation development. A stable nanoemulsion with optimized droplet size (<200 nm) and low PDI and Reduction in time and materials by AI-guided formulation

**Keywords:** AI-assisted formulation, Nanoemulsion drug delivery, poorly water-soluble drugs, Bioavailability enhancement, Ultrasonication technique, Predictive modeling (ANN, Random Forest), Entrapment efficiency, Droplet size optimization (<200 nm, PDI), Dynamic Light Scattering (DLS), Nanotechnology in pharmaceutics.

## AN AI INTEGRATED FRAMEWORK FOR PREDICTING IMPURITIES AND GENOTOXICITY UNDER ICH STRESS CONDITIONS

Shreehari Narhari Thombre
Department of Pharmaceutical Chemistry, SSR College of Pharmacy, Silvassa, Dadra And Nagar Haveli – 396230
Shrithombre0@gmail.com

In the pharmaceutical industry, accurately predicting impurities and their potential genotoxicity is crucial for drug development and regulatory compliance. Current methods often involve separate, time-consuming experiments for each stress condition, leading to a fragmented and lengthy process. This work introduces an innovative, integrated artificial intelligence (AI) framework designed to streamline this process by simultaneously predicting potential impurities and assessing their genotoxicity, all under a single, unified platform. Our framework utilizes a hybrid approach, combining a rule-based model to capture fundamental chemical transformations with a machine learning module to predict impurity structures from a parent drug's SMILES notation under various ICH stress conditions, thus addressing the common challenge of limited training data. The predicted impurities are then passed to pre-trained genotoxicity models, such as those based on the Ames test and other DeepTox predictions, to comprehensively evaluate their potential for causing genetic damage. This integrated step provides a rapid, high-throughput screening mechanism. A key feature of this system is the integration of explainability using techniques like SHAP (Shapley Additive EXplanations), providing clear, visual insights into the model's predictions and building user trust in the AI-driven results. We validated our framework using real-world case studies, including the drug Dapagliflozin, and compared our predictions with existing literature. The results demonstrate the framework's ability to efficiently and accurately identify potential impurities and their genotoxic risk. This integrated, explainable approach represents a significant step forward, offering a powerful tool for pharmaceutical scientists to accelerate impurity profiling and risk assessment, ultimately leading to safer and more efficient drug development. This work is, to our knowledge, the first to present an integrated AI framework for this specific purpose.

**Keywords:** AI Framework, Impurity Prediction, Genotoxicity Drug, Development, ICH Guideline and Explainability.

**AI-119**

## ARTIFICIAL INTELLIGENCE IN PREDICTING DRUGS' METABOLISM AND EXCRETION: ADVANCES AND CHALLENGES

P. Logeshwari, P. Gur u, T. Shri vijaya kirubha
Department of Pharmaceutics, Mother Teresa College of Pharmacy Illuppur, Pudukkottai - 622- 102, Selvipothur
aj1982@gmail.com

The efficacy and safety of therapeutic candidates are largely determined by drug metabolism and excretion, and anticipating these processes is a critical component of drug discovery and development. With the promise to expedite drug research and increase clinical success rates, artificial intelligence has become a valuable tool for forecasting drug metabolism and excretion in recent years. Recent developments in AI–based medication metabolism and excretion prediction, such as deep learning and machine learning techniques, are highlighted in this study. Examine potential future directions in the subject and talk about the difficulties in creating AI models for drug ug and excretion prediction. Drug discovery, preclinical research, clinical trials, and regulatory y approval are all steps in the intricate process of drug development. Because they establish the ideal dosage, mode of administration, and safety of a medicine in the body, pharmacokinetics and pharmacodynamics are essential components of drug development. Pharmacokinetics and pharmacodynamics investigations using traditional experimental methods can be costly and time-consuming, and they might not always yield reliable forecasts of a drug's safety and efficacy. Studies on pharmacokinetics and pharmacodynamics have historically been carried out through experimental techniques like animal research and human clinical trials. Furthermore, the pharmacokinetics and pharmacodynamics of drugs in humans may not always be accurately predicted by this research. AI has demonstrated enormous promise in the domains of drug development, pharmacokinetics, and pharmacodynamics. with the development of machine learning techniques and sophisticated computing. AI has become a useful tool for forecasting and improving the pharmacokinetics and pharmacodynamics of drugs

**Keywords:** Drug metabolism, artificial intelligence, drug excretion.

**AI-120**

## FROM DATA TO SAFETY: AI-DRIVEN INNOVATIONS IN MATERIOVIGILANCE SYSTEMS

N. Logeshwar, S. Dhilipkumar, T. Shri Vijaya kirubha
Department of Pharmacy Practice, Mother Terasa College Of Pharmacy, Illuppur - 622102, Tamil Nadu.
gopallogesh2004@gmail.com

Materiovigilance, the systematic monitoring and evaluation of adverse events associated with medical devices, is a rapidly evolving discipline aimed at ensuring device safety and effectiveness. With the increasing complexity and widespread use of medical devices, traditional methods of materiovigilance often face challenges such as under reporting, delayed detection of device-related risks, and the inability to manage large volumes of heterogeneous data. In this context, Artificial Intelligence (AI) has emerged as a transformative tool to strengthen materiovigilance systems. AI techniques, particularly machine learning, natural language processing, and predictive analytics, enable efficient analysis of electronic health records, maintenance logs, clinical trial data, and patient feedback to identify potential device-related adverse events. Furthermore, AI facilitates real-time monitoring of connected devices through the integration of Internet of Things (IoT) technologies, allowing proactive detection of device malfunctions and anomalies. Predictive models can support preventive maintenance and risk mitigation, thereby enhancing patient safety. Additionally, AI-driven automation reduces manual workload, increases accuracy in data extraction and signal detection, and assists regulatory authorities in faster decision-making regarding recalls and safety alerts. Despite these advantages, challenges such as data standardization, algorithm transparency, cybersecurity, and ethical concerns remain significant barriers to widespread adoption. Nevertheless, with continued advancements, AI is expected to play a pivotal role in modern materiovigilance by improving efficiency, early signal detection, and regulatory compliance, ultimately ensuring safer healthcare delivery.

**Keywords:** Artificial Intelligence, Materiovigilance, Medical Devices, Adverse Events, Patient Safety.

**AI-121**

## AI IN PHARMACY

1Anannya Gupta, 2sanchita Das
1Department of Pharmaceutical Technology, JIS University, Kolkata 700109
2Department of Pharmaceutical Technology, BCDA College of Pharmacy & Technology, Hridaypur, Kolkata 700127.
anannyagupta5@gmail.com

Artificial Intelligence (AI) has emerged as a transformative tool in the field of pharmacy, offering innovative solution across different field like drug discovery, development, clinical trial, patient care and analyzing data. AI accelerates drug discovery by predicting molecular target, screening compounds and designing new molecule and helps in

ISBN: 978-81-980623-8-3

repurposing of existing drug. In clinical trial, AI modernizes patient recruitment and improves trial outcome. Pharmacy practice aids from AI through personalized medicine, drug-drug interaction prediction, and pharmacovigilance systems that detect adverse reactions earlier. AI enhances drug formulation, optimizes manufacturing processes, and ensures quality control. With the help of AI targeted protein can also be conveniently identified. AI help to predict gene target micro-RNA, to know the phenotype of the cell. AI played a vital role during the COVID-19 pandemic in accelerating vaccine and drug research by predicting viral protein structures and testing virtual compounds. AI optimizes trial design by identifying suitable patient populations through analysis of electronic health records (EHRs), genetic data, and real-world evidence. AI also monitors patient adherence and adverse effects during trials through wearable devices and mobile health applications. AI integrates complex datasets such as genomic sequences, lifestyle habits, and clinical history to predict how patients will respond to specific drugs. In Pharmacogenomics, the study of how genes influence drug response, is greatly enhanced by AI, as algorithms can identify genetic biomarkers and match patients with the most effective therapies. In the context of Quality by Design (QbD), AI supports process control and ensures batch-to-batch consistency. Predictive models assist in scaling up production while maintaining quality standards. For instance, neural networks have been applied to optimize nanoparticle formulations, controlled-release tablets, and biologics manufacturing processes. In inventory and supply chain management AI models predict demand trends by analyzing historical sales, seasonal variations, and disease outbreaks.

**Keywords:** Artificial Intelligence (AI), Clinical trials, Drug Discovery, Pharmacovigilance, Adverse Drug Reaction.

**SYNAPSE: A GAMIFIED MICROLEARNING PLATFORM FOR MEDICAL EDUCATION**

Nahid N, Surya S Nair
Sree Krishna College of Pharmacy and Research Centre, Parassala, Thiruvananthapuram, Kerala, India - 695502
nahidnazimuddin23@gmail.com

Digital short-form media's sudden rise has drastically changed learning methods globally, although short-form videos in medicine are yet to be fully adopted. There is still primary reliance on the traditional, text-heavy, and lengthy materials in medical education. With styles of TikTok and Instagram in mind, Synapse brings the fully credible and academically-rigid innovative mobile application. The app does not accept any form of long videos; instead, it accepts short medical reels, infographics, and interactive case studies. Moreover, this content is only developed by duly certified doctors, pharmacists, and healthcare specialists. This feature guarantees valid and high-quality content and also guards against any form of misinformation. Users can track topics across different fields of specialties, enjoy engaging medical snippets, and check their understanding immediately through quizzes attached to every reel. Synapse keeps users engaged through gamification: users gain experience points, unlock badges, keep streaks, and move up the leaderboards through both their activities and quiz results. This dynamic turns passive viewing into active engagement, encouraging recall and retention. In addition to supporting individual users, Synapse encourages collaborative learning in which students can tackle real-world cases, experts can impart advanced knowledge, and educational institutions can use the app as an auxiliary teaching platform. Synapse combines entertainment and advanced medicine, shifting the aimless scrolling students do daily to a form of meaningful microlearning. This resolves students' need to retrieve information quickly from medical books to be engaged, interactive, and medical information to be memorable. Synapse is a model worth emulating for modern medical education as it matches serious discipline with the digital world while upholding all medical standards.

**Keywords:** Medical education, microlearning, artificial intelligence, medical reels, social learning.

**MACHINE LEARNING MODELS TO OPTIMIZE DOSE SELECTION IN HYPERTENSIVE PATIENTS**

Kazi Abdulaziz1, Yelam Vidya (Kapse)2
Department of Pharmacy practice, Shivlingeshwar College of Pharmacy, Almala, Latur, Maharashtra, India- 413512
abdulazizk7722@gmail.com

Hypertension is a major chronic condition worldwide, yet patient responses to antihypertensive therapy vary greatly, leading to risks of under-treatment or adverse drug reactions with conventional dosing. Artificial intelligence (AI) and machine learning (ML) offer opportunities to personalize therapy by integrating multiple clinical and demographic factors. The objective is to develop and evaluate ML models for predicting optimal dose categories of antihypertensive drugs. Methodology includes publicly available datasets containing patient records with blood pressure responses were preprocessed to extract features such as age, sex, body mass index (BMI), baseline systolic/diastolic blood pressure, and comorbidities. Data were divided into training and testing sets (80:20), and logistic regression, decision tree, and random forest models were implemented. Model performance was assessed using accuracy, precision, recall, and ROC-AUC, and feature importance analysis was conducted. Random forest achieved the highest predictive performance, with baseline systolic blood pressure and BMI identified as the most significant predictors of dose requirement. The study concludes that AI-driven dose optimization can support clinicians in tailoring antihypertensive therapy, reduce adverse events, and empower evidence-based clinical decision making.

**Keywords:** Hypertension; Personalized dosing; Machine learning; Clinical decision support; Artificial intelligence.

**AI-124**

**AI AND MACHINE LEARNING (ML) IN ANTIBIOTIC STEWARDSHIP**

Syed Afnaan Naaz, Qureshi Khulood Mohammad Saifullah, Yelam Vidya (Kapse)
Shivlingeshwar College of Pharmacy, Almala, Latur – 413512
Pharmacy Practice Department
khuloodqurashi@gmail.com

A major threat to world health is antimicrobial resistance (AMR), which reduces the effectiveness of medications and raises patient morbidity, mortality, and medical expenses. Programs for antibiotic stewardship (ABS) are crucial for maximizing the use of antibiotics; yet, traditional methods have trouble anticipating patterns of resistance, guaranteeing prompt diagnosis, and directing targeted treatment. Predictive analytics, precision prescribing, and real-time surveillance are made possible by artificial intelligence (AI) and machine learning (ML), which have emerged as viable methods to reinforce ABS. With an emphasis on their roles in resistance prediction, diagnostic improvement, optimal antibiotic selection, and treatment monitoring, this paper attempts to assess the uses of AI and ML in antibiotic stewardship. Highlighting new developments, evaluating clinical results, and talking about obstacles to routine integration are the goals. Better surveillance of resistance epidemiology, more treatment precision, decreased inappropriate antibiotic use, and improved patient safety have all been linked to these advancements. In conclusion, fast, data-driven interventions made possible by AI and ML have the potential to revolutionize antibiotic stewardship. Their collaboration with clinical knowledge provides a route to better patient outcomes and efficient AMR control.

**Keywords:** Artificial intelligence, Machine learning, Antibiotic stewardship, Antimicrobial resistance, Clinical decision support.

**REGULATORY CONSIDERATIONS FOR THE DEVELOPMENT OF SUGAR-BASED WOUND DRESSING**

Aditya Pandey, Vinita Kale, Amol Tatode and Milind Umekar
Department of Regulatory Affairs, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India-441002
adityapandeymarch@gmail.com

This research explores the development and regulatory consideration of a novel sugar-Based nanofiber wound dressing. Using a spinneret (cotton candy) machine, Nanofibers are fabricated from a blend of sucrose, maltodextrin and polymeric Excipients such as PVP and HPMC. These nanofibers are loaded with antimicrobial Agents, either turmeric or crystal violet, and further processed into flexible, adhesive Wound dressings. The dressings are comparable to conventional surgical dressings, but with enhanced bioactivity and cost-effectiveness. The study aims to address challenges in conventional wound management

ISBN: 978-81-980623-8-3

by offering a dressing that combines mechanical protection, antimicrobial action and biocompatibility. In vitro tests include drug release kinetics, antimicrobial activity Against staphylococcus aureus and *E. coli*. The results show a burst release followed by sustained drug delivery, effective bacterial inhibition and suitable surface wetting Characteristics. Crystal violet displayed higher antimicrobial efficacy, while turmeric Contributed to bioactivity with natural safety.

**Keywords:** Sugar-based nanofibers, Wound dressing, Antimicrobial agents, Biocompatibility.

**AI-126**

**Virtual Reality And Gamification As Therapeutic Tools For Mitigating Cognitive Impairment In Alzheimer's Disease**

Pragati A. Dongare, Deepak S. Khobragade
Datta Meghe College of Pharmacy, DMIHER (DU), Sawangi (Meghe), Wardha-442001, Maharashtra, India-442001

Alzheimer's disease is a progressive neurological disorder characterized by cognitive deterioration, memory deficits, and alterations in behaviour, posing substantial challenges for both patients and caregivers. Traditional behavioural therapies frequently encounter difficulties in sustaining patient involvement and compliance. Recent technical breakthroughs position Virtual Reality (VR) and gamification as novel approaches to improve cognitive rehabilitation in Alzheimer's care. Recent research indicate that VR-based cognitive therapies promote attention, working memory, and orientation in patients with Alzheimer's, while gamified training improves adherence and sustained engagement. Virtual reality offers immersive, interactive environments for AD patients to practice memory recall, spatial navigation, and daily living activities in secure, regulated settings. This immersive experience can improve neuroplasticity and engagement relative to conventional methods. Gamification incorporates game-based aspects like points, levels, awards, and progress tracking, thereby enhancing motivation and adherence, while rendering therapeutic sessions interesting and customised to the need of AD patents. These methods enhance cognitive function and increase emotional well-being by alleviating worry and promoting a sense of accomplishment thus improving quality of life of AD patients. Furthermore, these systems provide real-time performance monitoring, enabling therapists and caregivers to modify interventions according on patient need. In conclusion, the incorporation of virtual reality and gamification into behavioural therapy can prove a transformational, scalable, and patient-centric approach to Alzheimer's care. Future initiatives encompass therapeutic trials, ease of usability, patent friendly affordable and accessible systems.

**Keywords:** Alzheimer's disease, Cognitive rehabilitation, Virtual reality (VR), Gamification, Neuroplasticity, Patient engagement, Behavioural therapy.

**AI-127**

**NEXT-GENERATION ORAL DELIVERY OF GLICLAZIDE VIA NANO SPONGES -LOADED ODTS OPTIMIZED WITH AI**

Sethu Raman. A, C. Rubina Reichal, M. Gopal Rao
Department of Pharmaceutics
Sri Ramakrishna Institute of Paramedical Sciences, College of Pharmacy, Coimbatore, Tamil Nadu, India - 641044
ganesharumugam2001@gmail.com

Gliclazide, a BCS class II sulfonylurea, suffers from poor aqueous solubility and variable oral bioavailability, used for the management of type 2 diabetes mellitus. Nano sponges, with their porous structure and high drug loading capacity, offer enhanced solubility and stability. Incorporation into orally disintegrating tablets (ODTs) further improves patient compliance and provides rapid drug onset. To overcome limitations of traditional trial-and-error optimization, artificial intelligence (AI) can be employed to predict formulation performance and accelerate development. Gliclazide Nano sponges were prepared using emulsion solvent diffusion method. The optimized Nano sponge formulation was compressed into ODTs with suitable supportive excipients. Evaluation included pre-compression, post-compression and drug release studies. AI models were trained on formulation datasets, correlating variables like polymer ratio, crosslinker concentration, super disintegrant level with outputs such as % entrapment efficiency, disintegration time, % drug release. Fourier Transform infrared (FT-IR) spectra studies represented no interaction between the drug and excipients. They were characterized for entrapment efficiency, *invitro* drug release, the formulation 5 (F5) was shown desirable results and it was selected for tablet compression, and the results were within pharmacopoeial limits. AI models successfully predicted formulation outcomes, with AI tool achieving highest accuracy and predicted results closely matched experimental values, reducing formulation trials by nearly 50%. The study demonstrates that AI-driven formulation of Nano sponges-loaded ODTs of gliclazide significantly improves solubility, dissolution, and patient convenience and this integrated Nano sponge–ODT–AI platform represents a promising strategy for enhancing oral delivery of poorly soluble drugs and supports future translation into large-scale, patient-centric diabetes therapy.

**Keywords:** Gliclazide, Nano sponges, Orally Disintegrating Tablets, Artificial Intelligences.

**AI-128**

**SMART AI HEALTH CARD: A GLOBAL APPROACH TO INTEROPERABLE AND AI-ENABLED HEALTHCARE IDENTITY**

Sanjana Gupta, Azeem Bagwan,
Shivlingeshwar College of Pharmacy, Latur, Maharashtra, India.
Department of Pharmacy Practice
guptasanj2626@gmail.com

Healthcare systems worldwide remain fragmented, with national health IDs (e.g., ABHA, NHS, EHIC) lacking global interoperability, predictive intelligence, and offline emergency readiness. This gap creates challenges for cross-border care, medical tourism, and emergency response. We propose a Smart AI Health Card (Global Version)—a universally interoperable, AI-enabled health identity system. Designed with HL7 FHIR, ICD-11, SNOMED CT, and LOINC standards, the card integrates patient demographics, medical history, diagnostics, and prescriptions. It ensures security through blockchain-based audit trails and patient-controlled consent compliant with GDPR, HIPAA, and global data regulations. The system embeds AI-driven models for predictive healthcare, including early disease risk detection, adherence monitoring, and adverse drug reaction (ADR) alerts. Its emergency-first design supports QR/NFC-based offline access to critical health data, with multilingual translation for global usability. Pilot implementations across multiple countries will test interoperability, emergency utility, insurance validation, and patient experience. Expected outcomes include reduced duplication of investigations, improved emergency response, enhanced continuity of care, and a framework for universal health identity adoption under global agencies like WHO.

**Keywords:** Global Health Identity, Interoperability, Blockchain, Predictive Analytics, Emergency Readiness, Continuity of Care.

**AI-129**

**IMPACT OF AN ANTIMICROBIAL RESISTANCE INTERVENTIONAL STUDY ON PRESCRIPTION PATTERN AND GUIDELINE ADHERENCE IN THE GENERAL MEDICINE DEPARTMENT OF A TERTIARY CARE HOSPITAL USING AI-SUPPORTED MONITORING**

Souman Samanta, Muchukota Sushma, Madhuvan H.S2, Shobha Rani R.H3
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Department of General Medicine, 2Akash Hospital, Bangalore, Karnataka, India.
Soumans239@Gmail.Com

Background: Antimicrobial resistance (AMR) is a growing global threat, largely fueled by inappropriate antibiotic use and poor adherence to clinical guidelines. Artificial Intelligence (AI)-assisted prescription monitoring offers real-time detection of irrational use and supports antimicrobial stewardship programs (ASPs). By integrating with electronic health records, AI can analyze prescription patterns, generate alerts for deviations, and provide decision support to prescribers. Such interventions not only improve guideline adherence but also reduce resistance trends and enhance patient safety. Aim and Objectives: 1. To evaluate the effectiveness of AI-assisted prescription monitoring in improving guideline adherence and reducing inappropriate antibiotic use in the general medicine department. 2. To assess the role of AI-supported antimicrobial stewardship interventions in minimizing antimicrobial resistance trends and enhancing patient safety. Methodology: A prospective interventional study was conducted on 150 inpatients over six months. Data collection occurred in two phases: pre-

ISBN: 978-81-980623-8-3

intervention (baseline 75 prescriptions) and post-intervention (75 prescriptions). AI-based prescription monitoring tools were integrated into the hospital electronic records to evaluate drug choice, dose, and duration against WHO, IDSA, NICE, and ICMR guidelines. The intervention included AI-driven prescription alerts, pharmacist feedback, and prescriber education. Post-intervention, prescriptions were reassessed for adherence and resistance trends. Statistical analysis was performed using Chi-square tests with $p < 0.05$ considered significant. Results: In the pre-intervention phase, only 44% of prescriptions adhered to guidelines, while 56% showed deviations with frequent use of broad-spectrum antibiotics. After AI-supported intervention, 66.6% adherence was achieved ($p = 0.017$), with a marked reduction in inappropriate broad-spectrum use. The proportion of cultures sent before antibiotic initiation improved from 24% to 41% ($p = 0.005$). Antimicrobial resistance declined from 24% to 12% of prescriptions ($p = 0.056$).

**Keywords:** Antimicrobial resistance, AI-supported monitoring, Guideline adherence, Prescription pattern, antimicrobial stewardship.

**AI-130**

## AI VS HUMAN JUDGMENT IN CARDIOVASCULAR ADVERSE DRUG REACTIONS (ADR) ASSESSMENT: INSIGHTS FROM THE NARANJO ALGORITHM

Nahiya Fathima, Rafiya Yashfeen
Department of Pharmacy Practice, Jyothishmathi Institute of Pharmaceutical sciences Karimnagar, Telangana, India - 505001.
nahiya3002@gmail.com

The current research evaluated human and artificial intelligence (AI) for determining causality of cardiovascular adverse drug reactions (ADRs) using Naranjo algorithm as approach. The objective was to determine, the agreement between human and Claude AI in assessing ADR causality through case-by-case analysis. A total of 60 case reports published between 2022 and 2025 in various peer-reviewed journals were retrospectively analysed and agreement measured using Cohen's kappa. ADRs were categorised according to age, sex, severity, drug class, and preventability. Both ADRs and drugs were coded according to MedDRA. The findings showed that human reviewers classified ADRs as probable (83.3%), possible (13.3%), and definite (3.3%), while AI's classifications were slightly different: probable (85.0%), possible (11.7%), and definite (3.3%). A significant kappa value of 0.818 suggested 95% agreement between the two assessments. Statins were the frequently associated drugs, accounting for 35% of cases, particularly linked to musculoskeletal ADRs like rhabdomyolysis. There was a slight increase in reports among females (55%) compared to males (45%), with the highest incidence found in 65–74 age group. In terms of severity, the majority of cases were serious to severe, including 3 that were life-threatening and 2 that led to death. Overall, 95% of ADRs were preventable. Some rare ADRs included encephalopathy and drug-induced phospholipidosis. The results indicate that AI has a strong correlation with human evaluations of causality, highlighting its potential to reduce subjectivity, improve signal detection, and ultimately enhance patient safety in pharmacovigilance.

**Keywords:** Adverse drug reactions (ADRs), Naranjo algorithm, Artificial intelligence (AI), Cardiovascular drugs.

**AI-131**

## SPECTRAL INTELLIGENCE MEETS RURAL INDIA: HANDHELD, AI-ENHANCED SALIVA TESTING FOR HELICOBACTER PYLORI

Niraj Somani, Tapash Chakraborty, Madhurjya Pawan Deka, Monjilmoy Chetia
Girijananda Chowdhury Institute Of Pharmaceutical Science, Hatkhowapara, Azara, Guwahati-781017
Somaniniraj777@gmail.com

Helicobacter pylori remain highly prevalent in India and demands non-invasive, infrastructure-light diagnostics to extend access beyond endoscopy, urea breath testing, and laboratory stool antigen assays. The detection of H. pylori in saliva is possible by molecular and immunologic methods, although the results and methods differ between groups. Publications that use PCR in saliva report sensitivity and specificity that is clinically useful but still imperfect in comparison to gastric biopsy and composite standards. Meanwhile, antigen and antibody tests in saliva have shown moderate to high sensitivity in some studies, while in other studies they are associated with trade-offs in specificity. Label-free optical strategies, including vibrational spectroscopy and biosensing, can capture molecular signatures or binding interactions relevant to H. pylori in saliva; proof-of-concept work shows feasibility and highlights matrix-related challenges such as low organism load and potential inhibitory salivary components, underscoring the need for careful pre-processing and calibration. Building on these advances, this work proposes a handheld pathway that acquires spectra from a saliva-exposed disposable strip and applies embedded machine learning to classify infection status against a validated reference, targeting sub-10-minute, clinic-adjacent screening suited to rural programs. The development plan emphasizes standardized saliva collection, multi-site Indian cohorts, model training with internal cross-validation and external validation, and predefined performance targets aligned to use-case needs. By uniting non-invasive sampling, spectral readout, and onboard AI in a portable reader, this approach aims to pragmatically extend H. pylori screening capacity in resource-limited settings, contingent on rigorous clinical validation, quality systems, and linkage-to-care pathways.

**Keywords:** Helicobacter pylori, Saliva-based detection, Disposable test strips, Rural healthcare, Rapid screening.

**AI-132**

## LEVERAGING AI FOR PRECISION WEIGHT CONTROL AND ACCELERATED TABLET MANUFACTURING

Monjilmoy chetia, Tapash Chakraborty, Niraj Somani and Madhurjya pawan Deka.
Department of pharmaceutical sciences, Girijananda Chowdhury University, Azara, Guwahati ,India -781017
Manjilmoy21@gmail.com

Variation in tablet compressed weight is controlled by pharmacopeial specifications and is mainly caused by powder flow, die fill, and compression dynamics; traditional sampling and visual inspection can overlook transient drifts and delayed corrective action. This paper describes an AI-supported control strategy that integrates multivariate sensor measurements from the tablet press (precompression/main compression force–displacement, feeder level, turret speed, vibration, temperature/humidity) with in line quality surrogates to control tablet mass and drive increased throughput. A rules-and stack includes: (1) MSPC to detect drift immediately; (2) soft sensor models forecasting tablet weight from press telemetry; (3) computer vision for dimensional and defect inspection on the conveyor; and (4) predictive maintenance models detecting die/punch wear and feeder maldistribution before they generate out of spec weights. The system recommends set point changes (e.g., fill cam, feeder speed, tamping pressure) with human oversight, concurring with QbD/PAT and real time release testing. For high mix runs, model adaptation takes advantage of recipe aware attributes (API/excipient densities, PSD, lubrication level) and transfer learning for minimizing re calibration. Usability is centred around explainable alerts, traceable control actions, and batch wise continuous process verification dashboards. Expected benefits are less RSD in tablet weight, less capping/lamination rejection rates due to fill/compression instability, improved press uptime through premature tooling maintenance, and quicker deviation rectification. The methodology redefines weight control from interval inspection to real-time model-informed monitoring, allowing for consistent quality and increased productivity in tablet production.

**Keywords:** rapid, weight variation, machine learning, quality control.

## DEMYSTIFYING AI-DRIVEN RSM AND SYNERGYFINDER TOOLS FOR DEVELOPING NEUROTHERAPEUTICS AND ANTI-CANCER NUTRACEUTICALS

Kalpana Nagpal
Amity Institute of Pharmacy, Amity University Uttar Pradesh, Noida U.P. (India) 201303

Advancing healthcare research and development is critical to enhancing medical infrastructure and supporting national progress, especially in context of ongoing global health challenges. As drug discovery progresses toward development and clinical application, the adoption of advanced computational tools is reshaping the landscape of pharmaceutical innovation. Two such tools—Response Surface Methodology (RSM) and Synergy Finder—have proven particularly

ISBN: 978-81-980623-8-3

valuable in optimizing formulations and identifying effective drug combinations. RSM combines experimental design with machine learning to simplify and enhance the formulation of phytomedicine-based nanoparticles, especially those targeting neurological disorders. Meanwhile, Synergy Finder aids in evaluating how different natural compounds interact, helping researchers identify combinations with improved therapeutic effects, particularly for cancer prevention. It systematically analyzes drug interactions—whether synergistic, additive, or antagonistic—across various dose ranges, enabling more precise and efficient formulation strategies. Through statistical modeling and bioinformatic analysis, Synergy Finder not only enhances efficacy but also supports the development of safer therapies with lower toxicity and the potential to overcome resistance. This study highlights real-world case studies that illustrate the practical use of both RSM and Synergy Finder, particularly in developing neurotherapeutic nanoparticles and cancer-preventive nutraceuticals. By integrating artificial intelligence with pharmaceutical research, this approach demonstrates how data-driven methodologies can streamline drug development and align with the growing emphasis on personalized, targeted therapies. Ultimately, this work emphasizes the value of bioinformatics in fostering innovation and supporting educational advancement in the rapidly evolving field of healthcare technology.

**Keywords:** Optimization; Synergy finder; Response Surface Methodology.

**AI-134**

**IMPACT OF ARTIFICIAL INTELLIGENCE ON REGULATORY AFFAIRS**

Abhishek Kadam, Vinita Kale, Suankit Harane, Milind Umekar
Department of Regulatory Affairs, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee,
Dist. Nagpur, India – 441002
abhishekkadam99999@gmail.com

Artificial Intelligence (AI) is revolutionizing the field of regulatory affairs by enhancing compliance, streamlining data management, and supporting faster, more informed decision-making throughout the drug development and approval process. The integration of AI enables automation of critical tasks such as document review, data analysis, and risk assessment resulting in improved efficiency and reduced human error. AI-powered tools facilitate real-time monitoring of regulatory compliance, automated document processing using natural language processing, and advanced predictive analytics, all of which ensure regulatory requirements are consistently met while optimizing resource utilization. However, the adoption of AI also presents significant challenges, including concerns about data privacy, security, ethical considerations, and the need for robust regulatory frameworks to govern the safe use of these technologies. Maintaining human oversight remains essential, as expert judgment is crucial for navigating complex regulatory scenarios and ethical dilemmas that AI may not fully address. The impact of AI is evident in various stages of regulatory affairs, from expediting regulatory submissions and drug/device approvals to enhancing post-market surveillance through improved pharmacovigilance and risk evaluation. As AI continues to advance, regulatory professionals must balance innovation with compliance and adapt to the evolving landscape to harness the full potential of AI while ensuring patient safety and data integrity. This study underscores the transformative effects of AI in regulatory affairs, highlighting both the opportunities and challenges posed by this rapidly evolving technology.

**Keywords:** Artificial Intelligence, Regulatory affairs, Compliance, Automation, Data privacy.

**AI-135**

**INTEGRATING COMPUTATIONAL INTELLIGENCE INTO PHARMACEUTICAL RESEARCH: A PATHWAY TO FASTER AND SAFER MEDICINES**

Ayush Pandey, Pravin Kumar Sharma, Sumeet Dwivedi, G.N. Darwhekar
Acropolis Institute of Pharmaceutical Education and Research, Indore (M.P.), India – 453771
ayushpandey.bph24@acropolis.edu.in

In the present study, the potential of artificial intelligence (AI) is investigated within the pharmaceutical industry to accelerate drug discovery and strengthening manufacturing quality assurance. The methodology involved compiling datasets of molecular structures, clinical outcomes, and production records, which are then, analyzed using predictive modelling to identify drug-like candidates, anticipate molecular stability, and detect deviations in manufacturing. A comparative evaluation is performed between conventional experimental screening and AI-driven predictions to validate efficiency and accuracy. The result indicates that computational analysis reduced the time by nearly 40% while achieving above 90% accuracy in forecasting formulation stability and detecting process inconsistencies. Furthermore, predictive simulations revealed potential drug–target interactions that are consistent with available experimental references, suggesting the possibility of discovering novel therapeutic opportunities. Importantly, this approach not only optimizes industrial resources by reducing wastage but also emphasize the human-centered benefits of technology in healthcare. It can be concluded that AI, when integrated with pharmaceutical sciences, acts not as a substitute for human expertise but as a catalyst for precision, innovation, and compassionate healthcare. This review highlights the capacity of intelligent systems to bridge the gap between laboratory data and patient-centered outcomes to meet global health needs.

**Keywords:** Artificial intelligence, predictive modelling, drug discovery, quality assurance, healthcare innovation.

**AI-136**

**AI BASED PHYTOSOME DEVELOPMENT: A REVOLUTIONIZING PHYTOMEDICINE**

Gourav Gupta, Pravin Kumar Sharma, Sumeet Dwivedi, G. N. Darwhekar
Acropolis Institute of Pharmaceutical Education and Research,
Indore (M.P), India –453771

The development of plant-based therapeutic agents is often hindered by their poor bioavailability and instability. Phytosome technology, which complexes phytochemicals with phospholipids, has emerged as a solution, significantly enhancing the absorption and efficacy of these compounds. This report examines how the integration of artificial intelligence (AI) can overcome the remaining challenges in this field.AI can accelerate the discovery of novel phytochemicals by leveraging predictive models to analyze complex botanical and ethnobotanical datasets. Furthermore, generative AI can be applied to design and optimize new phytosome formulations, moving beyond traditional trial-and-error methods to a more efficient, data-driven approach. In manufacturing, AI-augmented systems can provide real-time quality control, ensuring consistent and scalable production. This convergence of phytosome and AI technologies promises to streamline the entire R&D pipeline, reduce costs, and pave the way for a future of personalized phytomedicine tailored to individual patient needs.

**Keywords:** Phytosomes, artificial intelligence (AI), phytomedicine, drug delivery systems, generative AI.

**AI-137**

**AI-DRIVEN DRUG DISCOVERY: ACCELERATING THE PATH FROM TARGET TO DRUG CANDIDATE**

Prakhar Bajpayee, Pravin Kumar Sharma, Sumeet Dwivedi, G. N. Darwhekar
Acropolis Institute of Pharmaceutical Education and Research, Indore (M.P), India – 453771
prakharbajpayee.mpceutics24@acropolis.edu.in

The traditional drug discovery process is an inefficient, resource-intensive undertaking characterized by long timelines and high failure rates. This explores show artificial intelligence (AI) is fundamentally transforming this pipeline, significantly accelerating the journey from identifying a disease target to discovering a viable drug candidate. By leveraging advanced machine learning algorithms, AI can analyze vast, complex datasets, including genomic, proteomic, and clinical information, at a speed and scale impossible for human researchers. This capability is applied across multiple stages: first, in target identification to pinpoint the most promising biological targets; second, in molecule design and optimization through virtual screening and generative models to rapidly create and refine new chemical entities; and third, in preclinical and clinical phases by predicting a drug's efficacy and toxicity. These AI-driven approaches minimize the need for costly trial-and- error experimentation, enabling pharmaceutical companies to prioritize high-potential candidates, reduce development costs, and ultimately deliver life-saving therapies to patients faster.

**Keywords:** Artificial Intelligence (AI), virtual screening, drug discovery, target identification, molecule design.

**AI-138**

**AI-DRIVEN DETECTION AND MANAGEMENT OF HERBAL INTERACTIONS WITH PROPYLTHIOURACIL TO ENHANCE PATIENT SAFETY**

Vaibhav Borkar, Vinita Kale, Suankit Harane, Milind Umekar
Department of Regulatory Affairs, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee,
Dist. Nagpur, Maharashtra, India – 441002
vaibhavborkar2586@gmail.com

Propylthiouracil (PTU) is a widely used antithyroid drug for the management of hyperthyroidism, notably in Graves' disease. Despite its effectiveness, PTU therapy presents challenges due to potential interactions with various substances, including herbal medicines, which may affect its safety and efficacy. Herbal components such as ginkgo biloba, St. John's wort, and other supplements could potentially alter thyroid hormone levels or PTU metabolism, posing risks of adverse effects or reduced therapeutic outcomes. However, much of the herb-PTU interaction data remains limited and under-researched, posing challenges for clinicians and patients in managing safe PTU therapy. This proposes the development of an AI-powered digital platform, tailored for PTU users to identify and assess herbal interactions. The platform would incorporate natural language processing and machine learning to facilitate user-friendly identification of substances from text, image, or voice inputs, enabling bilingual support for broader accessibility. It will provide evidence-based interaction severity alerts with clear, color-coded feedback to patients and healthcare professionals. Such a tool aims to enhance medication safety by promoting awareness of herb-PTU interactions, helping prevent adverse outcomes related to unmonitored herbal supplement use. Future enhancements may include integration with electronic health records and personalized risk assessments based on patient medication profiles and genetic factors affecting PTU metabolism. This approach aligns with regulatory frameworks emphasizing medication safety, patient education, data privacy, and the responsible use of AI in healthcare technology advancements.

**Keywords:** Propylthiouracil, Herbal interactions, Hyperthyroidism, AI-powered medication safety, Patient education.

**AI-139**

**THE IMPACT OF ARTIFICIAL INTELLIGENCE (AI) ERRORS ON PATIENT SAFETY: A CASE STUDY ANALYSIS OF MEDICAL DEVICE RECALLS**

Pratima Patel, Vrushank Patel, G.S. Chakraborthy
Department of Regulatory Affairs, Parul Institute of Pharmacy & Research, Parul University, Limda, Vadodara, 391760, India.
pratimapatel00@gmail.com

AI has rapidly made its way into healthcare, promising better patient care. However, the use of AI-enabled medical devices also introduces new risks that must be carefully evaluated, especially when it comes to patient safety. In this study, we examine AI-related errors by looking at medical device recalls. Our goal is to understand when these errors occur and what kinds of adverse events hospitals face as a result. By analysing 5 to 8 case studies of recalled medical devices with AI components, we uncover recurring patterns and the root causes behind these failures. The research focuses on three critical areas—data quality, algorithm design, and regulatory oversight—to highlight the vulnerabilities in AI-powered devices. We also discuss potential safety concerns such as misdiagnoses, treatment delays, and negative patient outcomes. We anticipate that our findings will provide essential guidelines for hospitals, regulatory bodies, and manufacturers to reduce risks and improve the safe use of AI in healthcare. Ultimately, by recognizing these challenges, stakeholders can take concrete steps to make devices safer, improve patient outcomes, and ensure that AI is integrated into healthcare in a responsible and ethical way.

**A SURVEY ON USAGE OF AI IN SELF-DIAGNOSIS**

Smitha Roselin A, Ruhana
Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka, Bengaluru-560064

Artificial intelligence (AI) is rapidly emerging in healthcare, particularly in self-diagnosis, raising questions about its acceptance and reliability. To explore this, a cross-sectional survey was conducted to assess awareness, attitude, usage patterns and perceptions regarding AI in self-diagnosis. The survey was conducted between 07/07/2025 and 23/08/2025. Demographic, knowledge, attitude, practice-based responses were collected using a structured questionnaire. The questionnaire was designed using Google forms and circulated to 150 individuals aged between 18 and above 50 years. All responses were systematically collected and analyzed. The following section presents the survey findings. Awareness of AI was high (97.3%), with 57.3% reporting its use for health-related queries, predominantly with ChatGPT (71.3%). While 52.6% acknowledged its potential in early disease detection, 72% believed it cannot replace human doctors, primarily due to accuracy concerns. Accuracy concerns persisted with 30% finding AI less correct than doctors. Nevertheless 64.6% agreed AI is transforming healthcare positively. In conclusion, the findings highlight strong awareness and growing acceptance of AI model in healthcare, especially in self diagnosis of symptoms, yet concerns about accuracy and reliability remain key barriers to its acceptance, while maintaining trust in human doctors as the cornerstone of clinical care.

Clinical trials remain a cornerstone of evidence-based medicine, yet they are increasingly challenged by rising costs, prolonged timelines, and complex data requirements. Recent advances in Artificial Intelligence (AI) have begun to reshape the clinical research landscape by supporting more efficient trial design, patient recruitment, monitoring, and data handling. Techniques such as machine learning, natural language processing, and predictive analytics allow sponsors to optimize study protocols, identify suitable participants, and ensure higher-quality data management. This review highlights current applications of AI in clinical trial design and data management, examines the benefits and limitations of these approaches, and discusses future directions and regulatory considerations that will influence the responsible integration of AI into clinical research.

**Keywords:** Artificial Intelligence, Clinical Trial Design, Data Management, Machine Learning, Patient Selection.

**AI FOR PERSONALIZED MEDICINE: PREDICTING PATIENT-SPECIFIC TREATMENT OUTCOMES**

Gunjan pise, Mr sumit kolte,
Priyadarshini J.L.college of pharmacy,Nagpur , Maharashtra 441110
gunjanpise2072@gmail.com

Personalized medicine aims to provide patient-centered treatment by considering genetic, clinical, and lifestyle factors. Traditional approaches often fail to capture complex biological interactions, leading to variable treatment outcomes. Artificial Intelligence (AI), with its ability to analyze large and diverse datasets, holds significant promise in predicting patient-specific responses to therapiesThe objective of this study is to explore the role of AI in predicting individualized treatment outcomes, thereby enhancing clinical decision-making and improving therapeutic efficacy. A systematic review of recent AI models applied in personalized medicine was conducted. Data from electronic health records, genomic sequencing, and clinical trials were analyzed using machine learning algorithms including random forest, deep learning, and support vector machines. Model performance was evaluated based on accuracy, sensitivity, and predictive value in forecasting treatment responsesAI-based models demonstrated high predictive accuracy, with deep learning achieving up to 85–90% precision in forecasting patient-specific outcomes for cancer immunotherapy and cardiovascular drug response. Integration of genomic and clinical data significantly improved model reliability compared to traditional statistical approachesAI has the potential to transform personalized medicine by accurately predicting patient-specific treatment outcomes. Early integration of AI-driven models into healthcare systems may reduce trial-and-error prescribing, minimize adverse effects, and improve overall treatment success rates. However, challenges such as data privacy, ethical concerns, and model interpretability need to be addressed for large-scale clinical adoption.

**Keywords:** Artificial Intelligence, Personalized Medicine, Machine Learning, Treatment Outcomes, Predictive Modeling, Genomics.

Postural Orthostatic Tachycardia Syndrome (POTS) is an underdiagnosed autonomic disorder characterized by excessive heart rate increase upon standing, disproportionately affecting young adults and women. Despite its growing recognition, therapeutic interventions remain fragmented, with significant care gaps in diagnosis, medication optimization, and patient monitoring. Clinical pharmacy has a vital role in addressing these challenges, and artificial intelligence (AI) offers novel avenues to enhance this role. This study explores AI-driven clinical pharmacy strategies to improve the management of POTS, focusing on predictive algorithms, personalized pharmacotherapy, and continuous digital monitoring. AI models can aid in early detection through analysis of electronic health records, wearable device data, and symptom trends, reducing diagnostic delays. Furthermore, AI-enabled decision support systems assist pharmacists in tailoring pharmacological regimens—such as beta-blockers, ivabradine, or fludrocortisone—while minimizing adverse effects and drug interactions. Machine learning–based adherence tools and chatbots can empower patients with real-time education, medication reminders, and lifestyle guidance. Integrating AI into pharmacy practice bridges existing care gaps by enabling precise, patient-centred interventions and fostering multidisciplinary collaboration. Importantly, such strategies align with the global vision of digital health transformation, ensuring cost-effectiveness, improved quality of life, and long-term outcome monitoring in emerging disorders like POTS.

**AI-DRIVEN SMART HEALTHCARE SYSTEMS: A PHARMACOEPIDEMIOLOGICAL DATA ANALYSIS.**

Garima Sharma, Sagar Haldekar, Neelam Balekar
IPS Academy College of Pharmacy, Indore, Madhya Pradesh, India 452012.
garimasharma9826@gmail.com

The integration of automation and Artificial Intelligence (AI) has revolutionized healthcare by enhancing diagnosis, remote monitoring, robotic surgery, and treatment strategies. With advancements in 5G, IoT, and edge computing, smart healthcare systems have created a highly connected and technology-driven medical environment. These AI-powered platforms can now make autonomous decisions, marking a significant shift in healthcare delivery. A mixed-methods study was conducted to examine AI adoption and perceptions within healthcare. Using a Google Forms survey, data were collected from 300 participants aged 18 and above who were familiar with smartphones, applications, and wearable devices. The survey assessed participants' knowledge of AI, trust in its decision-making abilities, privacy concerns, efficiency perceptions, and overall acceptance. Statistical analysis, including t-tests and correlation methods, was applied to interpret the results. Findings revealed that women, professionals, and individuals aged 31–60 demonstrated more favourable attitudes toward AI in healthcare compared to men, students, and younger participants aged 18–30. The study emphasizes the importance of targeted educational initiatives and hands-on AI demonstrations to enhance trust, awareness, and acceptance among diverse demographic groups, ultimately promoting wider AI integration in healthcare settings.

**AI RX: REIMAGINING INDIAN PHARMACY EDUCATION THROUGH CLINICAL, HOSPITAL, AND COMMUNITY INTELLIGENCE**

Aditya Ambadas Shirsat, Om Suresh Yelmame, Sachin Bhagwat Aglawe
Rashtrasant Janardhan Swami College of Pharmacy, Kokamthan ,Kopargaon, Maharashtra, India. 423601
adityashirsat9113@gmail.com

Artificial Intelligence (AI) is no longer just a buzzword—it's becoming a powerful tool across clinical, hospital, and community pharmacy settings. In India, where pharmacy education often leans heavily on traditional methods, AI opens up exciting possibilities to modernize how we learn, practice, and serve patients. In clinical pharmacy, AI helps pharmacists make smarter decisions by analysing patient data, predicting drug interactions, and even tailoring therapies based on genetic profiles. Hospital pharmacies are seeing the rise of automated dispensing systems, predictive inventory tools, and real-time monitoring of adverse drug reactions. Meanwhile, community pharmacies are embracing chatbots, tele pharmacy platforms, and AI-driven tools that improve medication adherence and patient engagement. Despite these advancements, Indian pharmaceutical education hasn't fully caught up. These highlights the urgent need to integrate AI into the curriculum—through hands-on training, interdisciplinary learning, and exposure to real-world digital tools. It also touches on key challenges like data

ISBN: 978-81-980623-8-3

privacy, algorithm bias, and the importance of ethical AI use in healthcare. By embracing AI, we're not just upgrading technology—we're empowering future pharmacists to deliver safer, smarter, and more personalized care. This shift is essential if India wants to stay aligned with global healthcare trends and prepare a workforce that's ready for tomorrow.

**Keywords**: Artificial Intelligence, Clinical Pharmacy, Pharmacy Education, Digital Health, Telepharmacy.

**ARTIFICIAL INTELLIGENCE INTEGRATION IN PHARMACY EDUCATION: INDIA'S PATH TO GLOBAL LEADERSHIP UNDER NEP 2020**

Dillip Kumar Sahoo[1]*, Prabir Banerjee[2]
[1] Belarani Institute of Medical Science, Onda, Bankura, West Bengal
[2] School of Pharmacy, Seacom Skills University, Birbhum, West Bengal

Background: AI integration in pharmacy education is transforming global healthcare preparation. India's NEP 2020 and PCI curriculum revisions create unprecedented opportunities for modernization. Objective: Assess India's AI integration status in pharmacy education, compare with global standards, and propose implementation framework. Methods: Mixed-methods analysis of 2,847 students, 156 faculty, and 25 institutions across India (2024-2025), with international benchmarking. Results: India shows 31% AI preparedness vs. 59% global average. Only 34.6% of students actively use AI tools. Critical gaps exist in faculty competency (32% vs. 64% globally) and curriculum integration (25% vs. 59% globally). However, strong policy support and scale advantages provide transformation potential. Conclusion: Systematic AI implementation through NEP 2020 framework can position India as global leader by 2035.

**Keywords:** Artificial Intelligence, Pharmacy Education, NEP 2020, Global Competitiveness.

***IN SILICO* TECHNOLOGY IN PHARMA FIELD**

Bajpai Ritu S, Yelam Vidya (Kapse), Dharashive V.M.Shivlingeshwar
College of Pharmacy Almala, Tq Ausa ,Dist Latur-413520,
Pharmacy Practice Department
kapse.vidya@gmail.com

Pharmaceutical research and development has seen a revolution because to insilico technology, which combines machine learning, artificial intelligence (AI), and computer models to speed up drug discovery and improve therapeutic results.Incontrast to conventional in vitro and in vivo approaches, insilico techniques make use of computer-based simulations to evaluate pharmacokinetics, pharmacodynamics, and toxicity profiles, as well as to anticipate molecular interactions and find new drug candidates.Due to the inability of traditional methods like in vitro and in vivo to examine vast amounts of data, this frequently yields ineffective results. Advanced insilico methods have provided pharmaceutical companies with a wealth of opportunities to find new possible drug targets, which in turn influences the duration and success of conducting clinical trials to find new drug targets.The time, expense, and ethical issues related to preclinical and clinical research are greatly decreased by this technology. In order to create safer and more efficient treatments, the pharmaceutical industry uses insilico technologies for target identification, virtual screening, structure-based drug design, and personalized medicine.Virtual clinical trials and disease modeling also improve decision-making and regulatory procedures. All things considered, insilico technology offers a quicker, more economical, and patient-centered route to healthcare innovation.

**SURVEY BASED ON USE OF AI IN THE DETECTION OF NON-ALCOHOLIC FATTY LIVER**

Annika Banerjee
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy, Education and Research, Bangalore, Karnataka, India.
banerjee.annika003@gmail.com

Non-alcoholic fatty liver disease represents one of the most prevalent chronic liver disorders worldwide, primarily linked to modifiable lifestyle factors such as obesity, sedentary behaviour, and dietary imbalances. In recent years AI has emerged as a promising tool in medical diagnostics. To evaluate public awareness of NAFLD and perceptions toward AI-driven healthcare, a cross-sectional survey was conducted and 178 participants responded. Findings revealed that 89% of respondents were aware of NAFLD, while 96% recognized the influence of unhealthy lifestyles on liver health. Additionally, 62% reported personal or familial liver-related diagnoses, reflecting the growing clinical burden. Preventive health practices were encouraging, with 79% expressing comfort with routine diagnostic procedures such as blood tests. Regarding digital health, 72% had prior knowledge of AI applications, and 77% believed AI could support physicians in achieving earlier and more precise NAFLD detection. Moreover, 74% indicated willingness to adopt AI-based liver health tests if recommended by clinicians. Among these, 36% prioritized accuracy and rapid results, whereas others emphasized affordability and data privacy. Concerning accessibility, 37% preferred mobile app-based self-screening, 36% supported community health camps, and the remainder favoured clinical or diagnostic centres. Importantly, 72% agreed that AI integration would enhance interest in preventive healthcare, and 81% expressed readiness to recommend AI-based screening if affordable. Overall, the survey indicates strong acceptance of ai based liver diagnostics, highlighting its potential in advancing NAFLD detection and preventive healthcare.

**Keywords:** Non-alcoholic fatty liver, AI, early detection, preventive health care, public perception.

**AI-INTEGRATED UNIQUE MEDICAL IDENTITY SYSTEM: BRIDGING THE GAP BETWEEN HEALTH IDS AND SMART HEALTHCARE IN INDIA.**

Boda Ram Prasad, Karna Sai Sunitha1, Netala Silvia2
1 Shri vishnu college of Pharmacy, Bhimavaram.
2 Department of Pharmacognosy, Shri vishnu college of Pharmacy,Bhimavaram.
ramprasadboda01@gmail.com

India's healthcare system is moving towards digitalization through the Ayushman Bharat Digital Mission (ABDM), which provides citizens with a unique health ID. However, current platforms mainly act as static record-keeping systems and lack intelligent features to support clinical decision-making. This gap often results in fragmented medical histories, duplicate tests, and medication errors. We propose an AI-integrated Unified Medical Identity System (UMIS), where every citizen is assigned a unique medical number similar to Aadhaar or PAN. All prescriptions, diagnostic results, and treatment histories from hospitals, pharmacies, and laboratories would automatically be linked to this ID. Artificial intelligence algorithms would analyze the longitudinal data to predict adverse drug reactions, check drug–drug interactions, support physician decision-making, and personalize treatment regimens. Additionally, anonymized datasets could accelerate pharmacovigilance and pharmaceutical research. This model envisions a dynamic, AI-driven ecosystem that ensures safer treatments, reduces healthcare costs, and strengthens India's digital health infrastructure.

**Keywords:** AI in pharma, Health ID, Unified Medical Identity, Pharmacovigilance.

**AI-DRIVEN PERSONALIZED SKINCARE FORMULATIONS: A NEW ERA OF COSMECEUTICALS**

Ishika Dhurandhar
Rungta College of Pharmaceutical Sciences and Research, Raipur, Chhattisgarh, India - 492099.
ishikadhurandhar5@gmail.com

Personalized skincare is becoming a key focus in cosmeceuticals, and artificial intelligence (AI) plays a central role in this transformation. Traditional formulations often fail due to variations in skin type, genetics, and environmental factors. AI technologies, including machine learning and deep learning, enable accurate skin diagnostics, bioactive compound selection, and the development of tailored formulations. These tools also support predictive safety analysis and formulation optimization, improving both efficacy and consumer trust. Future innovations such as digital twins, smart biosensors, and genomics integration hold great promise in advancing individualized skincare solutions. While issues like data privacy, algorithmic bias, and high costs remain challenges, AI has the potential to revolutionize cosmeceuticals

ISBN: 978-81-980623-8-3

by creating safe, effective, and highly personalized skincare products.
**Keywords:** Artificial intelligence, Cosmeceuticals, Personalized skincare, Predictive modeling, Biosensors.

**GUAVA LEAF EXTRACT-LOADED NANOSTRUCTURED LIPID CARRIER (NLC) MICROEMULSION FOR ANTI-INFLAMMATORY TOPICAL DELIVERY**

Safa Anjum, Shifa, Rajat Sayyed, Kiran Bhise
MCE Society's Dr. P.A. Inamdar University, Allana College of Pharmacy, Pune, India

Inflammation plays a pivotal role in chronic disease progression, and while synthetic anti-inflammatory drugs are effective, their long-term use is often linked to adverse effects. Plant-based alternatives offer safer therapeutic options. The present study focused on formulating and evaluating a guava leaf (Psidium guajava L.) extract-enriched Nanostructured Lipid Carrier (NLC)-based topical microemulsion for anti-inflammatory application. Using a factorial design approach, the optimized formulation was characterized for particle size, polydispersity index (PDI), zeta potential, entrapment efficiency, and stability. Molecular docking confirmed strong binding of phytoconstituents like quercetin and caffeic acid with COX-2, supporting anti-inflammatory potential. Predicted and experimental values for particle size (~120 nm), PDI (0.112), and zeta potential (−27.5 mV) demonstrated stability and uniformity. Encapsulation efficiency (90.05%) ensured effective drug loading, aligning with predicted outcomes. Overall, the formulation showed desirable nanoscale characteristics, robust stability, and high encapsulation efficiency, confirming its potential as a safe and effective topical delivery system.
**Keywords:** Psidium guajava, Nanostructured Lipid Carrier, Anti-inflammatory, Topical microemulsion, Drug delivery.

**AI-154**

**THE TRANSFORMATIVE ROLE OF ARTIFICIAL INTELLIGENCE IN THE MODERN PHARMACEUTICAL SECTOR**

Gauri Barad, Laxmikant Borse, Kuldeep Vinchurkar Sir
Sandip Institute Of Pharmaceutical Sciences, Nashik
Gauribarad05@Gmail.Com

Artificial Intelligence (AI) has emerged as a transformative force in the pharmaceutical sector, offering innovative solutions across the entire drug development and healthcare continuum. In pharmacy, AI technologies such as machine learning, natural language processing, and deep learning are increasingly being utilized to enhance drug discovery, formulation development, clinical trials, patient care, and pharmacovigilance. By analyzing large and complex biomedical datasets, AI enables the identification of novel drug targets, prediction of molecular interactions, and optimization of lead compounds, significantly reducing the time and cost traditionally associated with drug research and development. In clinical pharmacy, AI-driven decision support systems aid healthcare professionals in prescribing personalized therapies, optimizing dosages, and preventing adverse drug reactions. Moreover, AI plays a crucial role in supply chain management, inventory control, and precision marketing of pharmaceuticals, thereby ensuring better accessibility and affordability of medicines. Patient-centric applications, such as AI-powered mobile health apps, wearable devices, and chatbots, further support medication adherence, disease monitoring, and real-time health management. Despite its immense potential, the integration of AI into pharmacy faces challenges, including data privacy concerns, algorithm transparency, ethical considerations, regulatory compliance, and the need for skilled professionals who can bridge the gap between pharmacy and data science. Nevertheless, ongoing advancements and collaborations between academia, industry, and regulatory authorities are fostering the growth of AI in pharmacy.

**AI-155**

**ARTIFICIAL INTELLIGENCE IN PHARMACEUTICAL REGULATORY AFFAIRS**

Sahil Vijay Deshmukh
Mahavir Institute Of Pharmacy, Nashik

The complexity of pharmaceutical regulations is growing and requires smarter and more transparent systems, as manual dossier preparation and compliance monitoring often delay approvals and increase errors. By developing regulatory expertise, promoting transformative innovation, and enabling strategic decision-making, Artificial Intelligence (AI) can redefine regulatory affairs, enhancing operational efficiency, ensuring compliance, and safeguarding patient safety. A pilot AI-enabled automation tool was implemented at a leading Indian pharmaceutical company, where 120 historical submission dossiers (2018–2022) were digitized and analyzed using natural language processing (NLP) for automated classification and error detection. The model, trained with reviewer annotations, was validated on five new submissions in 2023, achieving 92% classification accuracy, a 43% improvement In error detection compared with manual review, and a 27% reduction in dossier preparation time. These gains translated into an estimated one and half to two month reduction in approval timelines. Globally, AI applications such as the FDA's Sentinel System for post-market surveillance and the EMA's AIassisted pharmacovigilance platforms demonstrate regulatory scalability. Beyond dossier automation, AI supports regulatory intelligence, consistency checks, pharmacovigilance, and decision support, reducing repetitive tasks and empowering professionals to focus on higherorder responsibilities. Therefore, AI-driven regulatory platforms can be effectively integrated within the Indian ecosystem, offering measurable improvements in accuracy, speed, and transparency. To sustain these benefits, professionals must be educated in digital tools, regulators and industry must innovate by co-developing adaptive frameworks, and all stakeholders must be empowered to accelerate patient access to safe and effective medicines.

**AI-156**

**ARTIFICIAL INTELLIGENCE IN PHARMACY EDUCATION: TRANSFORMING LEARNING FOR THE NEXT GENERATION**

Karthick.J John Berlin Joe.J. U, Arulprakasam
Jkkmmrf's Annai Jkk Sampoorani Ammal College Of Pharmacy
Namakkal Disrtrict, Tamil Nadu

The rapid advancement of artificial intelligence (AI) is developing health sciences education globally. In pharmacy education, there is increasing potential for AI to improve learning outcomes and student engagement. This study explores how AI-powered tools are being integrated into pharmacy education, examines their benefits and challenges, and proposes a roadmap for future implementation. Databases searched include PubMed, Scopus, and Google Scholar. Key inclusion criteria were studies involving AI-driven adaptive learning, virtual patient simulation, automated assessments, and AI-tutoring systems evaluated among pharmacy students. However, challenges include high cost of implementation, lack of faculty training in AI, concerns about data privacy, and risk of over-dependence on technology. AI has strong promise for transforming pharmacy education. Future research should focus on longitudinal studies assessing learning retention, cost-effectiveness, and student satisfaction in diverse settings, including resource-limited environments.
**Keywords:** Artificial Intelligence, Pharmacy Education, Virtual Simulation, Adaptive Learning, Automated Assessment.

**AI-157**

**AI IN CANCER: A MACHINE LEARNING APPROACH FOR PREDICTING BREAST CANCER IMAGES**

Sadhu Venkateswara Rao, Padmalatha Kantamneni
Department of Pharmaceutics,
Vijaya Institute of Pharmaceutical Sciences for Women
Enikepadu, Vijayawada, Andhra Pradesh, India – 521108
venkateshsadhu@gmail.com

Cancer is a disease that continues to plague our modern society. Among all types of cancer, breast cancer is now the most common type of cancer occurring in women worldwide. Various factors, including genetics, lifestyle, and the environment, have contributed to the rise in the prevalence of breast cancer among women of all socioeconomic strata. Therefore, proper screening for early diagnosis and treatment becomes a major factor when fighting the disease. Artificial intelligence (AI) continues to revolutionize various spheres of our lives with its numerous applications. Using AI in the existing screening process makes obtaining results even easier and more convenient. Faster, more accurate results are some of the benefits of AI methods in breast cancer screening.

ISBN: 978-81-980623-8-3

Nonetheless, there are many challenges in the process of the integration of AI that need to be addressed systematically. The proposed methodology involves the integration of machine learning algorithms such as Support Vector Machines (SVM), K-NN and Convolutional Neural Networks to analyze complex biological data and identify key features associated with cancer cells. This innovative machine learning-based approach holds great potential for revolutionizing cancer therapy by improving precision and efficacy. In this research, the CNN model was trained on the Kaggle dataset which contains 277,524 breast cancer images, the algorithm performed well on this data and predicted the cancer cells automatically. Finally, the proposed CNN achieved an 87.89 accuracy for the prediction of cancer cells.

**Keywords:** Support Vector Machines (SVM), K-Means, Machine learning (ML), Convolutional Neural Networks (CNNs), Breast cancer Images.

**AI-158**

**INTEGRATING AI, SPECTRAL ANALYSIS, AND PRACTICAL STUDIES FOR ANTIMICROBIAL EVALUATION OF LEAVES OF *MOMORDICA DIOICA***

Khushee Jaiswal, (Pharmacognosy and Phytochemistry), Bombay College of Pharmacy, Mumbai
khushee.mpharm@gmail.com

Artificial intelligence (AI) and *in-silico* approaches are transforming natural product research by enabling the predictive screening of bioactivities prior to laboratory confirmation. In this study, the antibacterial potential of leaves of *Momordica dioica* (momordicin) was anticipated using AI-assisted spectrum analysis and molecular docking. The NMR interpretation using ChemDraw revealed hydroxyl, carbonyl, aromatic, and ether functionalities that are consistent with flavonoids, tannins, and phenolic glycosides, all of which have established antibacterial action. Docking computations against bacterial target proteins revealed a substantial binding affinity for momordicin (-11.3 kcal/mol), which is nearly identical to ciprofloxacin (-12.8 kcal/mol), indicating potent antibacterial activity. Ethanolic leaf extracts of M. dioica were used in in vitro experiments to confirm these hypotheses. Alkaloids, tannins, and phenols were verified by phytochemical analyses. With MIC values of 1, 4, 2, and 16 µg/ml for *Staphylococcus aureus, Bacillus cereus, Escherichia coli,* and *Salmonella typhi,* respectively, and $IC_{50}$ values ranging from 29.27 to 46.14 µg/ml, the extract demonstrated detectable inhibition against these pathogens. The *in-silico* predictions were confirmed by zone of inhibition experiments, which showed a concentration-dependent response. This combined AI-driven prediction and experimental validation strongly establishes *M. dioica* as a promising source of antimicrobial agents, bridging computational pharmacognosy with practical drug discovery.

**Keywords:** *Momordica dioica*, antimicrobial activity, *in-silico* docking, analysis, pharmacognosy.

**AI-159**

**"AI-ASSISTED LIGAND DESIGN AND MOLECULAR DOCKING OF THEOPHYLLINE DERIVATIVES WITH HUMAN SERUM ALBUMIN FOR POTENTIAL ANTI-ASTHMATIC ACTIVITY"**

Aashita Sakore, Deepak s. Khobragade
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education and Research, (DU), Sawangi (M), Wardha, Maharashtra, India
Swapnil Deshmukh
Shri Shankaracharya technical campus, Faculty of Pharmaceutical science, Junwani, Bhilai, Chhattisgarh, India
aashitasakore14@gmail.com

Asthma is a prevalent chronic inflammatory disorder of the respiratory system. It is characterized by airway remodelling and hyperresponsiveness. It poses a significant role global health burden. Current therapeutic strategies generally deal with bronchodilators such as theophylline, a well-established xanthine derivative with a long history of clinical use. The structural modification of theophylline to improve its efficacy and safety profile represents a valuable approach in the design of novel anti-asthmatic agents. In the present study, computational methods were utilized to design and find the binding affinity of theophylline derivatives with human serum albumin (HSA), which is a key plasma protein that involved in drug transport and modulation. The three-dimensional structure of HSA (PDB ID: 2VUE) was retrieved and prepared for docking by removing non-essential molecules and adding hydrogen atoms. Ligands were constructed using Chem Draw Ultra 12.0, Geomol and chem draw pro. Artificial intelligence-based molecular modelling (GeoMol) was applied to translate the SMILES strings into optimized three-dimensional geometries Molecular docking was carried out using Argus Lab 4.0.1, applying the Argus Dock engine to predict binding poses and calculate binding energies. Theophylline was used as the reference compound, which yield a binding energy of −5.36945 kcal/mol. Among these designed derivatives (A1–A20), compounds A8, A10, and A15 showed better binding affinities as compared to the standard theophylline, with binding energies of –10.1209, –9.95421, and –10.0143 kcal/mol, respectively.

**Keywords:** Argus lab, Asthma, Chem draw, Human serum albumin, Theophylline.

**AI-160**

**AI-ENABLED 3D PRINTING: SHAPING THE FUTURE OF PERSONALIZED MEDICINES**

Shreya S. Ingle, Meghraj V. Suryawanshi
Department of Pharmaceutical Sciences, Sandip Institute of Pharmaceutical Sciences, Nashik, Maharashtra, India-422213
shreyaingle118@gmail.com

Personalized medicine is transforming healthcare by shifting from conventional "one-size-fits-all" therapies toward patient-focused treatment strategies. Standard dosage forms often lack the flexibility to adjust dose, combine multiple drugs, or control release patterns, which can reduce therapeutic success and patient adherence. Integrating artificial intelligence (AI) with three-dimensional (3D) printing offers a promising solution to these challenges. AI algorithms can interpret patient data, pharmacokinetic parameters, and excipient interactions to design optimized digital models of dosage forms. These can then be fabricated by 3D printing into customized tablets, polypills, and controlled-release systems that meet individual clinical requirements. The FDA-approved 3D-printed levetiracetam tablet (Spritam) demonstrates the clinical feasibility of this approach. Beyond this example, AI-enabled 3D printing reduces trial-and-error formulation, shortens development timelines, and supports cost-effective, on-demand manufacturing. Looking ahead, efforts may focus on expanding AI-driven formulation databases, incorporating real-time patient data, and developing scalable models to support wider clinical application. Together, these strategies could improve accessibility of personalized therapies and enhance patient outcomes. Overall, AI-assisted 3D printing represents a significant advance in pharmaceutical technology, with strong potential to optimize treatment efficacy, improve adherence, and foster a more patient-centric approach to drug delivery.

**Keywords:** Artificial intelligence, 3D printing, personalized medicine, patient-centric drug delivery, pharmaceutical technology.

**AI-161**

**PLAIN-LANGUAGE GAPS IN PATIENT INFORMATION LEAFLETS: USING NLP TO EVALUATE READABILITY, COMPLETENESS, AND RISK COMMUNICATION**

Krisha T Maheshvari, Akashkumar P. Mathuria and Sandipkumar P. Bhatt
Department of Pharmacology and Pharmacy Practice, K. B Institute of Pharmaceutical Education and Research, Kadi Sarva Vishwavidyalaya, Gandhinagar, Gujarat, India – 382023
Krishamaheshvari2004@gmail.com

Patient Information Leaflets (PILs) are essential for safe medication use, yet many are hard to understand, include insufficient information, or convey risks ambiguously. Pharmacists often compensate for these deficiencies. An analysis was conducted on 300 PILs (prescription, devices, over-the-counter; innovator vs generic; ≥8 classes). Readability (Flesch–Kincaid, Reading Ease, sentence length, jargon density) was evaluated after processing texts from PDFs/HTML. An eight-item checklist (indication, dose, administration, warnings, side effects, urgent care, storage, contact) gauged completeness. Risk clarity was measured as actionable ("Stop and call") versus hedged wording. Subgroup comparisons were made. Clarity and time to find urgent-care guidance were assessed (1–5 scale) in a subsample of 20 PILs with 40 laypeople. Wide variations were found in readability (F-K 4.8–19.2). Compared to OTC, prescription PILs were more difficult (median grade 11.0 vs 8.1, $p<0.01$). Completeness ranged 1/8–8/8; >80% lacked urgent-care

ISBN: 978-81-980623-8-3

instructions. Innovator brands scored higher than generics (7/8 vs 5/8). Only 22% of safety claims were actionable. Lay readers took longer to locate urgent-care instructions (92s vs 38s) and rated prescription PILs lower in clarity (2.8/5 vs 3.6/5). PILs are frequently challenging and lacking. Basic NLP tools can identify flaws. To standardize understandable, actionable PILs, a pharmacist checklist and plain-language templates are suggested.

**"AI IN PHARMA: A DOUBLE-EDGED SWORD OF INNOVATION AND RISK"**

Arshpreet Kaur, Monika, Pooja Chawla
University Institute of Pharmaceutical Sciences and Research
Faridkot, Punjab, India - 151203
preetarsh0785@gmail.com

Artificial Intelligence (AI) is transforming the pharmaceutical industry by introducing cutting-edge solutions that enhance drug discovery, clinical trial design, and supply chain management. By processing extensive biological and clinical datasets, AI enables faster identification of potential drug candidates, more efficient trial protocols, and improved manufacturing processes. These innovations have the potential to accelerate the development of effective treatments, lower production costs, and expand access to medicines, particularly in regions with limited healthcare infrastructure. Despite its promising contributions, the adoption of AI brings considerable challenges that must be addressed. A primary concern is the protection of data privacy and cybersecurity, as AI applications depend on vast amounts of sensitive patient information, exposing systems to risks of breaches and unauthorized exploitation. Another critical issue involves black box algorithms, whose lack of transparency prevents healthcare professionals from fully understanding or validating AI-generated decisions, which undermines trust. Additionally, algorithmic bias may result in unfair or inaccurate treatment recommendations, particularly affecting marginalized or underrepresented populations. Regulatory frame works often lag behind the rapid development of AI technologies, creating vulnerabilities where insufficiently tested or unsafe solutions may enter clinical practice. Intellectual property complexities also emerge, with unclear ownership over AI-generated discoveries and proprietary models. To fully benefit from AI in pharmaceuticals, we need clear regulations, open and understandable methods, strong ethical rules, and global cooperation. These steps are important to make sure AI is used safely, fairly, and responsibly in healthcare.

**Keywords:** Data bias, Intellectual property (IP) challenges, Black-box algorithms, Cybersecurity risks.

**AI-163**

**NEXT GENERATION CLINICAL LABS WITH ARTIFICIAL INTELLIGENCE.**

Harsharan Kaur, Rakesh Chawla, Pooja Chawla
University Institute of Pharmaceutical Sciences and Research.
Baba Farid University of Health Sciences, Faridkot 151203, Punjab, India.

Laboratory medicine has evolved into a highly automated medical discipline. In recent years, the application of artificial intelligence (AI) in laboratory medicine has attracted increasing attention, offering the potential to optimize laboratory workflows and even transform the field in the future. Despite this promise, only a few commercially available AI models are currently approved for clinical laboratory use, and they face limitations such as high costs, limited accuracy, and the requirement for manual review of results. There is a scarcity of comprehensive literature reviews that examine the current research landscape, challenges, and future opportunities for AI in laboratory medicine. We provide a concise introduction to AI and its key subsets, followed by a review of AI models currently employed or emerging in clinical laboratories. AI models in the clinical laboratory, requiring the joint efforts of laboratory professionals, information technology experts, and other stakeholders. We discuss the challenges associated with their implementation, explore potential solutions, and offer perspectives on future developments in the field. Beyond that, outside of clinical laboratories, wearable sensors have a great potential to become another huge market for AI applications Additionally, we highlight the current status of AI integration and its potential applications across various stages of the clinical testing process.

**EMPOWERING MIND: AI AND NETWORK PHARMACOLOGY FOR NEUROLOGICAL ACTIVITY**

Riya, Pooja Chawla, Viney Chawla
University Institute of Pharmaceutical Sciences and Research,
Baba Farid University of Health Sciences, Faridkot 151203, Punjab, India.

Artificial intelligence (AI) has emerged as a powerful tool in the field of neurology, significantly impacting the diagnosis and treatment of neurological disorders. Recent technologies have given us access to a plethora of information relevant to many aspects of neurology. The discovery of effective therapeutics against Alzheimer's disease and other neurological disorders remains a significant challenge. Artificial intelligence tools are of considerable interest in modern drug discovery processes and, by exploiting machine learning (ML) algorithms and deep learning (DL) tools, as well as data analytics, can expedite the identification of new drug targets and potential lead molecules. AI tools offering promising advancements in the diagnosis, monitoring, and treatment of neurodegenerative diseases such as Alzheimer's and Parkinson's. These disorders are characterized by progressive neuronal loss and complex pathological changes that are often difficult to detect in early stages using conventional methods. AI algorithms, particularly ML & DL models, have demonstrated high accuracy in analyzing large volumes of neuroimaging data (MRI, PET, CT scans), genetic information, and clinical records to identify early biomarkers and predict disease progression. Moreover, challenges such as data privacy, algorithm transparency, and integration into clinical workflows remain. Overall, AI holds significant potential to revolutionize the management of neurological disorders, enabling earlier interventions and improving patient outcomes.

**Keywords:** AI algorithms, Neuro-imaging, Alzheimer, Machine Learning.

**ADOPTION OF ARTIFICIAL INTELLIGENCE IN PHARMACY SERVICES: A CROSS-SECTIONAL STUDY AMONG PHARMACY PROFESSIONALS IN BANGALORE, INDIA**

Akash Nataraj, Rajeswari Ramasamy, Soumya Shivalingappa Morabad.
Department of Pharmacy Practice, MVM College of Pharmacy,
Yelahanka, Bengaluru, Karnataka, India
akashhnpharmd@gmail.com

Artificial Intelligence (AI) is rapidly transforming healthcare delivery, with applications extending into pharmacy services such as clinical decision support, patient counseling, inventory management, pharmacovigilance, and drug dispensing. However, its adoption among Indian pharmacy professionals remains underexplored. To assess knowledge, attitudes, and practices (KAP) regarding AI applications in pharmacy services among pharmacy professionals in Bangalore and to determine associations with demographic and professional variables. A descriptive cross-sectional survey was conducted among 120 pharmacy professionals between April and July 2025 using a structured KAP-based questionnaire. Participants were recruited from hospital, retail, and community pharmacy settings. Data were analysed using descriptive statistics, Chi-square tests, and one-way ANOVA. A total of 120 respondents participated in the study of whom 80 (66.7%) were aged 21–30 years, and redistribution of cadres showed 45 (37.5%) B. Pharm, 20 (16.7%) PharmD, 14 (11.7%) M. Pharm, and 41 (34.1%) D.Pharm. Overall, 96 (80.0%) had heard of AI in Pharmacy Services, and 50 (41.7%) reported formal AI-related training. Awareness was highest for clinical decision support (76.7%), patient counselling (70.0%), and inventory optimization (65.0%), while lowest for drug dispensing (52.5%). Usage followed the same trend but remained significantly lower than awareness ($\chi^2 = 18.52$, $p < 0.001$). Younger pharmacists (21–30 years) were more AI-aware ($\chi^2 = 10.42$, $p < 0.05$), and those with <3 years' experience were more likely to have AI training ($\chi^2 = 8.92$, $p < 0.02$). ANOVA revealed higher KAP scores among PharmD professionals (9.1 ± 1.0) compared to other groups ($F(3,116) = 6.02$, $p = 0.0007$). Hospital pharmacists scored significantly higher than community and retail

ISBN: 978-81-980623-8-3

pharmacists (F (2,117) = 4.12, p = 0.02). This study showed that awareness of AI in pharmacy services was generally high, though actual adoption in practice was considerably lower, highlighting a persistent awareness–practice gap. Awareness was particularly strong in areas such as clinical decision support and patient counselling, while drug dispensing showed relatively less recognition.

**Keywords:** Artificial Intelligence, Pharmacy Services, Knowledge-Attitude-Practice, Pharmacists, Healthcare Technology, India.

**AI-166**

## AI-Driven Admet Profiling Of Tyrosine Kinase Ligands For Drug Discovery And Repurposing

Pardha Saradhi Yedida, S. Ashok Krishnan
School Of Pharmaceutical Sciences And Technologies, Jawaharlal Nehru Technological University, Kakinada, Andhra Pradesh, India-533003
ypardhu4685@gmail.com

Tyrosine kinases (TKs) are critical therapeutic targets in oncology and other diseases, yet the identification of selective and safe ligands remains challenging. In this study, we integrated Cheminformatics filtering with Artificial Intelligence (AI)–based pharmacokinetic modeling to evaluate kinase-targeting ligands. A dataset of 28,314 small molecules targeting major TK families was obtained from ChEMBL via Kaggle. Activity-based filtering yielded 13,062 bioactive compounds, of which 6,294 molecules (48.1%) satisfied Lipinski's Rule of Five. These drug-like candidates were further profiled using ADMET-AI, a machine learning platform trained on large-scale pharmacokinetic and toxicity datasets, capable of predicting 41 endpoints spanning absorption, distribution, metabolism, excretion, and toxicity. The analysis showed that the mean Quantitative Estimate of Drug-likeness (QED) was moderate-to-high, with ~40–45% of compounds scoring above 0.67, a threshold for high-quality drug-like molecules. A majority displayed favorable solubility and logP values, suggesting good oral bioavailability potential. Predicted toxicity risks included hERG inhibition in ~15–20%, drug-induced liver injury (DILI) in ~12–15%, mutagenicity (AMES positive) in ~8–10%, and carcinogenicity in ~5–7%. Integrating both drug-likeness and toxicity filters, ~55–60% of compounds (≈3,500–3,800 molecules) were prioritized as promising candidates with favorable ADMET properties. This two-step workflow bioactivity enrichment followed by AI-based ADMET profiling demonstrates the utility of AI in systematically narrowing chemical space for kinase-targeted drug discovery. The reduced candidate pool provides a strong foundation for in silico drug design, repurposing studies, and future molecular docking and dynamics simulations.

**Keywords:** Tyrosine kinases, ADMET-AI, QED, DILI, In Silico Drug Discovery, Drug Repurposing.

## AI-GUIDED DESIGN AND SYNTHESIS OF MULTI-TARGET DIRECTED LIGANDS FOR THE TREATMENT OF ALZHEIMER'S DISEASE

Tripti Gupta, Jay Kumar Chandra, Bhavesh Yadav, D. K. Pradhan
Raigarh College of Pharmacy, Raigarh Chhattisgarh, India ,496001
guptatripti855@gmail.com

Alzheimer's disease (AD) is a multifactorial neurodegenerative disorder characterized by cholinergic dysfunction, amyloid-β (Aβ) aggregation, tau hyper phosphorylation, and oxidative stress [1]. Due to the complexity of AD pathogenesis, single-target drugs have shown limited efficacy, prompting interest in multi-target directed ligands (MTDLs) [2]. This study presents an artificial intelligence (AI)-assisted pipeline for the design, synthesis, and biological evaluation of novel MTDLs targeting key pathological mechanisms in AD. A deep generative model, trained on CNS-active compounds from the ChEMBL database, was employed to generate a focused library of drug-like molecules. Virtual screening was conducted using molecular docking (AutoDock Vina), followed by MM-GBSA free energy calculations and ADMET profiling to identify lead candidates. Three top-ranking compounds were synthesized via conventional organic synthesis routes and characterized by NMR and LC-MS. Biological evaluation included Ellman's assay for acetylcholinesterase (AChE) and butyrylcholinesterase (BChE) inhibition, thioflavin T fluorescence for Aβ aggregation, and DPPH assay for antioxidant capacity. The lead compound, MTDL-2025A, showed potent inhibition of AChE ($IC_{50}$ = 45.2 nM) and BChE ($IC_{50}$ = 61.7 nM), along with 63% inhibition of $A\beta_{1-42}$ aggregation at 10 µM, and strong free radical scavenging activity. Additionally, cytotoxicity screening in SH-SY5Y neuronal cells confirmed its safety at effective concentrations. These findings highlight the potential of AI-integrated medicinal chemistry strategies to accelerate the discovery of multifunctional agents for complex diseases like AD. Further in vivo studies are ongoing to validate pharmacokinetic and behavioral effects in transgenic AD models.

**Keywords:** Alzheimer's disease; multi-target ligands; artificial intelligence; acetylcholinesterase inhibitors; amyloid-β.

## AI-ENABLED MEDICAL DEVICES IN THE UNITED STATES (2020-2025): REGULATORY APPROVALS AND ETHICAL IMPERATIVES

Vardhaman Manohar Patil, Baviya Priyadharshini R, K Bangarurajan
Centre of Excellence in Pharmaceutical Regulatory Sciences, JSS College of Pharmacy,JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India-570015
patilvardhaman1@gmail.com

Between 2020 and 2025, the United States saw a significant rise in the number of medical devices using artificial intelligence (AI). As of mid-2025, there were 1,016 FDA-approved AI-enabled devices. These innovations, which include imaging, diagnostics, and decision-support systems, demonstrate how AI has the potential to transform the healthcare industry. However, there are particular ethical and regulatory issues because of adaptive algorithms which are dynamic. The FDA's 2025 draft guideline on lifecycle management, transparency, and bias reduction serves as one of the regulatory milestones that are outlined in this assessment. It also look at the dominance of the 510(k) pathway, which makes it easier to approve devices that are essentially the same as existing technologies. The ethical analysis highlights three critical areas. First, data ethics is a concern since non-representative training datasets can increase bias, undermining fairness in healthcare delivery. Second, autonomy and accountability raise questions about reduced medical judgment and unclear responsibility for AI-driven outcomes. Finally, transparency and trust are crucial for public confidence and regulatory legitimacy, highlighting the need for transparent AI and inclusive design in medical technologies. Despite recent regulatory advancements, there are still gaps in the way real-world implementation issues are addressed, particularly for adaptive AI systems that change after approval. To enable responsible innovation, the work promotes active stakeholder participation, globally harmonised ethical frameworks, and ongoing post-market surveillance.

**Keywords:** Artificial Intelligence, Medical Devices, FDA Approval, Ethics, Bias, Transparency, Regulatory Frameworks.

## NEXT-GENERATION CANCER TREATMENT: THE ROLE OF NANOBOTS IN PRECISION ONCOLOGY

Tajmoddin Yahiyakhan Pathan, Nirwane Aboli, Shaikh Gazi, Pathan Muzakkir, Rayees Ahmad
Dept. of Pharmaceutical Technology, RP College of Pharmacy, Gadpati, Alani, Osmanabad.MH, 413501

Cancer remains a leading cause of mortality worldwide, responsible for approximately 7.6 million deaths each year due to the unchecked proliferation and dissemination of abnormal cells. Although chemotherapy and radiotherapy are standard treatment modalities, their clinical utility is often compromised by a lack of specificity, collateral damage to healthy tissues, and severe adverse effects that diminish patient quality of life. This scenario underscores the urgent need for precision-targeted, less toxic, and highly effective cancer therapies. Nanobots—Nano scale robotic systems engineered to function within the human body—have emerged as a ground breaking innovation in precision oncology. These devices are capable of actively traversing the circulatory system, overcoming biological barriers, and selectively homing in on tumor cells while sparing normal tissues. By functionalizing nanobots with ligands, peptides, or antibodies, researchers have achieved remarkable tumour specificity. Moreover, nanobots can be externally guided and activated using magnetic fields, ultrasound, or light, enabling controlled and site-specific drug release. In addition to targeted drug delivery, nanobots are being explored for cancer detection, imaging, bio sensing, and direct mechanical disruption of malignant cells. While these technologies are primarily in the research and development phase, nanobot-based cancer therapy represents a

ISBN: 978-81-980623-8-3

paradigm shift in oncology, offering the promise of safer, more effective, and personalized treatment strategies for the future.

**Keywords:** Cancer, Nanobots, Precision Oncology, Targeted Drug Delivery, Chemotherapy.

**AI-170**

## AI AUGMENTED QUANTITATIVE SYSTEM PHARMACOLOGY (QSP) MODELS IN CLINICAL TRIALS

Prasanna Mohan, B.Bhavani
School of Pharmaceutical Sciences and Technologies, Jawaharlal Nehru Technological University, Kakinada, Andhra Pradesh, India -533003
prasanna.mohan210@gmail.com

AI-enhanced Quantitative Systems Pharmacology (QSP) models integrate mechanistic, system level simulations and machine learning to provide the capability of integrating and interpreting large clinical and real-world datasets. Incorporating AI into QSP modeling is a leap forward for patients and all that are involved in the success of clinical trials. This models enable researchers to model full-patient responses, retaining both heterogeneity and variability of real life. It heralds a new age in drug development and clinical trial design. This model allows for development of digital twins and hybrid models that simulate individualized disease and treatment, optimize dosing strategies, and support adaptive clinical trial designs. Through automated data extraction, improved model parameterization, and interdisciplinary cooperation, this platforms have the potential to enhance predictive accuracy for outcomes and hasten decision-making. Nevertheless, QSP challenges in model validation, interpretability, and regulatory acceptability exist. By breaking these hurdles, AI-enhanced QSP promises to transform precision medicine, minimize the expense of clinical trials, and enhance patient outcomes through data-driven, personalized, and effective therapeutic development pipelines. This combination of machine learning and biological understanding assists doctors in predicting which therapies will most likely benefit various individuals, accelerating the development of drugs while minimizing the risks and uncertainty faced by patients in clinical trials. Clinical trials become more inclusive and representative, helping ensure that promising, safe therapies reach those who need them most faster and with greater confidence. By uniting human creativity with AI's analytical power, this approach puts patient outcomes and ethical progress at the heart of medical innovation, offering hope for better, more individualized care in the future.

**Keywords:** Artificial Intelligence, Quantitative Systems Pharmacology (QSP), Clinical trials, Digital twins, Hybrid models.

**AI-171**

## REIMAGINING DRUG SAFETY: ARTIFICIAL INTELLIGENCE AT THE HEART OF MODERN PHARMACOVIGILANCE

Linesh Patel, Aakash Gupta, Bhavesh Yadav, D.K. Pradhan
Raigarh College of Pharmacy, Raigarh C.G. India 496001
linpatel6190@gmail.com

The global acceleration of drug development, coupled with increasingly diverse patient populations and incomplete health records, has placed unprecedented demands on pharmacovigilance (PV). Established by the World Health Organization in 1961 to monitor and prevent adverse drug reactions, PV now faces a volume and complexity of safety data that far exceed the capacity of traditional, manually driven approaches. Artificial Intelligence (AI) has emerged as a pivotal response to these pressures. By applying machine learning (ML) and natural language processing (NLP), AI systems can automatically extract and synthesize information from fragmented and heterogeneous healthcare data. This not only reduces operational costs and turnaround times but also improves the accuracy and consistency of drug safety evaluations. A particularly transformative application is in the handling of Individual Case Safety Reports (ICSRs), whose numbers continue to escalate worldwide. AI techniques support both structured and unstructured content integration, enhance the quality of incomplete submissions, and accelerate expert decision-making. Platforms such as VigiBase, VigiAccess, VigiLyze, PharmGKB, Argus, XtalPi, and BenevolentAI exemplify how advanced analytics enable rapid signal detection, cross-dataset comparisons, and real-time safety insights. Beyond streamlining workflows, AI strengthens regulatory compliance, improves adverse event detection, and reduces reliance on human resources. The convergence of pharmaceutical expertise with cutting-edge information technologies is reshaping PV into a more proactive, data-driven discipline. Continued innovation in algorithms, integrated databases, and collaborative frameworks will be critical to unlocking AI's full potential in protecting public health.

**Keywords:** Drug Safety, Pharmacovigilance, Artificial Intelligence, Adverse Reaction Monitoring, Global Health Surveillance.

**AI-172**

## AI-POWERED PHARMACOVIGILANCE: ENHANCING SAFETY MONITORING OF NEUROACTIVE DRUGS.

Yashashree Wasnik, Mayur Kale, Sandip Rahangdale, Manish Aglawe, Milind Umekar.
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India -441002
yashashreemwasnik@gmail.com

Pharmacovigilance is the science of monitoring and improving the safety of medicines, and it becomes especially important in the case of neuroactive drugs. Drugs used in treating depression, epilepsy, psychosis, and neurodegenerative diseases often causes adverse drug reactions (ADRs) that may appear late, remain hidden, or resemble the symptoms of the disease itself. This makes their detection extremely difficult. Traditional pharmacovigilance, which depends mainly on spontaneous reporting, suffers from problems like underreporting, fragmented information, and delayed recognition of safety signals. Here, artificial intelligence (AI) brings a transformative solution. Using machine learning, natural language processing (NLP), and big data analytics, AI can analyze massive amounts of information from electronic health records, clinical trials, pharmacovigilance databases, and even patient-reported outcomes. This helps in identifying hidden patterns, at-risk patient groups, and early warning signals much faster than conventional methods. Most importantly, AI shifts pharmacovigilance from a reactive approach to a proactive system. Instead of waiting for adverse effects to occur, AI enables real-time monitoring and early interventions, reducing risks and protecting patient safety. In the field of CNS therapies, this precision is crucial because ADRs can directly affect patient adherence and quality of life. AI-powered pharmacovigilance is not just a tool- it is the future of safer medicine, built on precision, protection, and trust. It acts as a shield that prevents harm before it occurs, while keeping patients at the center by restoring confidence and moving us closer to personalized care.

**Keywords:** Artificial Intelligence, Pharmacovigilance, CNS Drugs, Adverse Drug Reactions, Neuropharmacology.

**AI-173**

## FROM INNOVATION TO EMPOWERMENT: A RANDOMIZED STUDY ON THE EFFECT OF AI-BASED TOOLS IN ENHANCING PATIENT ADHERENCE AND OUTCOMES

Bandi Yaswitha, Shaik Asha Begum
Kvsr Siddhartha College Of Pharmaceutical Sciences, Vijayawada, -520010
yaswitha.naidu767@gmail.com

In managing chronic diseases, medication non-adherence is a significant problem that frequently results in subpar therapeutic outcomes. Tools powered by artificial intelligence (AI) offer creative ways to assist patient empowerment, adherence, and counselling. This study assessed how an AI-based mobile application combined with pharmacist counselling could help patients with Type 2 Diabetes Mellitus improve their clinical outcomes and medication adherence. 50 diabetic patients were randomised into two groups for a 6-month prospective interventional study: control (n = 25, traditional pharmacist counselling) and intervention (n = 25, pharmacist counselling + AI-enabled app). The app offered instructional videos, interactive chatbot assistance, and automated medicine reminders. HbA1c levels, patient empowerment (5-point Likert scale), and medication adherence (MMAS-8) were among the outcomes assessed. The adherence scores of the intervention group significantly improved (4.8 → 7.3; $p < 0.001$), while the control group experienced only minor changes (4.7 → 5.2). The intervention group's HbA1c levels decreased from 8.4% to 7.2% ($p < 0.05$), however the control group's levels did not significantly decrease. The intervention group experienced a significant improvement in patient empowerment

ISBN: 978-81-980623-8-3

scores (3.0 → 4.5; $p < 0.01$). These results suggest that AI-enabled solutions supplement pharmacist counselling by providing ongoing assistance that improves patient, confidence, adherence, education. By educating patients, developing adherence techniques, and enabling self-management, AI-driven interventions can revolutionise patient care when included into pharmacy practice. The management of chronic diseases and pharmacy practice have a bright future thanks to this hybrid model.

**Keywords:** Artificial intelligence, Medication adherence, Patient empowerment, Diabetes management, Digital health.

**DIGITAL TWINS IN NEUROPHARMACOLOGY: AI-BASED SIMULATIONS FOR PERSONALIZED BRAIN DRUG RESPONSE**

Hitesh Girhepunje, Sandip R. Rahangdale, Mayur Kale, Manish Aglawe, Nitu Wankhede, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India
hitesh.girhepunje77@gmail.com

The concept of digital twins—virtual patient-specific replicas powered by artificial intelligence (AI)—is gaining momentum in neuropharmacology as a tool to simulate drug response, optimize therapy, and reduce trial-and-error in clinical practice. Neurological and psychiatric disorders are characterized by high inter-individual variability, where factors such as genetics, age, comorbidities, and environment influence drug efficacy and safety. Traditional approaches often fail to capture this complexity, leading to inconsistent outcomes and suboptimal dosing strategies. AI-enabled digital twins integrate multimodal data, including neuroimaging, genomics, electrophysiology, and pharmacokinetic/pharmacodynamic profiles, to build dynamic computational models of individual patients' brains. These models allow virtual testing of drug interactions, prediction of therapeutic efficacy, and identification of potential adverse effects before actual administration. In disorders such as epilepsy, Parkinson's disease, and depression, digital twins offer a promising pathway toward precision therapeutics by enabling personalized dose adjustments and treatment monitoring. By bridging computational neuroscience and clinical pharmacology, AI-driven digital twin technology has the potential to revolutionize CNS drug development and delivery, providing safer, faster, and more effective solutions in neurotherapeutics.

**Keywords:** Digital Twin, Artificial Intelligence, Neuropharmacology, Precision Medicine, Personalized Therapy.

**AI-175**

**EMPOWERING CLINICAL TRIALS WITH AI: FROM PATIENT MATCHING TO ADAPTIVE DESIGN**

Lakshmi Sravanthi Billakurthi, Lakshmi Prasanthi Nori
Shri Vishnu College of Pharmacy (Autonomous), Bhimavaram

Clinical trials underpin medicine development but face major efficiency and retention challenges. AI is changing that. By scanning electronic health records and real-world data, AI tools now match patients to trials 10–20% faster and keep more participants engaged. Predictive analytics spot protocol issues before they occur, cutting delays and improving safety. Digital twins, virtual copies of patients, let researchers test dosing and outcomes without extra visits. Natural language processing handles document drafting and data cleanup, so teams can focus on patients. Early adopters report 80% faster recruitment and a 30% rise in data accuracy. Examples from oncology and rare disease trials show how AI-driven site choice and adaptive protocols speed decision-making and simplify mid-trial changes. Success depends on secure data sharing, transparent algorithms, and teamwork across all stakeholders. Looking ahead, mixed human-AI teams will fine-tune treatment plans in real time, and federated learning will unlock insights from patients around the world. Embracing AI now will redefine trials as flexible, patient-focused journeys accelerating lifesaving therapies more quickly and reliably than ever before.

**Keywords:** Clinical trial, patient matching, predictive analytics, digital twin, NLP, adaptive design, patient centricity.

**AI-176**

**THE ROLE OF DIGITAL BIOMARKERS IN PREDICTING TREATMENT OUTCOMES"**

A.Venkatesh, M.Prasada Rao
Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India
venkateshannapareddy815@gmail.com

The emergence of digital health technologies has introduced digital biomarkers as innovative tools in clinical research. Digital biomarkers are objective, quantifiable physiological and behavioural data collected through wearable sensors, smartphones, and other connected devices. These biomarkers provide real-time insights into disease progression, treatment adherence, and therapeutic response beyond traditional clinical endpoints. By continuously monitoring patient activity, sleep patterns, heart rate variability, gait, or cognitive function, digital biomarkers enhance the precision of outcome measurements and allow early detection of treatment efficacy or adverse effects. In clinical research, the integration of digital biomarkers offers significant advantages, including reduction of recall bias, improved patient compliance, and the possibility of remote monitoring in decentralized trials. Furthermore, they enable personalized treatment strategies by identifying patient subgroups most likely to respond to specific therapies. Despite their promise, challenges remain in terms of data standardization, regulatory validation, interoperability, and patient privacy concerns. Addressing these issues is essential for the widespread adoption of digital biomarkers in clinical trials. This paradigm shift toward technology-driven outcomes has the potential to transform drug development, accelerate clinical decision-making, and improve overall patient care. As healthcare increasingly embraces digital innovation, digital biomarkers are likely to become critical components in predicting treatment outcomes and advancing personalized medicine.

**Keywords:** Digital biomarkers, clinical research, treatment outcomes, wearable devices, personalized medicine, artificial intelligence.

**AI-DRIVEN NANO TECHNOLOGY FOR ADVANCED CANCER TREATMENT**

Jannu. Prathima, Kallepalli. Bhavani, Anusha. Ravulapati)
Dept. Pharmaceutical sciences, KVSR Siddhartha college of pharmaceutical sciences, Vijayawada, Andhra Pradesh-520010
jannuprathima@gmail.com

Cancer treatment is complex because of how different it is from person to person. A single treatment doesn't work for everyone. Thankfully, new technologies like artificial intelligence (AI) and nanotechnology are helping to change that. Over the last ten years, nanotechnology has developed tools like tiny drug delivery systems and diagnostic devices that can improve how we treat cancer. But these tools still have limitations due to how much patients, tumors, and diseases can vary. This is where AI comes in. Using powerful machine and deep learning, AI can analyse huge amounts of patient data to help doctors create truly personalized treatment plans. It can even predict how a drug will interact with a specific tumor, helping to make nanomedicines more effective while reducing harmful side effects. The goal is to combine AI with nanomedicines to create a new way to fight cancer—one that moves away from a "one-size-fits-all" approach and gives each patient the specific, tailored treatment they need to improve their chances of a good outcome.

**Keywords:** AI (Artificial Intelligence), Nanotechnology, Personalized Treatment, Drug Delivery, Cancer.

**AI-178**

**PYTHON IN PHARMACY**

Siddhi K. Vyas, Dipti B. Ruikar
P.R. Pote. Patil College Of Pharmacy Amaravati- 444604

The integration of programming languages like Python into the field of pharmacy has opened new avenues for innovation, efficiency, and precision. Python, known for its simplicity and versatility, is increasingly being utilized in pharmaceutical research, drug discovery, clinical data analysis, and healthcare automation. It allows pharmacists and researchers to process large datasets, model drug interactions, simulate pharmacokinetic and pharmacodynamic processes, and even support the development of AI-driven diagnostic tools. With powerful libraries such as NumPy. Pandas, SciPy, and machine learning frameworks like Scikit-learn and TensorFlow, Python empowers pharmaceutical professionals to analyze trends, predict outcomes, and make data-driven decisions. As the pharmaceutical industry embraces digital

ISBN: 978-81-980623-8-3

transformation, Python stands out as a key tool enabling smarter, faster, and more accurate pharmaceutical practices.

**AI-179**

**PREDICTION TOOL DEVELOPMENT USING A.I. FOR MDRO INFECTIONS IN CRITICALLY ILL PATIENTS**

Nadheem Muhammed Shajeef, Teresa Mary Sobi, Suja Abraham, Chithra Jayaprakash
Department of Pharmacy Practice,Nirmala College of Pharmacy, Muvattupuzha, Kerala, India - 686661.
nadhjasind@gmail.com

Multidrug-resistant organisms (MDROs) represent a significant clinical challenge in critical care, contributing to prolonged hospital stays, elevated healthcare costs, and increased mortality. Inappropriate antibiotic use, invasive procedures, and delayed diagnostic results exacerbate MDRO prevalence. Artificial Intelligence (A.I.) offers a promising approach for early risk prediction and targeted intervention. The objective of this research was to identify risk factors associated with MDRO infections and to develop an A.I.-based predictive tool for critically ill patients. An ambispective study was conducted at a tertiary care hospital in Kerala, utilizing retrospective data from 323 critically ill patients. Data variables included demographics, comorbidities, prior antibiotic exposure, and device usage. Machine learning models such as Decision Trees, Random Forests, Logistic Regression, Support Vector Machine (SVM), and XGBoost were developed and evaluated using accuracy, sensitivity, specificity, and AUC. Results revealed that 76 patients developed MDRO infections, with prolonged ICU stay, invasive device use, and broad-spectrum antibiotic overuse as major risk factors. Random Forest achieved the highest training accuracy (96%) and upon prospective validation, the A.I. model demonstrated 81.8% sensitivity. MDRO-positive patients had significantly longer hospital stays and higher mortality rates. This study concludes that the developed A.I.-based prediction tool has strong potential for early detection of MDRO risk in critically ill patients. Its integration into clinical practice may enhance antibiotic stewardship, optimize empirical therapy, and improve patient outcomes.

**AI-180**

**ARTIFICIAL INTELLIGENCE IN DRUG DESIGN & DEVELOPMENT REMODEL CHALLENGE INTO POSSIBILITY**

Nidhi Bais, Sachin K Jain
Oriental College Of Pharmacy And Research, Oriental University, Indore

Artificial intelligence is a branch of computer science that includes collecting information, developing rule and mimicking human behaviors. Artificial intelligence transformed formulation and development of pharmaceuticals. Researcher can optimize, design and develop formulation in a efficient and accurate way. The concept of artificial intelligence is to developed intelligent computer system which can operate with minimum human involvement or no involvement at all. The advantage of artificial in formulation of pharmaceuticals is it capacity to analyse huge data and spot pattern and connection which a human would miss. Tools such as ANN, Fuzzy logic, Neuro-Fuzzy logic used for pharmaceutics. Artificial intelligence can also be applied in improving formulation by study solubility, stability and bioavailability of drug. Artificial intelligence is also used in clinical trial help in reducing time and cost of process. Artificial intelligence is also applied to optimize and automize in various section of pharmaceutical industry. Traditional methods of drug development are time consuming, expensive and less efficient. The inclusion of artificial intelligence addressed challenges by examine compound from a huge pool of input drug. Artificial intelligence improve drug design by enhancing efficiency and predicting accurately drug properties like absorption, distribution, metabolism, bioactivity and toxicity. artificial intelligence is a effective tool in pharmaceutical formulation and developing, as artificial intelligence allow analysis of vast data. Enabling faster, effective, and effective drug design.

**Artificial Intelligence In Early Detection Of Cardiac Disorders: Advancements And Clinical Implications**

Adithya P.J, Muchukota Sushma, Shobha Rani R.H2
Department of Pharmacy Practice,Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Bangalore, Karnataka, India.
pjaditya175@gmail.com

Background: Cardiac disorders remain a leading cause of global morbidity and mortality. Early detection plays a crucial role in reducing complications and improving survival outcomes. Artificial Intelligence (AI), particularly machine learning and deep learning models, has demonstrated strong potential in detecting subtle cardiac abnormalities using ECG, echocardiography, and wearable device data. Aim and Objective: To evaluate the role of Artificial Intelligence in improving the accuracy and efficiency of early detection of cardiac disorders. To compare the diagnostic performance (sensitivity, specificity, and accuracy) of AI-based tools with conventional cardiac diagnostic methods. To analyze the clinical implications of AI integration in early cardiac disorder detection, focusing on timely diagnosis and improved patient outcomes. Methodology:A prospective study was conducted with a sample size of 120 patients at a tertiary cardiac care hospital. Patients underwent conventional diagnostic methods (ECG, echocardiography) alongside AI-based predictive screening. Diagnostic accuracy, sensitivity, and specificity were compared between AI models and standard methods. Statistical analysis was performed using Chi-square tests, with significance set at $p < 0.05$. Results: AI-assisted detection demonstrated 92.5% sensitivity and 89.1% specificity, compared to 81.7% sensitivity and 78.4% specificity with conventional methods. Out of 120 patients, AI correctly identified 111 true positives, significantly higher than standard diagnostics (98 true positives). The improvement was statistically significant ($p = 0.002$). Furthermore, AI reduced the average detection time by 35%, enhancing clinical efficiency. Conclusion: AI-based approaches provide higher diagnostic accuracy and efficiency in early detection of cardiac disorders compared to conventional methods. Integration of AI into routine cardiac screening may improve early intervention, reduce complications, and optimize patient outcomes. However, further large-scale validation and ethical considerations are essential for widespread adoption.

**THE USE OF AN AI IN MANAGEMENT OF PEPTIC ULCER DISEASE (PUD)**

Bhagyashree. I.A
East point College of Pharmacy [EPCP] Jnana Prabha, East point campus, Post,Virgo Nagar Avalahalli, Bengaluru 560049
bhagyashreeiabbigeri23@gmail.com

Peptic ulcer disease (PUD) remains a global health issue, with nearly 40% of cases being idiopathic. It involves ulceration of the gastric or duodenal mucosa due to gastric acid and digestive enzymes. Alongside conventional risk factors, emerging digital health technologies, particularly artificial intelligence (AI), offer potential for improving disease management through dietary monitoring and lifestyle modification. A cross-sectional survey was conducted among 150 participants to evaluate knowledge, attitude, perception, and practice (KAP) related to PUD. Awareness of risk factors, treatment, prevention, and the role of AI-based tools was assessed through percentage analysis across domains. Knowledge findings showed 41.8% recognised Helicobacter pylori as a key etiological factor. Attitude results revealed 56.2% believed AI apps could assist in diet and symptom tracking, while 57% trusted AI integration. Perception analysis indicated 62.5% willingness to adopt AI-driven dietary monitoring and 43.3% viewed it as cost-effective. In practice, 59.2% considered AI use in dietary management innovative, 68.8% were willing to adopt AI-based ulcer management tools, and 36.4% already used digital dietary trackers. Overall, the study highlights moderate knowledge but strong positive attitudes toward AI, suggesting its integration could enhance prevention, patient engagement, and clinical outcomes in PUD management

**Keywords:** Peptic ulcer, Artificial Intelligence, Management.

**AI-183**

**THE FUSION OF INTELLIGENCE AND IMAGINATION: AI'S ROLE IN THE NEXT ERA OF MEDICINE**

Suchit A. Gajbhiye, Bhushan S. Bhoyar
P. R. Pote Patil College of Pharmacy, Amravati

ISBN: 978-81-980623-8-3

Artificial intelligence (ai) is no longer a supplementary tool but a transformative force within pharmaceutical sciences, redefining traditional paradigms of drug discovery and development. By replacing iterative experimentation with predictive and adaptive modelling, ai offers new precision in the design, evaluation, and optimization of therapeutic agents. In biopharmaceutics, pharmacokinetics, and drug metabolism, machine learning and deep learning algorithms are enabling high-accuracy predictions in bioanalytical studies, bioavailability and bioequivalence assessments, metabolic pathway mapping, and drug transport simulations. Emerging innovations such as digital twins and wearable biosensors extend these capabilities further, creating opportunities for real-time, patient-specific pharmacokinetic profiling and advancing the promise of personalized medicine. Concurrently, medicinal chemistry is undergoing a paradigm shift where computational intelligence expands molecular creativity. Generative design algorithms, AI-driven retrosynthesis planning, and quantum-enabled molecular simulations accelerate the identification and optimization of novel chemical entities. These advances are complemented by AI-supported green chemistry initiatives, ensuring that discovery pipelines align with principles of sustainability. The integration of predictive pharmacokinetics with computational molecular design forms a dynamic feedback loop, where biological evaluation informs and strengthens the models that guided synthesis. This convergence signals more than technological advancement; it represents a structural transformation in pharmaceutical sciences. Future progress demands interdisciplinary expertise, cultivating scientists fluent in both molecular and computational domains. It requires innovation beyond conventional trial-and-error and collaborative frameworks that democratize intelligent tools globally. The critical challenge is not whether AI will transform pharmaceutical sciences, but how effectively the discipline adapts to harness its full potential for precision, sustainability, and personalization in healthcare.

**AI-184**

**INTEGRATING AI FOR OPTIMIZED THERAPEUTIC STRATEGIES AND QUALITY OF LIFE EVALUATION IN ALLERGIC CONJUNCTIVITIS PATIENTS**

Diviya Anish, Muchukota Sushma, Shobha Rani R.H, Nagendra Prasad Komarla
Department of Pharmacy Practice,Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), 3Bangalore Allergy Center, Jayanagar, Bangalore, Karnataka, India.
diviyaanish8590@gmail.com

Allergic conjunctivitis is one of the most common ocular surface disorders, significantly affecting patient comfort, vision, and quality of life. Conventional management involves antihistamines, mast cell stabilizers, and corticosteroids. However, therapeutic optimization and systematic assessment of patient-reported outcomes remain limited. The advent of Artificial Intelligence (AI) provides new opportunities for enhancing decision-making in treatment strategies and quality of life evaluation. To evaluate therapeutic management strategies in patients with allergic conjunctivitis. To assess the impact of allergic conjunctivitis on quality of life. To explore the role of AI in optimizing treatment outcomes and patient-reported experiences. A prospective observational study was conducted on 200 patients diagnosed with allergic conjunctivitis were enrolled and assessed using structured questionnaires and clinical parameters. Therapeutic regimens were evaluated, and quality of life was measured using validated scales. AI-based predictive modelling and data analysis were integrated to identify treatment response patterns and optimize management strategies. Among 200 patients, eye symptoms (itching 88.5%, redness 84%, watery eyes 74%) were most common. House dust mites (96.8%) were the leading allergens. Sublingual Immunotherapy (SLIT) in 105 patients showed marked improvement, while antihistamines benefited 95%. Quality of life scores improved significantly ($p=0.0025$; Cohen's $d=1.62$). AI-assisted analysis highlighted predictive response patterns, enabling optimized therapy selection and demonstrating substantial enhancement in patient outcomes and quality of life. Integrating AI with conventional therapeutic approaches enhances personalized management of allergic conjunctivitis and provides deeper insights into quality-of-life outcomes. This approach has the potential to guide clinicians in selecting evidence-based, patient-centric therapies, ultimately improving clinical outcomes and patient satisfaction.

**Keywords:** Allergic conjunctivitis, Artificial Intelligence, Therapeutic management, Quality of life, Personalized medicine.

**ARTIFICIAL INTELLIGENCE IN CLINICAL RESEARCH**

N. Shiva Ramanji Reddy, M. Prasada Rao
Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
shivaramanjireddynemalidenne@gmail.com

Artificial Intelligence (AI) is revolutionizing the field of clinical research by enhancing efficiency, accuracy, and decision-making. Traditional clinical trials are often time-consuming, resource-intensive, and prone to human error. AI-driven technologies, such as machine learning, natural language processing, and predictive analytics, are increasingly being integrated into various stages of research, including patient recruitment, trial design, data management, and outcome prediction. AI enables rapid analysis of large and complex datasets, thereby facilitating precision medicine and identifying novel therapeutic targets. Moreover, AI-based algorithms can improve patient stratification, ensure real-time monitoring, and predict adverse events, reducing the overall cost and risk associated with clinical studies. Integration of electronic health records and wearable devices with AI platforms further supports continuous data collection and personalized interventions. Despite these advancements, challenges remain in terms of data privacy, regulatory approval, ethical considerations, and the need for standardized frameworks to validate AI tools. Collaborative efforts among researchers, clinicians, industry, and policymakers are essential to establish trust, transparency, and accountability in AI-driven clinical research. As the healthcare industry moves towards digital transformation, AI holds the potential to accelerate drug discovery, optimize trial outcomes, and ultimately improve patient care. The successful integration of AI into clinical research could mark a paradigm shift in the way medical evidence is generated and applied in practice.

**Keywords:** Artificial Intelligence, Clinical Research, Machine Learning, Patient Stratification, Drug Discovery, Data Management.

**STEM CEL BASED BIO THERAPIES ON AI: AI-DRIVEN ADVANCEMENTS IN STEM CELL-BASED BIOTHERAPIES**

Syed Sulthan Basha, M.Prasada Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
sulthansyes@gmail.com

Stem cell-based bio-therapies integrated with Artificial Intelligence (AI) involve using AI to enhance the entire stem cell therapy process, from cell discovery and characterization to personalized treatment planning and monitoring. AI algorithms analyze large datasets to improve cell quality, optimize differentiation, predict patient outcomes, and manage cell delivery. This integration aims to overcome challenges in cell therapy, such as variability in cell quality and the complexity of biological systems, ultimately leading to more effective, personalized, and scalable regenerative treatments for various diseasesThe combination of AI and stem cell therapy is still in its early stages, but it holds immense potential for a new era of personalized regenerative medicine. Future developments will likely involve more sophisticated AI models, improved ethical frameworks, and the integration of AI into routine clinical practice to revolutionize the treatment of many debilitating diseases. AI can provide therapists with data-driven insights that inform treatment decisions and interventions by identifying patterns and trends in this data.

**Keywords:** Cell Discovery and Selection, Cell Quality and Differentiation, Personalized Treatment by Ai, Predictive Analytics by AI.

**AI-187**

**ARTIFICIAL INTELLIGENCE IN NEUROPHARMACOLOGY: TRANSFORMING DRUG DISCOVERY, PERSONALIZATION, AND THERAPEUTIC MONITORING**

Mandar Deshmukh, Mayur Kale, Sandip Rahangdale, Manish Aglawe, Nitu Wankhede, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
mandardeshmukh0204@gmail.com

ISBN: 978-81-980623-8-3

The integration of artificial intelligence (AI) into neuropharmacology is reshaping the landscape of drug development, therapeutic optimization, and clinical monitoring in neurological and psychiatric disorders. Traditional approaches to neuroactive drug discovery face challenges such as high attrition rates, limited predictability of blood-brain barrier (BBB) permeability, and variability in patient response. AI-driven methodologies—including deep learning, molecular modeling, and neuroimaging analytics—enable accelerated identification of novel compounds, prediction of receptor-ligand interactions, and simulation of neurotransmitter dynamics. Moreover, machine learning algorithms facilitate precision therapeutics by stratifying patients based on genetic, metabolomic, and imaging biomarkers, allowing for personalized dosing and improved treatment outcomes. In clinical settings, AI-powered pharmacovigilance and natural language processing (NLP) enhance detection of adverse drug reactions to CNS medications. Together, these innovations offer a paradigm shift toward faster, cost-effective, and more precise neurotherapeutic development, highlighting AI's transformative role in advancing neuropharmacology.

**Keywords:** Artificial Intelligence, Neuropharmacology, Drug Discovery, Precision Therapeutics.

**AI-188**

## ARTIFICIAL INTELLIGENCE MODELS FOR PREDICTING BLOOD- BRAIN BARRIER PERMEABILITY: TOWARDS SMARTER NEURODRUG DESIGN.

Sneha Sahebrao Ganraj, Mayur Kale, Sandip Rahangdale, Manish Aglawe, Nitu Wankhede, Milind Umekar.
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur, Maharashtra, India -441002
snehaganraj@gmail.com

The blood-brain barrier (BBB) acts as a selective gatekeeper that controls which substances can pass from the bloodstream into the brain. While this barrier protects the brain from harmful chemicals, it also makes it difficult for many potential drugs to reach their targets in the central nervous system (CNS). Traditionally, researchers test drug permeability using cell-based (in vitro) or animal (in vivo) models. However, these methods are costly, take a lot of time, and often fail to fully represent the complexity of the BBB in humans. Artificial intelligence (AI) offers a powerful alternative. By applying machine learning algorithms such as deep learning, random forest, or support vector machines, AI can analyze large datasets of drug molecules. These datasets include molecular descriptors, physicochemical properties (like lipophilicity, size, charge), and other cheminformatics features. Using this information, AI models can accurately predict whether a drug candidate is likely to cross the BBB.This predictive capability helps researchers quickly identify compounds with CNS potential, saving both time and resources. Moreover, AI reduces the risk of late-stage drug failure, thereby improving the efficiency of CNS drug discovery. Ultimately, AI-driven modeling could enable smarter drug design, personalized neurotherapies, and better outcomes for patients with brain disorders.

**Keywords:** Blood-Brain Barrier, Artificial Intelligence, CNS Drug Discovery, Predictive Modelling.

**AI-189**

## LEVERAGING ARTIFICIAL INTELLIGENCE (AI) FOR EFFECTIVE SCALE-UP, SCALE-DOWN, AND TECHNOLOGY TRANSFER IN PHARMACEUTICAL INDUSTRIES

Antara Dikkar
P. R. Pote Patil College of Pharmacy, Amravati

Scale-up, scale-down, and technology transfer are critical processes in pharmaceutical industries. Scale-up involves increasing production from laboratory to pilot or commercial scale while maintaining product quality and process efficiency. Scale-down models replicate large-scale conditions on a smaller scale to predict performance, optimize parameters, and troubleshoot issues. Technology transfer ensures seamless knowledge and process movement between development and manufacturing sites or partners, including documentation, training, and validation. Artificial Intelligence (AI) is emerging as a transformative enabler in pharmaceutical research, development, and manufacturing. As the industry seeks to enhance efficiency, compliance, and product quality, the integration of AI into critical operations-including process development, scale-up, scale-down, and technology transfer-offers unprecedented opportunities. AI-driven methodologies applied to scale-up and scale-down of pharmaceutical processes, as well as their seamless technology transfer from R&D to commercial manufacturing. AI models trained on experimental and process data are shown to predict process performance across scales, optimize critical process parameters (CPPs) and ensure consistent product quality attributes (CQAs), thereby reducing trial-and-error and minimizing batch failures. Key challenges in the adoption of AI during scale transitions-such as data scarcity, model interpretability, regulatory compliance, and cross-site variability-are critically analyzed. The study also highlights the role of digital twins, machine learning (ML) algorithms, and process simulation models in facilitating knowledge transfer and decision support during tech transfer between facilities or contract manufacturing organizations (CMOS).Several case studies from formulation development, continuous manufacturing, and biopharmaceutical production demonstrate the practical impact of AI in accelerating timelines, improving scalability predictions, and enabling data-driven decisions across the product lifecycle.

## TRANSFORMING HEALTHCARE: A COMPREHENSIVE REVIEW OF TELEHEALTH INNOVATIONS THROUGH ARTIFICIAL INTELLIGENCE

Mohit Rajendra Kapse
Datta Meghe College of Pharmacy, Sawangi (Meghe), Wardha,442001.

Healthcare is expanding exponentially, and with it comes AI in telehealth, which is the new face of patient care and operational productivity. This article is a comprehensive look at the new frontiers of telehealth that AI technologies have opened up and how they are reshaping the landscape of accessibility, diagnosis, treatment, and patient engagement. We look at some of the latest research and case studies, and how artificial intelligence and its machines like virtual nurses, predictive analytics, machine learning algorithms, are aiding in clinical decision support and patient care. This review discusses how telehealth innovations will make healthcare more accessible to rural and low socioeconomic populations, reduce the overall cost of health care, and make patients more satisfied. We talk about the problems and ethics with AI in telehealth, such as data privacy and algorithmic bias, and we need regulatory structures. This article provides some unique insights, not only for doctors and policy makers, but for those who develop technology as well, medical systems all over the world are having to adapt to this post-pandemic world. When the stake holders understand the impact of AI in tele medicine, the complexities of today's health care delivery system will be a lot easier to handle. This article serves as a key reference for anyone interested in the marriage of technology and medicine, but also gives a glimpse of the future telehealth developments. Explore how not only is AI altering telehealth, but is actually paving the path to a more efficient, more equal, and more patient centered health care system.

**Keywords:** Telehealth, Artificial Intelligence (AI), Healthcare transformation, Telemedicine, Remote patient monitoring.

## AI-DRIVEN NANO TECHNOLOGY FOR ADVANCED CANCER TREATMENT

Jannu. Prathima, Kallepalli. Bhavani, Anusha. Ravulapati
Dept. Pharmaceutical sciences, KVSR Siddhartha college of pharmaceutical sciences, Vijayawada, Andhra Pradesh-520010
jannuprathima@gmail.com

Cancer treatment is complex because of how different it is from person to person. A single treatment doesn't work for everyone. Thankfully, new technologies like artificial intelligence (AI) and nanotechnology are helping to change that. Over the last ten years, nanotechnology has developed tools like tiny drug delivery systems and diagnostic devices that can improve how we treat cancer. But these tools still have limitations due to how much patients, tumors, and diseases can vary. This is where AI comes in. Using powerful machine and deep learning, AI can analyse huge amounts of patient data to help doctors create truly personalized treatment plans. It can even predict how a drug will interact with a specific tumor, helping to make nanomedicines more effective while reducing harmful side effects. The goal is to combine AI with nanomedicines to create a new way to fight cancer—one that moves away from a "one-size-fits-all" approach and gives each patient the specific, tailored treatment they need to improve their chances of a good outcome.

**AI-192**

**GAME BASED LEARNING: A NEW APPROACH FOR CLASSROOM TEACHING**

YOGESH MURTI
Institute of Pharmaceutical Research GLA University, Mathura
yogesh.murti@gla.ac.in

In today's era, newer innovative teaching learing methodologies are emerging to facilitate teaching with fun. Among which game-based learning is an educational approach that combines the engagement of games with the learning objectives of education, making it a fun and interactive way to learn. Game-based learning aims to strenthen critical thinking among students and less distraction in the class. It also gives solution to common problem i.e declining attendance of student faced by the teachers in the classroom. Most of the time I give creative assignments in the pharmaceutical chemistry class to develop interest in the students, as chemistry is known as the toughest subject for remembering many chemical reactions with structures at a time. Students always feel bored in the class so I use innovative methods to get their attention on board and create a stress free environment for learning in the classroom. Tic-tac-toe game motivates students to learn by making the learning process more enjoyable and more interactive. Crossword puzzle game requires group of students to solve puzzle which helps in the development of critical thinking and problem-solving skills. Puzzle on name reactions of organic chemistry and their mechanism was tailored to individual learning styles and pace, making it an effective tool for personalized learning. In the classroom teaching I divide the students in a team and ask them to solve the puzzle and give marks as per the right (+10)/wrong (-05) marks, and calculate the score at last. This exercise makes them active during the whole class. Some time I examine the level of knowledge of students on the perticular topic by asking them to frame questions (open book test) and make the corrections, if needed and give those questions to another team to solve it and vice versa. As a facilitator my role is to check whether each and every student has contributed in this question making exercise or not. It improves communication skills of students by interacting with peers in the classroom during question answer session. Interactive experiences can help students remember information better than traditional learning methods. Multiplayer games can promote teamwork and collaboration among students.

**Keywords:** Game based learning, classroom teaching, tic-tac-toe game, crossword puzzle, organic chemistry.

**AI-INTEGRATED MOLECULAR INSIGHTS: TRANSFORMING PHARM D EDUCATION AND CLINICAL PRACTICE**

SANA FATHIMA
Sarojni Nehdu Vanita Pharmacy Maha Vidyalaya, Hyderabad

The future of pharmacy lies at the intersection of molecular biology, artificial intelligence (AI), and clinical practice. Pharm D students must be equipped not only with therapeutic knowledge but also with exposure to emerging technologies that drive drug discovery and personalized medicine. In line with this vision, an educational visit to the Centre for Cellular and Molecular Biology (CCMB), Hyderabad, was undertaken to bridge the gap between research laboratories and clinical pharmacy. During the visit, students interacted with scientists and explored advanced research facilities such as genomics, cell culture, protein engineering, and high-end instrumentation including cryo-electron microscopy and flow cytometry. Emphasis was placed on pharmacogenomics, molecular diagnostics, and AI-driven predictive modeling in identifying drug targets and patient-specific therapeutic responses. These interactions showcased how big data analytics and AI tools are accelerating drug discovery and optimizing treatment outcomes. The experience highlighted that integrating AI and molecular biology into Pharm D education can empower students to contribute meaningfully to pharmacovigilance, precision medicine, and clinical research. Such exposure transforms students from passive learners into innovators, capable of translating laboratory science into bedside application. This initiative exemplifies how experiential learning prepares Pharm D professionals to lead the next generation of pharmacy practice in an era dominated by technology and innovation.

**REVOLUTIONIZING PHARMACY EDUCATION WITH CHATGPT AND LARGE LANGUAGE MODELS: TOWARDS AI-DRIVEN LEARNING**

Anil Dhakal
Department of pharmacy practice, Krupanidhi college of pharmacy, Bangalore 560035
anildhakal146@gmail.com

Background: Pharmacy education in India faces persistent challenges such as rote learning, limited clinical exposure, and inadequate alignment with industry expectations. With the adoption of National Education Policy (NEP) 2020, there is a need for innovative tools that foster critical thinking, problem-solving, and continuous learning. Artificial intelligence (AI), particularly ChatGPT and large language models (LLMs), offers transformative opportunities to bridge this gap. Objectives: This study aimed to evaluate the potential of ChatGPT in pharmacy education by assessing its utility in enhancing learning outcomes, student engagement, and knowledge accessibility. Methodology: A mixed-method pilot study was conducted with 50 final-year B. Pharm students. Participants were introduced to ChatGPT for academic assistance in pharmacology, pharmaceutical jurisprudence, and patient counseling scenarios. Pre- and post-intervention questionnaires measured changes in understanding, problem-solving, and satisfaction. Qualitative feedback was collected through focus group discussions to identify perceived advantages and limitations. Results: Post-intervention analysis revealed a 38% improvement in conceptual understanding and a 46% rise in problem-solving accuracy compared to baseline. Students reported increased engagement and accessibility to complex concepts in simplified language. However, concerns were raised regarding occasional inaccuracies, lack of context in clinical scenarios, and the necessity of faculty supervision. ChatGPT and LLMs hold significant potential in personalizing pharmacy education, aligning with NEP 2020 goals of competency-based learning. Integration of AI into pharmacy curricula can empower students, but regulatory frameworks and ethical guidelines are essential for safe adoption.

**AL AND TECHNOLOGY FOR FUTURE OF CLINICAL PHARMACY AND PATIENT CARE**

Aditya Kale, Amaan Tamboli, Pratik Bongane, Anas Tamboli, Satish Polshettiwar Vishwanath Karad, Department of Pharmaceutical Sciences
School of Health Sciences and Technology MIT World Peace University, Pune-411038
adityakale1818@gmail.com

Today's world is dominated by artificial intelligence (AI) and technology, and this is going to be more dominant in clinical pharmacy and patient care. In the past, pharmacists mainly dispensed medicines and offered basic counselling, but future roles will be far more data-driven and patient-centred. New technologies and AI-based platforms can support pharmacists in delivering personalised, effective, and efficient care beyond routine practice. Based on an extensive literature survey, our study highlights three major fields where AI is transforming pharmacy practice. Predictive analytics enables early identification of patients at risk of adverse drug reactions, non-compliance, or disease progression. Studies show AI systems can reduce medication errors by up to 15% and increase patient compliance by 10%. Machine learning tools predicting conditions like diabetes or hypertension achieve over 85% accuracy, supporting early intervention. Personalised medicine will benefit greatly from genetic profiling and biomarker analysis. AI-assisted drug selection and dose optimisation have been shown to reduce prescription processing time by 40%, giving pharmacists more time for clinical decision-making. Pharmacogenomic platforms have demonstrated a 30% improvement in antidepressant therapy outcomes and a 25% reduction in serious adverse events in cancer treatment. Telepharmacy and remote monitoring further extend pharmacist reach. Wearables and digital platforms support real-time patient oversight and proactive interventions. AI-based image analysis in teledermatology detects drug-

ISBN: 978-81-980623-8-3

induced skin reactions with 92% sensitivity. Automation of routine tasks such as medication reconciliation and inventory management also enhances efficiency. Our findings emphasise that pharmacy education is increasingly integrating informatics and data science. Embracing AI will strengthen pharmacists' roles within the healthcare team and lead to improved patient care and system-wide benefits.

3.Rungta College of Pharmaceutical Sciences & Research, Bhilai
Preranasahu06.ps@gmail.com

Artificial Intelligence (AI) and modern technological advancements are transforming the pharmaceutical industry, creating new possibilities in research, development, and patient care. The theme "AI & Technology in Pharma: Educate, Innovate, Empower" highlights the pivotal role of digital transformation in shaping the future of pharmacy and healthcare. Educating pharmacy professionals and students in AI-driven tools such as machine learning, predictive analytics, and bioinformatics ensures the development of a workforce capable of adapting to global technological trends. Innovation is fostered through applications like AI-assisted drug discovery, virtual screening, molecular modeling, precision medicine, automated manufacturing, and digital health monitoring, all of which accelerate processes and reduce costs. Furthermore, technology empowers pharmacists, researchers, and healthcare providers to make data-driven decisions, enhance regulatory compliance, and improve patient-centric approaches. Integration of AI in pharmacovigilance, supply chain management, telepharmacy, and wearable-based drug monitoring ensures safe, effective, and accessible healthcare. This holistic approach educating the next generation, innovating through technology, and empowering communities strengthens the bridge between science and society. By embracing AI and digital tools, the pharmaceutical sector not only transforms traditional practices but also ensures sustainable growth, global competitiveness, and improved quality of life.

**Keywords:** Artificial Intelligence (AI), Pharmaceutical Technology, Drug Discovery, Machine Learning, Precision Medicine, Digital Health, Pharmacovigilance, Automation.

## TRANSFORMING CLINICAL PRACTICE: THE ROLE OF AI-POWERED MEDICAL ASSISTANTS IN ENHANCING HEALTHCARE EFFICIENCY AND DECISION-MAKING

Ravi B Nagargoje, Deepak Khobragade
Datta Meghe Institute of Higher Education and Research, Sawangi (Meghe), Wardha.

The integration of Artificial Intelligence (AI) into clinical practice has emerged as a transformative force in modern healthcare. AI-powered medical assistants, driven by Natural Language Processing (NLP) and Machine Learning (ML), enhance efficiency by supporting clinicians in documentation, diagnosis, triage, and decision-making. These systems streamline patient interaction, improve the accuracy of electronic medical records, and reduce the administrative workload that often contributes to clinician burnout. Furthermore, AI-enabled assistants facilitate personalized treatment recommendations, optimize resource utilization, and ensure continuity of care. Despite their significant promise, challenges remain regarding algorithmic bias, data privacy, interoperability, and regulatory compliance. Addressing these issues is critical for building trust and ensuring ethical adoption. This paper underscores the potential of AI-powered medical assistants to revolutionize healthcare efficiency while emphasizing the importance of transparent governance frameworks and robust quality standards to safeguard patient safety.

**Keywords:** Artificial Intelligence, Clinical Efficiency, AI Medical Assistants, Digital Health, Decision Support, Healthcare Automation.

## AI-DRIVEN ZLD: TURNING PHARMA WASTEWATER INTO A RESOURCE

Arpita Hendave, Vinita Kale, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee Nagpur- 441002.
arpitahendve@gmail.com

Pharmaceutical formulation plants generate wastewater streams containing high salinity, organic loads, and cleaning chemicals, making sustainable water management a critical challenge. Traditional Zero Liquid Discharge (ZLD) systems, while effective, are energy-intensive and operationally complex. This study proposes an innovative smart ZLD architecture that integrates Internet of Things (IoT) and Artificial Intelligence (AI) with energy-efficient process technologies. The system combines advanced biological and membrane processes (MBR, UF, high-recovery RO, FO/MD) with thermal concentration steps (MVR, crystallizer). The approach is supported by renewable energy integration and waste-heat recovery to optimize performance. IoT-enabled sensors and AI-driven control systems enable real-time monitoring and process optimization, resulting in improved water recovery, energy efficiency, and operational flexibility. The combination of advanced treatment technologies ensures compliance with environmental regulations and enables resource recovery from pharmaceutical wastewater. The proposed AI-driven ZLD system offers a sustainable and cost-effective solution for pharmaceutical wastewater management, transforming wastewater into a valuable resource and minimizing environmental impact.

**Keywords:** Zero Liquid Discharge, Pharmaceutical Wastewater, Artificial Intelligence, Internet of Things, Sustainable Water Management.

## AI-INTEGRATED SMART MEDICAL DISPENSARY SYSTEM: BRIDGING RURAL HEALTHCARE GAPS AND ENHANCING URBAN CONVENIENCE

Darsipudi Naga Subhadra Sravani V.Naga Sahithi
Department of pharmaceutics, Vikas institute of pharmaceutical sciences, Near Airport,
Rajahmundry, East Godavari District, Andhra Pradesh, India-533102.
sravanidarsipudi77@gmail.com

Access to essential healthcare varies greatly between rural and urban populations, with rural areas facing shortages of medical infrastructure and professionals, and metropolitan cities struggling with overcrowding, long queues, and limited 24×7 access. To address both challenges, a Smart Medical Dispensary System integrated with Artificial Intelligence

ISBN: 978-81-980623-8-3

(AI) is proposed. The system ensures round-the-clock availability of critical drugs, including emergency medications, cardiac drugs, and antidiabetic therapies, supported by the presence of a pharmacist or doctor either on-site or via teleconsultation. Villagers can utilize medical cards linked to primary healthcare centers for accurate patient identification and treatment history, while urban residents benefit from digital health record integration and faster access in high-footfall areas such as hospitals, metro stations, and residential complexes.AI-based prescription scanning and analysis improve safety by detecting potential errors, interactions, and duplications before dispensing. The system also employs data analytics to monitor medication demand, send refill reminders, and optimize stock management.By reducing travel in rural regions and saving time in metropolitan cities, the proposed model creates a scalable, community-centric, and technology-driven healthcare solution. It has the potential to strengthen healthcare delivery, improve adherence in chronic disease management, and ensure equitable access to life-saving medicines for diverse populations.

**AI-201**

**AI-ASSISTED PH-SENSITIVE NANOPARTICLES FOR DUAL DRUG DELIVERY OF CATECHIN AND CURCUMIN IN PERSONALIZED ANTICANCER THERAPY**

Sonali Devne, Neelam Bhagdewani , Meenal Kubde
Department of Pharmaceutics, Shri Gajanan Maharaj Shikshan Prasarak Mandal's Dnyanvilas College of Pharmacy, Pimpri-Chinchwad,Pune, Maharashtra, India-412105
sonalidevne26@gmail.com

Artificial intelligence (AI) is rapidly reshaping the development of nanomedicine by enabling predictive modelling and intelligent optimization of different dosage forms. This study aims to the design of pH-sensitive nanoparticles co-loaded with catechin and curcumin. Catechin and curcumin are natural polyphenols having anticancer, antioxidant, anti-inflammatory activities. The tumor microenvironment, characterized by acidic pH and oxidative stress, provides an ideal target for such stimuli-responsive delivery systems. Different AI assisted software such as *Design expert* can be used to optimize formulation parameters including polymer ratio, surfactant concentration, particle size, zeta potential and drug loading efficiency. AI-assisted predictive tools such as Gastroplus further used to study drug release kinetics under tumor simulated acidic conditions, significantly reducing experimental workload and accelerating formulation screening. Preliminary simulations suggest synergistic cytotoxicity and sustained release, enhancing drug accumulation at the tumor site while minimizing systemic toxicity. This innovative approach illustrates how AI educates formulators, innovates dual-drug nanocarrier design and empowers oncology therapy through targeted, patient-centric solutions. The work emphasizes the future role of AI-driven nanomedicine in developing safer, more effective and personalized anticancer strategies.

**Keywords:** AI-assisted drug delivery, pH-sensitive nanoparticles, dual drug release, formulation.

**AI-202**

**ARTIFICIAL INTELLIGENCE IN OPTIMIZING COMBINATION OF ANTIBIOTIC FORMULATIONS**

Mahesh Patil, Suankit Harane, Vinita Kale, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur, Maharashtra, India-441002
mahesh55517@rediffmail.com

The design and optimisation of antibiotic formulations and combinations are being accelerated by artificial intelligence (AI), which is changing the pharmaceutical development environment. Artificial intelligence driven systems that incorporate enormous amounts of biological, chemical, and clinical data are gradually replacing conventional trial-and-error drug formulation techniques. While predictive models employing machine learning and natural language processing evaluate toxicity, pharmacokinetics, and modes of action, generative models—such as deep learning, reinforcement learning, and evolutionary algorithms—can suggest new compounds with desirable antibacterial characteristics. While network-based technologies like INDIGO and synergy-predictive models like CoSynE offer insights into the best antibiotic pairings, platforms like IDentif.AI have been effectively used to quickly prioritise multiple regimens against infectious illnesses. The capacity of AI to find extremely efficient antibiotics with lower toxicity and broad-spectrum effectiveness against multidrug-resistant organisms is demonstrated by notable achievements, such as the discovery of halicin. Candidate validation is further improved by combining AI with physics-based modelling, such as molecular docking, molecular dynamics, and quantum-chemical simulations, which forecast binding energies, conformational changes, and possible off-target effects at the atomic level. This blend of generative and physics-based approaches ensures that AI-driven discovery yields results that are clinically useful by bridging computational prediction with experimental confirmation. AI may be used to find antibiotic combinations that work well together and lower the risk of resistance. For instance, by closely examining medication interactions, these models are able to forecast which compound combinations work best against resistant strains, perhaps leading to the development of innovative combination medicines that are superior to single-drug treatments.

**Keywords:** Artificial intelligence; Machine learning; Antimicrobial Resistance; Synergic prediction.

**AI-203**

**ARTIFICIAL INTELLIGENCE IN DRUG DISCOVERY**

Sana Sai Kumar
Department of Research and Development of Drug Discovery, Ratnam Institute of pharmacy, SPSR Nellore – 524346, Andhra pradesh
sanasaikumar5@gmail.com

Artificial Intelligence (AI) is a branch of computer science that develops algorithms to simulate human intelligence. In recent years, AI has transformed drug discovery and development by accelerating and optimizing multiple stages of the process. De novo drug design, which generates novel molecules with desired properties; Structure–Activity Relationship (SAR) modeling, which elucidates how chemical structures influence biological activity; and toxicity prediction, which forecasts potential adverse effects early in development, are some of the key applications. Target identification, which predicts potential biological targets for new therapies; virtual screening, which enables rapid evaluation of large compound libraries; and de novo drug design are all examples of these applications. AI-driven methods enhance the efficiency of drug research by analyzing complex molecular structures, identifying promising candidates, and reducing time and cost associated with traditional drug discovery approaches. Moreover, AI facilitates precision in predicting pharmacokinetics, pharmacodynamics, and safety profiles, improving the likelihood of clinical success. AI provides insights that guide rational drug design and the creation of novel therapies for complex diseases by integrating large datasets from genomics, proteomics, and chemical databases. This presentation focuses on the role of AI in modern drug discovery, highlighting how it streamlines candidate identification, optimizes molecular design, and predicts potential adverse effects. The incorporation of AI into pharmaceutical research represents a paradigm shift because it opens the door to the production of drugs that are safer and more efficient while simultaneously lowering overall development costs.

**Keywords:** Artificial Intelligence, Drug Discovery, Drug Toxicity, Molecular Properties, Target Identification.

**ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING IN RADIOLOGY**
**KANCHARLA ESWAR VARDHAN**

Department of pharmacy practice, Ratnam Institute Of Pharmacy, Nellore, Andhra Pradesh -524346
eswarvardhankancharla@gmail.com

The quantitative evaluation of Artificial Intelligence (AI) systems in a clinical context is a challenging endeavor. Here, we propose a scientific concept, Artificial Intelligence Prospective Randomized Observer Blinding Evaluation (AI-PROBE) for quantitative clinical performance evaluation of radiology AI systems within prospective randomized clinical trials. To demonstrate the applicability of our AI-evaluation framework, we present a first prospective randomized clinical trial on investigating the effect of automatic identification of Intra-Cranial Hemorrhage (ICH) in emergent care head CT scans on radiology study Turn-Around Time (TAT) in a clinical environment. Here, we acquired 620 consecutive non-contrast head CT scans from CT scanners used for inpatient and emergency room patients at a large academic hospital over

ISBN: 978-81-980623-8-3

a time period of 14 consecutive days. Study TAT was measured automatically as the time difference between study completion and first clinically communicated study reporting, with time stamps for these events automatically retrieved from various radiology IT systems. TATs for flagged cases (73 ± 143 min) were significantly lower than TATs for non-flagged (132 ± 193 min) cases, where 105 of the 122 ICH-AI+ cases were true positive reads. Total sensitivity, specificity, and accuracy over all analyzed cases were 95.0%, 96.7%, and 96.4%, respectively. In a broader context, our results suggest that our AI-PROBE framework can contribute to a systematic quantitative evaluation of AI systems in a clinical workflow environment with regards to clinically meaningful performance measures, such as TAT or diagnostic accuracy metrics.

**Keywords:** Artificial Intelligence (AI), Turn-Around Time (TAT), Intra-Cranial Hemorrhage (ICH), Radiology, Clinical Trial, AI-PROBE.

**REVOLUTIONIZING PHARMACOLOGY: AI-POWERED APPROACHES IN MOLECULAR MODELING AND ADMET PREDICTION**

Shruti Dubey, Mohammad Adnan Raza, Ajazuddin.
Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh, India-490023
shrutid326@gmail.com

The fusion of Artificial intelligence (AI) with computational chemistry has revolutionized drug discovery by enhancing compound optimization, predictive analytics, and molecular modeling. This review explores the integration of AI techniques, including machine learning (ML), deep learning (DL), and generative models with traditional computational methods such as molecular docking, quantum mechanics, and molecular dynamics simulations. It outlines the evolution of computational chemistry and the transformative role of AI in interpreting complex molecular data, automating feature extraction, and improving decision-making across the drug development pipeline. Core AI algorithms support vector machines, random forests, graph neural networks, and transformers are examined for their applications in molecular representation, virtual screening, and ADMET property prediction. Special attention is given to de novo drug design using generative adversarial networks (GANs) and variational autoencoders (VAEs), as well as AI-driven high-throughput virtual screening that reduces computational costs while improving hit identification. The review also discusses platforms like Deep-PK and Deep Tox for pharmacokinetics and toxicity prediction using graph-based descriptors and multitask learning. In structure-based design, AI-enhanced scoring functions and binding affinity models outperform classical approaches, while DL transforms molecular dynamics by approximating force fields and capturing conformational dynamics. The convergence of AI with quantum chemistry and density functional theory (DFT) is illustrated through surrogate modeling and reaction mechanism prediction. Despite these advances, challenges remain in data quality, model interpretability, and generalizability. The review concludes by highlighting future directions, including hybrid AI-quantum frameworks and multi-omics integration, underscoring AI's potential to accelerate safer, more cost-effective drug discovery.

**Keywords:** Virtual screening; Computational chemistry; Molecular modeling; ADMET prediction; Drug discovery; Predictive toxicology.

**AI-206**

**AI-DRIVEN PLATFORM FOR PERSONALIZED DRUG RISK ASSESSMENT AND DOSE OPTIMIZATION**

Tejas Bhalchandra Dev, Subodh S Satheesh
Department of Artificial Intelligence and Data Science in Healthcare, Institute of Health Management Research, Bangalore
tejasdev77579@gmail.com

The increasing use of multiple medications and genetic variability among patients make safe and effective prescribing more difficult. Adverse drug reactions remain a leading cause of illness, largely due to the traditional "one-size-fits-all" approach that overlooks individual differences. To address this challenge, we developed an AI-powered clinical decision support system that provides personalized drug risk assessments and optimized dosing recommendations. Patient data including clinical history, laboratory results, and pharmacogenomic markers are processed through a modern web-based platform integrating Google's Gemini 2.5 Flash multimodal AI model via the GenAI and JavaScript SDK. Structured JSON outputs were used to ensure consistent and interpretable predictions. The frontend, built with React, TypeScript, and Tailwind CSS, delivers a lightweight, responsive, and clinician-friendly interface. The model was trained with alignment with global evidence-based standards such as CPIC and FDA recommendations, enabling translation of complex patient data into clear, prioritized, and actionable insights. The system identifies patient-specific risks, including drug-drug and drug-gene interactions, and presents them through intuitive reports that align with existing clinical workflows rather than overwhelming clinicians with reactive alerts. By enabling faster, safer, and more precise prescribing decisions, this platform advances the integration precision medicine into routine clinical practice and has a strong potential to reduce adverse drug reactions and improve therapeutic outcomes across diverse patient populations in India and beyond.

**Keywords:** Artificial Intelligence, Pharmacogenomics, Clinical Decision Support, Personalized Medicine, Adverse Drug Reactions.

**TRANSFORMATION OF AI AND TECHNOLOGY IN PHARMACEUTICAL SECTOR**

Garima Sahu, Rudra Pratap Singh Rajput, Ankita Sen
Royal College of Pharmacy, Raipur (C.G.)-492099, India
sahugarima763@gmail.com

Background: The study was needed because traditional pharma methods are slow, costly and less patient-centric.AI and Technology can speed up research, improve education, drive innovation and empower patients and professionals, making healthcare more efficient and accessible. Specific Problems when relaying on AI are Incorrect Dosing and Treatments, Ignoring Patient-Specific Factors, Drugs Interactions and Side Effects, Over Reliance on AI, Data Privacy and Security Issues. Aim: The aim is to leverage AI and Technology in the pharmaceutical sector to educate stakeholders with data-driven insights, faster innovation in drug development and healthcare delivery, and empower patients, professionals and researchers for a more efficient and patient-centric system. Method: The application of AI in pharmacy education and practice is transforming the field through various innovative approaches such as AI-Powered e-learning Platforms provide personalized learning experiences for Students and Professionals, while Virtual and Augmented Reality Stimulations enhance understanding of Drug Mechanisms and Clinical Practices, AI Chat boxes, Digital Libraries, Machine Learning Algorithms, Robotics and Smart Manufacturing are improving Pharmaceutical Production, Mobile Health Apps, Telemedicine. By utilizing AI Algorithms that analyze extensive biological data, including genomics and proteomics. Result: This study provides an overview of various AI-Based Approaches utilized in Pharmaceutical Technology, highlighting their benefits and draw backs. Nevertheless, the continued investment in and exploration of AI in the Pharmaceutical Industry offer exciting prospects for enhancing drug development processes and patient care. Conclusion: AI and Technology are transforming the pharmaceutical industry by enhancing education, driving innovation and empowering all stakeholders. They shorten drug development timelines; improve decision-making and enables personalized care. By integrating AI tools, pharma can become more efficient, inclusive in patient-centric, ensuring better healthcare outcomes for future. The Government of India launched the National Strategy for AI (2018) under NITI Aayog, positioning AI as "AI FOR ALL".

The pharmaceutical industry is undergoing a significant transformation with the integration of Artificial Intelligence (AI) technology. As the industry continues to evolve, there is a growing need for innovative solutions to address complex challenges in drug discovery, development, and delivery and improving patient outcome. AI has the potential to revolutionize the pharmaceutical industry by enhancing education, driving innovation, and empowering professionals. Enhancing the

ISBN: 978-81-980623-8-3

learning of professionals and virtual experimentation aligning with ethical and regulatory guidelines. By leveraging AI-powered tools and platforms, pharmacists and researchers can access vast amounts of data, analyze complex information, and make informed decisions. To investigate the transformative potential of Artificial Intelligence (AI) technology in the pharmaceutical industry, with a focus on its role in educating professionals, driving innovation, and empowering decision-making. By Integration of AI into curricula, Hands-on training, online courses and resources, reduction of disruption in supply chain, certification program, interdisciplinary collaboration between academia, industry and government, support entrepreneurship. The integration of Artificial Intelligence (AI) technology in the pharmaceutical industry has the potential to revolutionize the way we approach education, innovation, and professional empowerment. By educating professionals, driving innovation, and empowering decision-making, AI can improve patient outcomes, streamline processes, and enhance the overall quality of care. AI is essential to address the complex challenges as the industry continues to evolve. By embracing AI technology, we can unlock new opportunities, drive growth, and create a brighter future for healthcare.

**AI FOR PERSONALIZED MEDICINE AND PHARMACOGENOMICS**

Bacchala Charishma, P.Geetha bhavani
Department of Pharmaceutical Sciences, Vikas institute of Pharmaceutical Sciences,Near Air Port, Rajahmundry, East Godavari District, Andhra Pradesh, India-533102.
charishmabacchala@gmail.com

Pharmacogenomics is a rapidly evolving field that investigates the relationship between an individual's genetic makeup and their response to medications. This personalized approach to medicine moves beyond the traditional "one-size-fits-all" model by analyzing genetic variations that influence drug metabolism, efficacy, and the risk of adverse drug reactions (ADRs). By tailoring drug therapy to a patient's unique genetic profile, healthcare professionals can select the most effective medication at the optimal dose from the outset, thereby increasing treatment success and minimizing dangerous side effects. This strategy has gained significant traction in clinical areas such as oncology, psychiatry, and cardiology, where genetic differences can drastically impact drug response.

**Keywords:** pharmacogenomics, personalized medicine, genetic makeup, drug metabolism, drug efficacy, adverse drug reactions, precision medicine, genetic testing.

**AI-210**

**ARTIFICIAL INTELLIGENCE IN PHARMACOGENOMICS: SURGE IN PERSONALIZED MEDICINES WITH DATA-DRIVEN UNDERSTANDING**

Najwa Bade, Sumaiya Baig Mirza, Mahek Bagwan , Rajat Sayyed
Department of Pharmaceutical Sciences, Savitri Bai Phule University, Pune, Maharashtra, India- 411001
badenajwa02@gmail.com

Pharmacogenomics is the science behind the individual's genetic makeup and drug action. Pharmacogenomics introduced the transformative concept of personalized medicines with the collaboration of Artificial Intelligence. By simplifying intricate and large-scale genomic datasets, it offers revolutionary therapeutic solutions accompanied by minimized adverse drug reactions. Artificial Intelligence is the cornerstone of pharmacogenomics. The subsets of AI, such as machine learning and deep learning, elucidate the genetic profile, study the drug response for personalized medicines, and aim at accurate dosing regimens. Additionally, AI unveils the interactions between genes and medicines. This allows multipurpose therapeutic repositioning of medicines. Healthcare specialties, namely oncology, cardiology, and psychiatry leverage AI to compare possible therapeutic options by studying the tumour's genomic structure. Therefore, AI-driven pharmacogenomics facilitates dose modifications for antidepressants and anticoagulants like warfarin based on CYP450 gene variants. AI in pharmacogenomics offers accessible treatment solutions for chronic and acute disorders by in-depth analysis of individualized gene configuration. The substantial breakthrough of AI in pharmaceutical progress enables millions of healthcare professionals to improve drug delivery, treatment results, and reduced errors in prescription. Although the numerous benefits of AI and pharmacogenomics overweighs the limitations, the unexplored genomic datasets, ethical concerns, and continuous adaptation still posses a threat for the best outcomes. The integration of AI and pharmaceutical sciences emphasizes a future with innovative solutions and ideal patient performance. This transformation is not only qualitative but also optimized.

**Keywords:** Pharmacogenomics, Personalized medicines, Therapeutic repositioning, genomic datasets.

**AI-211**

**ARTIFICIAL INTELLIGENCE IN POST-MARKETING SURVEILLANCE: REDEFINING PHARMACOVIGILANCE**

Rakhshanda Ansari, Ujma Maljapte, Fatima Naik, Rajat Sayyed
Department of Pharmaceutical Sciences; M.C.E. Society's Allana College of Pharmacy, Pune, Maharashtra, India-411001
rakhshanda258@gmail.com

Post-Marketing Surveillance (PMS) plays a crucial role in ensuring the ongoing safety and efficacy of medicines once they are introduced into the market. Traditional pharmacovigilance methods face challenges due to the exponential growth of adverse event reports, data fragmentation and delays in signal identification. AI offers novel opportunities to enhance efficiency, accuracy, and timeliness in drug safety monitoring. AI algorithms, particularly machine learning and language processing, can analyse large-scale heterogeneous data sets, including electronic health records, social media discussions, adverse event reports, and insurance claims. These techniques ensure the early detection of rare ADRs, prediction of at-risk populations and identification of hidden safety patterns that conventional methods may miss. AI tools also enhance case processing efficiency, automate signal detection and provide continuous monitoring across diverse patient populations. Furthermore, predictive risk-benefit assessment enables regulatory authorities and pharmaceutical companies to make data-driven decisions with higher accuracy. The intervention of AI in PMS leads to better outcomes by reducing the manual load and allowing the pharmacovigilance team to focus on complex analyses. It also focuses on mitigating bias and adhering to ethical guidelines. AI-driven PMS represents a paradigm shift in pharmacovigilance, promising a more robust, efficient, and patient-centric approach to drug safety monitoring.

**Keywords:** Post-Marketing Surveillance, Drug Safety Monitoring, AI, Risk-Benefit Assessment, Patient-Centric, Regulatory Authorities.

**AI-212**

**THE SYNERGY OF AI AND VALUE-BASED PRICING: ADVANCING REGULATORY AND MARKET ACCESS FRAMEWORK**

Esha Vishwakarma, Nehal Bhimjiyani, Anil M.Pethe
Datta Meghe College of Pharmacy, Datta Meghe Institute Higher Education and Research (DU), Sawangi (Meghe), Wardha, Maharashtra
eshavish1001@gmail.com

The integration of Artificial Intelligence (AI) with value-based pricing (VBP) models is composed to redesign the landscape of healthcare market access and regulatory decision making. As health systems progressively shifting toward value-driven approaches, leveraging AI's analytical power offers new opportunities to optimize pricing strategies based on real-world outcomes and patient-centric system of measurement. The integration supports more accurate and transparent evaluations of value, enabling the development of systems that are both flexible and based on real-world evidence. Furthermore, AI can streamline regulatory pathways by enabling predictive modelling, risk stratification, and data-driven scenario analysis, thereby accelerating time-to-market for innovative therapies. This model shift holds significant potential to align stakeholder - including clients, regulators, providers, and patients - around outcomes-focused care delivery, while also addressing cost- effectiveness and impartiality considerations. Ultimately, the junction of AI and VBP can drive more sustainable healthcare systems and foster access to high-value medical innovations globally.

**Keywords:** Value based pricing, market access, integration, stratification.

**AI-213**

**Dish & Dose: A Mobile Interaction Application For Identifying And Managing Food-Drug Interactions To Enhance Patient Safety And Medication Adherence**

ISBN: 978-81-980623-8-3

Anushka Kulkarni
Mahavir Institute of Pharmacy, Nashik
Department of Pharmaceutics, Dr. Babasaheb Ambedkar Technological University, Lonere, India

Food-drug interactions are a major concern in clinical practice as they may reduce therapeutic efficacy, alter pharmacokinetics, or increase the risk of adverse reactions, ultimately affecting patient safety and medication adherence. The present study focused on the development of Dish & Dose, a mobile-based interactive application designed to identify, predict, and manage food-drug interactions in real time. The application integrates a structured database of commonly prescribed medications with dietary components and utilizes a rule-based algorithm to provide users with clear, patient-friendly alerts regarding potential interactions. The objective of this work was to evaluate the efficiency of the application in improving patient awareness, supporting medication adherence, and reducing the likelihood of interaction-related complications. The system was tested for accuracy of interaction detection, usability, and patient acceptance. Preliminary evaluations indicated that Dish & Dose demonstrated high accuracy in identifying clinically significant interactions and was well accepted by users for its simplicity and accessibility. By offering tailored guidance, this tool aims to bridge the communication gap between healthcare professionals and patients, promoting safe medication use and improved therapeutic outcomes. Thus, the study concludes that Dish & Dose can serve as a practical digital health intervention to enhance patient safety and adherence in routine clinical practice.

**Keywords:** Food-drug interactions, mobile application, patient safety, medication adherence, digital health.

## AI GUIDED OPTIMIZATION OF A TOPICAL POLYHERBAL GEL. A SYNERGISTIC FORMULATION OF CURCUMA LONGA AND BOSWELLIA SERRATA FOR ENHANCED ANTI-INFLAMMATORY ACTIVITY.

Fatima Mapka, Sanika Bhosale, Mehek Shaikh, Rajat Sayyed
Department of Herbal Formulation And Phytochemistry- SPPU Allana College Of Pharmacy, Azam Campus, PUNE 411001
Mapkarfatima8@gmail.com

This research demonstrates the application of machine learning (ML) to optimise a Polyherbal topical gel formulation, moving beyond traditional tests and error methods. The study focuses on synergistic blend of methanolic extracts from Curcuma longa(Turmeric) and Boswellia serrata (Indian Frankincense) both are famous for their anti-inflammatory properties. The aim is to use AI to identify the ideal ratio for maximum effect. The function includes a lab based approach. At first, methanolic extracts will be prepared from the raw materials and their phytochemical profile will be determined using HPLC-High Performance Liquid Chromatography and then, mixture design of experiments(DoE) will be employed to prepare gel formulation with varying ratios of the two extracts. Anti-inflammatory activity will be evaluated in vitro using the protein denaturation inhibition assay, with a standard anti-inflammatory drug (e.g., Diclofenac) as a positive control. A machine learning model will be trained using experimental data. This model will learn the relationship between the components and biological response, allowing for the prediction of the most effective combination. This project shows how AI can streamline research and accelerate the development of safe and effective herbal products.

**Keywords:** Phytochemistry, Herbal Gel, Machine Learning.

## AI-215

## OPTIMIZATION IN CHRONIC DISEASE: MACHINE LEARNING–GUIDED THERAPY IN DIABETES, COPD, AND HEART FAILURE

Darshana Yashwant Maheshan
Department of [Pharmacy practice (Pharm D- Doctor of Pharmacy)]
Shivlingeshwar college of Pharmacy Almala, Latur, Maharashtra, INDIA
maheshandarshana@gmail.com

Introduction: Chronic diseases such as diabetes mellitus (DM), chronic obstructive pulmonary disease (COPD), and heart failure (HF) impose significant morbidity and healthcare burden. Standard guideline-based treatments may not account for interpatient differences in disease progression or therapeutic responsiveness. Artificial intelligence, and specifically machine learning (ML), offers potential to individualize therapy, thereby optimizing clinical outcomes. Objectives: To design, validate, and simulate deployment of ML-based decision support models for therapy optimization in individuals with DM, COPD, and HF, and to estimate the possible improvements in outcomes (e.g. exacerbations, hospitalizations, glycemic control). Methods: A retrospective cohort of patients with DM, COPD, or HF was assembled from institutional databases. Input features included demographics, comorbidities, laboratory values, longitudinal biomarker trends, medication adherence data, imaging or sensor/remote monitoring data. We applied supervised ML algorithms (e.g. random forest, gradient boosting machines, neural networks) to predict individualized therapy adjustments (dose changes, drug selection) that maximize composite outcome metrics (e.g. reduction in adverse events, hospital visits, biomarker targets). Models were cross-validated internally and tested on external holdout sets. Simulation modeling projected the potential impact of applying ML recommendations in routine care over a 12-month horizon. Across disease groups, the best ML models achieved AUROC values in the range 0.82 to 0.89 for correctly recommending therapy adjustments. Simulation application suggested a potential reduction in hospitalizations by 12–18%, and disease-specific complications by 8–15%. Feature importance analyses revealed that past exacerbation frequency, biomarker trajectories, adherence metrics, and comorbid burden were among the strongest predictors influencing decision logic. Conclusion: Machine learning–guided optimization in chronic disease therapy shows promise for enhancing personalization, improving outcomes, and reducing healthcare burden in diabetes, COPD, and heart failure. Prospective clinical trials are needed to validate these findings in real-world settings.

**Keywords:** machine learning, personalized therapy, chronic disease, diabetes, COPD, heart failure, decision support.

## AI-216

## AI IN PHARMACEUTICAL DEVELOPMENT AND MANUFACTURING: DATA-DRIVEN INSIGHTS WITHIN THE ICH Q8–Q14 FRAMEWORK AND INDIAN INDUSTRY ADOPTION

Rongala Appala Swamy Naidu,
Independent Researcher, Hyderabad - 500072, India
drrasnaidu60@gmail.com

In the present study, the applications of Artificial Intelligence (AI) and Machine Learning (ML) in pharmaceutical development and manufacturing were systematically evaluated in alignment with ICH Q8–Q14 guidelines. The objective was to analyse the impact of AI-driven technologies on drug discovery, clinical trials, manufacturing, and regulatory submissions, with a specific focus on Indian pharmaceutical companies. A structured review of 65 peer-reviewed publications (2018–2024), regulatory reports (FDA, EMA, ICH), and industry case studies was performed. Data from global leaders (Pfizer, Roche, AstraZeneca, Johnson & Johnson) and Indian firms (Sun Pharma, Dr. Reddy's, Biocon, Lupin, Cipla, Glenmark, Zydus) were compared to assess improvements in cycle time, cost savings, and regulatory readiness. The analysis revealed that AI integration reduced drug discovery timelines by 6–12 months with 15–20% lower costs, while oncology trial enrolment increased by 18% (AstraZeneca, 2021). AI-enabled predictive maintenance in manufacturing demonstrated 30% downtime reduction and 5–10% faster batch release in Indian pilot studies. Regulatory agencies (FDA, EMA) have published AI-related guidance (2021–2023), whereas CDSCO has yet to issue India-specific frame works. It was concluded that AI provides measurable benefits in global and Indian pharmaceutical operations, particularly when mapped to ICH Q8 (development), Q9 (risk management), Q10 (quality systems), and Q13 (continuous manufacturing). However, limitations remain in data integrity, algorithm transparency, workforce skills, and regulatory harmonization. The study highlights the urgent need for India to build AI-ready infrastructure and policies to ensure sustained quality, safety, and efficacy of medicines.

**Keywords:** Artificial Intelligence, ICH Q8–Q14, Pharmaceutical Development, Manufacturing, Regulatory Submissions, India, Continuous Manufacturing, Risk Management.

## INTEGRATING MACHINE LEARNING WITH NANOTECHNOLOGY: A PATHWAY TO NEXT-GENERATION DRUG DELIVERY SYSTEMS

Yeduvaka Dinesh, Sowjanya Pulipati, P. Srinivasa Babu

ISBN: 978-81-980623-8-3

Department of Pharmaceutics, Vignan Pharmacy College (Autonomous), Vadlamudi – 522213, Guntur (Dt), Andhra Pradesh, India - 522213.
kumard40035@gmail.com

Nanoparticulate drug delivery systems have emerged as a promising approach to overcome the limitations of conventional therapeutics, including poor solubility, low bioavailability, off-target effects, and uncontrolled release profiles. However, the design and optimization of nanoparticles with desired physicochemical properties and biological performance remain challenging due to the complexity of formulation variables and biological interactions. Machine learning (ML), a subset of artificial intelligence, offers powerful tools to accelerate the development of nanoparticulate drug delivery systems by enabling predictive modeling, data-driven optimization, and pattern recognition. ML algorithms can be applied to predict nanoparticle size, shape, surface charge, drug loading efficiency, and release kinetics, as well as to assess biocompatibility, biodistribution, and therapeutic efficacy. Moreover, the integration of ML with high-throughput screening and computational simulations allows for rational design, reduced experimental workload, and improved translational potential. This convergence of nanotechnology and machine learning holds the potential to create personalized, efficient, and safe drug delivery systems. This review highlights the role of ML in enhancing nanoparticle-based drug delivery, emphasizing its applications, challenges, and future perspectives in precision medicine.

## A BLUEPRINT FOR A FUTURE-READY PHARMACY WORKFORCE: INTEGRATING AI AND TECHNOLOGY INTO INDIA'S RURAL PHARMACY EDUCATION SYSTEM

Naidu Narapusetty, V Jhansipriya Marabathuni
Bellamkonda Institute of Technology and Science, Podili, Andhrapradesh, India-523245.
narapusetty.naidu@gmail.com

The Indian pharmaceutical sector stands at a critical juncture. While globally recognized as the "Pharmacy of the World," its continued leadership is contingent on the modernization of its educational infrastructure, particularly in rural areas. A significant chasm exists between the rapid technological advancements in the global pharmaceutical industry—driven by artificial intelligence (AI), the Internet of Things (IoT), and data analytics—and the systemic limitations of India's traditional, rural-centric pharmacy education system. This report provides a comprehensive diagnostic analysis of this challenge, examining the outdated curriculum, the profound digital and infrastructural divide, and a pervasive human resource crisis. It then outlines a strategic, multi-stakeholder pathway to transformation. The analysis finds that the recent, forward-looking curriculum changes initiated by the Pharmacy Council of India (PCI) provide a crucial foundation for this reform. However, the successful implementation of this new curriculum is contingent on addressing deep-seated issues in rural institutions, including a lack of reliable internet, a shortage of qualified faculty, and a crisis of accountability evidenced by the "ghost faculty" phenomenon. The report proposes a collaborative framework for implementation, leveraging Public-Private Partnerships (PPPs), targeted government policy, and industry-led Corporate Social Responsibility (CSR) initiatives. By moving beyond traditional funding models to a strategic, outcome-oriented approach, India can not only bridge the existing skills gap but also cultivate a future-ready pharmacy workforce that solidifies its position as a global leader in healthcare innovation and delivery.

**Keywords:** Educational infrastructure, Artificial intelligence (AI), the Internet of Things (IoT), Pharmacy Council of India (PCI), Public-Private Partnerships (PPPs), targeted government policy

## NEURO-RESPONSIVE SMART INHALER: EEG-GUIDED AI FORPRE-SYMPTOMATIC PREDICTION AND CLOSED-LOOP RESCUE IN ASTHMA AND COPD

Bankuru Likhitha, N.pavan Kalyan, B.Asha Jyothi, R.Divya
Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili, Affiliated by Andhra University, India-535558
bankurulikhitha5@gmail.com

Respiratory disorders such as asthma and chronic obstructive pulmonary disease (COPD) remain major global health challenges, largely due to delayed intervention and improper inhaler use.Conventional smart inhalers monitor adherence but cannot predict imminent attacks or guide patients in real time. To address this gap, we present a Neuro-Responsive Smart Inhaler— an innovative device integrating neuro-sensors, respiratory flow sensors, and artificial intelligence (AI). The system employs a lightweight 28 g dry-electrode EEG headband (or adhesive neuro-patch) to capture stress-related brain activity, a micro-machined airflow mouthpiece to assess inhalation dynamics, and a ring $SpO_2$ sensor to monitor oxygen saturation. These multimodal signals are processed on-device through a TinyML pipeline. Patient-specific 1-D CNN–LSTM models, trained on EEG β/θ ratios, inspiratory flow skewness, and oxygen-saturation slopes, can forecast exacerbations a median of 7.4 minutes before clinical symptoms or a ≥20% drop in peak expiratory flow (AUC 0.94, sensitivity 0.91, specificity 0.87). When risk thresholds are exceeded, the system initiates tiered interventions: (i) haptic vibration to coach inhaler technique, (ii) smartphone alerts to caregivers, and (iii) if critical status is confirmed via redundant safety checks, electronic actuation of a bronchodilator valve within 150 ms. A modeled 12-month randomized controlled trial with 300 patients predicts 40% fewer exacerbations, 30% fewer emergency visits, 18% higher adherence, and a cost-effectiveness ratio of £9,800/QALY. By merging predictive neuro-respiratory monitoring with closed-loop drug delivery, this device enhances safety, personalizes therapy, and offers clinicians and pharmacists real-time adherence insights, representing a next-generation tool for global respiratory care.

**Keywords:** EEG-based prediction; smart inhaler; AI early detection; closed-loop drug delivery; personalized respiratory therapy.

## AI USED IN HERBAL FORMULATIONS

Sakshi Sonone, Amol Tatode, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur Maharashtra, India – 441002
sakshisonone2003@gmail.com

The integration of artificial intelligence (AI) in herbal drug research has emerged as a promising approach to overcome challenges associated with complexity, variability, and standardization of herbal formulation. A reviews highlight that AI tools – including machine learning –model which are predicts there therapeutics effects and optimize the herbal growth promoter, deep learning –traditional medicines text, Scientific Literature, quantitative structure activity relationships (QSAR), and network pharmacology – are increasing applied to identify bioactive phytoconstituents, optimize formulation parameters and predicts pharmacological activity. Studies report that AI-assisted methods improve quality control through chromatographic and spectroscopic data analysis, ensure authentication of raw botanicals, and support toxicity prediction and herb-drug interaction assessment, while integration with clinical data and interaction in genetics variation integrate data from pharmacogenomics, and Predicting therapeutics outcomes. AI can optimise the formulation of herbal with combination of herbs with synergistic and antagonistic action – reinforcement learning. This study concluded that, AI bridges traditional herbal knowledge with pharmaceuticals science. The reviewed confirms its potentials to enhance efficiency, reproducibility, and personalization of herbal medicines, stronger regulatory acceptance to ensure safe and effective integration of AI into herbal drug development.

**Keywords:** Artificial Intelligence, QSAR Modelling, Machines Learning, Herb-Drug Interaction, Quality Control.

## Digital Twins In Healthcare

Vinay Salunke, Anand Shedge
Bombay College of Pharmacy (Autonomous), Mumbai, India.
vinaysalunke@yahoo.co.in

Digital twins (DTs) represent a transformative technology in healthcare, creating dynamic virtual replicas of patients, organs, or healthcare systems through real-time data integration from electronic health records, wearable devices, medical imaging, and genomic profiles. These

ISBN: 978-81-980623-8-3

sophisticated computational models leverage artificial intelligence, machine learning, and Internet of Things technologies to enable unprecedented personalized medicine capabilities. The primary applications of healthcare digital twins span personalized treatment planning, surgical simulation, drug discovery acceleration, and chronic disease management. By integrating multi-omics data with physiological parameters, DTs facilitate precise disease progression modeling, treatment response prediction, and proactive intervention strategies. Real-time monitoring capabilities enable continuous patient assessment, particularly beneficial for managing cardiovascular diseases, cancer treatment optimization, and remote patient care. Current implementations demonstrate significant improvements in diagnostic accuracy, reduced surgical complications, and enhanced clinical decision-making through predictive analytics. The global healthcare digital twins market, valued at approximately $1.37-2.69 billion in 2024, is projected to reach $3.55-59.94 billion by 2030-2032, reflecting a compound annual growth rate of 25.7-68.0%. Despite promising applications, challenges persist including data privacy concerns, system interoperability issues, computational infrastructure requirements, and ethical considerations regarding patient consent and algorithmic bias. Technical barriers encompass model validation, real-time data integration complexity, and resource-intensive implementation costs. Future developments focus on autonomous digital twins, AI-driven surgical planning with haptic feedback, and integration with emerging technologies like blockchain for enhanced security. The convergence of digital twins with precision medicine promises to revolutionize healthcare delivery through predictive, preventive, and personalized therapeutic approaches.

**Keywords:** Digital Twins, Personalized Medicine, Precision Healthcare, Virtual Patient Models, AI-Driven Medical Simulation.

**ARTIFICIAL INTELLIGENCE FOR THE FUTURE OF PHARMACEUTICALS: APPLICATIONS, CHALLENGES, AND OPPORTUNITIES**

Harshita Dhanuka, Kalyani R. Thombre Krishna R. Gupta, Milind J. Umekar
Department of Pharmaceutical Chemistry, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, 441002 Email - 9511705720j@gmail.com

Artificial Intelligence (AI) has become a transformative force across multiple sectors, with the pharmaceutical industry at the forefront of this technological evolution. This review explores the diverse and rapidly growing applications of AI within the pharmaceutical domain, including drug discovery, drug design, drug repurposing, clinical trial management, and the optimization of pharmaceutical manufacturing and supply chains. Through the use of machine learning, deep learning, natural language processing, and other AI-driven techniques, pharmaceutical processes are becoming faster, more accurate, and less resource-intensive. By automating complex data analysis, predicting drug-target interactions, and identifying novel therapeutic compounds, AI significantly accelerates early-stage research and reduces the high failure rates traditionally associated with drug development. Additionally, AI contributes to the design of more efficient and adaptive clinical trials by enabling patient stratification, real-time monitoring, and predictive modeling of outcomes. The integration of AI not only improves decision-making and productivity but also helps reduce human workload and operational costs. This review also examines the tools and platforms currently driving AI innovation in the pharmaceutical sector, the interplay between various AI technologies, and the ongoing challenges, such as data privacy, regulatory constraints, algorithm transparency, and integration into existing workflows. Finally, it discusses prospects and strategic directions, emphasizing the potential of AI to reshape the pharmaceutical landscape and contribute to more personalized, accessible, and effective healthcare solutions.

**A REVIEW ON USING ARTIFICIAL INTELLIGENCE AND OTHER TOOLS FOR FRAMING BACHELOR OF PHARMACY SYLLABUS**

Pakki. Venkata Varalakshmi, P.Sureshkumar, P.Radhakrishna, K.Rajesh
Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili, Affiliated By Au, India-53558
lakshmipakki314@gmail.com

Artificial Intelligence [AI] is being integrated into the pharmacy under the Pharmacy council of India [PCI] to equip future pharmacist with digital and computational skills. The revised syllabus for Bachelor of Pharmacy, Diploma in Pharmacy, and Master of Pharmacy, emphasizes Artificial Intelligence applications in drug discovery development and patient care. Artificial Intelligence introduced through computer applications, Bio-informatics, Pharmaceutical Analysis, Clinical Pharmacy, Pharmacovigilence modules. Students learn about machine learning tools for molecular modelling, predictive analytics for adverse drug reactions and Artificial Intelligence based clinical decisions supported system. Present Scenario of pharmacy syllabus need modifications with recent updated tools like Artifcial Intelligence, quantum, Data science. Artificial Intelligence in relevance to Data science, Pharmacy like driven education helps pharmacy students grasp complex data sets efficiently.

**Keywords:** Data Science, Pharmacy Curriculum, Quantum, Artificial Intelligence

**AI-225**

**ARTIFICIAL INTELLIGENCE DRIVEN GREEN CHEMISTRY FOR PHARMA**

CH. GANAPATHI RAO , D. Mahesh, B. Soniya, G.Ramakrishna
Bhaskara institute of pharmacy, Komatipalli (village), Bobbili , Andhra Pradesh, affiliated to Andhra University , Vishakhapatnam, 257537
Chennamganapathirao953@gmail.com

The integration of Artificial Intelligence (AI) with green chemistry principles is transforming pharmaceutical research, development, and manufacturing. Traditional drug synthesis often relies on resource-intensive processes, toxic solvents, and generates significant chemical waste. Artificial intelligence-driven green chemistry provides a sustainable alternative by employing predictive algorithms, machine learning models, and big data analytics to design eco-friendly synthetic routes, optimize reaction conditions, and minimize hazardous by-products. By simulating reaction pathways, Artificial intelligence can identify safer catalysts, renewable raw materials, and energy-efficient processes without exhaustive experimental trials. This not only reduces environmental burden but also accelerates time-to-market, lowers production costs, and ensures regulatory compliance with sustainability guidelines. Furthermore, Artificial intelligence -assisted green chemistry supports circular economy practices in pharma by promoting waste valorization and greener process scale-up. Thus, the convergence of Artificial intelligence and green chemistry represents a significant leap toward sustainable, cost-effective, and innovative pharmaceutical manufacturing.

**Keywords:** Artificial Intelligence (AI); Green Chemistry;Sustainable Pharmaceuticals; Eco-friendly Drug Synthesis; Machine Learning; Process Optimization; Waste Minimization.

**ETHICAL CONSIDERATIONS AND SECURITY IN AI-DRIVEN DRUG DISCOVERY: NAVIGATING DATA SHARING, BIAS, AND ACCOUNTABILITY**

Sumia Fatima, Farazia Sultana, Syeda Kulsum Haider,
Azad College of Pharmacy, Moinabad, Hyderabad, Telangana.

The rapid adoption of artificial intelligence in drug discovery is transforming the pharmaceutical landscape, ushering in remarkable efficiencies and new possibilities. Yet, alongside these advancements, the field faces significant ethical and security dilemmas. This work examines how AI's dependence on vast, often sensitive datasets raises urgent questions about data privacy, responsible data sharing, and consent. Furthermore, it delves into the risks of algorithmic bias—where unbalanced training data can inadvertently reinforce health disparities—and highlights how the "black box" nature of complex AI systems challenges transparency and trust. The discussion also addresses accountability: when AI errors occur, who is responsible? Through real-world examples, this study explores practical frameworks for ensuring fair, safe, and trustworthy AI-driven drug discovery, emphasizing collaborative governance, transparency, and ongoing ethical evaluation. By acknowledging these challenges and proposing actionable solutions, we can harness the promise of AI while safeguarding the interests of patients and society.

**Keywords:** Artificial Intelligence, Pharmaceutical Landscape, Black Box, AI-Driven Drug Discover.

**A STUDY ON AI ADOPTION AND PERCEPTION AMONG HOSPITAL PHARMACISTS IN CHENNAI**

R.J.T. Nirmalraj, MD. Dhanraju, Thamaj Bhanu. A, Prince.R. Prabhu
Research Scholar, Hindustan Institute of Technology and Science (Deemed to be University), School of Management, Chennai.
nirmalready@gmail.com

Artificial Intelligence (AI) is surfacing as a revolutionary force within the healthcare sector, presenting chances to enhance efficiency, improve patient safety, and support clinical decision-making. This study explores the degree of awareness, implementation, attitudes, and barriers surrounding AI among hospital pharmacists in Chennai. A carefully designed structured questionnaire was distributed to 100 pharmacists from private, public, and educational hospitals. The data were examined using descriptive statistics, chi-square analyses, t-tests, ranking assessments, and thematic categorization of open-ended feedback. Results indicate that although awareness of AI is at a moderate level, adoption rates are significantly higher in private hospitals compared to public and educational institutions. Pharmacists generally possess a positive outlook regarding AI's capability to boost patient safety and alleviate workload. Primary barriers consist of insufficient training, high costs of implementation, concerns regarding data privacy, and inadequate infrastructure, with resistance from staff being the least reported issue. Survey participants strongly advocated for training workshops, government assistance, and policy frameworks to ease the integration of AI. The study concludes that pharmacists are open to AI, yet systematic and resource-related challenges impede its adoption. Tackling these barriers through training, infrastructure enhancement, and supportive policies could hasten AI adoption in the healthcare framework of Chennai.

**PHARMACEUTICAL SCIENCE, SUSTAINABLE DEVELOPMENT GOALS AND ROLE OF ARTIFICIAL INTELLIGENCE**

Aanchal Arya, Tirath Kumar
Department of Pharmaceutical Sciences, Kumaun University, Nainital, India- 263136.
Aanchalarya183@gmail.com

The role of artificial intelligence (AI) in global healthcare is increasingly important in the context of the "United Nations Sustainable Development Goals" (SDGs) and the vision "Viksit Bharat 2047". AI presents a transformative tool and significant opportunities for enhancing healthcare delivery systems by improving access, equity, and efficiency. AI and digital technologies can significantly contribute to achieving Sustainable Development Goals 3, 9, 12, and 17 related to health. The ongoing digital transformation presents opportunities for integrating new technologies and AI to address health challenges, particularly drug discovery and design through molecular screening, nano-drug design and virtual screening, pre-clinical development, and clinical trials etc. The key areas can be marked as drug discovery and development, supply chain optimisation, waste reduction, and access to healthcare. AI technologies, such as machine learning, deep learning, natural language processing, robotics, automation, and predictive analytics, can be a game-changer in the pharma industry in many ways. AI-based molecular modelling and predictive algorithms shorten the traditional drug discovery process by simulating molecular interactions, identifying potential drug compounds, reducing trial-and-error methods, enhancing innovation and improving global health outcomes. AI-driven process optimisation in pharmaceutical manufacturing enhances efficiency, reduces waste, and shields quality control. Predictive analytics detect production line deviations, reducing errors and recalls, aligning with SDGs 9 and 12. AI plays a key role in healthcare delivery systems, from chatbots assisting patients with medical queries to AI-supported diagnostic imaging tools detecting diseases at early stages. These applications increase access to affordable and timely care. AI also recommends that policymakers facilitate knowledge transfer and technology, signifying digital learning platforms to improve health literacy and training for healthcare staff.

**AI-DRIVEN BIOMARKER DISCOVERY FOR PRECISION TOXICOLOGY**

Thaneshwari pittala, SK Sushma taj
Department of Pharmaceutical Sciences, Joginpally B R pharmacy college Yenkapally, Moinabad, Hyderabad - 500075.
thaneshwari.p2003@gmail.com

Introduction: Early and accurate prediction of drug toxicity remains a critical challenge in preclinical and clinical development, contributing to high attrition rates and adverse patient outcomes. Conventional toxicological assessments often fail to capture the complex biological mechanisms underlying variability in drug response. Artificial intelligence (AI) provides powerful tools for analyzing multi-omics datasets to uncover predictive biomarkers. This study explores machine learning (ML) and deep learning (DL) approaches for identifying genetic, proteomic, and metabolomic biomarkers in precision toxicology. Methods: A comprehensive multi-omics dataset—including genomic variants, proteomic expression profiles, and metabolomic signatures—was curated from public repositories and toxicology consortia. Data preprocessing involved normalization, feature selection, and dimensionality reduction. Supervised ML models (random forests, support vector machines) and DL architectures (convolutional and recurrent neural networks) were trained and validated using cross-validation and independent test cohorts. Explainable AI techniques, including Shapley Additive Explanations (SHAP), were applied to identify biologically relevant features. Results: The models successfully identified panels of candidate biomarkers predictive of toxicity across multiple drug classes. Genomic variants correlated with hepatotoxicity, proteomic signatures indicated cardiotoxicity, and metabolomic alterations predicted nephrotoxicity. Integration of multi-omics features enhanced predictive accuracy and generalizability compared with single-omics approaches. Conclusion: AI-driven biomarker discovery demonstrates strong potential to transform precision toxicology by enabling earlier and more reliable toxicity prediction. This approach can lower drug development costs, improve patient safety, and accelerate the design of safer therapeutics.

**Keywords:** Precision toxicology; Biomarker discovery; Machine learning; Deep learning; Multi-omics; Drug safety.

**AI-230**

**Multi-Objective Optimization (MOO) In Generative AI For Effective Nanoparticle-Based Formulation And Design**

Nishant B. Awandekar, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur-441002
nishant.awandekar@gmail.com

Nanoparticle-based systems are central to next-generation drug delivery, diagnostics, and therapeutic platforms. The development of high-

ISBN: 978-81-980623-8-3

performing nanoparticles (NPs) for targeted drug delivery is fundamentally limited by the requirement to simultaneously optimize multiple, often conflicting, critical quality attributes (CQAs). For example, achieving high drug loading capacity frequently compromises colloidal stability, while controlling hydrodynamic diameter to ensure effective biodistribution may reduce synthesis yield. Traditional empirical and single-objective computational screening methods may be inefficient at navigating this vast, multi-dimensional formulation space. Multi-Objective Optimization (MOO) in generative Artificial Intelligence (AI) may reshape this landscape by enabling simultaneous optimization across critical, and often competing, factors such as particle size, stability, drug loading, biocompatibility, release kinetics etc. Generative models—ranging from Variational Autoencoders and Adversarial Networks to transformer-based architectures—can be integrated with MOO strategies, such as Pareto Front Analysis, Reinforcement Learning, and Bayesian optimization, to rapidly navigate vast formulation spaces and generate the designs that are both functionally robust and practically manufacturable. Importantly, this framework can incorporate regulatory, scalability, and cost considerations at early stages, thereby aligning innovation with translational feasibility. By reducing dependence on extensive wet-lab iterations, MOO-driven generative AI has the potential to significantly accelerate discovery timelines, lower development costs, and expand the range of viable nanoparticle platforms. The application of MOO-driven generative AI thus represents a shift from experimental-based formulation design toward a data-driven, adaptive, and scalable process. By bridging computational intelligence with nanoscience, this approach has the potential to shorten development cycles, minimize resource utilization, and unlock novel nanoparticle designs that were previously inaccessible through conventional methods.

**Keywords:** Nanoparticles, Multi-Objective Optimization, Artificial Intelligence, Critical Quality Attributes.

**AI-231**

**Integration Of Multi-Omics And Artificial Intelligence To Uncover Mechanisms Of Drug Resistance**

Thaneshwari pittala, SK Sushma taj
Department of Pharmaceutical Sciences, Joginpally B R pharmacy college Yenkapally, Moinabad, Hyderabad - 500075.
thaneshwari.p2003@gmail.com

Introduction: Drug resistance remains a major barrier to effective treatment in oncology and infectious diseases, leading to therapeutic failure and poor patient outcomes. Traditional single-omic approaches provide partial insights but often fail to capture the complexity of resistance mechanisms. Integrating multi-omics data—including genomics, transcriptomics, proteomics, and metabolomics—offers a holistic view of biological systems. However, the vast dimensionality and heterogeneity of these datasets require advanced computational strategies. Artificial intelligence (AI), particularly machine learning and deep learning, provides powerful tools to analyze and integrate multi-omics data, enabling the discovery of novel resistance pathways and predictive biomarkers. Methods: We systematically integrated multi-omics datasets from cancer cell lines and microbial isolates with documented drug response profiles. Data harmonization was achieved through standardized preprocessing pipelines, followed by dimensionality reduction using autoencoders. AI models, including random forests and deep neural networks, were trained to identify patterns correlating with resistance phenotypes. Network-based analyses were applied to map interactions across omics layers. Results: The integrative AI-driven framework successfully identified multi-layered signatures of resistance. Key findings included genomic mutations in drug target genes, transcriptomic reprogramming of survival pathways, and metabolomic shifts supporting adaptive phenotypes. Cross-validation confirmed robust predictive performance, with improved accuracy compared to single-omic models. Pathway analysis revealed novel resistance-associated networks, including metabolic rewiring and epigenetic regulation. Conclusion: This study demonstrates that AI-enabled multi-omics integration provides mechanistic insights into drug resistance and identifies predictive biomarkers for therapy response.

**Keywords:** Multi-omics integration, artificial intelligence, drug resistance, machine learning, precision medicine, biomarkers.

**ARTIFICIAL INTELLIGENCE IN CLINICAL PHARMACY: ENHANCING DRUG SAFETY, ADHERENCE,AND PATIENT –CENTERED CARE**

M.Rishi Vardhana Rao, A.Sony Priyanka
Department of Pharmacy Practice, ASN Pharmacy College, Tenali, Guntur District, Andhra Pradesh, India – 522201
roonie576@gmail.com

Artificial Intelligence (AI) rapidly transforms clinical pharmacy by enhancing the drug safety, medication adherence, and patient-centered care. This topic explores the application of AI in clinical pharmacy and its potential to revolutionize the pharmacy practices by improving the patient outcomes. It highlights the AI-driven innovations in drug safety through predictive analytics for adverse drug event detection and prevention and advancements in pharmacovigilance. Additionally, AI's role is to optimize the medication adherence through personalised strategies, reminders, and digital tools is discussed, emphasizing the importance of improving patient compliance for better therapeutic outcomes. The integration of AI into patient-centered care is to examine, while focusing on personalized medicine, clinical decision support, and AI-powered patient engagement tools that improve counselling and patient monitoring. Despite the promising benefits, challenges such as regulatory, ethical, and technological barriers to AI adoption in clinical pharmacy are addressed. Finally, the topic provides recommendations for the future integration of AI into clinical pharmacy, which emphasizes the need for clear regulatory frameworks, ethical guidelines, and technological advancements to ensure safe, effective and equitable implementation.

**AI-INTEGRATED, SENSOR-ENABLED LIVER-ON-CHIP FOR REAL-TIME DRUG-INDUCED LIVER INJURY (DILI) AND ADME PROFILING**

Venkata Sharmila Koppara, Pedapudi Prasanna Kumar, Prasanthi Karneddi.
Vignan Institute of pharmaceutical Technology,Vishakapatnam, Andhra Pradesh-530046, India.
sharmisaranya05@gmail.com

Background: The liver governs drug metabolism, yet animals and 2D cell cultures often mis predict human liver toxicity. Liver-on-chip systems replicate sinusoidal structure, spatial zonation, multicellular cross-talk, and gentle perfusion to improve disease models, metabolism studies, and safety testing. Methods: This synthesis compares device classes (patterned 2D co-cultures, matrix-free spheroids, matrix-embedded 3D constructs), biomaterials, and cell sources (primary and iPSC-derived hepatocytes plus endothelial, stellate, and Kupffer cells). It evaluates oxygen/zonation control, multi-organ couplings for first-pass ADME, and embedded optical/electrochemical sensors against benchmarks (albumin/urea, phase I/II metabolism, bile canaliculi, inflammatory/fibrotic responses, functional longevity, and clinical concordance). Results: Perfusion with tailored extracellular matrix and non-parenchymal cells preserved differentiated hepatocyte function for weeks, restored paracrine and immune signalling, and increased sensitivity to drug-induced liver injury and drug–drug interactions. Integrated sensors enabled real-time tracking of oxygen, glucose, lactate, albumin, and redox state for kinetic toxicity profiling. Platforms recapitulated NAFLD/NASH, alcoholic injury, viral hepatitis, tumour–liver interfaces, and gut–liver first-pass metabolism; remaining gaps include bile-excretory modelling, small-molecule sorption by polymers, scalable oxygen-gradient control, iPSC immaturity, and limited standardization. Conclusion: Advances in vascularization and zonation control, engineered matrices, immune-competent co-cultures, patient-specific organoids, and multimodal analytics can reduce animal use and improve clinical predictivity, provided harmonized protocols, reference compounds, scalable manufacturing, and prospective validation are adopted.

**"AI-DRIVEN PHARMACOLOGY: ACCELERATING DRUG DISCOVERY FROM MOLECULE TO MECHANISM"**

ISBN: 978-81-980623-8-3

Namrata Kushwaha and Seemu Singh, Sonam Chaturvedi
Sri Aurobindo Institute of Pharmacy, Indore, Madhya Pradesh, India - 453555
namrata.kushwaha@saip.ac.in

The integration of Artificial Intelligence (AI) into pharmacology is rapidly transforming the drug discovery landscape by enabling more efficient and accurate prediction of drug behavior from the molecular level to therapeutic mechanisms. Traditional drug development pipelines face significant challenges, including high costs, long timelines, and a high rate of late-stage failures. AI offers a promising solution by augmenting each stage of the pharmacological workflow—from molecular design and target identification to pharmacokinetic/pharmacodynamic (PK/PD) modeling and mechanism-of-action prediction. This study explores the application of machine learning and deep learning models in key areas such as virtual screening, de novo drug design, ADMET prediction, and systems pharmacology. We highlight the role of AI in integrating diverse data sources—including chemical structures, biological assays, genomics, and real-world data—to identify lead compounds with higher success potential. Additionally, we discuss how AI algorithms are being used to simulate drug-target interactions, predict side effect profiles, and uncover underlying molecular mechanisms that drive therapeutic or adverse outcomes. AI-driven pharmacology not only accelerates the pace of drug discovery but also enhances the accuracy and reliability of early-stage decision-making. This poster underscores the potential of AI to bridge the gap between chemistry and pharmacology, paving the way for faster, safer, and more personalized drug development.

**Keywords:** Artificial Intelligence (AI), Drug Discovery, Machine Learning, Molecular Modeling, Target Prediction.

**AI-235**

## AI-DRIVEN INNOVATIONS IN CLINICAL PHARMACY FOR ENHANCING DRUG SAFETY, COMPLIANCE AND INDIVIDUALIZED PATIENT CARE.

Sonam Chaturvedi, Namrata Kushwaha, Seemu Singh, Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore (M.P.) 453555
sonam.chaturvedi@saip.ac.in

Artificial intelligence (AI) is increasingly shaping healthcare, and its application in clinical pharmacy provides opportunities to improve medication safety, promote compliance, and deliver individualized care. With rising therapeutic complexity and polypharmacy, clinical pharmacists face growing challenges that AI tools such as machine learning, predictive analytics, and natural language processing can help address.A narrative review was conducted using PubMed, Scopus, and Google Scholar to identify publications from 2015–2025. Keywords included artificial intelligence, clinical pharmacy, drug safety, medication compliance, individualized care, and pharmacogenomics. Relevant studies were analyzed to explore AI-driven innovations, their benefits, and implementation challenges in clinical pharmacy. Findings highlight three major areas of AI impact. First, in drug safety, AI-enabled clinical decision support systems reduce prescription errors, predict adverse drug reactions, and assist with precision dosing using pharmacogenomic insights. Second, in medication compliance, AI-powered smart devices, mobile health applications, and predictive models identify non-adherent patients and enable timely interventions. Third, in individualized care, AI supports personalized therapy, automates routine processes, and facilitates patient counselling through virtual assistants. Collectively, these applications enhance pharmacist efficiency, patient engagement, and treatment outcomes.

AI offers transformative potential in clinical pharmacy by enhancing safety, improving compliance, and supporting individualized patient care. Addressing challenges such as data privacy, algorithmic bias, and interoperability is essential for sustainable integration. With appropriate adoption, AI can complement clinical pharmacists and contribute significantly to precision medicine and patient-centered healthcare.

**Keywords:** Artificial intelligence, Clinical pharmacy, Drug safety, Medication compliance, Pharmacogenomics, Individualized care, Precision medicine.

**AI-236**

## ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING IN PHARMACEUTICAL SCIENCES: ADVANCES, CHALLENGES, AND CLINICAL IMPACT

Seemu Singh, Sonam Chaturvedi, Namrata Kushwaha, SunilKumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore (Madhya Pradesh), 453555
seemu.singh@saip.ac.in

Artificial intelligence (AI) and machine learning (ML) are revolutionizing the pharmaceutical sciences by providing powerful tools to accelerate drug discovery, optimize clinical development, streamline manufacturing, and strengthen pharmacovigilance. Recent research underscores this momentum: multi-agent large language model systems now simulate entire drug discovery pipelines (Pharm Agents, 2025); generative models such as IDO Lpro (2024) enable multi-objective molecular design balancing potency and synthetic feasibility; and AI methods are increasingly applied to pharmacovigilance, leveraging structured electronic health records and unstructured clinical text for adverse drug event detection. These innovations illustrate how AI/ML is rapidly advancing from experimental applications toward integration across the full medicinal product lifecycle. Alongside these scientific gains, regulatory oversight is becoming a critical focus. Authorities including the USFDA, EMA, MHRA, TGA, and WHO emphasize risk-based approaches to AI adoption, highlighting the need for transparency, robust data quality, lifecycle model management, human oversight, and mitigation of algorithmic bias. The USFDA's draft guidance on AI/ML for regulatory decision-making marks an important step in framing standards for safe and effective use in drug and biological product development. Persistent challenges include ensuring data integrity, improving model explainability, addressing bias, and harmonizing regulatory practices globally. Overcoming these barriers will require collaborative engagement between regulators, industry, academia, and civil society. In conclusion, AI and ML hold transformative potential to enhance efficiency, quality, and patient outcomes in pharmaceutical sciences. Their successful adoption depends on robust validation, ethical deployment, and globally aligned regulatory frameworks that foster both innovation and trustworthiness.

**Keywords:** Artificial Intelligence, Machine Learning, Pharmaceutical Sciences, Regulatory Frameworks, Drug Development, Pharmacovigilance.

## TRANSFORMING CLINICAL TRIAL MANAGEMENT WITH AI: SMARTER DECISIONS, FASTER OUTCOMES

Pavani Akkala
Pharmaceutical Management, A.S.N. Pharmacy College, Burripalem, Tenali, Guntur [Dt], Andhra Pradesh, India – 522201.
Pavaniakkala.1323@gmail.com

The integration of Artificial Intelligence (AI) into clinical trial management is reshaping the pharmaceutical landscape by enabling smarter decision-making and accelerating trial outcomes. Traditional clinical trials often face challenges such as high costs, complex protocols, recruitment delays, and data management inefficiencies. AI-driven technologies—including machine learning, predictive analytics, natural language processing, and real-world data integration—offer powerful solutions to overcome these barriers. By streamlining patient recruitment, enhancing protocol design, monitoring trial progress in real time, and improving risk assessment, AI ensures greater efficiency, accuracy, and compliance. Furthermore, AI supports adaptive trial designs and predictive modeling, allowing for faster identification of safety signals and efficacy trends. Ultimately, the use of AI in clinical trial management not only reduces timelines and costs but also empowers researchers, regulators, and sponsors to make informed, data-driven decisions that benefit patients. This transformation signifies a paradigm shift toward a more agile, efficient, and patient-centric drug development ecosystem.

**Keywords:** Clinical Trial Management, AI Machine Learning, Predictive Analytics, Protocol design adaptive Trials, Real-World Data Drug Development.

## EVALUATING AI-DRIVEN DRUG DISCOVERY IN POLYCYSTIC OVARIAN SYNDROME (PCOS) MANAGEMENT USING ANIMAL MODELS

Vijayanandhan V1, Agilandeswari Devarajan2
1Department of Pharmacognosy, MVM College of Pharmacy, Yelahanka, Bangalore - 560064

ISBN: 978-81-980623-8-3

2 Department of Pharmaceutics, MVM College of Pharmacy, Yelahanka, Bangalore – 560064
vijayanandhanvenkatesh@gmail.com

Polycystic Ovarian Syndrome (PCOS) affects 8-13% of women of reproductive age worldwide, highlighting the urgent necessity for novel therapeutic strategies. This study was the first to combine traditional animal model validation with computational methods driven by artificial intelligence to change the way drugs are found for PCOS. A complete AI pipeline that used machine learning algorithms like support vector machines, random forests, and deep neural networks was used to test large libraries of compounds against molecular targets linked to PCOS. Network pharmacology and molecular docking simulations identified lead compounds that target important pathways like insulin signaling, androgen metabolism, and inflammatory cascades. The AI algorithms accurately identified 15 new therapeutic candidates that had a strong binding affinity for PCOS-related targets like ESR1, PPARG, and CYP17A1. They were 98% accurate in predicting drug-target interactions. Subsequent validation employed established animal models, including letrozole-induced, dehydroepiandrosterone (DHEA)-induced, and prenatal androgen (PNA) exposure PCOS models in rodents. In vivo studies demonstrated that AI-identified compounds markedly reestablished hormonal equilibrium, characterized by diminished luteinizing hormone and testosterone levels, normalized estrous cyclicity, and enhanced ovarian morphology relative to conventional treatments. Metabolic parameters, such as insulin resistance markers and lipid profiles, showed significant improvement, confirming the predictions made by computers. Combining AI-driven drug discovery with strict animal model validation creates a new way to treat endocrine disorders. This speeds up the development process and makes it easier to find the right therapeutic targets.

**Keywords:** Artificial Intelligence, Drug Discovery, Polycystic Ovarian Syndrome, Animal Models, Machine Learning, Computational Pharmacology, Network Pharmacology, Molecular Docking, Preclinical Validation.

**AI-239**

## MINIMALLY INVASIVE AND DIGITAL SOLUTIONS ENHANCING OUTCOME IN PCOD TREATMENT

Thallapudi Sravanthi D.Uma Sankar, T.Hemani, S.Udaya Lakshmi
Bhaskara Institue Of Pharmacy, Komatipalli Village, Bobbili, Vizianagaram, Affiliated By Andhra University
India-535558
tsravanthi611@gmail.com

Polycystic Ovary Disease (PCOD) is a prevalent endocrine disorder that affects reproductive, metabolic, and hormonal health in women. Traditional approaches to diagnosis and treatment have often been limited by delayed detection and generalized treatment plans. However, recent advancements in minimally invasive techniques and digital healthcare solutions are transforming PCOD management, offering improved outcomes and patient-centric care. Minimally invasive surgical techniques, particularly robotic-assisted ovarian drilling, provide greater precision with fewer complications, reduced recovery times, and minimal scarring. These approaches are especially beneficial for women who are resistant to medical therapy and seek fertility restoration. On the digital front, advanced imaging technologies like 3D ultrasonography and high-frequency transvaginal imaging allow for accurate ovarian assessment, enabling early and more reliable diagnosis. Artificial Intelligence (AI) is also playing a critical role by analyzing hormonal profiles, ultrasound data, and patient history to detect PCOD patterns and support personalized treatment strategies. Telemedicine platforms further enhance care by providing remote consultations, continuous monitoring of metabolic parameters, and timely treatment adjustments, making specialized care accessible even in underserved regions. Additionally, nanotechnology-based drug delivery systems enable targeted therapy, improving drug efficacy while reducing side effects. These innovations collectively shift the focus from symptom management to a more comprehensive, root-cause-driven approach. By integrating minimally invasive procedures with digital health technologies, PCOD treatment becomes more precise, accessible, and effective—ultimately improving the quality of life and long-term outcomes for affected women.

**Keywords:** Polycystic Ovary Disease (PCOD), 3D Ultrasonography Transvaginal Imaging, Artificial Intelligence (AI), Personalized Treatment, Robotic-Assisted Surgery.

**AI-240**

## "AI IN PHARMA: CHALLENGE, OPPORTUNITIES, BREAKTHROUGH"

Ritika chhajed, Namrata Kushwaha, Sunil Kumar Dwivedi
Sri Aurobindo Institute of pharmacy Indore, Madhya Pradesh, India-453555
ritikachhajed1400@gmail.com

Artificial Intelligence (AI) is quickly revolutionizing the pharmaceutical sector with data-driven drug discovery, clinical trials optimization, and personalized medicine. AI-driven platforms are capable of examining enormous biological datasets, foreseeing molecular interactions, and speeding up the identification of potential new drug candidates, drastically cutting costs and timelines for research. Yet, issues including data privacy, compliance with regulations, few high-quality datasets, and concerns about transparency and bias present huge hurdles. Pharma integration with AI also requires skilled manpower and strong infrastructure, which are still in the making in most parts of the world. In the face of these challenges, the potential remains huge. AI has the capability to enhance accuracy of drug design, enhance adverse effect prediction, and optimize patient recruitment in trials. Further, advances in generative AI, quantum computing, and multi-omics integration are creating new avenues for precision therapeutics and rare disease research. Strategic partnerships among technology firms, academia, and pharma companies are also boosting innovation. As AI keeps evolving, the convergence of AI with biotechnology and digital health can bring a revolution in pharma research and healthcare delivery by making treatments more effective, cost-friendly, and patient-focused. Challenges will be overcome by regulatory regimes, ethical practices, and inter-disciplinary cooperation to unlock the transformational power of AI in pharma.

**Keywords:** Artificial Intelligence, Pharma, Drug Discovery, Clinical Trials, Precision Medicine, Data Challenges, Breakthroughs, Opportunities.

## AI-DRIVEN PHARMACOVIGILANCE IN PSYCHIATRY: DETECTING ADRS OF ANTIDEPRESSANTS AND ANTIPSYCHOTICS IN REAL TIME

BOLLAM PRINCE
Vision college of Pharmaceutical Sciences & Research

Psychiatric medications such as antidepressants and antipsychotics are associated with a wide range of adverse drug reactions (ADRs), including metabolic disturbances, extrapyramidal symptoms, QT prolongation, and suicidality risks. Underreporting of ADRs in psychiatry is common due to patient stigma, cognitive impairment, and delayed symptom recognition. With the rapid integration of Artificial Intelligence (AI) into healthcare, there is an emerging opportunity to strengthen pharmacovigilance practices in psychiatry for real-time ADR detection and improved patient safety. To explore the role of AI-driven systems in enhancing ADR detection, monitoring, and reporting of psychiatric medications. A narrative review was conducted using PubMed, Scopus, and WHO-UMC databases. Literature from 2015–2025 was screened for studies applying AI, machine learning, and natural language processing (NLP) in pharmacovigilance. Key focus areas included AI-enabled electronic health record (EHR) mining, social media monitoring, and predictive algorithms for ADR detection in psychiatric drugs. AI-based models demonstrated higher sensitivity in detecting ADRs compared to traditional methods. NLP algorithms effectively identified ADRs related to antidepressants and antipsychotics from unstructured clinical notes. Machine learning tools enabled prediction of high-risk patients for metabolic syndrome and EPS, facilitating early interventions. Social media mining provided additional insights into underreported ADRs such as emotional blunting and sexual dysfunction. Integration of AI with national programs like Pv PI has the potential to bridge underreporting gaps and provide real-time pharmacovigilance in psychiatry. AI-driven pharmacovigilance offers a transformative approach in psychiatry, enabling proactive detection of ADRs, reducing underreporting, and enhancing patient safety. Future integration of AI with routine psychiatric care could empower clinicians and pharmacists to provide more personalized and safer treatment strategies

**THE ROLE OF ARTIFICIAL INTELLIGENCE IN PHARMACOGENOMICS AND PERSONALIZED MEDICINE EDUCATION**

A.Roshini, B.Swathi, B.Mani, R.Divya
Bhaskara Institute of Pharmacy, Komatipalli Village, Bobbili
Affiliated by Andhra University,
India-535558
roshini.akkena@gmail.com

Artificial intelligence (AI) is rapidly emerging as a transformative tool in pharmacogenomics and personalized medicine education. AI can help with clinical decision-making, enhance the interpretation of complicated genomic data, and speed up the identification of gene–drug interactions by utilizing machine learning, natural language processing, and predictive analytics. In education, AI-driven platforms offer interactive learning modules, adaptive assessments, and virtual simulations that enhance understanding of pharmacogenomic principles among healthcare professionals and students. These technologies not only simplify the integration of genetic data into clinical contexts but also allow learners to engage with real-world case scenarios in a dynamic and personalized manner. Additionally, AI makes it possible to create intelligent decision-support systems that are integrated into electronic health records and help physicians apply pharmacogenomic knowledge to patient treatment. Furthermore, by customizing information for each student, AI-based training technologies can close knowledge gaps and foster proficiency in a variety of healthcare environments. Notwithstanding its potential, issues like algorithm openness, moral dilemmas, data privacy, and fair access must yet be resolved. By utilizing AI in pharmacogenomics education, the next generation of medical professionals can be empowered, promoting safe, evidence-based medication therapy globally and guaranteeing the successful implementation of customized medicine.

**"PERSONALIZED MEDICINE POWERED BY AI: A NEW ERA IN PHARMA"**

Megha salunke, Namrata kushwaha, Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore, Madhya Pradesh india-453555
Meghasalunke610@gmail.com

The inclusion of Artificial Intelligence (AI) is inherently revolutionizing the landscape of the pharmaceutical sector and evolving a new paradigm of personalized medicine (PM). Conventional drug development is expensive and time-consuming, with prevalent reliance on the "one-size-fits-all" strategy for treatment. AI, which includes Machine Learning (ML) and Deep Learning (DL), benefits from the exponential expansion of big data—genomic, clinical, lifestyle, and real-world evidence—to design more customized therapeutic approaches. AI algorithms are particularly good at inspecting large, intricate datasets for subtle patterns and biomarkers of disease risk, optimal drug targets, and individual patient responses. The ability to do this is transforming drug discovery by streamlining virtual screening and molecular design and significantly accelerating target identification through clinical candidate selection. In addition, AI optimizes clinical trial design, patient stratification, and real-time monitoring, making clinical trials more efficient and ethical. In the clinical setting, precision diagnostics and pharmacogenomics with AI-enabled tools enable clinicians to choose the best type and dosage of drug, reducing side effects and enhancing therapeutic responses, especially in such challenging areas as oncology. Despite its immense promise, the adoption of AI in personalized medicine faces challenges related to data quality, security, regulatory frameworks, and addressing algorithmic bias to ensure equitable healthcare. Future progress requires rigorous validation, ethical oversight, and interdisciplinary collaboration to fully realize the potential of AI to deliver truly personalized and effective patient care.

**Keywords:** Artificial Intelligence (AI), Precision Medicine, Personalized Medicine, Pharmaceutical Industry, Drug Discovery, Machine Learning, Deep Learning, Genomics, Clinical Trials, Pharmacogenomics.

**"THE ROLE OF ARTIFICIAL INTELLIGENCE IN THE FUTURE OF PHARMACEUTICALS"**

Bhumika Nimjhe, Namrata Kushwaha, Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore Madhya Pradesh, India - 453555
bhumikanimjhe@gmail.com

By speeding up innovation and changing each phase of the drug lifecycle, artificial intelligence (AI) is completely changing the pharmaceutical sector. AI-driven technologies are opening up previously unheard-of possibilities to increase productivity, cut expenses, and improve patient outcomes in everything from early-stage drug discovery to post-market surveillance. Drug development failure rates have historically been high, but machine learning algorithms, predictive modeling, and big data analytics are helping researchers find new drug candidates more quickly and precisely. AI improves reliability and safety in clinical trials by streamlining patient recruitment, streamlining trial design, and guaranteeing real-time monitoring. Additionally, by evaluating genetic, clinical, and lifestyle data to customize treatments for specific patients, AI is assisting personalized medicine. In supply chain management and manufacturing AI ensures reliable delivery of safe medications by improving productivity, quality assurance, and predictive maintenance. By identifying negative drug reactions and tracking long-term drug safety using empirical data, artificial intelligence (AI) supports pharmacovigilance after the product is marketed. Additionally, platforms driven by artificial intelligence (AI) and natural language processing (NLP) are revolutionizing regulatory affairs, medical education, and decision-making throughout the pharmaceutical industry. Notwithstanding its enormous potential, there are still issues like data privacy, ethical concerns, system integration, and the demand for qualified personnel. But AI is poised to be a key component of pharmaceuticals' future with responsible application and ongoing development, propelling a paradigm shift toward creativity, accuracy, and patient-centered care.

**Keywords:** Artificial Intelligence, Pharmaceuticals, Drug Discovery, Clinical Trials, Personalized Medicine, Pharmacovigilance, Big Data, Machine Learning, Healthcare Innovation, Patient-Centric Care.

**AI-POWERED PHARMACOVIGILANCE AND CLINICAL TRIALS: BRIDGING INNOVATION WITH SUSTAINABLE HEALTHCARE**

Neetesh K Jain[1], Ankur Joshi[1], Sapna Malviya[1], Anil Kharia[1]
[1]Modern Institute of Pharmaceutical Sciences Indore, Madhya Pradesh -India
drnkjain9781@gmail.com

Artificial Intelligence (AI) has emerged as a transformative force in clinical trials and pharmacovigilance, addressing key limitations of conventional approaches such as prolonged timelines, high attrition rates, and resource-intensive safety monitoring. This study employed a mixed-method research framework involving systematic literature review (2015–2025) of peer-reviewed articles, case studies of AI applications in global trials, and meta-analysis of secondary datasets from regulatory and pharmacovigilance repositories. AI models, including machine learning, natural language processing, and generative AI, were evaluated for predictive modelling, adverse event detection, and real-time trial monitoring. Tools such as digital twins, wearable devices, Internet of Medical Things (IoMT), and blockchain-enabled platforms were assessed for their role in enhancing trial efficiency and ensuring transparent, secure data management. Findings demonstrate that AI-powered analytics improved adverse drug reaction prediction accuracy by up to 38% compared to conventional models. Implementation of digital twins and IoMT reduced trial completion timelines by approximately 27%, while blockchain-based systems enhanced data security and regulatory compliance. Cloud-based AI platforms further streamlined reporting processes, reducing manual effort by nearly 42%. Collectively, these interventions supported cost-effectiveness, minimized bias, and promoted environmentally sustainable practices in drug development. Integration of advanced AI technologies is shifting pharmacovigilance and clinical trials from reactive to predictive frameworks. By enhancing efficiency, precision, and inclusivity, AI fosters sustainable healthcare systems capable of delivering safer therapies with reduced ecological footprint.

**Keywords**: Artificial Intelligence, Clinical Trials, Pharmacovigilance,

**"INNOVATIVE NEUROLOGICAL DISORDER DETECTION DEVICE: ADVANCING EARLY DIAGNOSIS AND PERSONALIZED HEALTHCARE THROUGH CUTTING-EDGE SENSOR TECHNOLOGY AND MACHINE LEARNING ALGORITHMS"**

Naveen Kumar Choudhary, Rekha Pathak
Faculty Of Pharmacy, Mandsaur Institute Of Pharmacy, Mandsaur University, Mandsaur, Madhya Pradesh, India.

Neurological disorders represent a significant global health challenge, often detected only at advanced stages due to the limitations of conventional diagnostic tools. Early identification is critical for improving patient outcomes, enabling timely interventions, and reducing the overall healthcare burden. To address this gap, we propose an Innovative Neurological Disorder Detection Device that integrates advanced biosensor technology with machine learning algorithms to provide accurate, non-invasive, and real-time diagnosis. The device employs multimodal biosensors capable of detecting subtle physiological and biochemical variations associated with the early onset of neurological dysfunctions. These data are analyzed using optimized machine learning models that enhance sensitivity, ensure reliable pattern recognition, and generate patient-specific risk profiles. Unlike standard diagnostic approaches, the system emphasizes personalized healthcare, offering continuous monitoring and adaptability to individual needs. Preliminary evaluations suggest the device can identify early biomarkers of neurodegenerative and neurological conditions with higher precision compared to existing methodologies. Its portability, cost-effectiveness, and suitability for both clinical and remote healthcare environments make it highly scalable. By combining sensor-driven data acquisition with artificial intelligence, the device bridges the gap between traditional diagnostics and next-generation healthcare technologies. This innovation demonstrates strong potential to transform the landscape of neurological disorder management by advancing early diagnosis, promoting precision medicine, and improving accessibility to patient-centered care worldwide.

**ARTIFICIAL INTELLIGENCE IN PHARMACY**

Swarangi Karangale,. Niya Catherine Binoy, Arshita Kumari, Swarangi Karangale, Sunil Kumar Dwivedi
Department of Pharmacology, Sri Aurobindo Institue of Pharmacy, Indore, MP-453555
swarangi.karangale@saip.ac.in

Artificial Intelligence (AI) is rapidly transforming the field of pharmacy by enhancing drug discovery, personalized medicine, clinical decision-making, and pharmacy operations. This poster explores the integration of AI technologies—such as machine learning, natural language processing, and predictive analytics—in various aspects of pharmacy practice. AI-driven tools enable accelerated identification of novel drug candidates, optimize dosage regimens tailored to individual patient profiles, and improve medication adherence through intelligent monitoring systems. Furthermore, AI facilitates efficient inventory management and pharmacovigilance by predicting drug demand and detecting adverse drug reactions early. As pharmacy evolves towards precision healthcare, AI serves as a critical enabler for improving therapeutic outcomes and operational efficiency. Challenges such as data privacy, ethical considerations, and the need for interdisciplinary collaboration are also addressed. This presentation aims to provide insights into current AI applications and future prospects within pharmacy education, research, and clinical practice.

**Keywords:** Artificial Intelligence, Pharmacy, Drug Discovery, Personalized Medicine, Machine Learning, Pharmacovigilance, Predictive Analytics, Precision Healthcare, Medication Adherence, Clinical Decision Support.

**AI-248**

**ARTIFICIAL INTELLIGENCE–DRIVEN EXPLORATION OF BOERHAVIA DIFFUSA IN RHEUMATOID ARTHRITIS: CURRENT EVIDENCE AND FUTURE DIRECTIONS**

Jyotsana Tumnia, Veena Devi SinghFaculty of Pharmacy, Shri Rawatpura Sarkar University, Raipur (C.G.) 492001
jyotsanatumnia@gmail.com

Rheumatoid arthritis (RA) is a chronic autoimmune disorder that primarily affects the joints, leading to pain, swelling and eventual joint destruction with unknown etiology. Bottom of Form Conventional treatments provide relief but are limited by incomplete response and adverse effects, creating a need for safe, multi-target alternatives. Boerhavia diffusa (Punarnava), a traditional herb, possesses anti-inflammatory and immunomodulatory phytoconstituents such as punarnavine, flavonoids, and rotenoids. This review aims to evaluate the therapeutic promise of B. diffusa in RA and explore the emerging role of artificial intelligence (AI) in accelerating its discovery, standardization, and clinical translation. Studies conducted between 2010 and 2024 were reviewed from PubMed, Scopus, Google Scholar, and Web of Science, focusing on pharmacological studies of B. diffusa, AI-driven drug discovery, and computational approaches in RA management. Preclinical investigations demonstrate significant attenuation of pro-inflammatory cytokine release, and oxidative stress in RA models treated with B. diffusa. In parallel, AI-based tools show promise in predicting therapeutic targets, optimizing extraction methods, and integrating data. Furthermore, AI can aid in identifying synergistic phytochemical interactions, formulating standardized transdermal or oral preparations, and advancing precision medicine by predicting patient-specific responses. The integration of B. diffusa pharmacology with AI analytics offers a novel, safe, and personalized therapeutic pathway for rheumatoid arthritis, bridging traditional herbal medicine with cutting-edge technology.

**Keywords:** Rheumatoid arthritis, Boerhavia diffusa, Artificial intelligence, Immunomodulation.

**AI-249**

**ARTIFICIAL INTELLIGENCE IN CARDIOVASCULAR PHARMACOLOGY: ADVANCING DRUG DISCOVERY AND PERSONALIZED THERAPY**

Gargi Kiranrao Makode, Mayur B. Kale, Nitu L. Wankhede, Sandip R. Rahangdale, Manish M. Aglawe, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra, 441002, India
gargimakode1692005@gmail.com

Cardiovascular diseases (CVDs) remain the leading cause of mortality worldwide, with therapeutic outcomes often limited by inter-individual variability, polypharmacy, and unpredictable drug responses. Traditional drug development and monitoring approaches are time-consuming and resource-intensive, posing challenges for rapid identification of effective cardiovascular therapies. Artificial intelligence (AI) has emerged as a transformative tool in cardiovascular pharmacology, offering predictive models for drug efficacy, safety, and patient-specific response. Machine learning algorithms and deep learning frameworks can analyze large-scale datasets from electronic health records, genomics, proteomics, and clinical trials to identify novel drug candidates, optimize dosing regimens, and predict adverse cardiovascular events. AI also enables the development of digital twins of the cardiovascular system, allowing virtual simulation of pharmacodynamic and pharmacokinetic responses in individual patients. Furthermore, AI-powered predictive analytics can support early detection of drug-induced cardiotoxicity, facilitating timely intervention and reducing adverse outcomes. By integrating AI into cardiovascular drug discovery and clinical management, researchers and clinicians can accelerate precision medicine, enhance patient safety, and improve therapeutic efficacy, ultimately transforming the landscape of cardiovascular healthcare.

**Keywords:** Artificial Intelligence, Cardiovascular Pharmacology, Drug Discovery, Precision Medicine, Predictive Analytics.

**AI-250**

**GREEN SYNTHESIS AND IN SILICO EVALUATION OF A NOVEL QUINAZOLINONE SCAFFOLD AS POTENTIAL LEAD AGAINST CANDIDIASIS**

Affan Ansari, Atharva Deshmane, Jayshree Patil
Anjuman-I-Islam's Kalsekar Technical Campus, School of Pharmacy, New Panvel, Navi Mumbai, Maharashtra 410206
affanansari9930@gmail.com

The discovery of new therapeutic agents by integrating sustainable synthetic strategies with modern computational approaches is rapidly

ISBN: 978-81-980623-8-3

emerging as promising approach. Quinazolin-4-one is recognized as versatile scaffold with diverse pharmacological activities. In the present work, 3-aminoquinazolinone were synthesized using a green, microwave-assisted synthetic approach producing higher yields, shorter reaction times, and reduced solvent consumption compared to conventional methods. The synthesis involves condensation of methyl anthranilate with acetic anhydride in the presence of pyridine, followed by treatment with hydrazine hydrate to yield 2-methyl-3-amino-4-quinazolinone. The synthesized compounds were purified and monitored by thin layer chromatography, while melting points were determined using the open-ended capillary tube method. Structural elucidation was confirmed through FT-IR, GC-MS, and NMR spectroscopy. In silico evaluation of synthesized molecule was performed against key antifungal targets (1IYK, 4HOE, 5V5Z) of *Candida albicans*—the causative pathogen of candidiasis, a life-threatening opportunistic fungal infection. The ligand showed moderate binding affinities (–6.7 to –6.8 kcal/mol) compared to the standard antifungal drug voriconazole (–6.9 to –7.7 kcal/mol). On further analysis, overlapping of amino acid residues with co-crystal ligands, confirm the correct orientation and competitive binding within active sites. This study highlights the successful integration of eco-friendly microwave synthesis with computational antifungal activity evaluation, indicating 3-amino-2-methylquinazolin-4-one as a potential lead scaffold for the development of novel antifungal agents against candidiasis.

**Keywords:** Quinazolinone, Microwave-assisted synthesis, Candidiasis, Molecular docking.

**AI-251**

**TRANSFORMING HEALTHCARE SUPPORT WITH WELLNESS AI: AN AI-DRIVEN MEDICAL CHATBOT**

Sonu Patel, Subodh S Satheesh
Department of Artificial Intelligence and Data Science in Healthcare, Institute of Health Management Research, Bangalore
Sonupatel17019@gmail.com

India continues to face significant healthcare challenges, particularly in rural and semi-urban areas where 65% of the population resides. The doctor-patient ratio is 1:1500, far below the WHO standard of 1:1000, leading to delayed treatment and reliance on unverified local advice. Limited health literacy, language barriers, and the lack of real-time emergency support further contribute to preventable complications and poor outcomes. To address these gaps, we developed WellnessAI, an AI-powered medical chatbot designed to deliver safe, reliable, and accessible healthcare support. The system is built on a prompt engineering framework and powered by the Google Gemini large language model, ensuring accurate, context-aware, and structured outputs. Users interact with the chatbot through WhatsApp, IVR, or mobile apps in Hindi, English, and regional languages using both voice and text. The chatbot integrates multiple modules: a symptom checker for guided triage, SOS emergency support with step-by-step instructions for six critical conditions (CPR, choking, bleeding, burns, fractures, and snake bites), a medical report simplifier that explains lab results and prescriptions in layman's terms, and a doctor/hospital locator powered by Google Maps and Just Dial APIs. To ensure accuracy and relevance, the system combines curated datasets with real-time web data extraction, using Beautiful Soup for static sources and Playwright for dynamic content. Structured JSON outputs provide interpretable and consistent responses, aligned with safety protocols. By merging domain-specific prompt engineering, real-time knowledge retrieval, and inclusive design, WellnessAI delivers a safer, smarter, and more accessible digital health solution for India's underserved communities.

**ARTIFICIAL INTELLIGENCE IN ADVERSE DRUG REACTION PREDICTION: A STEP TOWARDS SAFER PHARMACOVIGILANCE**

Kodali Hima Bindhu
Department of Pharmacy, A.S.N Pharmacy College

Background: Adverse drug reactions (ADRs) remain a major challenge in global healthcare, contributing to hospitalizations and patient morbidity. Traditional pharmacovigilance methods rely heavily on manual case reporting and signal detection, often leading to delays in recognizing potential risks. Artificial Intelligence (AI) offers new opportunities to predict ADRs by analyzing large and complex datasets more efficiently. Objectives: The aim of this study is to explore the application of AI and machine learning techniques in predicting ADRs, thereby improving patient safety and regulatory compliance. Methodology: A curated dataset of ADR case reports and electronic health records was analyzed using machine learning algorithms such as Random Forest, Support Vector Machines, and Neural Networks. Features including patient demographics, co-medications, and treatment history were used for model training. Performance was evaluated using accuracy, sensitivity, and specificity metrics. Results: AI-based models demonstrated an improved ability to detect potential ADR signals compared to traditional methods. The Random Forest model achieved 87% accuracy, while Neural Networks provided early identification of high-risk drug–patient combinations. This approach reduced the average detection time for safety signals by 40%. Conclusion: AI-driven pharmacovigilance systems can significantly enhance ADR prediction and signal detection. By enabling faster, data-driven insights, these technologies support proactive risk management and strengthen the overall safety monitoring framework.

**Keywords:** Pharmacovigilance, Artificial Intelligence, ADR Prediction, Machine Learning, Drug Safety.

**AI-253**

**APPLICATION OF ARTIFICIAL INTELLIGENCE IN THERAPEUTIC DECISION-MAKING: A SURVEY-BASED STUDY IN BENGALURU**

Ruhana, Shobha Rani R.H
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka, Bengaluru, Karnataka, India-56004
ruhana@adityapharmacy.in

Artificial intelligence (AI) has emerged as a valuable tool in optimizing therapeutic decision-making by supporting dose adjustments, drug interaction detection, and personalized treatment planning. The present study aimed to assess the awareness, attitudes, and acceptance of AI-based tools among clinicians and pharmacists in Bengaluru. A structured questionnaire was designed using Google Forms and distributed to healthcare professionals across tertiary hospitals between January and March 2025. The survey included sections on demographic information, familiarity with AI applications in healthcare, attitudes toward AI in clinical decision support, and responses to hypothetical case vignettes presenting AI-suggested regimens. A total of 210 responses were analyzed (54% physicians, 46% pharmacists; mean age 36.7 ± 7.9 years). Only 32% reported prior exposure to AI in healthcare, yet 68% expressed willingness to integrate AI into therapeutic decision-making. Case vignette analysis demonstrated 70% concordance with AI-suggested dose modifications, particularly in renal impairment and polypharmacy scenarios. Reported concerns included lack of transparency of algorithms (41%) and clinical accountability for adverse outcomes (29%). Younger clinicians and pharmacists showed higher acceptance compared to senior physicians ($p < 0.05$). Thus, the study concludes that healthcare professionals in Bengaluru demonstrate favorable attitudes toward AI adoption in therapeutic decision-making, although trust, transparency, and liability issues remain challenges. These findings highlight the need for pilot implementation and training programs to support AI integration in clinical practice.

**Keywords:** Artificial intelligence, therapeutic decision-making, clinical decision support, clinician perceptions.

**AI CHATBOTS AND VIRTUAL ASSISTANCE IN PHARMA**

Gavara Aparna, Swarna Latha Surakala
Department of Pharmacology, GITAM School of Pharmacy, GITAM (Deemed to be University) Visakhapatnam-530045, Andhra Pradesh, India.
agavara@student.gitam.edu

Artificial Intelligence (AI) is revolutionizing healthcare and the pharmaceutical sector, with chatbots and virtual assistants emerging as innovative tools to enhance patient care, streamline operations, and support research. In pharmacy practice, AI-driven chatbots provide real-time drug information, dosage reminders, adverse effect alerts, and patient counseling, thereby improving adherence and safety. Virtual

ISBN: 978-81-980623-8-3

assistants are being integrated into pharmacovigilance systems for adverse drug reaction (ADR) detection, monitoring, and reporting, significantly reducing manual workload and minimizing human error. In the industrial sector, AI-enabled assistants contribute to drug discovery, clinical trials, and regulatory documentation by accelerating data analysis and decision-making. Moreover, their role in consumer education ensures rational medicine use and combats issues such as antimicrobial resistance (AMR). Despite these advancements, challenges remain regarding data privacy, regulatory acceptance, ethical concerns, and the need for pharmacist training to effectively adopt AI tools. The future of pharmacy will likely witness a hybrid model where pharmacists collaborate with AI-based systems to deliver personalized care, enhance pharmacovigilance activities, and support public health initiatives. This highlights the growing significance of AI chatbots and virtual assistants in shaping modern pharmacy practice and industry, emphasizing their potential to complement the pharmacist's role rather than replace it.

**Keywords:** Artificial Intelligence, Chatbots, Virtual Assistants, Pharmacovigilance, Pharmacy Practice.

**AI-255**

**AI-BASED COMPUTATIONAL APPROACHES FOR TARGET IDENTIFICATION AND DRUG DISCOVERY IN RHEUMATOID ARTHRITIS**

Satyabhama Sahu, Veena Devi Singh
Faculty of Pharmacy Shri Rawatpura Sarkar University, Raipur (C.G.)
sahusatya0490@gmail.com

Rheumatoid arthritis (RA) is a chronic, systemic autoimmune disorder characterized by persistent joint inflammation, cartilage degradation, and progressive disability. Despite the availability of disease-modifying antirheumatic drugs (DMARDs) and biologics, such as incomplete therapeutic response, adverse effects, and drug resistance highlight the urgent need for novel therapeutic strategies. Artificial Intelligence (AI), integrated with in silico computational approaches, is using Artificial Intelligence to dramatically speed up and improve the process of finding and developing new medicine, prediction of bioactive compounds, and optimization of drug–protein interactions. This study provides, the methods used by AI such as machine learning (ML), deep learning (DL), and natural language processing (NLP) were applied to identify critical molecular targets implicated in RA pathogenesis, including TNF-α, IL-6, JAK/STAT, and NF-κB pathways. Computational modeling techniques, including molecular docking and virtual screening, were helped to evaluate natural and synthetic compounds against these validated targets. AI algorithms facilitated the prediction of pharmacokinetics (ADMET) and toxicity profiles, reducing experimental attrition rates. This review highlights how AI-based computational work flow accelerate target deorphanization, repurposing of existing drugs, and discovery of novel therapeutics for RA. The integration of AI with systems biology and chemical information not only enhances the accuracy of target identification but also significantly reduces time and cost in drug development. These approaches hold promise for the next generation of personalized and more effective RA therapies.

**Keywords:** Rheumatoid Arthritis, Artificial Intelligence, Drug Discovery, *In Silico* Molecular Docking, Machine Learning.

**AI-256**

**ARTIFICIAL INTELLIGENCE & DRUG DEVELOPMENT**

Naga Prathyusha
Department of Pharmaceutical Sciences, MAM College of Pharmacy,
Kesanupalli, AP, India-522601
nagaprathushagopu@gmail.com

Artificial intelligence (AI) is transforming the landscape of drug development by offering advanced computational approaches that enhance efficiency, accuracy, and innovation. Traditional drug discovery processes are time-consuming, costly, and often limited by high attrition rates. By integrating AI, researchers can accelerate target identification, optimize lead compounds, and predict drug–disease interactions with greater precision. Machine learning algorithms and deep neural networks enable the rapid analysis of complex biological data, including genomics, proteomics, and chemical libraries, thus uncovering patterns that are often beyond human capability. AI-driven predictive models reduce the dependency on extensive experimental trials by simulating pharmacokinetics, toxicity, and efficacy in silico, leading to improved candidate selection and reduced failure rates in clinical trials. Natural language processing tools further assist in mining vast scientific literature, clinical records, and patent databases, ensuring a comprehensive understanding of existing knowledge. Moreover, AI facilitates personalized medicine by tailoring therapies based on individual patient profiles, thereby improving therapeutic outcomes. Despite its potential, challenges remain, including data quality, interpretability of models, regulatory acceptance, and ethical considerations regarding patient data. Addressing these concerns requires collaborative efforts among researchers, clinicians, industry, and policymakers. Overall, the integration of AI into drug development holds significant promise in revolutionizing healthcare by accelerating discovery, lowering costs, and delivering safer and more effective therapies.

**Keywords:** Artificial Intelligence, Drug Discovery, Machine Learning, Predictive Modeling, Personalized Medication.

**TECH FOR TRASH: AI-ENABLED MEDICAL WASTE REUSE AND INFECTION SAFETY**

M.Durga susmitha , M. Prasad Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy,
Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
durgasusmitam@gmail.com

Medical waste poses a dual challenge to modern healthcare: it is both an environmental burden and a vector for hospital-acquired infections (HAIs). Current systems treat all waste as hazardous, leading to excessive disposal costs, carbon emissions, and occupational risks. Tech for Trash proposes a paradigm shift from the linear "use-and-dispose" model to an AI-enabled circular system that ensures infection safety and sustainable reuse. Leveraging computer vision, machine learning, hyperspectral imaging, and robotics, the system performs real-time smart sorting of waste into hazardous, recyclable, and general categories. Advanced sterilization—optimized through AI-controlled autoclaving, hydrogen peroxide vapor, or microwave-generated steam—guarantees pathogen elimination, while blockchain integration ensures traceability and regulatory compliance. This approach unlocks a reuse loop, where high-cost single-use medical devices can be safely reprocessed, and plastics/metals repurposed into new products, thereby reducing procurement needs and creating new revenue streams. Hospitals benefit from up to 50% reduction in disposal costs, enhanced infection control, and minimized carbon footprint. Moreover, AI-driven analytics provide actionable insights into waste generation patterns, supporting better procurement and sustainability strategies. Despite challenges—including regulatory barriers, upfront infrastructure costs, and cultural resistance—this model represents a transformative opportunity.

**Keywords**: Medical waste management, Artificial intelligence, Hospital-acquired infections, Smart sorting, Robotics, Sterilization, Blockchain, Circular economy, Sustainability, Healthcare innovation.

**AI-258**

**AI-POWERED MULTI-OMICS INTEGRATION TO IDENTIFY SHARED BIOMARKER SIGNATURES IN CVD, ALZHEIMER'S, AND PARKINSON'S: A COHORT STUDY**

Y. Shrivastav, J Shah, N. Manocha
Indore Institute of Pharmacy, Indore, Madhya Pradesh -453331
yashashwishrivastav@gmail.com

Cardiovascular Disease (CVD) and neurodegenerative disorders, including Alzheimer's disease (AD) and Parkinson's disease (PD), represent a significant global health burden, often exhibiting overlapping molecular and metabolic alterations. Despite advances in individual disease biomarker research, the shared pathophysiological mechanisms connecting CVD with neurodegeneration remain underexplored. This study leverages AI-driven multi-omics integration, encompassing genomics, transcriptomics, proteomics, and metabolomics, to systematically identify convergent biomarker signatures across these conditions. By applying machine learning algorithms and network-based analyses, we delineate common molecular pathways, including inflammation, oxidative stress, mitochondrial dysfunction, and lipid metabolism dysregulation, which may underlie both cardiovascular and neurodegenerative pathologies. Our integrative approach uncovers

ISBN: 978-81-980623-8-3

novel candidate biomarkers with potential predictive and therapeutic relevance, offering insights into early detection and risk stratification. Furthermore, AI-based models demonstrate superior capability in predicting disease onset and progression by harnessing high-dimensional multi-omics datasets.

Integration of single-cell omics, spatial transcriptomics, and real-world patient data can refine biomarker specificity. AI-guided multi-modal models could inform personalized therapeutic interventions, bridging cardiovascular and neurodegenerative disease management. Additionally, exploring epigenetic and microbiome interactions may reveal novel mechanistic links and therapeutic targets.

**Keywords:** Cardiovascular Disease, Alzheimer's Disease, Parkinson's Disease, Multi-Omics Integration, AI, Biomarkers.

**AI-259**

**ARTIFICIAL INTELLIGENCE (AI) - AIDED ADAPTIVE HEART: TOWARD PREDICTIVE CARDIAC CARE**

Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili
Affiliated By Andhara University India -535558
K.Neelima, K.Hymavathi, G.Gayatri, C. Krishnaveni
kilaparthihema168@gmail.com

The development of artificial hearts has long aimed to provide viable alternatives for patients with end-stage heart failure who are ineligible for transplantation. While early devices, such as the AbioCor total artificial heart, demonstrated the feasibility of fully implantable circulatory support, challenges related to biocompatibility, size, energy efficiency, and adaptability limited their widespread use. Recent advances in artificial intelligence (AI), biomedical engineering, and materials science present new opportunities to overcome these barriers. This paper proposes the concept of an artificial intelligence (AI) integrated artificial heart capable of real-time physiological adaptation. Using machine learning algorithms, the device would continuously monitor patient-specific parameters including blood pressure, cardiac output, oxygen saturation, and activity levels, adjusting pumping rates and stroke volume to closely replicate natural cardiac dynamics. Predictive artificial intelligence models could anticipate fluctuations due to stress, exercise, or circadian rhythms, thereby enhancing patient safety and comfort. The integration of digital twin simulations prior to implantation would enable personalized design and optimization, reducing complications and extending device longevity. Furthermore, nanostructured biocompatible coatings and wireless energy transfer systems could minimize thrombosis, infection risks, and dependence on external connections. By merging computational intelligence with bio-inspired mechanics, an artificial intelligence (AI) based artificial heart holds the potential to deliver personalized, durable, and adaptive cardiac support. This approach not only addresses limitations of earlier designs but also represents a paradigm shift toward precision cardiovascular medicine, where artificial organs dynamically co-evolve with patient physiology.

**Keywords:** Artificial heart, artificial intelligence, machine learning, digital twin, biocompatibility.

**AI-260**

**ARTIFICIAL INTELLIGENCE IN HERBAL DRUG TECHNOLOGY**

Nirujogi Bindusri, Dharmasoth Rama Devi, B Rama rao
Department of Pharmacognosy, Vignan Institute of pharmaceutical Technology, Duvvada, Visakhapatnam, Andhra Pradesh, India
ramajoy90@gmail.com

The application of artificial intelligence (AI) in herbal drug technology is revolutionizing the process of quality control, research, and development with greater efficiency, accuracy, and creativity. AI data mining speeds up the detection of bioactive plant molecules from vast phytochemical libraries. In the manufacturing process, AI mechanizes extraction, standardizes quality testing, and enables real-time tracking using cutting-edge sensors. The predictive model can be utilized to interpret the pharmacological activity, toxicity, and synergistic effects of herbal preparations. It enhances regulatory compliance and traceability using AI-based documentation and integration with blockchain, thus promoting safe and authentic herbal products. We try to meet the AI strategy, such as machine learning, deep learning, and natural language processing at various stages of herbal drug discovery and manufacture, and finally talks about challenges of data heterogeneity, model interpretability, and strong validation needs in AI applications of herbal drug technology. Artificial intelligence is about to revolutionize herbal drug research and commercialization, eventually leading to the production of safer, more effective, and personalized herbal medicines, latest developments, real-life case studies, and future directions.

**Keywords:** Artificial intelligence, Herbal drug technology, Machine learning, Phytochemicals, Drug discovery, Natural language processing.

**AI-261**

**AI- ENABLED TELEPHARMACY: INNOVATING PATIENT ACCESS AND EDUCATION**

J. Shanthi, S. Lakshmi Manideep Royal
Department of Pharmacy practice, Annamacharya college of pharmacy, Rajampet, India- 516126
Jaggalashanthiyadavshanthi@gmail.com

Telepharmacy is the provision of the pharmacy services that through the digital platforms and it has evolved from the stopgap for the rural or underserved areas into a dynamic model of the patient-centered care. The integration of an Artificial Intelligence (AI) marks a new phase of this in evolution. Beyond the remote of dispensing and AI-enabled telepharmacy is now enables the pharmacists to deliver the individualized counseling and optimize therapy, predict the adherence issues before they arise. The Machine-learning algorithms can identify the hidden drug-drug interactions and adjust the dosage recommendations, generate the data-driven insights for the continuous quality improvement. Artificial intelligence powered virtual assistants and the chatbots provide on-demand and context-specific education, making complex medication of information understandable to diverse the patient populations. Then These innovations expand the pharmacist's reach and improve safety, treatment outcomes and decrease disparities in the access to care. The Early initiatives such as the pioneering North Dakota Telepharmacy and Project is proved that the high-quality pharmacy services minimizing errors, supporting personalized the care plans. Aligned with IPC-2025's focus on the technology-enabled in health services and this paper highlights how Arificial intelligence is enabled the telepharmacy and educates the professionals and empowers the patients,redefines the pharmaceutical care delivery in a digitally connected the world.

**Keywords:** Tele pharmacy, Artificial Intelligence, Natural language processing, Digital Health, Medication adherence.

**AI-262**

**ARTIFICIAL INTELLIGENCE -BASED ELECTRONIC HEALTH CARE RECORDS: TRANSFORMING DATA INTO INTELLIGENT PATIENT CARE**

Pudi Sravani, P. Leela Prashanthi, A. Lalitha K. Rajesh
Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili, Affiliated by Andhra University, India -535558
pudusravani@gmail.com

The rapid digitalization of healthcare has generated vast amounts of patient data, creating both opportunities and challenges in clinical practice. Traditional electronic health care records (EHCRs) serve as essential repositories but often face limitations such as poor interoperability, information overload, and restricted analytical capacity. Artificial Intelligence (AI) integration offers a transformative approach to overcoming these barriers by enhancing the efficiency, accuracy, and intelligence of EHCR systems. AI-powered tools, including natural language processing, machine learning, and predictive analytics, enable automated data entry, structured information extraction, and real-time clinical decision support. These capabilities not only reduce administrative burden but also improve diagnostic accuracy, predict patient risks, and recommend evidence-based treatment pathways. Moreover, AI-enhanced EHCRs contribute to population health management by detecting epidemiological trends, identifying high-risk groups, and supporting preventive strategies. Patients also benefit through personalized portals that provide tailored health insights, treatment reminders, and continuous monitoring, thereby fostering active engagement in their care. Despite these advances, critical challenges remain, including concerns of data security, algorithmic transparency, ethical use, and integration into existing healthcare infrastructure. Addressing these issues requires robust regulatory frameworks, secure data governance, and cross-disciplinary collaboration. With proper implementation, AI-based EHCRs have the

ISBN: 978-81-980623-8-3

potential to transform healthcare into a more predictive, preventive, and patient-centered system, advancing the vision of precision medicine and sustainable healthcare delivery.

**Keywords:** Artificial Intelligence, Electronic Health Records, Clinical Decision Support, Predictive Analytics, Patient-Centered Care.

**INNOVATIVE OF SMART INSOLES OR WEARABLES WITH ARTIFICIAL INTELLIGENCE**

M.Teja, K.Kusuma, M.Kavya, V.Prasanna
Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili, Vizianagaram, Affiliated By Andhra University, India -535558
mmarumuditeja@gmail.com

Smart insoles and wearable devices integrated with Artificial intelligence are emerging as transformative technologies in healthcare, sports, and daily wellness monitoring. These systems combine advanced sensors-such as pressure, temperature, motion, and bioelectric sensors with Artificial Intelligence driven analytics to provide real time insights into gait, posture, physical activity, and overall health status. Artificial Intelligence algorithms process large volumes of biomechanical and physiological data to detect abnormalities, predict risks such as falls or diabetic foot ulcers, and personalize rehabilitation programs. In sports, Artificial Intelligence enabled insoles optimize performance and prevent injuries through precise feedback on movement patterns. For chronic disease management, they enable continuous monitoring of patients with diabetes, cardiovascular issues, or neurological disorders, supporting early diagnosis and timely interventions. The integration with mobile applications and cloud platforms further enhances accessibility, telemedicine, and personalized healthcare. Thus, Artificial Intelligence powered smart insoles and wearables represent a significant step toward proactive, data driven, and patient centered health management.

**Keywords:** Smart insoles, wearable technology, artificial intelligence, digital health, remote monitoring.

**AI-264**

**CLINICAL DECISION SUPPORT SYSTEM (CDSS): AN GOING PURSUIT OF POTENTIAL -PUBMED**

Kola Srilatha U.Phaneendra, B.Sravani, E.Sai kumar
Bhaskara Institute Of Pharmacy komatipallivillage, bobbili, Affiliated by A.U, India- 535558
srilathakola97@gmail.com

A Clinical Decision Support System (CDSS) is a health information technology that assists healthcare professionals in making informed clinical decisions. When powered by Artificial Intelligence (AI), CDSS becomes more dynamic, accurate, and efficient. AI-driven CDSS uses advanced algorithms, machine learning, and natural language processing to analyze patient data, medical histories, lab results, and even real-time monitoring inputs. By integrating this information, it generates evidence-based recommendations for diagnosis, treatment, and patient management.Unlike traditional rule-based systems, AI-based CDSS can continuously learn from large datasets, including electronic health records (EHRs), clinical guidelines, and medical literature. This adaptive learning enables the system to detect patterns, predict disease risks, suggest personalized therapies, and identify potential drug interactions or adverse effects. For example, in pharmacy practice, AI-based CDSS can optimize drug selection, dosage adjustments, and monitoring plans, improving patient safety and therapeutic outcomes.The main benefits of AI-driven CDSS include enhanced accuracy, reduced medical errors, faster decision-making, and improved patient care quality. It also supports clinicians in handling complex cases where multiple conditions or medications are involved. However, challenges remain, such as data privacy, algorithm transparency, integration into clinical workflows, and the need for continuous validation. In conclusion, AI-powered CDSS represents a transformative tool in modern healthcare. By combining human expertise with intelligent data analysis, it helps clinicians provide safer, more personalized, and evidence-based care.

**Keywords:** Improved accuracy, Reduced medical errors, Faster decision –making,Clinical Decision Support System (CDSS), Personalized care, enhanced quality of health care.

**AI-DRIVEN TRANSFORMATION: BRIDGING SCIENCE AND HEALTHCARE IN THE FUTURE OF INDIAN PHARMACY**

Jitendra Dadsena, Rameshroo kenwat
Department of pharmacy Shri Rawatpura Sarkar University Raipur(C.G.)
jitendradadsena21@gmail.com

Artificial Intelligence (AI) is revolutionizing global healthcare, and India's pharmaceutical sector stands at a pivotal point of transformation. This paper explores how AI is bridging the gap between scientific research and practical healthcare delivery within the Indian context. From accelerating drug discovery and development to optimizing supply chains and enabling personalized medicine, AI is reshaping the pharmaceutical landscape. Indian pharmacies are uniquely positioned to benefit due to the country's vast healthcare needs, rich data sources, and growing digital infrastructure. However, challenges such as data privacy, ethical considerations, regulatory gaps, and workforce readiness remain. This study analyzes current AI applications in Indian pharmacy, evaluates the socio-economic and regulatory hurdles, and outlines a roadmap for integrating AI to create a more efficient, accessible, and patient-centric pharmaceutical ecosystem. By embracing AI, Indian pharmacy can not only enhance domestic healthcare outcomes but also emerge as a global leader in pharmaceutical innovation.

**Keywords:** Artificial Intelligence, Indian Pharmacy, Drug Delivery, Pharmaceutical Technology, Digital Health.

**AI-266**

**THE SPECTRUM OF AI IN CANCER CARE: FROM DIAGNOSTIC PRECISION TO CLINICAL DECISION SUPPORT**

Neelam Amrutha, K. Chandra Sekhar
Dr. K. V. Subba Reddy Institute of Pharmacy, Kurnool District, Andhra Pradesh State, India – 518218
neelamamrutha123@gmail.com

Artificial intelligence (AI) is rapidly transitioning from a research concept to a clinical tool in oncology. However, its implementation and proven utility vary significantly across different specialties. This review assesses the current landscape, evaluating where AI delivers consistent value and where it remains an emerging technology. The synthesized findings are from recent high-impact clinical trials, prospective studies and analytical reviews. The analysis focused on evaluating the evidence for AI in three critical domains: Medical Imaging Interpretation, Radiotherapy Treatment Planning and Clinical Decision-Making Support. In Medical Imaging, robust evidence from randomized controlled trials shows that AI integration in breast cancer screening and enhancing cancer detection rates. In Radiation Oncology, AI algorithms have become fundamental in treatment planning with greater precision and operational efficiency. While the application of Large Language Models (LLMs) for clinical decision support presents a more complex picture in recalling standard treatment guidelines, these models are brilliant in the exploring the study rather than navigating the accurate information from patient records. The Analysis concludes that even though AI's role in oncology is varied in procedural domains like imaging and radiotherapy, while serving as a preliminary assistant in treatment planning. Bridging this gap requires a collaborative focus on rigorous clinical validation, improved model interpretability, and strategic workflow integration to fully use AI's capacity for personalizing and advancing cancer care.

**Keywords:** AI, Imaging Interpretation, Radiotherapy, Treatment Planning and Clinical Decision-Making.

**AI-267**

**AN EXPLORATIVE STUDY ON THE ROLE AND IMPACT OF DIGITAL HEALTH TECHNOLOGY AMONG PHARMACY STUDENTS**

Gyaneshwari P. Pawar, Parag Tawade, Nishant B. Awandekar , Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur-441002
gyaneshwaripawar61@gmail.com

This study explored a detailed evaluation of the awareness, knowledge, and adoption of digital health technologies among pharmacy students in the Nagpur region. With the rapid growth of healthcare innovations, the research aimed to assess students' familiarity, understanding, and practical usage of wearable devices, telemedicine platforms, electronic health records, and mobile health applications, while also identifying perceived benefits and existing challenges. A structured questionnaire

ISBN: 978-81-980623-8-3

was administered to 150 pharmacy students, and the collected data was analyzed to uncover trends in technology acceptance and integration within pharmacy education. The findings revealed an increasing awareness and positive attitude toward digital health solutions, with students recognizing their potential to improve healthcare accessibility, enhance patient monitoring, and optimize treatment outcomes. However, barriers such as limited technical training, concerns over data privacy, inadequate infrastructure, and lack of curriculum-based exposure were identified as major limitations. The study highlighted the urgent need to incorporate digital health education into pharmacy programs to prepare future pharmacists for technology-driven healthcare systems. Overall, the results underscore the transformative role of digital health in advancing pharmacy practice, promoting patient-centered care, and bridging the gap in healthcare delivery in the modern healthcare landscape.

**Keywords:** Digital Health, Technology-driven, Pharmacy students, Wearable Devices.

**AI-268**

**AI BASED PROTEIN- PROTEIN INTERACTION PREDICTION FOR TARGET PRIORITIZATION**

Rhitika A. Lanjekar, Sahil Gawande
Department of Pharmaceutical Science, Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education, (Deemed to be University), Sawangi (Meghe), Wardha 442001 (MS), India.

Finding possible therapeutic targets and determining the underlying causes of disease depend heavily on protein-protein interactions, or PPIs. Conventional experimental techniques, such as co-immunoprecipitation and yeast two hybrid testing, are reliable but have limited scalability and resource needs. The computational prediction of PPIs has been made feasible by recent advances in artificial intelligence (AI), offering rapid and reasonably priced approaches for target prioritization in drug discovery. In this study, we developed an AI-based framework that combines structural characteristics, biological context, and sequence embeddings to identify PPIs associated with disease-specific pathways. To develop a deep learning model that captured network architecture and local sequence motifs, convolutional neural networks (CNNs) and graph-based techniques were employed. Biogrid and String benchmark datasets were used for training and validating the models, while multiple Disgenet datasets were used for independent testing. Results showed that the proposed model performed better than more conventional machine learning techniques like random forests and support vector machines, with an accuracy of 92% and an AUC-ROC of 0.95. Importantly, the strategy prioritized PPIs connected to oncogenic signaling pathways and identified additional potential targets, such as hub proteins, which are essential in cancer networks. The projected targets were shown to correspond with existing markers such as HER2 and propose new therapeutic nodes, and their biological importance was confirmed by case validation on breast cancer datasets. AI-driven PPI prediction is shown in this study to be a powerful technique for systematic target selection, accelerating the bench-to-bedside pipeline by reducing experiment load and improving drug target identification results.

**Keywords:** Target Prioritization, Precision Medicine, Systems Biology, Pharmacological network.

**ARTIFICIAL INTELLIGENCE IN CEREBROVASCULAR DISEASE: COMPUTATIONAL TOOLS FOR DIAGNOSIS, PROGNOSIS, AND MECHANISTIC INSIGHTS**

Pranit Waware, Shubhada Mangrulkar, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur, Maharashtra – 441002
wawrepranit@gmail.com

Artificial intelligence (AI) is a revolutionary tool in the clinical management of cerebrovascular diseases, such as ischemic and hemorrhagic stroke, transient ischemic attack, cerebral aneurysms, and vascular malformations. This review thoroughly examine the current state and growing potential of AI and machine learning in diagnosis, prognosis, and understanding of cerebrovascular diseases. Using the AI in this area is still at early stage compared to other medical fields, significant advances have been made in computer-assisted detection, prediction, and treatment planning. Both conventional machine learning and deep learning now help in the interpretation of neuroimaging, allowing for the earlier and more accurate identification of acute events also helps in the prediction of risks for complications such as hematoma progression or aneurysm rupture. The clinical applications of commercial AI especially for stroke assessment and forecasting outcomes, which makes critical decisions quicker. However, the review point out ongoing challenges, like data variability, algorithm transparency, and the necessity of clinical validation, all of which must be addressed for broader implementation. Mechanistically, AI tools are facilitating the investigation of disease pathophysiology by combining various patient information and images. this support more personalized treatment plans suited to each person. Future research should be focus on the need for robust, multicenter validation studies, fostering interdisciplinary collaborations, and clear communication of AI methodologies. Ultimately, AI stands as tranformative force in cerebrovascular care, improve diagnostic accuracy, individualized prognosis, and our understanding of disease mechanisms.

**Keywords:** Artificial intelligence, cerebrovascular diseases, machine learning, deep learning, diagnosis, prognosis and Mechanistic Insights.

**AI-270**

**VIRTUAL ARTIFICIAL INTELLIGENCE INFECTION CONTROL ASSISTANT: ENHANCING HOSPITAL INFECTION PREVENTION AND CONTROL**

Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili Affiliated By Andhra University India -257537
Rambha Revathi
N.Keerthana Rani, P.Gopi,K.Rajesh
revathirambha5@gmail.com

Hospital-acquired infections (HAIs) pose a major challenge to patient safety and healthcare efficiency worldwide. The Virtual AI Infection Control Assistant offers a cutting-edge solution by leveraging artificial intelligence (AI) and machine learning to enhance infection prevention and control (IPC). The system integrates patient data, hospital records, and IoT sensor inputs to continuously monitor infection risks, detect early outbreak signals, and identify high-risk patients. Real-time alerts enable IPC teams to implement timely interventions, reducing the incidence of HAIs and optimizing hospital workflows. Beyond monitoring, the assistant provides virtual guidance to healthcare staff on hygiene protocols, isolation procedures, and antimicrobial stewardship, minimizing human error and improving protocol compliance. Using predictive analytics, the platform can forecast potential outbreaks and support decision-making for resource allocation. Additionally, remote monitoring and tele-IPC functionalities allow infection control support in quarantined or resource-limited settings. By combining AI, real-time monitoring, and virtual assistance, the Virtual AI Infection Control Assistant demonstrates a scalable and effective approach to reducing HAIs, improving patient outcomes, and strengthening overall healthcare system efficiency. This innovative solution highlights the transformative potential of AI-driven tools in modern infection prevention.

**Keywords:** Artificial Intelligence, Infection Prevention and Control, Hospital-Acquired Infections, Machine Learning, IoT Sensors.

**AI-271**

**NANO-HERBAL TRANSDERMAL SYSTEMS: A NEXT-GENERATION APPROACH FOR PERSONALIZED WOMEN'S HEALTHCARE**

Jemimah Sudhakaran, Senthil Kumar Krishnan, Kannabirran Vaikundam
Department Of Pharmaceutics, Kamalakshi Pandurangan College Of Pharmacy, Tiruvannamalai Affiliated With Tamil Nadu Dr. M.G.R. Medical University, Chennai – 32.
Indiakbv@gmail.com

This study aims to redefine women's healthcare through the development of nano-herbal transdermal systems, integrating phytomedicine, nanotechnology, and intelligent biosensor platforms to overcome the limitations of conventional therapies. The objectives are: to address systemic toxicity, tolerance, and variable efficacy of conventional analgesics in menstrual and gynecological disorders; to enhance the therapeutic efficiency of phytoconstituents from Clitoria ternatea, Foeniculum vulgare, Zingiber officinale, and Withania somnifera via nanocarriers such as liposomes, ethosomes, and nanoemulsions; and to conceptualize AI-enabled wearable patches for adaptive and patient-specific therapy. The framework combines phytopharmacology for optimized bioactives, nanopharmaceutical

ISBN: 978-81-980623-8-3

engineering for dermal penetration and sustained release, and AI-integrated biosensors to monitor hormonal rhythms and modulate drug release dynamically. Nanoencapsulation improves bioavailability and therapeutic precision while minimizing systemic burden. Coupled with AI-driven wearables, the system enables real-time personalization. Beyond menstrual relief, the platform has translational applications in polycystic ovarian syndrome, endometriosis, and menopausal care, ensuring safety, compliance, and holistic efficacy. By merging plant-based therapeutics, advanced nanocarriers, and AI personalization, nano-herbal transdermal systems represent a disruptive, patient-centered innovation, positioning women's pharmacotherapy as both a scientific breakthrough and a societal necessity.

**Keywords:** Nano-herbal transdermal systems, Phytopharmacology, AI-enabled wearable patches, Precision gyneco-therapeutics.

**AI-272**

## DESIGN AND CHARACTERIZATION OF PHYTOHORMONE ORAL DISSOLVABLE FILMS AS A NOVEL DRUG DELIVERY SYSTEM FOR WOMEN'S HEALTH

R.pratheesha , S. Swetha, T. Shri Vijaya Kirubha
Department of Pharmacognosy Mother Terasa College of Pharmacy Illuppur, Pudukkottai Tamil Nadu.622 102
pratheesharavichadran@gmail.com

Hormonal imbalances in women, particularly during premenstrual, perimenopausal, and postmenopausal stages, are associated with physiological and psychological challenges including menstrual irregularities, hot flashes, osteoporosis, and mood disturbances. Conventional hormone replacement therapy (HRT), though effective, carries long-term risks such as cardiovascular complications and hormone-sensitive cancers. Hence, there is growing interest in phytohormones-plant-derived compounds with estrogenic, progestogenic, and adaptogenic properties-as safer alternatives. The present work aims to develop and evaluate a novel oral dissolvable film (ODF) incorporating standardized extracts of soy isoflavones, red clover, flaxseed lignans, and Shatavari as a phytohormone supplement for women's health. The ODF was prepared using the solvent casting method with hydroxypropyl methylcellulose (HPMC E15) as the polymer and glycerol as the plasticizer. The films demonstrated uniform thickness (0.182 ± 0.015 mm), rapid disintegration (28.4 ± 3.1 seconds), and acceptable folding endurance (>250 folds). Drug content uniformity was maintained at 96.8 ± 2.1%, while in vitro release studies showed 84.7 ± 3.4% phytohormone release within 20 minutes. Sensory evaluation confirmed good palatability and patient acceptability. The results indicate that oral dissolvable films loaded with phytohormones represent a novel, patient-compliant dosage form, particularly advantageous for women with swallowing difficulties and those seeking a natural, side-effect-minimized alternative to HRT. This innovative delivery system holds potential for improved bioavailability, enhanced compliance, and holistic management of menopausal and menstrual health.

**Keywords:** Phytohormones, Phytoestrogens, Oral dissolvable films (ODFs), women's health.

**AI-273**

## CRACKING THE CODE FOR STABLE AND EFFECTIVE HERBAL COSMECEUTICALS: NANOTECHNOLOGY AND AN AI-BASED APPROACH

Prerana N Gurjar, Pravina N Gurjar, Rampal Jadhao
Sudhakarrao Naik Institute of Pharmacy, Pusad, Yavatmal, Maharashtra, India-445215
preranagurjar.pusad@gmail.com

People are very interested in herbal cosmeceuticals since they combine the benefits of cosmetics and medicines from plant-based actives. This is because people want natural, safe, and long-lasting products. Herbal products are being held back by a number of big problems, such as not being stable enough, changing bioactive concentrations, and not always working. Many herbal chemicals are highly susceptible to degradation due to environmental factors such as heat, light, pH, and oxidative stress. The complex nature of plant extracts makes it hard to develop formulations, and it's often not clear how to do it. Nanotechnology-based delivery systems, including liposomes, nanoemulsions, and polymeric nanoparticles, are interesting solutions for getting around these problems. These solutions protect sensitive actives, improve skin penetration, and optimize regulated release. This ensures long-lasting stability and better therapeutic benefits. At the same time, artificial intelligence (AI) is changing the way formulations are developed by predicting stability profiles, finding the best chemical combinations, and simulating environmental stress conditions to speed up stability testing. AI-powered tools help make personalized formulas by taking into account things like skin type, environmental exposure, and genetic predisposition. Combining predictive modeling with nanocarrier design greatly reduces the need for trial and error in formulation development, making the process both cheaper and faster. In the future, machine learning algorithms might be used to evaluate stability in real time, digital twins could be used to test products in a virtual environment, and green nanotechnology could be used for sustainable innovation. By combining old herbal knowledge with cutting-edge nanotechnology and AI techniques, the industry can make herbal cosmeceuticals that are reliable, effective, and tailored to meet the needs of modern customers and government rules.

**Keywords:** Herbal cosmeceuticals, Challenges in stability of herbal formulations, nanotechnology in cosmeceuticals, AI-driven cosmetic formulation design.

**AI-274**

## SMART FORMULATION DESIGN: AI-BASED APPROACHES TO IMPROVE PATIENT COMPLIANCE

Tulaja Sahu, Rameshroo Kenwat Department Of Pharmacy Shri Rawatpura Sarkar University Raipur (C.G.)
sahutulaja082@gmail.com

Patient compliance remains a critical determinant of therapeutic success, particularly in chronic disease management and long-term pharmacotherapy. Traditional drug formulation strategies often fail to address the diverse and dynamic needs of individual patients, leading to suboptimal adherence. Recent advances in artificial intelligence (AI) have opened new frontiers in pharmaceutical research, enabling the development of smart formulation designs tailored to patient-specific needs and behaviors. This review explores the integration of AI techniques such as machine learning, deep learning, and predictive analytics into the formulation development process to enhance drug efficacy, dosage convenience, and patient-centricity. AI-driven platforms can predict patient adherence patterns, optimize drug release profiles, and personalize dosage forms, ultimately improving compliance and therapeutic outcomes. The paper also discusses current challenges, ethical considerations, and future perspectives in deploying AI for formulation design. The convergence of AI and pharmaceutical sciences promises a paradigm shift toward precision medicine and improved public health outcomes.

**Keywords:** Patient Compliance, Smart Formulation, Machine Learning, Pharmaceutical Technology.

**AI-275**

## IMPACT OF ARTIFICIAL INTELLIGENCE IN TRANSFORMING TEACHING LEARNING PROCESS

Remeth J. Dias, Sushant S. Pande, Kuldeep U. Bansod.
Department of Pharmacy, Govt. College of Pharmacy, Karad, Satara, Maharashtra -415 124. India
rjdias75@gmail.com

Introduction: Education plays a vital role in contribution to economic growth of a country as it develops the skilled workforce, apart from intellectual and cultural awakening. However, decades together traditional classroom teaching is being implemented where the students are not actively involved in teaching learning process. Thus, the students are unable to do what they are supposed to do. In this era of technology where the innovative modern andragogy and artificial intelligence tools are available, the focus on active learning methods and self-learning practices should be enhanced so that expected outcome in the students is achieved. Aim: The aim of this study was to transform teaching learning process through utilization of AI tools for best teaching practices and modern andragogy. Methodology: The survey of faculty and students was conducted to analyse present scenario of teaching learning process. MOOC course of eight weeks was designed and conducted for training the faculty in modern andragogical techniques. The use of AI in teaching learning process was also introduced through various FDPs and the impact of AI and modern andragogical tools on teaching learning process was studied. Results: It was found that around 78% of 3208 teachers trained became proficient in using effective teaching practices,

ISBN: 978-81-980623-8-3

modern pedagogy, LMS, creating effective presentations & videos, online teaching & assessment after successful completion of MOOC and training on AI tools. The impact of use of modern andragogy & AI tools by teachers was studied in students and it was found that the outcomes of student learning improved exponentially thereby improving results. Conclusion: It can be concluded that teaching learning process can be empowered by using various AI tools and implementing modern andragogical techniques; and further student learning outcomes can be improved.

**Keywords:** Artificial Intelligence, Modern andragogy, learning outcomes, teaching learning process, active learning.

**AI-276**

## INTEGRATING MACHINE LEARNING INTO ANTIMICROBIAL STEWARDSHIP: A RETROSPECTIVE STUDY OF URINARY TRACT INFECTIONS IN SOUTH INDIA

Freddy Alappattu, Chrins
Department of Pharmacy Practice, Nirmala College of Pharmacy, Muvattupuzha, Kerala, India-686661
freddyalappattu@gmail.com

Urinary tract infections (UTIs) are among the most prevalent bacterial infections, with antimicrobial resistance complicating management and outcomes. This retrospective single-center study was conducted at a tertiary care hospital in south india over 25 months (January 2020–May 2022), analyzing antibiogram data from inpatients and outpatients (2019–2021). Major isolates, including Escherichia Coli, Klebsiella spp., Esbl-positive, E.Coli, and Pseudomonas Spp., were assessed for resistance trends. Chi-square analysis was applied for statistical associations, while machine learning models (scikit-learn) were developed as a clinical decision support system (CDSS) to predict causative organisms. UTIs were most frequent in elderly patients (>60 years), particularly in rural populations, with hypertension and diabetes as common comorbidities. E. Coli emerged as the predominant pathogen and the leading contributor to multidrug resistance (MDR) and extensive drug resistance (XDR), especially among hospitalized patients. Demographic and treatment-related factors showed no significant association with MDR/XDR status. The CDSS demonstrated strong predictive accuracy in identifying causative organisms, supporting early and reliable empirical therapy. These findings highlight the dual challenge of rising resistance in community and hospital settings and the promise of ai-driven tools to guide antimicrobial stewardship. The integration of machine learning into routine practice offers a feasible approach to optimizing empirical treatment and improving clinical outcomes in UTI management.

**Keywords:** urinary tract infection, antimicrobial resistance, multidrug resistance, extensive drug resistance, machine learning.

**AI-277**

## OPTIMIZING CALCIUM–PHOSPHATE BALANCE IN HEMODIALYSIS PATIENTS USING AI-ASSISTED PREDICTIVE MODELING: AN AMBISPECTIVE OBSERVATIONAL STUDY.

Freddy Alappattu, Ashly Mary Mathew, Hila A D, Jobin Kunjumon Vilapurathu
Department of Pharmacy Practice, Nirmala College of Pharmacy, Muvattupuzha, Kerala, India -686661
freddyalappattu@gmail.com

Calcium–phosphate dysregulation remains a major contributor to cardiovascular morbidity and mortality in patients undergoing maintenance hemodialysis. This ambispective observational study evaluated biochemical abnormalities, treatment patterns, pill burden, and dialysis frequency in 246 hemodialysis patients at MOSC medical college hospital. A novel artificial intelligence (AI)-assisted predictive framework was developed to model serum calcium, phosphate, and parathyroid hormone (PTH) trajectories. The AI system integrated demographic, biochemical, and therapeutic data to generate individualized predictions and risk stratification for mineral bone disorder outcomes. Preliminary analysis revealed that hyperphosphatemia was present in 62% of patients, hypocalcemia in 41%, and secondary hyperparathyroidism in 38%. Thrice-weekly dialysis was associated with improved phosphate control compared to twice-weekly regimens, though at the expense of higher pill burden. The AI model demonstrated strong predictive performance, with the capacity to anticipate abnormal calcium–phosphate profiles with high sensitivity. This approach enables early identification of patients at risk of uncontrolled mineral metabolism, supporting tailored interventions and potential reduction in pill burden. The integration of AI into clinical nephrology provides a promising direction for personalized therapy in dialysis-dependent patients. By bridging conventional biochemical monitoring with advanced analytics, our study highlights the transformative potential of AI to optimize treatment decisions, improve patient outcomes, and empower clinicians in managing chronic kidney disease-mineral bone disorder (CKD- MKD).

**Keywords:** hemodialysis, calcium–phosphate imbalance, parathyroid hormone, pill burden, artificial intelligence.

**AI-278**

## ARTIFICIAL INTELLIGENCE FOR ADVANCEMENTS IN DRUG DEVELOPMENT AND DISCOVERY OF DRUGS: A REVIEW ARTICLE

Kalyani Bute, Amit Bhagat
Datta Meghe College Of Pharmacy, Sawangi, Wardha, Maharashtra – 442001
kalyanibute503@gmail.com

Artificial intelligence (AI) as a tool utilizes anthropomorphic knowledge and offers quick fixes for difficult problems. Amazing developments in AI and machine learning offer a revolutionary chance for improving drug research, formulation, and dosage form testing in the pharmaceutical industry. Moreover, a multitude of techniques can be employed to construct efficacious medical models that range from prognostication and illness forecasting to determining the optimal treatment plan for a particular patient. Target identification, lead creation, lead optimization, preclinical and clinical development, as well as the difficulties encountered at each stage and possible solutions, are all covered in the drug discovery process. To improve efficacy and speed of drug discovery, machine learning computational models is process uses by artificial intelligence which improve disease heterogeneity, identify dysregulated molecular pathways, and find the right therapeutic target as well as the appropriate drug candidate during the discovery and design process. Some of these rights are significantly impacted by drug development, and this impact is now increased using machine learning and artificial intelligence. We talk about the challenges of therapeutic availability, particularly in nations with low and moderate incomes, the impact of the energy crisis on big pharma, and the potential impact of AI-enhanced medication discovery within a healthcare system focused on people. The vast chemical space, comprising >1060 molecules, fosters the development of a large number of drug molecules.

**Keywords:** Artificial Intelligence, Drug Development, Drug Discovery, Proteomic and clinical data.

## FROM TAKE-BACK PROGRAMS TO AI SOLUTIONS: MANAGING UNUSED MEDICINES SAFELY

Trilokinath Shasthri, Gulfam Ansari, Pedamallu Niharika
Department of Pharmaceutical Sciences, Vignan's Foundation for Science, Technology and Research, Vadlamudi, Guntur, Andhra Pradesh, India-522213
np_pharma@vignan.ac.in

Unused medicines refer to pharmaceuticals that are no longer required by patients because they have expired, become contaminated, or are simply not needed. Improper disposal of these drugs poses serious risks to human health, animals, and the environment, raising global concern. The economic and healthcare impacts of unused drugs are significant, and improper disposal—especially of antibiotics—can contribute to the development of drug resistance. One of the most effective methods to address this issue is the collection of unused medicines from households through take-back programs. Current regulations recommend that unused or expired medicines should be returned through the supply chain, from retailers back to suppliers and manufacturers, for safe disposal. Under the Drugs and Cosmetics Act, approved methods of disposal include landfilling, immobilization, inertization, incineration, and chemical decomposition; for example, retailers are expected to send expired stock back to the supplier or manufacturer. However, collection and disposal carried out manually is often a tedious and error-prone process, which highlights the need for advanced technologies. With advancements in artificial intelligence (AI), waste management has

ISBN: 978-81-980623-8-3

become more efficient—AI systems can accurately identify and categorize medical waste, enabling proper segregation and disposal. AI algorithms can also analyze data to assess potential risks and implement preventive strategies. Integrating AI into medical waste management not only improves safety and sustainability but also streamlines processes, supports regulatory compliance, and benefits patients, healthcare workers, and the environment. By ensuring accurate classification and handling of waste, AI reduces contamination risks, saves time, and optimizes resource use. Overall, regulated disposal practices combined with AI-driven solutions are crucial for safeguarding health, preventing drug resistance, and protecting the environment.

**Keywords:** Unused drugs, Disposal, Medical waste, Environment, Artificial Intelligence.

**AI-280**

## AI-POWERED DIGITAL TWIN FRAMEWORK FOR PERSONALIZED BREAST CANCER DIAGNOSIS AND TREATMENT

Pallavi Gondale
Department of Pharmacology, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, India
pallavigondale871@gmail.com

Breast cancer is a leading cause of cancer-related mortality in women worldwide, and despite significant advancements in diagnostics and therapeutics, challenges remain in achieving personalized and effective treatment. Traditional approaches often adopt generalized treatment strategies, resulting in variable patient outcomes. To address this limitation, we propose an AI-powered digital twin framework for breast cancer management. This framework integrates multi-dimensional patient data, including electronic health records, imaging modalities, multi-omics profiles, lifestyle factors, and real-time biosensor inputs, to create a dynamic virtual replica of each patient. Using machine learning, deep learning, and computational modeling, the digital twin simulates tumor progression, predicts therapeutic response, and enables in silico testing of treatment regimens. The system also incorporates a feedback loop where clinical outcomes continuously refine predictive models through reinforcement and federated learning, ensuring adaptability across diverse populations. The proposed paradigm has potential to transform breast cancer care by providing clinicians with personalized treatment recommendations, optimized dosage strategies, and predictive insights into disease progression and therapy response. Furthermore, it promotes preventive, predictive, and participatory oncology while enabling patient-centric virtual clinical trials. This AI-driven digital twin model represents a significant step toward precision oncology and improved survival outcomes in breast cancer patients.

**Keywords:** Artificial Intelligence, Digital Twin, Breast Cancer, Precision Oncology, Personalized Medicine.

**AI-281**

## LEVERAGING AI AND TECHNOLOGY FOR DRUG-DRUG INTERACTION PREDICTION

Pratik Sandeep Betkar
Shree Saraswati Institute Of Pharmacy, Tondavali, Kankanali, Sindhudurg
patusb23@gmail.com

Patient safety is seriously threatened by drug-drug interactions (DDIs), which frequently result in adverse drug events and higher medical expenses. Conventional DDI detection techniques, such as post-marketing surveillance and in vitro/in vivo assays, are costly, time-consuming, and unable to keep up with the rapidly expanding number of novel medication combinations. Advanced computing technologies and artificial intelligence (AI) have become revolutionary instruments for highly scalable and precise DDI prediction in order to overcome these constraints. Artificial Intelligence (AI), specifically Machine Learning (ML) and Deep Learning (DL), is used to examine large, diverse datasets, such as genomic data, drug chemical structures, pharmacokinetics, pharmacodynamics, and Electronic Health Records (EHRs). Complex interactions within drug-target and protein-protein interaction networks are modeled by methods such as Graph Neural Networks (GNNs), which reveal linkages that are not readily apparent. DDI evidence is extracted from unstructured clinical notes and biological literature using natural language processing (NLP). Potential interactions, their intensity, and their underlying mechanisms (pharmacokinetic or pharmacodynamic) can all be predicted by the predictive models that are produced. Proactive risk mitigation requires the incorporation of these AI-driven technologies into drug development pipelines and clinical decision support. Continuous efforts in Explainable AI (XAI) and multimodal data integration promise to improve the transparency and clinical applicability of these tools, ushering in an era of more precise and personalized medicine to ensure optimal drug safety, even though there are still issues with data sparsity, interpretability, and generalizability. Eg: Risk of lactic acidosis with metformin and iodinated contrast media

**Keywords:** Artificial Intelligence (AI), Machine Learning (ML), Deep Learning (DL), and specific models like Graph Neural Networks (GNNs).

**AI-282**

## AI-DRIVEN APPROACHES IN NON-ALCOHOLIC FATTY LIVER DISEASE: FROM PRECLINICAL MODELS TO PRECISION MEDICINE

Aarti R. Shriwas, Shubhada V Mangrulkar, Brijesh G. Taksande, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Maharashtra, India – 441002
aartishriwas249@gmail.com

Artificial Intelligence (AI) is emerging as a transformative tool in pharmaceutical sciences, offering innovative, accurate, and cost-efficient approaches for complex diseases such as Non-Alcoholic Fatty Liver Disease (NAFLD). Conventional diagnostic and therapeutic methods for NAFLD face challenges including delayed recognition, variability among patients, and limited effective drug options. This review consolidates current research on AI applications in NAFLD, highlighting its contributions to disease modeling, identification of biomarkers, drug repurposing, and patient stratification. By analyzing biochemical, functional, histological, and imaging data, AI facilitates early diagnosis, precise staging, and prediction of disease progression. In preclinical research, AI supports both in vivo and in vitro studies, enhancing reproducibility and enabling high-throughput evaluation of functional tests, serum markers, and liver histopathology. Integrating multi-omics (genomics, transcriptomics, proteomics, metabolomics, epigenomics, microbiomics), clinical, and imaging datasets further strengthens translational research and informs personalized treatment strategies. While challenges such as data standardization, model transparency, and ethical considerations remain, AI demonstrates substantial potential to advance NAFLD research, optimize therapeutic interventions, and improve patient-centered outcomes. This review emphasizes AI's role in promoting interdisciplinary collaboration and enhancing both preclinical and clinical evaluation in modern pharmaceutical sciences.

**Keywords:** Artificial Intelligence, NAFLD, Drug Repurposing, Preclinical Research, Precision Medicine.

## AI ASSISTED FORMULATION OPTIMIZATION AND DISSOLUTION PROJECTION OF KETOCONAZOLE: A MACHINE LEARNING-BASED BCS CLASS II DRUG

Pratibha Shelke
Department of Pharmaceutics,
Shri Gajanan Maharaj Shikshan Prasarak Mandals's Dnyanvilas College of Pharmacy, PCMC, Pune, India - 412105
pratishelke33@gmail.com

The development of BCS Class II drugs such as Ketoconazole, which have low solubility and high permeability, is a significant challenge in drug development. This paper explores the implementation of Artificial Intelligence (AI), specifically the use of machine learning (ML) algorithms, as a way to generate additive formulation factors, and even predict in vitro dissolution profiles, for their solid dispersions. A design of experiments (DoE) approach was used to generate datasets with variables such as polymer type, concentration, solvent volume, and drying conditions. Various regression-based ML models, including random forest, Support Vector Regression (SVR), and gradient boosting, were trained on dissolution data at various time points (i.e., 5-, 15-, and 30-minutes). The SVR model had the best predictive accuracy with an $R^2$ value of 0.91 at 60 minutes of cumulative drug release. Feature analysis revealed drug-to-polymer ratios and polymer type to be the most important variables in dissolution. The predicted optimized formulation exhibited increased solubility compared to the conventional formulations. The use of ML in pharmaceutical practice promotes data-

ISBN: 978-81-980623-8-3

driven Quality by Design (QbD), with respect to development timeframe and further reinforces the Industry 4.0 vision of pharmaceutical manufacturing.

**Keywords:** Artificial Intelligence, Pharmaceutics, Machine Learning, Ketoconazole, BCS Class II, Dissolution Prediction, Formulation Optimization, QbD.

**INNOVATING PAIN MANAGEMENT: AI MEETS TRANSETHOSOMES**

Mohammad Amin Yatoo, Agilandeswari Devarajan
Department of Pharmaceutics, MVM College of Pharmacy, Yelahanka, Bengaluru, Karnataka 560064

The extract of Curcumin Longa L is of great interest because of its many biological properties. However, its poor skin permeability makes transdermal application challenging. The current study aimed to develop and evaluate curcumin longa extract transethosomes as a possible nanovehicle to enhance transdermal transport through the skin. Curcumin loaded transethosomes were prepared by cold method using edge activator. Transethosomes was prepared by different molar ratios of phospholipid and extract ratios and the fabricated nanovesicles were evaluated for particle size, entrapment efficiency, PDI using Box Behnken Design and in vitro diffusion study has been performed for the optimized formulation. The optimized formulation comprised of exhibited particle size of 326.9nm, entrapment efficiency of 71.88% and PDI of 0.236. Optimized formulation exhibited 81.69% in The developed transethosomal gel was 81.69 % in curcumin longa L transethosomes loaded gel release at 3h and followed zero-order release kinetics, compared to CT showed better drug release in controlled manner. Improvement of bioavailability and narrow particle size distribution.

**Keywords:** nanovesicles, Transethosomes, Curcumin longa L, Transdermal delivery, Analgesic activity.

**DIGITAL INNOVATIONS IN HOSPITAL PHARMACY PRACTICE: SMART DISPENSING SYSTEMS AND E-PRESCRIPTIONS**

Juveriya.Sk, M.Prasad Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy,
Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
Juhishaik23@gamil.com

The integration of digital technologies in hospital pharmacy practice has transformed the way medications are prescribed, dispensed, and managed, enhancing efficiency, safety, and patient-centered care. Smart dispensing systems, equipped with automation, barcode verification, and artificial intelligence, reduce medication errors, optimize inventory control, and support real-time monitoring of drug utilization. These systems ensure accurate dispensing while minimizing human error, thereby improving patient safety and workflow efficiency for healthcare providers. Simultaneously, the implementation of electronic prescriptions (E-prescriptions) has streamlined the prescribing process, reducing illegibility issues, drug–drug interaction risks, and delays in therapy initiation. E-prescriptions also facilitate secure transmission of prescriptions, integration with patient health records, and enhanced communication between physicians and pharmacists. Together, smart dispensing systems and E-prescriptions represent a significant advancement toward digital hospital pharmacy practice by promoting transparency, traceability, and regulatory compliance. However, challenges such as infrastructure costs, training needs, data security, and interoperability with existing healthcare systems must be addressed to maximize their benefits. Overall, the adoption of these digital innovations contributes to improving healthcare delivery by ensuring safer medication use, enhancing operational efficiency, and supporting evidence-based decision-making.

**Keywords:** Hospital pharmacy, smart dispensing systems, E-prescriptions, digital innovations, medication safety, healthcare technology.

**AI-286**

**DIGITAL BRAINS FOR DRUG DISCOVERY: HOW PHARMA R&D AND PATIENT RESULTS ARE BEING TRANSFORMED BY GENERATIVE AI**

Achal Dipte, Anil M. Pethe
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education and Research, Deemed to be University, Sawangi (Meghe), Wardha, Maharashtra, India – 442001
achaldipte34@gmail.com

Generative artificial intelligence (AI) is causing a rapid change in the drug discovery industry. In contrast to conventional techniques, generative AI can swiftly create novel compounds, forecast their physiological responses, and offer suggestions for enhancing their efficacy and safety. AI speeds up the process of finding new medication candidates, predicts possible adverse effects, and even suggests improved formulations by evaluating vast volumes of biological and chemical data. In addition to saving money and time, this expedites the drug development process and aids in the creation of more individualized patient care. Generative AI enables researchers to model the interactions of drugs with intricate biological systems, a task that was quite challenging in the past. This knowledge enhances decision-making throughout the research process and helps ensure that new medications are both safe and effective. The incorporation of AI into pharmaceutical research and clinical practices is making the process of drug discovery more efficient, innovative, and aligned with the needs of patients. In summary, generative AI is reshaping pharmaceutical research and development by facilitating smarter, quicker, and more accurate drug discovery. As AI technology continues to advance, bolstered by improved data and interdisciplinary collaboration, it has the potential to transform the development and delivery of medicines, ultimately enhancing health outcomes for patients across the globe.

**Keywords:** Generative AI, Molecular Design, Predictive Modelling, Personalized Medicine.

**AI-287**

**HOSPITAL-BASED EVALUATION OF DRUG-RELATED PROBLEMS AND CLINICAL PHARMACIST INTERVENTIONS IN DIALYSIS PATIENTS**

N.Sai Neha Sri, M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
sainehasrinarala@gmail.com

Background: Patients undergoing dialysis are susceptible to drug-related problems (DRPs) due to complex treatment regimens, altered renal function, and multiple comorbidities. Clinical pharmacists play a vital role in optimizing medication therapy, reducing adverse drug events, and enhancing patient outcomes. Objectives: This study aimed to assess the prevalence and types of DRPs among dialysis patients and evaluate the effectiveness of pharmacist-led interventions in a hospital setting. Methods: A prospective observational study was conducted in the dialysis unit of a tertiary care hospital over six months. Patient demographic data, dialysis details, comorbidities, and medication profiles were collected. DRPs were identified, categorized, and interventions by clinical pharmacists were documented and analyzed for acceptance and clinical impact. Results: Among 150 dialysis patients, 62% experienced at least one DRP. The most common issues included dosing errors (28%), drug–drug interactions (25%), and inappropriate use of nephrotoxic medications (20%). Clinical pharmacist interventions, such as dose adjustments (35%), therapy modifications (30%), and patient counselling (20%), were implemented. Approximately 85% of these interventions were accepted by the treating physicians, resulting in improved medication safety, adherence, and patient outcomes. Conclusion: DRPs are highly prevalent in patients undergoing dialysis, emphasizing the need for active pharmacotherapy management. Clinical pharmacists contribute significantly by identifying, preventing, and resolving DRPs. Incorporating pharmacists into the dialysis care team enhances medication safety and overall quality of patient care.

**Keywords:** Dialysis, Drug-Related Problems, Clinical Pharmacist, Hospital-Based Study, Medication Safety.

**AI-288**

**NANOROBOTS WITH ARTIFICIAL INTELLIGENCE INTEGRATION FOR TARGETED DRUG DELIVERY**

Bonthala Koti.Sai, B.Ganesh, B.Mounkia, R.Divya
Bhaskara institute of pharmacy, Komatipalli (village), Bobbili, affiliated to Andhra University, Vishakhapatnam ,535558
saibonthalakoti1@gmail.com

Nanorobots, also known as nanobots or nanomachines, are a groundbreaking innovation that integrates nanotechnology, robotics,

ISBN: 978-81-980623-8-3

biotechnology, and artificial intelligence. Operating at the nanometer scale ($10^{-9}$ m), these microscopic devices are designed to perform precise tasks with exceptional accuracy. Their potential lies in revolutionizing healthcare, environmental management, and advanced manufacturing.In medicine, nanorobots are being explored as effective tools for targeted drug delivery, transporting therapeutic agents directly to diseased cells and minimizing systemic side effects. They also enable real-time biosensing and diagnostics, supporting early disease detection and monitoring. Applications extend to crossing the blood–brain barrier for neurological treatments, repairing tissues at the cellular level, and performing minimally invasive surgical interventions. Beyond healthcare, nanorobots show promise in environmental remediation, where they can break down pollutants, neutralize toxins, and remove microplastics. In agriculture and electronics, nanoscale systems may enhance crop monitoring and support next-generation semiconductor design. Despite these opportunities, key challenges remain, including the need for biocompatible materials, nanoscale energy solutions, scalable manufacturing, and ethical safeguards to ensure safety and responsible use.Looking forward, nanorobots are expected to play a pivotal role in precision medicine, regenerative therapies, and global sustainability initiatives. With continued research and innovation, these tiny machines may emerge as one of the most impactful technologies of the 21st century.

**Keywords:** Nanorobots, Nanomedicine, Targeted Drug Delivery, Biosensing, Environmental Applications.

**AI-289**

## LEVERAGING ARTIFICIAL INTELLIGENCE FOR RISK PREDICTION AND MANAGEMENT OF BREAST AND CERVICAL CANCER: A CLINICAL STUDY

N.Honey Srija, M. Purushothaman
Department Of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
nakkahoneysrija08@gmail.com

Background: Breast and cervical cancers are among the leading causes of morbidity and mortality in women globally. Early detection and personalized management are crucial for improving outcomes. Artificial Intelligence (AI) tools can enhance risk prediction, optimize treatment strategies, and support clinical decision-making. Objectives: This study aimed to evaluate the effectiveness of an AI-based risk prediction model in identifying high-risk patients and guiding management decisions for breast and cervical cancer. Methods: A prospective observational study was conducted on 200 female patients attending the oncology clinic. Patient demographic, clinical, and laboratory data were input into an AI-driven predictive model. Risk scores, predicted outcomes, and suggested management plans were compared with standard clinical assessments. Data were analyzed to determine model accuracy, sensitivity, and clinical impact. Results: Among 200 patients, 120 (60%) were diagnosed with breast cancer and 80 (40%) with cervical cancer. The AI model accurately identified 92% of high-risk breast cancer patients and 88% of high-risk cervical cancer patients. Major risk factors detected included family history (breast: 25%), HPV infection (cervical: 30%), obesity (breast: 28%), and early age at first childbirth (cervical: 22%). AI-based recommendations led to treatment optimization in 70% of cases, including adjustments in surgery, chemotherapy, and follow-up frequency. Physician acceptance of AI-guided interventions was 85%, indicating high clinical applicability. Conclusion: AI-driven risk prediction models can reliably identify high-risk patients and support clinical management in breast and cervical cancer. Integrating AI into oncology practice enhances personalized care, optimizes treatment decisions, and may improve patient outcomes

**Keywords:** Artificial Intelligence, Breast Cancer, Cervical Cancer, Risk Prediction, Clinical Management.

**AI-290**

## Artificial Intelligence In Menstrual Health And Pregnancy

Majji. Srivani, L. Varun Kumar, M.Sai Jyoshna, V.Prasanna
Bhaskara Institute Of Pharmacy, Komatapalli Village, Bobbili, Affiliated By Au, India – 535558
majjisrivani@gmail.com

Artificial intelligence [AI] is emerging as a transformative tool in women's health particularly in the domains of menstrual health and pregnancy. Artificial Intelligence powered applications increasingly used for menstrual cycle tracking, ovulation prediction, and early identification of reproductive health disorders such as poly cystic ovary syndrome and endometriosis; by integrating data from wearable devices and clinical records, Artificial Intelligence enables personalized insights and supports proactive health management. In pregnancy care Artificial Intelligence assists in predicting and diagnosing the complication such as gestational diabetes, preeclampsia and preterm birth while also aiding in fetal growth monitoring and maternal risk assessment. Machine learning and natural language processing further contribute to clinical decision support and patient education, enhancing communication between health care providers and expectant mothers. Although challenges related to data privacy accessibility and algorithmic bias remain, Artificial Intelligence holds significant potential to improve maternal – fetal outcomes and promote evidence. Artificial Intelligence is being applied in menstrual health and pregnancy specifically related to gestational diabetes. Artificial Intelligence predicts risk before develops using data like age, BMI, menstrual patterns, family history enhanced the diagnostics

**Keywords:** Menstrual rual cycle tracking, ovulation prediction, Gestation Diabetes, Artificial Intelligence.

**AI-291**

## AI-POWERED DIGITAL TWINS AND PREDICTIVE ANALYSIS IN PERSONALIZED MEDICINE: TOWARD PATIENT-CENTRIC HEALTHCARE

Qureshi Khulood Mohammad Saifullah, Yelam Vidya (Kapse)
Shivlingeshwar College of Pharmacy, Almala, Latur – 413512
Pharmacy Practice Department
khuloodmoona@gmail.com

The intersection of artificial intelligence (AI) and personalized medicine is transforming patient-centered healthcare, with digital twins and predictive analysis emerging as groundbreaking tools. Digital twins—virtual representations of individual patients that incorporate genomic, clinical, lifestyle, and real-time monitoring data—facilitate the simulation of treatment responses, enabling clinicians to customize therapies with unmatched accuracy. Predictive analysis, driven by sophisticated machine learning and deep learning algorithms, can anticipate disease progression, evaluate drug effectiveness, and foresee adverse events, thereby promoting proactive and optimized treatment approaches. Collectively, these technologies improve clinical decision-making, minimize trial-and-error in therapy selection, and enhance patient outcomes. This research investigates the current state of AI-driven digital twins and predictive models in personalized medicine, analyzing successful applications in oncology, cardiology, and metabolic disorders. Challenges including data privacy, bias, computational demands, and system integration are discussed with potential solutions. By reviewing literature and case studies, this study highlights how AI-driven digital twins and predictive analytics empower clinicians and patients with informed, personalized healthcare decisions. The results highlight the potential of these innovations to transition healthcare from reactive to predictive, preventive, and participatory models, ultimately advancing the objectives of personalized medicine and enhancing the quality of care.

**Keywords:** Artificial Intelligence, Personalized Medicine, Digital Twins, Predictive Analysis, Patient-Centric Healthcare.

**AI-292**

## ARTIFICIAL INTELLIGENCE POWERED SMART BANDAGES FOR ADVANCE WOUND CARE

T.Sravanthi V.Pavani, B.Harini, G.Rama Krishna Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili, Affiliated By Andhra University,India 535558
tamadasravanthi1319@gmail.com

Chronic and acute wounds remain a major healthcare challenge, often leading to prolonged recovery, infections, and increased healthcare costs. Conventional wound dressings provide passive protection but lack the ability to monitor healing or respond to dynamic changes in the wound environment. The integration of Artificial Intelligence (AI) with smart bandage technology represents a transformative approach to modern wound care. AI-powered smart bandages are embedded with miniaturized sensors capable of continuously monitoring parameters such as pH, temperature, moisture, and bacterial load. The collected data is analyzed in real-time by AI algorithms to assess healing

ISBN: 978-81-980623-8-3

progression, detect early signs of infection, and predict complications. Based on these analyses, the bandage can release therapeutic agents such as antibiotics, growth factors, or anti-inflammatory drugs directly to the wound site, enabling personalized, responsive treatment. This intelligent system not only accelerates healing but also reduces the risk of secondary infections, minimizes unnecessary hospital visits, and optimizes clinical outcomes. Moreover, cloud-based data integration allows healthcare professionals to remotely monitor patients, enhancing telemedicine and home-care capabilities. The combination of AI analytics, sensor technology, and targeted drug delivery positions smart bandages as a next-generation solution in wound management, aligning with the broader objectives of precision medicine and digital health innovation.

**Keywords:** smart bandages, wound care, chronic wounds, sensors, personalized medicine.

**AI-293**

**BREAKING BARRIERS WITH AI: ADDRESSING WEIGHT BIAS AND OPTIMIZING PUBLIC UNDERSTANDING OF GLP-1 MEDICATIONS**

Dipti A. Banerjee, Ujwal Vyas
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education and Research (Deemed to be University), Sawangi (Meghe), Wardha, Maharashtra, India – 442001
diptiban2004@gmail.com

GLP-1 receptor agonists, including Mounjaro (tirzepatide) and Ozempic (semaglutide), have demonstrated substantial efficacy in managing type 2 diabetes and obesity. However, public acceptance of these therapies is shaped not only by clinical outcomes but also by health beliefs and weight-related biases. This study examined how psychosocial factors influence perceptions of GLP-1 medications, revealing that stronger positive health beliefs foster more favorable attitudes, while weight bias contributes to skepticism and reduced willingness for adoption. Demographic moderators such as age, gender, and BMI further shaped these associations, emphasizing the need for inclusive strategies. Beyond these findings, the integration of artificial intelligence (AI) into pharmaceutical research and patient engagement offers a transformative path forward. AI-enabled predictive models can identify behavioural patterns, forecast adherence challenges, and customize educational interventions that directly address misconceptions and stigma. Moreover, AI-powered digital health platforms provide personalized education, interactive decision-support tools, and inclusive community spaces that empower patients to make informed health choices. By merging pharmacological efficacy with AI-driven innovation, the pharmaceutical sector can move beyond treatment to education and empowerment, dismantling barriers of bias and misinformation. This holistic framework repositions AI not merely as a technological tool but as a catalyst for social change, fostering equitable access, trust, and improved uptake of GLP-1 therapies.

**Keywords:** GLP-1 receptor agonists, tirzepatide, semaglutide, health beliefs, weight bias, artificial intelligence, patient empowerment, digital health.

**AI-294**

**HARNESSING AI FOR NEXT-GENERATION NATURAL AND HERBAL PRODUCT DISCOVERY**

Bhavani Reddi, S.Kiranmai, D.UmaSankar
Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili, Affiliated By A.U, India-257537
bhavanireddi42@gmail.com

AI-driven screening methods are transforming the discovery of therapeutic compounds from natural and herbal sources by overcoming traditional limitations such as structural complexity and high costs, enabling rapid and accurate identification of bioactive molecules through techniques like machine learning, deep learning, and network pharmacology. By leveraging extensive databases and natural language processing, AI facilitates virtual screening, uncovering novel compound-target interactions, predicting ADMET properties, and analyzing multi-component herbal formulations for synergistic effects, thus accelerating the development of standardized, safe, and effective herbal therapeutics. This innovative integration of AI with traditional medicine not only enhances efficiency and reduces costs but also broadens the potential for evidence-based phytopharmaceuticals, addressing modern healthcare challenges with a promising, more precise approach.

**Keywords:** Artificial Intelligence (AI), Machine Learning, Deep Learning, Network Pharmacology, Virtual Screening, Natural Products, Herbal Medicine, Bioactive Compounds, Compound-Target Interaction, ADMET Prediction, Synergistic Effects, Phytopharmaceuticals, Standardization, Drug Discovery, Evidence-Based Medicine.

**ARTIFICIAL INTELLIGENCE IN THE PHARMACEUTICAL RESEARCH**

Shashikant Chandrakar
Columbia Institute of Pharmacy, Tekari, Raipur (Chhattisgarh) 493111, India
shashikant.py@gmail.com

Artificial intelligence (AI) transformed the pharmaceutical research. Drug development can be a lengthy and complex process; however, with AI assistance, this time can be greatly minimized. The pri
mary benefits of AI in pharmaceutical formulation lie in its ability to process large datasets and identify patterns and relationships that human researchers might overlook. Different tools and technologies, including ANN, fuzzy logic, neuro-fuzzy logic, and genetic algorithms, are employed for data analysis, with ANN being the most widely used and recognized. AI facilitates the identification of new pharmacological targets and the development of more effective drugs. AI can also be utilized to enhance medication formulations by predicting the solubility, stability, and bioavailability of drug candidates, thereby boosting the chances of successful clinical trials. AI is utilized in the design of clinical trials, minimizing both the time and expenses involved by pinpointing patient groups that are most likely to gain from the treatment. Moreover, AI has the capability to observe patients in clinical trials, identifying real-time side effects and modifying dosages to enhance patient results.

**Keywords:** Artificial Intelligence, Pharmaceutical Research, Pharmaceutical formulation.

**AI-296**

**DEMONSTRATION OF EFFECTIVE INDIGENOUS ARTIFICIAL INTELLIGENCE BASED DRUG DESIGN AND DISCOVERY TOOLS.**

Shashikant V Bhandari1, Ganesh Waghule2, Satish Polshettiwar3, Ashwini R Madgulkar1

Drugdesign1@Gmail.Com

With the objectives to reduce, time, energy, efforts, cost involved and with improved precision in drug design and Discovery, AI tools are explored in this research work. Artificial Intelligence (AI) is transforming drug discovery by accelerating processes, reducing costs, and improving accuracy in predicting molecular behavior. The presentation highlights AI-based tools integrated into the comprehensive GEINFORCE platform, which streamlines precision medicine and complex drug discovery workflows. GeinBioPredictor employs machine learning to estimate molecular bioavailability, enabling optimization of lead compounds. GeinTox predicts molecular toxicity across multiple endpoints, ensuring early detection of safety issues. ForceADME evaluates pharmacokinetic properties—absorption, distribution, metabolism, and excretion—with high accuracy, facilitating reliable candidate selection. GeinMol uses de novo design to generate novel, target-specific molecules with optimized structures, enhancing lead identification. GeinDock Suite integrates AI-driven active site prediction and molecular docking, providing robust protein–ligand interaction analysis with user-friendly visualization. Beyond drug design, the platform incorporates supportive AI tools like the AI Detector for authenticity verification of AI-generated text and ForcePhrase, a natural language processing tool for accurate paraphrasing to improve scientific writing. Together, these solutions accelerate discovery while ensuring reliability, safety, and clarity in research. Overall, the PPT underscores how AI-powered innovations, through advanced predictive modeling and generative algorithms, are redefining pharmaceutical chemistry by addressing challenges in bioavailability, toxicity, pharmacokinetics, and novel molecule design.A detailed overview of AI tools for Drug Design and Discovery will be presented in the 74th IPC with Demonstrations.

**Keywords:** AI-based Drug Design, Discovery, GeinBio Predictor, GeinTox, ForceADME, Bioavailability, GeinMol, GeinDock.

## AI IN PHARMACOVIGILANCE: STRENGTHENING SAFETY AND RISK MANAGEMENT

Revu. Naga Praveen
Clinical research and pharmacovigilance, A.S.N. Pharmacy College, Burripalem road, Tenali, Guntur [Dt], Andhra Pradesh, India – 522201.
Praveenrevu570@gmail.com

Pharmacovigilance plays a critical role in ensuring the safety, efficacy, and quality of medicines throughout their life cycle. With the exponential growth of healthcare data, traditional pharmacovigilance systems often face limitations in timely detection, assessment, and prevention of adverse drug reactions (ADRs). The integration of Artificial Intelligence (AI) offers a transformative approach to strengthen safety monitoring and risk management in the pharmaceutical sector. AI-driven tools such as natural language processing, machine learning algorithms, and predictive analytics can rapidly analyze large datasets from clinical trials, electronic health records, and patient reports to identify potential safety signals with greater accuracy and speed. These technologies not only enhance decision-making for pharmaceutical managers but also reduce the burden of manual reporting and regulatory documentation. Furthermore, AI empowers healthcare professionals and patients by enabling proactive risk communication and personalized safety strategies. This highlights how AI in pharmacovigilance bridges education, innovation, and empowerment—equipping pharmaceutical management with smarter tools to safeguard public health and foster trust in the healthcare system.

**Keywords:** Pharmacovigilance, Artificial Intelligence, Adverse Drug Reactions, Risk Management, Drug Safety.

**AI-298**

## ARTIFICIAL INTELLIGENCE APPLICATIONS IN PHARMACY: AN INNOVATION PERSPECTIVE

Syed Khamarjaha
Department of Hospital, community and clinical pharmacy, A.S.N pharmacy college, Burripalem road, Tenali, Guntur (D.T), Andhra Pradesh, India -522201.
Khamarjahasyed03@gmail.com

Artificial Intelligence (AI) has emerged as a transformative solution for data-driven and computational challenges, catalyzing technological advancements across diverse fields—including engineering, architecture, education, accounting, business, and healthcare. In the healthcare sector, AI has significantly enhanced the storage and management of critical data such as patient medical histories, medication inventories, and sales records. Furthermore, AI-powered tools and systems, including automated machines and diagnostic technologies like MRI and CT scan applications, have revolutionized the delivery of medical care by improving accuracy and efficiency. The pharmacy sector, in particular, has experienced a surge in AI integration. Recent years have witnessed growing interest in the application of AI across key pharmaceutical domains, including drug discovery, dosage form design, polypharmacology, and hospital pharmacy operations. Recognizing the increasing importance of AI in pharmacy, this report aims to provide a comprehensive overview to equip practicing pharmacists with insights into the most impactful breakthroughs facilitated by AI technologies.

## AI AND NETWORK PHARMACOLOGY DRIVEN OPTIMIZATION OF VITAMIN D AND CALCIUM SYNERGY FOR COUNTERACTING MICROGRAVITY-INDUCED BONE LOSS

Tejal Deore, Shubhada Mangrulkar, Brijesh Taksande, Milind Umekar
Department of Pharmaceutical sciences, Smt.Kishoritai Bhoyar College of Pharmacy, Kamptee, Maharashtra, India - 441002
tejaldeore11@gmail.com

Long duration spaceflight induces bone loss in astronauts due to microgravity based imbalances of bone resorption versus formation. The calcium and vitamin D (Vit D) supplements are standard to address this issue, However, its efficacy is limited by inter-individual differences in Vit D bioavailability and polymorphisms in the Vit D receptor gene. Motivated by recent attention based drug synergy AI frameworks such as MADSP, we have proposed an AI and network pharmacology based pipeline to optimize Ca + Vit D synergy for microgravity associated bone loss. Publicly available space-analog omics data (e.g. NASA GeneLab, drugComb, hind-limb-unloading models) were screened to identify microgravity responsive bone modeling genes and map them to VDR regulated pathways. A curated panel of Vit D analogs (calcitriol, eldecalcitol, paricalcitol) and candidate herbal bioenhancers was evaluated via in-silico molecular docking (e.g. PDB 1DB1, 4ITF) and fed into an AI based synergy scoring model that integrates dose response patterns and VDR polymorphism information. A simplified PK/PD simulation was performed to illustrate the potential for dose sparing regimens. Preliminary proof of concept analysis denotes that several microgravity perturbed bone genes overlap with VDR dependent pathways; that Vit D analogs such as eldecalcitol show stronger predicted binding (≈ –10 kcal/mol) than cholecalciferol; and that inclusion of a bio-enhancer may lower required Vit D analog doses by 15–20 %. This integrative strategy aims to educate the space medicine community on nutrient gene pathway links, innovate by applying AI and network pharmacology to predict synergy and empower both astronauts and osteoporosis patients on Earth with evidence based and personalized bone health interventions.

**Keywords:** Microgravity, Bone loss, Vitamin D, Network pharmacology, Artificial intelligence.

## "AI-POWERED MEDICATION ADHERENCE TOOLS: SMART PILLBOXES, REMINDER APPS, AND WEARABLE SENSORS FOR CHRONIC DISEASE MANAGEMENT"

AR.Reema Ashmi, A.Gayathri, T.Shri Vijaya Kirubha
Department of Pharmacy Practice, Mother Terasa College of Pharmacy, Illuppur – 622 102, Tamil Nadu.
ashmi2736@gmail.com

Medication adherence is a critical component of effective chronic disease management, yet non-adherence remains a major global healthcare challenge. Emerging artificial intelligence (AI)-powered tools—such as smart pillboxes, mobile reminder applications, and wearable sensors—are transforming how patients engage with their treatment regimens. These technologies utilize real-time data, predictive analytics, and personalized feedback to improve adherence and health outcomes. Smart pillboxes equipped with sensors can track pill dispensing, send alerts to patients or caregivers, and generate adherence reports for healthcare providers. Mobile apps with AI integration offer personalized reminders, monitor behavioural patterns, and provide adaptive interventions to encourage routine compliance. Meanwhile, wearable sensors continuously track physiological indicators and activity patterns, correlating this data with medication intake to detect and predict non-adherence events. Collectively, these tools not only support patient engagement but also enhance clinical decision-making and facilitate remote monitoring. Despite their promise, challenges such as data privacy, user acceptance, and integration with existing healthcare systems remain. Continued research and collaboration among stakeholders are essential to optimize their effectiveness and ensure equitable access. AI-powered adherence tools represent a significant advancement in chronic disease management, offering scalable solutions to improve patient outcomes and reduce healthcare costs.

**Key words:** Medication adherence, Wearable sensors, Digital health, Remote Monitoring, Healthcare technology.

## "ARTIFICIAI INTELLIGENCE-POWERED DIAGNOSIS OF SKIN RASHES: "ADVANCING DERMATOLOGICAI CARE"

Gottapu manasa, D.Durga Prasad, C. Krishnaveni
Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili Au India-53558
gottapumanasa0@gmail.com

Skin rashes are common dermatological condition with multiple causes, including allergies, infections, autoimmune disorders, and adverse drug reactions (ADRs). Accurate and timely diagnosis is critical for effective treatment and prevention of complications. Artificial Intelligence (AI) has shown great potential in dermatology by applying machine learning and deep learning algorithms to analyze skin images, patient history, and

ISBN: 978-81-980623-8-3

laboratory data. Artificial Intelligence powdered diagnostic tools can distinguish between different types of rashes such as eczema, psoriasis, urticaria, and drug-induced eruptions with high accuracy. In the pharmacy domain Artificial Intelligence plays a vital role in detecting rashes caused by ADRS, supporting pharmacovigilance, and assisting pharmacists in drug selection and dosage adjustment. Teledermatology integrated with Artificial Intelligence allows pharmacists and healthcare professional to provide early intervention and personalized tools can distinguish between different types of rashes such as eczema, psoriasis, urticaria, and drug-induced eruptions with high accuracy. In the pharmacy domain, Artificial Intelligence plays vital role in detecting rashes caused by ADRs, supporting pharmacovigilance, and assisting pharmacists in drug selection and dosage adjustment. Teledermatology integrated with Artificial Intelligence allows pharmacists and healthcare professionals to provide early intervention and personalized recommendations for patients in remote areas. Additionally, Artificial Intelligence-Driven electronic health records (EHR) systems enable monitoring of treatment outcomes and medication adherence. Thus, Artificial Intelligence-Based skin rash diagnosis enhances precision in dermatological care, supports safe drug use, and strengthens the role of pharmacists in patient-centered therapy.

**Keywords:** Artificial intelligence (AI), skin rashes, pharmacy, Dermatology, Adverse drug reactions.

**INTRODUCTION TO PYTHON LIBRARIES FOR AI IN DRUG DISCOVERY**

Alekhya Gondela , Srinivasa Rao Yarraguntla, Bhagavan Rajesh Babu Koppisetty
Department of Pharmaceutical Analysis, Vignan Institute of Pharmaceutical Technology, Visakhapatnam, Andhra Pradesh-530046, India.
galekhyarajini@gmail.com

The consolidation of artificial intelligence (AI) into pharmaceutical science has transformed the landscape of modern drug search, traditionally expanding time and resources requirement processes. Python along with the versatile ecosystem of his libraries, means the basics of developing AI-powered solutions for computational drug design and analysis. This paper introduces fundamental Python libraries-together with NumPy and Pandas for facts preprocessing, Scikit-learn for device learning modelling, TensorFlow and PyTorch for deep studying packages, and RDKit for cheminformatics-that together enable efficient coping with of complex molecular datasets. Emphasis is placed on how these libraries facilitate obligations together with molecular assets prediction, virtual screening, and shape–interest dating modeling. By imparting an on hand but powerful computational framework, Python empowers researchers to integrate AI methodologies with pharmaceutical information, thereby enhancing precision, decreasing experimental expenses, and expediting the discovery of novel therapeutic retailers. This highlights the pivotal position of Python libraries in bridging computational intelligence with drug discovery, aiming to encourage the adoption of AI-based totally strategies in pharmaceutical research and improvement.

**Keywords:** Python, Artificial Intelligence, Drug Discovery, Machine Learning, Deep Learning, Cheminformatics.

**"SMART PHARMACOLOGY: HOW AI IS PERSONALIZING MEDICINE"**

Dimple Yadav
Danteswari college of pharmacy Borpadar Raipur road Chhattisgarh

Traditional pharmacotherapy has long relied on a standardized "one-size-fits-all" approach, often overlooking the genetic, physiological, and environmental variability among patients. This can lead to suboptimal treatment outcomes, adverse drug reactions, and drug resistance. The integration of artificial intelligence (AI) into pharmacology has opened new horizons in the field of personalized medicine. By leveraging machine learning, big data analytics, and pharmacogenomics, AI systems can analyze patient-specific information such as genetic profiles, biomarkers, and electronic health records to predict individual drug responses with high precision. AI applications in personalized pharmacology include dose adjustment based on pharmacokinetic modeling, early identification of adverse drug reactions, and the design of precision oncology treatments where AI helps select the most effective drug regimen for cancer patients. Additionally, AI can support drug repurposing by identifying novel therapeutic uses for existing medications, particularly in rare or complex diseases. Future developments may include AI-driven "digital twins" of patients and integration with wearable health devices to enable real-time therapy adjustments. Thus, smart pharmacology powered by AI represents a paradigm shift, aiming not only to enhance therapeutic efficacy but also to ensure patient safety, reduce healthcare costs, and ultimately improve quality of life.

**AI-304**

**ARTIFICIAL INTELLIGENCE FOR NEURODEGENERATIVE DISEASES DRUG DEVELOPMENT (ALZHEIMER'S, PARKINSON'S)**

HARSHRAJ CHETANSINH RATHOD
Department of Pharmaceutical quality assurance, SSR College Of pharmacy, Silvassa, Dadra and Nager haveli Diu and daman, 396230, India
rathodharshraj29@gmail.com

Artificial intelligence (AI) has emerged as a transformative tool in accelerating drug development for neurodegenerative diseases such as Alzheimer's disease (AD) and Parkinson's disease (PD). These disorders are characterized by complex pathophysiology, multifactorial etiology, and high clinical trial failure rates, making conventional drug discovery approaches both costly and time-consuming. AI-driven platforms enable the integration and analysis of multidimensional datasets, including genomics, proteomics, neuroimaging, electronic health records, and clinical trial data, to identify novel therapeutic targets and biomarkers. Machine learning and deep learning models are increasingly applied to predict disease progression, classify patients into subgroups, and optimize drug design through molecular docking, de novo compound generation, and virtual screening. Furthermore, AI enhances precision medicine by enabling patient stratification for clinical trials, reducing heterogeneity, and improving treatment response prediction. In neuroimaging, AI facilitates early diagnosis by detecting subtle brain changes that are often overlooked by conventional methods. Despite significant promise, challenges such as data quality, model interpretability, regulatory acceptance, and ethical considerations remain. Nevertheless, the integration of AI in neurodegenerative drug development offers a paradigm shift toward faster, cost-effective, and more personalized therapies, with the potential to improve outcomes for millions affected worldwide.

**Keywords:** Artificial intelligence, Alzheimer's disease, Parkinson's disease, drug development, machine learning, deep learning, biomarkers, precision medicine, neuroimaging, virtual screening.

**AI-305**

**UNLOCKING THE FUTURE OF MEDICINE WITH ARTIFICIAL INTELLIGENCE IN DRUG DISCOVERY**

Seher Momin, Rajat Sayyed,
MCES Dr. P.A Inamdar University.

Artificial Intelligence (AI) is no longer science fiction—it's transforming how new medicines are discovered. Traditional drug discovery takes over a decade and billions of dollars, but AI is helping scientists identify drug candidates faster, smarter, more precisely, and more cost-effectively. This study explores the role of machine learning, deep learning, and predictive algorithms in key drug discovery stages: target identification, molecular screening, protein modelling, and toxicity prediction. Tools like AlphaFold and AI-powered screening platforms were examined for their contributions. These applications have led to measurable advances in the efficiency and precision of drug discovery: Specifically, AI has significantly reduced the time to find active compounds, accurately predicted 3D protein structures, and enabled drug repurposing. AlphaFold, for example, solved complex protein folding problems that challenged researchers for decades. AI enables large-scale biological data analysis, reveals previously unseen patterns, and supports personalized medicine. Despite challenges like data quality and ethical concerns, AI is revolutionizing pharmaceutical research leading to faster cures, safer drugs, and a smarter future in medicine. AI is not just improving how we find drugs – it is shaping the next generation of precision medicine. By bridging biology and technology, AI is leading us toward a future of faster cures, safer drugs, and truly personalized treatments. Are we ready to embrace this AI-powered revolution in medicine?

ISBN: 978-81-980623-8-3

**Keywords:** Artificial intelligence, Machine learning, Drug Discovery, Protein Modelling (Alpha fold), Personalized Medicine.

***IN VITRO IN VIVO* CORRELATION WITH AI**

Purva Wankhade
P. R. Pote patil college of pharmacy Amravati

The integration of Artificial Intelligence (AI) into in vitro–in vivo correlation (IVIVC) is opening a new era of innovation in pharmaceutical research. Traditionally, IVIVC has been used to establish a predictive link between laboratory-based dissolution studies and real human pharmacokinetic outcomes. While useful, this conventional approach often struggles with biological variability, complex formulations, and lengthy experimental processes. AI offers ground breaking solutions to overcome these barriers. One of the most promising applications is the development of AI-driven virtual bioequivalence trials, where machine learning algorithms can simulate human drug absorption and predict formulation equivalence without the need for large-scale human studies. Similarly, digital twin models of the human gastrointestinal tract are being created using AI, allowing scientists to virtually test how drugs dissolve, release, and absorb in different physiological conditions. Another innovative approach lies in personalized IVIVC models, where AI integrates patient-specific variables such as genetics, age, microbiome, and disease state. This ensures more accurate predictions of drug performance across diverse populations, ultimately supporting the move toward personalized medicine. Additionally, real-time adaptive formulation design powered by AI can optimize excipients, coating parameters, and particle size automatically until the most suitable IVIVC fit is achieved. Future innovations also involve linking IVIVC with wearable biosensors, which continuously monitor drug levels in the body. AI can instantly analyse this data, refining predictive models in real time and providing a dynamic feedback loop between lab and clinic. Overall, the fusion of IVIVC with AI is not just about faster predictions—it represents a paradigm shift toward smarter, personalized, and cost-effective drug development, ensuring safer medicines reach patients more efficiently.

**AI IN PHARMACY**

Ishika D. Pakade, Pankaj H. Chaudhary, Dipti B. Ruikar.
P. R. Pote Patil College of Pharmacy, Amravati, Maharashtra 444603.

Artificial Intelligence (AI) is emerging as a game-changing technology in the pharmaceutical industry, offering novel solutions to critical challenges across the drug development and healthcare spectrum. Traditionally, pharmaceutical research and manufacturing are time intensive, costly, and highly complex processes. By integrating AI, companies can accelerate innovation, improve efficiency, and support data-driven decisions that enhance both scientific and clinical outcomes. In the early stages of drug discovery, AI-driven algorithms assist in high-throughput compound screening, prediction of molecular properties, and quantitative structure–activity or structure–property relationship (QSAR/QSPR) modeling. These approaches not only reduce experimental costs but also facilitate de novo drug design with optimized therapeutic potential. Beyond discovery, AI contributes significantly to formulation development, clinical trial design, and patient specific treatment strategies. Machine learning models, robotic systems, and automated manufacturing execution platforms ensure compliance, process transparency, and consistent product quality. In hospital and clinical settings, AI improves drug supply chain management, enhances medication adherence, enables personalized dosage adjustments, and supports epidemic prediction through large-scale data analysis. Recent applications also extend to poly pharmacology, controlled-release formulations, and precision medicine approaches for complex diseases such as cancer, neurodegenerative disorders, and cardiovascular conditions. Despite its transformative potential, the implementation of AI in pharmacy is not without limitations. High infrastructure and setup costs, limited technical expertise, ethical concerns, and data privacy issues present significant hurdles to widespread adoption. Nevertheless, with advancements in machine learning, neural networks, and collaborative research, AI is poised to reshape the pharmaceutical industry. This review emphasizes the growing role of AI as a catalyst for innovation in pharmaceutical research, manufacturing, and healthcare delivery, ultimately aiming to improve efficiency, reduce costs, and ensure better patient outcomes.

**AI-308**

**AI-ENABLED PHARMACOVIGILANCE HARNESSING BIG DATA FOR DRUG SAFETY**

Mohammad Anwash Mohammad Ashfaque
P. R. Pote Patil College of Pharmacy, Amravati, Maharashtra 444603.

Pharmacovigilance, the science of detecting and preventing adverse drug reactions (ADRs), is essential for patient safety. Traditional approaches depend on manual reporting, voluntary submissions, and retrospective reviews, which are slow, incomplete, and often delayed in identifying safety signals. With increasingly complex therapeutics and vast real-world data sources, these methods face major limitations. Artificial intelligence (AI) is emerging as a transformative tool to address these challenges. By leveraging big data from electronic health records, clinical trials, patient registries, social media, and scientific literature, AI enhances drug safety monitoring. Natural language processing (NLP) can analyze unstructured text from medical notes or online health forums to identify unreported ADRs, while machine learning algorithms reveal hidden patterns in datasets, predicting drug–drug interactions and safety risks beyond the reach of traditional methods. This predictive capability enables early intervention and helps prevent large-scale health issues. In addition, AI-driven systems increase efficiency by automating triage, coding, and data cleaning, reducing workload and enabling faster regulatory decisions, recalls, and reporting. Integration of AI further supports precision medicine by tailoring risk assessments to individual genetic profiles, comorbidities, and medication histories. However, challenges persist, including concerns around data privacy, transparency, algorithmic bias, and the need for regulatory harmonization across regions. Overcoming these issues requires collaboration among regulators, pharmaceutical companies, and technology developers. Ultimately, AI-enabled pharmacovigilance represents a shift from reactive to proactive safety surveillance, strengthening healthcare systems, accelerating ADR detection, and advancing patient protection.

**Keywords:** Pharmacovigilance, Adverse drug reactions (ADRs), Drug safety monitoring, Artificial intelligence (AI), Big data analytics, Machine learning, Natural language processing (NLP), Predictive modelling, Electronic health records (EHRs), Drug–drug interactions, Precision medicine, Regulatory challenges.

**THE IMPACT OF ROBOTICS ON SURGERY AND REHABILITATION**

Tejal Pravin Lokhande
Datta Meghe College of Pharmacy, Sawangi (Meghe), Wardha,442001.

This article examines the impact of robotics in surgery and rehabilitation. Robotics is an interdisciplinary topic that deals with the design, building, use, and the use of robots. The use of robotics in healthcare has gone a long way since the 1980s when mechanical robots were initially utilized in surgical settings. Today, robots are used in many specialized scientific domains, automating many operations and bringing enormous benefits. Robotic surgery is a minimally invasive procedure, where a robotic equipment is used to do the surgery. Robotic surgical systems have made considerable gains in lowering surgery time, improving therapy, and increasing surgical success rates Robotic rehabilitation is a fast-expanding field that involves the use of robotic technology for support for rehabilitation and progress in medicine. Robotic-assisted therapy can offer many advantages over traditional methods, including a structured training environment, assistance with transitions, and the ability to increase the volume and volume of treatment, Table 1 history of robotics in healthcare physical burden and it lies on physicians as well as examples of robotic surgery systems for rehabilitation are also included in the article. Benefits of maintenance robots include continuous training, improved productivity and availability, tailored training environments, adaptable support, increased strength and volume, reduced physiological stress on doctors, and enhanced drive to learn.

**Keywords:** Robotics, surgery, Rehabilitration, robotic surgery, Senhance surgical system.

**AI-310**

**WILL USE OF ARTIFICIAL INTELLIGENCE SPPED UP THE REGULATORY DECISIONS MAKING IN INDIA?**

ISBN: 978-81-980623-8-3

Bhimjiyani Nehal, Esha Vishwakarma, Anil M Pethe
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education & Research Sawangi (Meghe) Wardha, Maharashtra, India
nehalbhimjiyani99@gmail.com

The Indian regulatory decision-making process has traditionally been characterized by in-depth data review, manual evaluation, and multi-level authorization across pharmaceutical, medical device, and food sectors to ensure safety and efficacy. However, this conventional compliance process often involves time-consuming manual tasks, which can lead to inefficiencies, delays in product approval, and reduced patient access to medical advancements. The emergence of artificial intelligence (AI) offers an opportunity to accelerate these processes by enabling informed, evidence-based decisions supported by large datasets. Using machine learning and advanced analytical tools, AI systems can rapidly process regulatory submissions, identify inconsistencies, and prioritize high-risk cases more efficiently than human reviewers. In areas such as pharmacovigilance and clinical trial assessment, AI can quickly detect potential adverse event signals by analysing real-world data, simplify protocol evaluation, track patient safety, and validate statistical findings. This can shorten approval timelines while preserving scientific integrity, fostering innovation, and safeguarding patient well-being. Integrating AI into Indian regulatory agencies such as the Central Drugs Standard Control Organization (CDSCO) and the Food Safety and Standards Authority of India (FSSAI) could therefore significantly modernize and streamline the regulatory ecosystem.

**Keywords:** Artificial Intelligence (AI), CDSCO (Central Drugs Standard Control Organization), FSSAI (Food Safety and Standards Authority of India).

**AI-311**

## AI IN CADD IN GENE THERAPY FOR INHERITED AND INFECTIOUS DISEASES

Aarthi Priya Odalla
Avanthi Institute of Pharmaceutical Sciences, Gunthapally, R.R, Telangana-501512
oaarthipriya@gmail.com

AI is emerging as a powerful tool in CADD for gene therapy and transforming CADD by integrating multi-omic, structural, clinical data that accelerates development of gene therapy for inherited and infectious diseases. Target identification, de novo design of therapeutic molecules, in-silico screening of candidates that modulate gene expression, complement defective genes have been supported by advanced machine learning, deep learning models. Rational engineering of viral and non-viral vectors, including optimized adeno-associated virus capsids with improved tissue tropism, immune evasion and gene delivery packaging efficiency has been enabled by AI-driven sequence and structure prediction. In monogenic inherited disorders, patient specific genomic variants with structural information regarding affected gene products that guides the design of gene-replacement vectors, base-editing or prime-editing strategies and modulatory small molecules that restore or compensate for dysfunctional pathways can be integrated with AI and CADD. The risk of insertional mutagenesis, immunogenicity and systemic toxicity are reduced by using AI-enhanced off target prediction tool, ADMET models which evaluates safety and delivery profile of viral and non-viral vectors, gene-editing nucleases and accessory drugs. For infectious diseases, rational design of antimicrobial gene therapies targeting essential pathogen genes, host-pathogen interaction interfaces, host factors required for replication are assisted by AI-supported CADD. AI-driven CADD helps in creating safe, effective, and precision-based gene therapies for inherited and infectious diseases.

**Keywords:** CADD, gene therapy, AI.

**AI-312**

## TRANSFORMING PHARMACEUTICAL INNOVATION THROUGH ADVANCED DATA ANALYTICS AND DIGITAL INSIGHTS

Aniket Urkude
Bharati Vidyapeeth College of Pharmacy, Belapur, Navi Mumbai, Maharashtra, India – 400614
aniketurkude1705@gmail.com

The speed at which new medicines are being developed is increasing quickly because of better use of data and digital tools. These tools are changing how drugs are discovered, made, and given to patients. By using data-focused methods, drug companies can now gather and understand a lot of different kinds of information—from genetic data and early lab tests to clinical trial results, real-life patient data, and medical records. This helps them make better predictions, find better drug options faster, and shorten the time it takes to bring new medicines to market. Using AI, machine learning, and big data, companies can study complex biological information, predict how drugs will work in the body, and how patients will respond, which improves both the effectiveness of treatments and the chances of successful products. In addition, using digital systems like the Internet of Things, cloud computing, and advanced digital tools has created more connected, flexible, and teamwork-based ways to do research and make medicines. These systems allow for smooth, real-time data gathering, analysis, and sharing, which helps track clinical trials and production processes better. They also increase transparency in the supply chain and support smarter decisions based on data. Also, using modern DataOps and MLOps practices helps automate data sharing, making sure data is consistent, integrated, and scaled properly. This ensures that useful, clear insights are available at every step of the process of making and delivering medicines.

**Keywords:** Data analytics, Artificial intelligence (AI), Machine learning (ML), Digital technologies, pharmaceutical innovation, DataOps, MLOps.

**AI-313**

## ORODISPERSIBLE FILM OPTIMIZED USING AI-BASED FACTORIAL DESIGN

Appikatla Raga Rithvika, Pisipati. Aparna
Department of pharmaceutics, NRI College Of Pharmacy, Pothavarapadu, Agiripalli, Eluru district-521212
Rithvika3004@gamil.com

Orodispersible films (ODFs) have emerged as a patient-friendly drug delivery system offering rapid disintegration, enhanced compliance, and improved therapeutic efficacy, especially for pediatric and geriatric populations. The present study focuses on the development and optimization of a fast-dissolving orodispersible film using an AI-assisted factorial design approach. A model drug was incorporated into a polymeric film matrix prepared by the solvent-casting technique using hydroxypropyl methylcellulose (HPMC E5) as the primary film-forming polymer, PEG-400 as a plasticizer, and suitable superdisintegrants such as Pregelatinized Starch (Starch 1500) to enhance rapid dispersion. An AI-based optimization model integrating factorial design, response surface methodology, and machine learning prediction (Artificial Neural Network) was employed to evaluate the influence of polymer concentration, plasticizer level, and superdisintegrant ratio on critical film attributes. Key responses such as disintegration time, tensile strength, drug content uniformity, and film flexibility were predicted with high accuracy. The AI-optimized ODF exhibited a disintegration time of <15 seconds, excellent mechanical strength, and uniform drug distribution. In-vitro dissolution demonstrated more than 85% drug release within 5 minutes, confirming the film's suitability for quick absorption. This study demonstrates the potential of AI-driven formulation design to accelerate development, reduce experimental workload, and achieve superior product performance compared to conventional optimization methods.

**Keywords:** Orodispersible film, Artificial Intelligence, Factorial design, Machine learning optimization, Rapid disintegration.

**AI-314**

## AI-AUGMENTED WEARABLE BIOMARKERS FOR MONITORING ANXIETY AND OPTIMIZING ANXIOLYTIC PHARMACOTHERAPY

Arati Tiwari, Brijesh Taksande, Milind Umekar, Madhura Vinchurney
Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India
aratitiwari0505@gmail.com

Anxiety disorders remain highly prevalent yet often underdiagnosed due to reliance on subjective self-reporting and limited access to mental health specialists. Advances in wearable technology now allow continuous monitoring of physiological markers such as heart rate variability, galvanic skin response, respiratory rate, sleep architecture,

ISBN: 978-81-980623-8-3

and daily activity patterns. When analysed using artificial intelligence (AI) and machine learning algorithms, these real-time data streams can reveal subtle autonomic and behavioural changes associated with evolving anxiety states. This work highlights the growing potential of AI-augmented wearable biomarkers in assessing and optimizing pharmacotherapy for anxiety. Emerging evidence demonstrates that improvements in HRV, sleep stability, and activity rhythms correlate well with therapeutic response to SSRIs and SNRIs, while wearable-based monitoring can also detect benzodiazepine-related over-sedation, beta-blocker–induced bradycardia, and early activating effects of antidepressants. AI models further enhance clinical decision-making by predicting likely responders to specific anxiolytic classes, identifying early relapse indicators, and supporting data-driven, individualized treatment adjustments. Together, these innovations position AI-enabled wearable systems as powerful tools for objective anxiety assessment and personalized drug therapy optimization. Their integration into pharmacy practice can enhance monitoring accuracy, improve safety outcomes, and strengthen pharmacist-led mental health care by bridging physiological data with therapeutic decision-making.

**Keywords:** Anxiety, Wearables, Artificial Intelligence, Heart Rate Variability, Anxiolytics, Pharmacotherapy, Digital Health.

**AI-315**

## TRANSFORMATIVE ROLE AND PROSPECTS OF AI IN PHARMACY EDUCATION: A TIER- WISE PERSPECTIVE ACROSS PHARMA HEIS IN INDIA

BLR Madhavi Dhanwantari College of Pharmacy,
Bengaluru- 560090, Karnataka, India
madhaviblr@gmail.com

Artificial Intelligence is reshaping pharmacy education by transforming instructional methods and strengthening competency-based learning. This paper discusses the role of AI in pharmacy academics, curriculum integration, learning management systems and pedagogical enhancement across various institutional tiers. AI tools complement adaptive learning platforms, automated assessments and virtual simulations; thereby improve conceptual clarity and help bridge gaps between students and educators. For teachers and academicians, AI supports content development, academic analytics and early identification of learning deficiencies. Institutional administrators can utilise AI-driven dashboards for monitoring academic performance, evaluating research, distributing workload and guiding strategic planning to reinforce outcome-based education. A tier-wise comparison across more than 4000 pharmacy HEI: Tier-1 institutions (7 NIPERs, universities) lead with AI-assisted laboratories and data-centric academic governance; Tier-2 colleges show moderate integration through LMS and digital instructional tools and Tier-3 institutions, limited by resources, remain in early adoption stages, though low-cost AI applications. National bodies including UGC (UGC Regulations, 2018) and NAAC (policy for negative marking) promote responsible AI use through plagiarism checks, publication ethics and research authenticity measures. Challenges such as content misuse, retractions and compromised originality underscore the need for ethical implementation, faculty training and awareness to ensure sustainable integration into the traditional educational system.

**Keywords:** Artificial Intelligence, Pharmacy Education, Academic Integrity, Tier-wise Comparison, Outcome-Based Education.

**AI-316**

## MACHINE LEARNING-GUIDED DEVELOPMENT OF CURCUMIN NANOEMULSION FOR ENHANCED BIOAVAILABILITY

Bandi. Aasritha, Pisipati. Aparna
Department of pharmaceutics, NRI College Of Pharmacy,
Pothavarapadu, Agiripalli, Eluru district-521212
aasritha262005@gamil.com

Curcumin is a natural polyphenol with proven antioxidant and anti-inflammatory properties; however, its therapeutic application is limited due to poor aqueous solubility and low oral bioavailability. Nanoemulsion-based delivery is a promising approach to enhance solubility and absorption. In this study, a curcumin nanoemulsion was developed using coconut oil (MCT) as the oil phase, Tween 20 as surfactant, and propylene glycol (PG) as co-surfactant to achieve a cost-effective, laboratory-feasible formulation. An AI-assisted optimization approach employing Machine Learning (Artificial Neural Networks) and Response Surface Methodology was used to identify optimal component ratios for minimal droplet size and improved stability. The optimized nanoemulsion showed a mean droplet size < 100 nm, low polydispersity index (< 0.3), and good thermodynamic stability. In-vitro release studies demonstrated enhanced dissolution compared to pure curcumin. Preliminary in-vivo evaluation suggested improved oral bioavailability, confirming enhanced absorption. The study demonstrates that AI-guided formulation design combined with low-cost excipient selection can effectively improve bioavailability and practicality for laboratory and academic research use.

**Keywords:** Coconut Oil; Tween 20; Propylene Glycol; Bioavailability; Drug Delivery.

**AI-317**

## SMARTPHONE-BASED NON-INVASIVE HEMOGLOBIN PREDICTION USING PHOTOPLETHYSMOGRAPHY AND ARTIFICIAL INTELLIGENCE

Shivani Bele
Department of Pharmacology, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, India
Shivanibele9763@gmail.com

Haemoglobin (Hb) is a vital biomarker for assessing blood oxygen-carrying capacity and detecting conditions such as anaemia. Conventional haemoglobin estimation methods are invasive, time-consuming, and require trained personnel and laboratory infrastructure. To overcome these limitations, this study proposes a smartphone-based non-invasive haemoglobin prediction system utilizing photoplethysmography (PPG) signals and artificial intelligence (AI) algorithms. The proposed approach leverages the smartphone camera and flash to capture PPG signals from the fingertip, extracting key optical features related to blood volume and oxygenation. Machine learning and deep learning models are trained on these features to predict haemoglobin concentration accurately. The system integrates data pre-processing, signal filtering, feature extraction, and predictive model optimization to ensure reliable estimation under varying lighting and skin conditions. This innovation enables real-time, affordable, and accessible haemoglobin monitoring without needles or external sensors. It holds significant potential for anaemia screening, remote health monitoring, and resource-limited settings, empowering users with personalized health insights. Future work includes clinical validation and integration with cloud-based AI systems for continuous health analytics and adaptive learning.

**Keywords**: Artificial Intelligence, Photoplethysmography, Haemoglobin Prediction, Non-Invasive Monitoring, Smartphone-Based Health.

**AI-318**

## ARTIFICIAL TECHNIQUES FOR DISEASE DIAGNOSIS AND PATIENT CARE

Dasam Akshitha, Vanga Sridhar, Raparla Ramakrishna
Vaageswari Institute Of Pharmaceutical Sciences, Karimnagar, Telangana-50552
dasamakshithaakshitha@gmail.com

The rapid advancement of artificial intelligence (AI) and computational technologies has greatly influenced the healthcare sector, particularly in disease diagnosis and patient care. By leveraging large volumes of clinical, imaging, and genomic data, AI-driven techniques such as machine learning, deep learning, and natural language processing enable more accurate and timely detection of diseases. These technologies assist healthcare professionals in interpreting medical images, predicting disease outcomes, and formulating personalized treatment plans. Furthermore, innovations such as medical robotics, wearable sensors, and virtual health assistants have improved patient monitoring, rehabilitation, and remote healthcare delivery. Despite challenges such as data privacy, algorithmic bias, and the need for standardized regulations, the integration of artificial techniques in healthcare continues to enhance diagnostic precision, patient safety, and overall healthcare efficiency. This paper discusses the various artificial techniques applied in disease diagnosis and patient care, emphasizing their applications, advantages, and challenges.

**Keywords:** Artificial Intelligence (AI), Disease Diagnosis, Patient Care, Medical Imaging, Predictive Analytics, Personalized Medicine, Healthcare Technology.

**AI-319**

ISBN: 978-81-980623-8-3

**DIGITAL PHARMACIST: LEVERAGING AI TO BRIDGE RESEARCH, EDUCATION, AND PATIENT CARE**

Gautam Verma, Pravin Kumar Sharma, Sweta S. Koka, G.N. Darwhekar
Acropolis Institute of Pharmaceutical Education and Research, Indore (M.P.) India–453771
gautamverma.mpceutices24@acroplish.edu.in

Pharmacists are evolving from conventional dispensers to tech-driven healthcare entrepreneurs as a result of the digital revolution. The three main pillars of pharmacy—education, research, and patient care—are now connected by artificial intelligence (AI) and digital tools, creating the foundation for the "Digital Pharmacist." To enhance learning, expedite research, and assist in clinical decision-making, this contemporary professional uses data intelligence, automation, and predictive analytics. Pharmacy education is changing from a theory-heavy curriculum to one that is interactive and skill-focused thanks to AI-powered virtual platforms, adaptive learning systems, and augmented reality simulations. Predictive algorithms, in silicomodeling, and machine learning in research provide quick drug-target screening, formulation optimization, and early adverse effect detection, which reduces drug development time and costs. Pharmacists can provide customized treatments, improve medication safety, and monitor adherence in real time with the help of pharmacogenomic databases, telepharmacy services, e-prescription analysis, and AI-powered clinical decision support systems. By combining multiple disciplines, AI empowers pharmacists to act as digital health strategists and provide efficient, patient-centered, and evidence-based pharmaceutical services. The emergence of the digital pharmacist signifies a major shift toward intelligent, networked, and technologically sophisticated healthcare systems.

**Keywords:** Artificial intelligence, Digital pharmacist, Pharmaceutical education, Drug research, Patient care, clinical Empowerment.

**AI-320**

**AI GUIDED CRISPR GENOME EDITING**

Honnur Ayesha
Avanthi Institute of Pharmaceutical Sciences, Gunthapally, R.R, Telangana-501512
hunnorayesha@gmail.com

The Clustered Regularly Interspaced Short Palindromic Repeats (CRISPR) - CaS9 system, which originates from prokaryotic adaptive immunity has been the precise and affordable technology for targeted genome editing. CRISPR depends on guide RNA to create a double strands break in specific genomic location by the help of CaS9 nuclease. The programmable modification of the genome are allowed by subsequent cellular repair mechanisms- Non-homologous End Joining [NHEJ] for gene knockout or Homologous Directed Repair [HDR] for gene insertion. CRISPR-CaS9 system has revolutionized genomic engineering but challenges persist in achieving precise, efficient and safe edits. The use of Artificial intelligence has been used to overcome the challenges in maximizing the safety and efficiency of CRISPR. AI analyse vast genomic and experimental database to precisely predict the efficacy of guide RNA design, and minimize detrimental off-target effects, and optimize efficient delivery systems. AI incorporates features such as guide RNA sequence composition, target chromatin accessibility, nucleosome positioning and local sequence context to train deep learning models. AI integration transforms CRISPR-Cas technology from a manual, trial-and-error process into a predictive, high-throughput platform. This AI-guided approach paves the way for accelerating basic research, facilitating the discovery of new therapeutic targets and ultimately improving the clinical translation of safer and more effective gene therapies

**Keywords:** Clustered Regularly Interspaced Short Palindromic Repeats (CRISPR), AI genomic engineering, guide RNA, deep learning models. Therapeutic gene therapy.

**AI-321**

**FROM TRADITIONAL TO DIGITAL: REDEFINING PHARMACY PRACTICE IN THE 21ST CENTURY**

Anitha.I, M.Prasada Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
anitaitla2@gmail.com

Pharmacy practice has undergone a significant transformation in the 21st century, evolving from traditional roles focused primarily on compounding and dispensing medications to dynamic, patient-centered, and technology-driven services. The integration of digital health tools—including electronic prescribing, telepharmacy, artificial intelligence, mobile health applications, and electronic health records—has redefined the pharmacist's role in improving accessibility, and quality of care. Traditional pharmacy practice emphasized face-to-face interactions and manual processes; however, modern digital advancements now enable pharmacists to provide remote consultations, medication therapy management, personalized patient education, and real-time monitoring of therapeutic outcomes. These innovations not only expand the pharmacist's scope of practice but also address challenges such as medication non-adherence, drug interactions. Despite these advancements, the transition to digital practice presents challenges, including data privacy concerns, technology adoption barriers, workforce training needs, and maintaining. Balancing traditional expertise with digital innovation is therefore crucial in ensuring optimal healthcare delivery. This paradigm shift signifies a redefinition of pharmacy as both a science- and service-oriented profession, positioning pharmacists as key stakeholders in digital health ecosystems. Ultimately, embracing digital transformation while retaining the core principles of traditional practice ensures that pharmacists remain indispensable in safeguarding public health in the 21st century.

**Keywords:** Pharmacy practice, digital health, telepharmacy, electronic prescribing, healthcare innovation.

**AI-322**

**AI-ASSISTED OPTIMIZATION OF ZOLMITRIPTAN MUCOADHESIVE NASAL IN-SITU GEL FOR RAPID MIGRAINE RELIEF**

Jonnalagadda. Deepthi Harika, Pisipati. Aparna
Department of pharmaceutics, NRI College Of Pharmacy, Pothavarapadu, Agiripalli, Eluru district-521212
jonnalagaddadeepthiharika@gmail.com

Migraine is a disabling neurovascular disorder requiring rapid therapeutic onset to alleviate acute symptoms. Nasal drug delivery provides faster systemic absorption and potential direct nose-to-brain access, thereby bypassing hepatic first-pass metabolism and reducing onset time compared to oral administration. In this study, a mucoadhesive thermosensitive zolmitriptan nasal in-situ gel was developed and optimized using AI-assisted experimental design (Response Surface Methodology / Artificial Neural Network) to achieve rapid onset with sustained drug release. Formulations were prepared using the cold method with Poloxamer 407 as the thermoresponsive gelling agent and Carbopol 934 as the mucoadhesive polymer, while PEG-400 acted as a solubilizer. AI-based optimization enabled identification of ideal polymer concentrations to attain suitable gelation temperature, viscosity, and mucoadhesion. The optimized formulation (2 mg/mL zolmitriptan) exhibited a gelation temperature of 31.5 ± 0.8°C, pH 5.8 ± 0.1, and desirable viscoelasticity for nasal administration. In-vitro release demonstrated an initial burst followed by sustained release up to 6 hours, following the Korsmeyer–Peppas model (n = 0.48), indicating diffusion-relaxation controlled release. Stability studies over 1 month showed no significant change. The AI-optimized formulation appears promising for fast-acting and prolonged migraine therapy.

**Keywords:** Zolmitriptan; Nasal In-Situ Gel; Mucoadhesive Drug Delivery; AI-Based Optimization.

**AI-323**

**ROLE OF AI IN PHARMACEUTICAL PRODUCT DEVELOPMENT**

Khushi Verma, Rudra Pratap Singh Rajput
Department of Pharmaceutics, Royal College of Pharmacy, Raipur – 492099, Chhattisgarh, India.
kv7213008@gmail.com

Artificial intelligence (AI) has been making a significant impact in various industries, including the pharmaceutical sector. AI can greatly improve the product development process, making it faster, more efficient, and more accurate. The pharmaceutical industry is constantly looking for new ways to improve the speed and efficiency of drug development. AI can help in this area by providing accurate data analysis, drug discovery,

ISBN: 978-81-980623-8-3

and drug development. AI can assist in discovering new drug targets and identifying new chemical compounds that can be used to treat specific diseases. AI algorithms can analyse vast amounts of data to identify new drug targets, predict side effects and interactions, and help to reduce the time and cost of the drug development process. AI can also help in optimizing the design of clinical trials and providing insights into patient populations. Implementation of AI can lead to better patient selection, improved patient outcomes, and increased efficiency in the drug development process. AI can also help in the optimization of drug manufacturing processes, leading to improved efficiency, better quality control, and reduced costs. The use of AI in pharmaceutical product development has the potential to revolutionize the way drugs are developed and manufactured, making it faster, more efficient, and more effective.

**AI-ENABLED PERSONALIZED TREATMENT RECOMMENDATION**

Komal Hajare, Shiwani Gawali, Latasha Thakur, Nishant Awandeka, Milind Umekar
Smt. Kishoritai Bhoyar College Of Pharmacy, Nagpur
komalhajare61@gmail.com

Artificial intelligence (AI) is reshaping the way personalized treatments are created and delivered in modern healthcare. By utilizing advanced data analytics and machine learning, AI algorithms can process patient-specific information such as genetic markers, electronic health records, and lifestyle habits to recommend therapies tailored to each individual. These technologies support clinicians in selecting the most appropriate drug, dosage, and care strategy, reducing adverse reactions and improving overall patient outcomes. Recent progress in integrating AI into clinical practice has enabled timely diagnosis and enhanced precision in managing conditions like cancer, neurological disorders, and chronic diseases. In pharmacy, AI-powered systems also help monitor medication adherence and predict potential health risks, allowing healthcare providers to proactively address challenges in patient care. Real-world applications showcase how these innovations move beyond generic guidelines, fostering informed decisions that match each patient's unique medical profile. While the use of AI offers significant benefits, it also raises important ethical, privacy, and implementation considerations. This poster explores the impact, opportunities, and limitations of AI-fueled personalized treatment recommendations in the pharmaceutical sector, emphasizing how these advancements empower pharmacists and clinicians to deliver safer, more effective, and individualized care

**AI-POWERED DRUG-DRUG INTERACTION PREDICTOR: DEVELOPMENT AND VALIDATION OF A MACHINE LEARNING MODEL FOR POLYPHARMACY MANAGEMENT IN GERIATRIC PATIENTS**

Vaijayantimala Palaniswamy, Sarmatha V, Lalith Kumar R, Kannan S, Sangameswaran Balakrishnan.
Ssm College Of Pharmacy, Department Of Pharmacy Practice, Erode, Tamilnadu, India.

Background: Elderly individuals aged 65 years and above who consume multiple therapeutic agents simultaneously face elevated vulnerability to harmful medication interactions, leading to heightened disease burden, hospital admissions, and escalating medical expenditure. Conventional manual verification approaches consume substantial time and remain susceptible to human mistakes, highlighting the necessity for automated computational intelligence frameworks. Objective: To construct and authenticate an artificial intelligence-driven prediction framework that can detect probable medication interaction scenarios among senior citizens undergoing concurrent multi-drug treatment regimens (five or more pharmaceutical agents). Pharmaceutical interaction intelligence will be extracted from recognized repositories such as DrugBank, PubChem, alongside peer-reviewed scientific publications. Computational learning frameworks, specifically Random Forest and Neural Network architectures, will undergo training using extensive medication interaction repositories encompassing in excess of 10,000 pharmaceutical combinations. Framework authentication will utilize computer-generated elderly patient medication profiles (n=500 scenarios) that mirror typical concurrent medication usage patterns. Assessment parameters will encompass precision rates, detection sensitivity, identification specificity, affirmative prediction reliability, and processing duration metrics. Results: The computational intelligence framework is projected to demonstrate precision exceeding 85% in forecasting medication interactions while maintaining instantaneous analytical capability (under 2-second processing per medication profile). The framework will deliver hazard categorization (minor, intermediate, critical interaction classifications) alongside evidence-based therapeutic guidance. Conclusion: This artificial intelligence-enhanced clinical support mechanism demonstrates promise in strengthening pharmaceutical safety protocols, minimizing preventable medication-related complications, and assisting hospital pharmacists in refining treatment outcomes for elderly individuals experiencing concurrent medication requirements.

**AI-ENABLED STANDARDIZATION AND REGULATORY HARMONIZATION OF HERBAL DRUGS: A NEXT-GENERATION PHARMACOGNOSY APPROACH**

Manasi M. Choudhari, Swati P. Deshmukh, Subhranshu Panda
Jaipur National University, Jaipur
Shraddha Institute of Pharmacy, Kondala Zambre, Washim, Maharashtra
Director, School of Pharmaceutical Sciences, Jaipur National University, Jaipur

Herbal medicines are a big part of healthcare around the world, but they aren't widely accepted by regulators because it's hard to standardize, authenticate, and ensure their quality. Traditional pharmacognosy methods rely heavily on manual evaluation, which can lead to variability and subjectivity. This study suggests an AI-enabled framework to change the way herbal drugs are standardized and regulated. By using artificial intelligence tools like deep learning for image-based authentication, machine learning for spectral data analysis, and natural language processing for regulatory text mining, the model improves reproducibility, traceability, and compliance with international guidelines (WHO, AYUSH, FDA, EMA). The integration of blockchain technology guarantees end-to-end traceability and transparent documentation. The suggested system facilitates the shift toward data-driven, precision-based herbal therapy by bridging the gap between conventional pharmacognosy and contemporary regulatory research. In the end, this next-generation "Smart Herbal Pharma 5.0" strategy lays the groundwork for herbal remedies that are both globally standardized and guaranteed to be of high quality.

**Keywords**: Artificial Intelligence (AI), Pharmacognosy, Herbal Drug Standardization, Regulatory Harmonization, Machine Learning, Deep Learning, Blockchain, Quality Control, WHO Guidelines, Smart Herbal Pharma 5.0.

**AI-327**

**AI-BASED DRUG DISCOVERY: *IN SILICO* DESIGN OF NOVEL MOLECULES, DUAL TARGETING OF EGFR AND MTOR PATHWAYS FOR TRIPLE-NEGATIVE BREAST CANCER**

Mandala Srivdya, Kalirajan Rajagopal
Department of Pharmaceutical Chemistry, JSS College of Pharmacy/JSS Academy of Higher Education and Research, Ooty, The Nilgiris, India - 643001
vidyasri463@gmai.com

Triple-negative breast cancer (TNBC) lacks ER, PR, or HER2 receptors, which makes it challenging and gives a poor prognosis. Additionally, EGFR overexpression and mTOR hyperactivation boost tumour growth and resistance in monotherapy; this study focuses on the in-silico development of novel molecules as dual EGFR–mTOR inhibitors to address obstacles and enhance therapy efficacy for TNBC. The objective is to identify and computationally assess new small-molecule inhibitors, can simultaneously target EGFR and mTOR to enhance antitumor efficacy against TNBC. A series of novel substituted acridine derivatives

ISBN: 978-81-980623-8-3

is evaluated through molecular docking, molecular dynamics (MD) simulations, and ADMET profiling by using the Schrodinger suite 2025-2. Molecular docking of designed scaffolds was performed against the EGFR (PDB ID: 7U99) and mTOR (PDB ID: 4DRH) by using the Glide module. Top molecules were analysed for molecular dynamics studies to identify the most promising candidates by using the Desmond module. Molecular docking and dynamics studies revealed that novel molecules showed strong binding affinity at the binding sites of both targets, with stable RMSD and RMSF profiles. ADME predictions showed good drug-likeness, stability, and bioavailability, indicating promising potential for effective TNBC inhibition. The designed molecules as dual EGFR-mTOR inhibitors showed favorable outcomes against TNBC. These findings enable the development of next-generation multi-targeted therapies and support further experimental validation.

**Keywords:** TNBC, mTOR, EGFR, Dual inhibitors.

**AI-328**

**SMART RINGS: THE FUTURE OF WEARABLE BIOSENSORS FOR CONTINUOUS HEALTH MONITORING AND PERSONALIZED WELLNESS**

Manepalli Pranathi krishna, I.V. Ramarao
Department of Pharmaceutics, NRI College of Pharmacy, Pothavarappadu, Agiripalli Mandal, Eluru District, Andhra Pradesh, India -521212.
pranathikrishna.manepalli@gmail.com

A smart ring is a wearable technology device where a person can wear it to their fingers just like a finger ring that incorporates the sensors and mobile technology which offers various functions like health tracking, contactless payments and one can receive any of the notifications if he/she is not carrying mobile with them. The 1st smart ring discovered is NFC (Near Field Communication Ring) which is launched in 2013 by a British company McClear. As our fingers contain abundant number of blood vessels and nerve endings, it is very easy for the smart rings to track and amplify / modify our daily day to day activities by using biosensors. This phenomenon is also known as "Photoplethysmography". Photoplethysmography (PPG) is a non-invasive optical technique that uses light to measure blood volume changes in tissue microvascular bed, typically by illuminating the skin with a light emitting diode (LED) and measuring light absorption with a photo detector. Smart rings help improve your sleep cycle by tracking your sleep stages, which in turn helps adjust your biological clock. They also encourage a healthier lifestyle by motivating you to exercise and go for daily walks. This activity helps you burn calories. Smart rings don't directly boost your immune system, but they help by providing you with the data and insights you need to make lifestyle choices that support a healthy immune response. Smart rings are great for everyone, not just for people who are obese. Smart rings help lower stress by tracking your stress levels and offering tips for relaxation. They also encourage better eating habits by guiding you toward nutritious food options. Ultimately, these devices are a great way to support a healthier life. For women, smart rings are a valuable tool because they track menstrual cycles, helping them stay informed about their period dates. The rings also monitor key health metrics like blood oxygen levels and skin temperature.

**Keywords:** Smart ring, NFC, McClear, Biosensors, Photoplethysmography

**AI-329**

**THE AI TRANSFORMATION OF PHARMACOVIGILANCE: LEVERAGING REAL-WORLD DATA FOR PROACTIVE RISK MANAGEMENT ENHANCING SAFETY SIGNAL DETECTION AND POST-MARKET SURVEILLANCE THROUGH DIGITAL TOOLS**

Mohammed Shariq
Department of Pharmaceutical Sciences, Vaageswari College Of Pharmacy,karimnagar, Telangana, India- 505001.
mohammedshariq153@gmail.com

Pharmacovigilance (PV) is critical for ensuring drug safety throughout a product's lifecycle. Traditional systems, reliant on spontaneous reporting, suffer from underreporting, inconsistent data quality, and time-intensive manual review. The digital revolution has generated an unprecedented volume of unstructured Real-World Data (RWD), necessitating the adoption of advanced computational tools. This necessitates a transition of PV from a reactive surveillance system to a proactive safety science. This study examines the transformative application of Artificial Intelligence (AI) and Machine Learning (ML), particularly Natural Language Processing (NLP) and Deep Learning models, to enhance the PV workflow. We focus on three critical areas: (1) Automated Case Processing: Using NLP to extract, standardize, and accurately code adverse drug reaction (ADR) information from unstructured documents, including Electronic Health Records (EHRs) and literature, thereby improving regulatory compliance speed. Proactive Signal Detection: Employing advanced ML algorithms to conduct high-throughput, disproportionality analysis across petabytes of aggregated RWD, including claims data and social media, to detect subtle, emerging safety signals. Risk Prioritization: Utilizing predictive models to stratify detected signals based on potential patient impact and severity, allowing safety teams to focus resources effectively. Implementation of these AI/ML tools has demonstrated a compelling 75% reduction in manual review time for case intake and coding, yielding significant operational efficiencies. Furthermore, advanced signal detection models applied to large EHR cohorts successfully identified critical safety concerns (e.g., specific cardiovascular risks) up to six months earlier than conventional methods.

**Keywords:** Artificial Intelligence (AI), Pharmacovigilance (PV), Real-World Data (RWD), Machine Learning (ML), Natural Language Processing (NLP), Signal Detection, Drug Safety.

**AI-DRIVEN PHARMACOVIGILANCE: MINING SOCIAL MEDIA AND ELECTRONIC MEDICAL RECORDS FOR EARLY DETECTION OF ADVERSE DRUG EVENTS**

Mrudula chamarthi , Pranavi Badithala, Pedapudi Prasanna Kumar
Vignan Institute of Pharmaceutical Technology, Visakhapatnam, Andhra Pradesh- 530046, India.
dr.mrudulaprasad@gmail.com

Traditional spontaneous reporting is slow and under-ascertains adverse drug events (ADEs). Real-world text sources (social media, EMRs/EHRs) coupled with modern AI offer scalable early-warning capabilities. To synthesize contemporary AI approaches that detect ADEs from social media and clinical narratives, evaluate their performance, and identify operational gaps for deployment. We reviewed recent studies (2012–2025) reporting AI/NLP use on social media, EMRs, pharmacovigilance databases and hybrid sources. Extracted metrics: model class, datasets, performance (F1/AUC), deployment examples, and practical limitations. Transformer-based models (BERT, Bio BERT, Clinical BERT, XLM) and ensemble/deep-learning pipelines dominate recent gains, achieving F1/AUC ranges of ~0.78–0.97 across social and clinical corpora. Hybrid fusion of social media with formal reports improved recall by up to ~25% and flagged signals weeks earlier than regulatory systems; hospital electronic triggers reported up to 13-fold increases in detected ADEs versus voluntary reporting. Explainable and interpretable models improve clinical acceptability but often trade off peak performance. Major barriers: labelled data scarcity, domain adaptation, multilingual and non-English performance, validation heterogeneity, privacy/regulatory constraints, and need for prospective evaluation. AI-driven pharmacovigilance reliably augments traditional systems by accelerating signal detection and broadening coverage to patient-reported experiences. Priority next steps are standardized benchmarking, domain adaptation for diverse languages/populations, privacy-preserving architectures, and prospective real-world validation to translate promising algorithms into regulatory-grade surveillance.

**Keywords:** Pharmacovigilance, Adverse Drug Events (ADEs), Natural Language Processing (NLP), Social Media Surveillance, Electronic Health Records (EHRs).

Vaageswari Institute of Pharmaceutical Sciences, Karimnagar, Telangana-505527
nagunurinandhini0@gmail.com

Clinical trials play a vital role in bringing new drugs, technologies, and treatments into medical practice, yet only about 10% of trials successfully progress through all phases due to high costs and

ISBN: 978-81-980623-8-3

complexity. This low success rate impacts public health, standard treatments, and healthcare sustainability. Artificial Intelligence (AI) offers potential solutions by improving patient selection, matching, and enrollment, thereby reducing treatment-related risks and inefficiencies. However, the full integration of AI into clinical trials still faces significant challenges and demands further high-quality validation. This review highlights the future potential of AI in enhancing clinical research and patient care.

Machine learning (ML) is becoming pivotal to personalized medicine through its capability to enable data-driven, patient-specific therapy that optimizes the efficacy of therapy and minimizes side effects. In healthcare systems moving toward sustainability and precision, ML offers a solid platform for facilitating green treatments. With advanced data sets including genomic, electronic medical records, and behavior, ML algorithms allow customized selection of drug, dose, and treatment duration according to the specific needs of each patient with less drug abuse and wastage of health. Predictive analytics minimizes trial-and-error prescribing, lowering pharma manufacturing, shipping, and waste disposal environmental footprint. It not only improves patient outcomes but also environmental sustainability objectives through effective utilization of resources in clinical practice. ML also facilitates green drug discovery by selecting medicines with good safety and efficacy profiles early in the drug development pipeline and minimizing unnecessary use of animals and failed clinical trials. While promising, the interaction between sustainable personalized medicine and machine learning is not challenge-free such as model interpretability, data privacy, and worldwide availability of AI technology. Mitigation of these challenges is imperative in the realization of a patient-centered and sustainable healthcare system. In the paper, the interaction between personalized medicine, machine learning, and sustainability with current innovations, applications, and potentialities is depicted

**AI POWERED DIGITAL EDUCATIONAL TOOLS FOR STUDENT ANALYTICS AND EFFECTIVE ASSESSMENT**

Payal Rahul Dande
School of Pharmaceutica Science, Faculty of Health Science, JSPM University, Pune-412207, India
drpayaldande@gmail.com

The integration of Artificial Intelligence (AI) into education has empowered the traditional pedagogical approaches, with AI-powered digital tools that foster interactive, student-centred learning and assessment. It is said to address the current problems of students having low engagement, and attention deficit. Research was carried to evaluate the effects of the AI Tools such as Socrative and Evalbee on student engagement and academic performance in formative and summative assessment of the students. The project involved two divisions with 60 students each of Semester V. In one division, conventional pedagogical tools were used and, in another division, AI assisted tools were used for learning and evaluation. Continuous feedback and reminder session were taken for both the groups. The study assessed student engagement by percentage involvement, student interaction and real-time feedback of students in class. The effect was evaluated by comparing the formative and summative assessment of the students for both divisions. The study excluded the students who remained absent for more than 25% of regular learning period. The AI assisted formative assessment was able to improve student engagement by 50% and student performance by 30%. The students with conventional teaching showed 40 and 60% while the students taught with the use of AI tools showed better engagement with 80 and 70% performance in the formative and summative subjective assessment. The ABC classification was utilized to evaluate the performance of students in internal continuous evaluation. There was 15% increase in category A students scoring more than 80% marks. The above study showed that these AI powered intelligent tools are able to enhance learner engagement, ensured active participation and provide instant feedback to promote formative assessment through data-driven insights for future educational goals.

**FACULTY PERCEPTION ON THE ROLE OF ARTIFICIAL INTELLIGENCE (AI) IN PHARMACEUTICAL EDUCATION AND ITS INTEGRATION IN THE NEW PCI PROPOSED CURRICULUM: A SURVEY**

Pearl Dighe, Mangirish Deshpande
PES's Rajaram and Tarabai Bandekar College of Pharmacy, Farmagudi

The present study employed a non-probability convenience sampling method to collect data from pharmacy teachers across various institutions. A structured questionnaire was developed using Google Forms and shared through professional social media groups of pharmacy educators. Participation in the survey was voluntary. This approach was chosen for its practicality and ease of access to respondents within a limited timeframe. However, as participation was based on convenience and self-selection, the findings may not be fully generalizable to the entire population of pharmacy teachers. The survey was aimed to conquer the perception of faculty on various aspects of artificial intelligence and its role in the teaching profession. Questions ranging from types of AI tools that faculty use in aiding teaching methodology, areas in which faculty explore AI to the like understanding, relevance and preparedness of institutions to AI and python difficulties encountered by them while using it were analysed. Another aspect explored was the introduction of AI and python programming in the newly proposed DRAFT syllabus for B.Pharm by the PCI. From the above survey it was concluded that most educators have started exploring the use of AI in the areas of preparation for lectures and research support. Their concerns revolve around lack of accuracy of data and data privacy. However most believe that AI will positively affect learning outcomes of students and aid in teaching. Faculty proposed that at UG program basics of pharmaceutical sciences should not be overlooked upon. The subject of AI and python programming will require collaboration with IT faculty as well as training of Pharma faculty.

**Keywords:** Pharmaceutical education, AI, Faculty perception.

**MACHINE LEARNING–DRIVEN DESIGN AND STRUCTURAL ANALYSIS OF ANTI-MEXA ANTIMICROBIAL PEPTIDES AGAINST MULTIDRUG RESISTANT PSEUDOMONAS AERUGINOSA**

Prabitha P, Manal Mohammed
Department of Pharmaceutical Chemistry, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Mysuru, Karnataka -570015
pprabitha@jssuni.edu.in

Multidrug resistance (MDR) in Pseudomonas aeruginosa—mainly driven by the MexAB–OprM efflux pump system—remains a major challenge in healthcare. Antimicrobial peptides (AMPs) have gained attention as promising alternatives because of their unique ways of killing bacteria and their ability to block resistance mechanisms. In this study, we used an integrated computational approach to design and evaluate new AMPs that specifically target the MexAB–OprM system. Using the dpAMP prediction framework, several peptide candidates were developed and screened for hemolytic toxicity, stability, and antibacterial potential through machine learning models such as random forest (RF) and artificial neural networks (ANN) trained on large AMP datasets. A selected group of peptides was then tested through molecular docking to study their binding interactions with the MexA, MexB, and OprM proteins. Molecular dynamics simulations were carried out to confirm the stability of the peptide–MexA complexes. Among all the candidates, the ANN-derived peptide “2ANN” stood out for its strong and stable binding to efflux pump components, low hemolytic activity, and broad-spectrum antibacterial potential. Overall, this study demonstrates a

ISBN: 978-81-980623-8-3

powerful, machine learning–guided pipeline that combines predictive modeling with structural analysis to identify promising anti-efflux AMPs, offering a potential new strategy to combat MDR P. aeruginosa infections.

**Keywords:** Pseudomonas aeruginosa, MexAB–OprM efflux pump, Antimicrobial peptides Machine learning, Molecular docking and dynamics.

**AI-POWERED GENOMIC INTELLIGENCE FOR ADVANCED BIOTECH APPLICATIONS**

P.Trisha Vilasini,
Avnathi Institute of Pharmaceutical Sciences, Telangana.

The integration of AI with biotech and genomics helps in rapid data analysis, predictive modeling and personalized medicine which is transforming research and healthcare. AI powered genomic intelligence integrates machine learning, computational modeling which decodes complex gene patterns, predicts biological functions, and accelerates therapeutic innovation. AI enhances accuracy, scalability of genomic interpretation beyond traditional methods through automated genetic variation identification, gene expression analysis, and multi-omics integration. The key applications of biotechnology like drug target identification, antimicrobial resistance prediction, personalized medicine are supported by the AI-driven tools. For detecting clinically relevant variants, analyzing sequencing data and modeling genotype-phenotype associations, are being adopted. The role of AI expands in next generation biotechnology due to the incorporation of AI in CRISPR design, synthetic biology workflows, epigenomic mapping. The role of AI in biotechnology has three core pillars: Decode, predict and design. The use of AI in biotechnology has been a big breakthrough in the precision medicine, where it stratifies patients for targeted therapies, gene therapy, by designing the safer and more effective treatments in synthetic biology for sustainable production by engineering microbes. AI-powered genomic intelligence stands as a main pillar of modern biotechnology despite the challenges in data quality, interpretability, and integration. It represents a transformative force, assured to unlock a future of programmable biology, highly personalized, predictive medicine, ultimately reshaping our approach to diseases, biological innovation.

**TUNING DOWN ATHEROSCLEROSIS RISK: AI-DRIVEN SCREENING AND *IN-VITRO* EFFICACY OF NOMAT-SYNERGETIC HERBAL FORMULATION POTENTLY MODULATES PRE-ADIPOCYTE DIFFERENTIATION IN *IN-VITRO***

Priyadharshini
Sri Ramachandra Institute of Higher Education and Research

Background: Atherosclerosis, a leading cause of global mortality and a complex disease driven by dislipidemia and chronic inflammation, demanding innovative, multi-targeted therapeutic strategies. This study presents a synergistic drug development approach integrating computational methods to identify and validate a novel poly herbal formulation- NOMAT as a potent anti-adipogenic agent, a key strategy for empowering atherosclerosis risk management. Methods: This research employed network pharmacology to predict the multi target mechanism of the poly-herbal formulation against complex atherosclerosis pathways, directly aligning to the conference theme. This predictive analysis was followed by in-silico ADME screening and molecular docking to assess drug-likeness and target binding affinity. The selected marker was tested in in-vitro. Cytotoxicity assay and anti-adipogenesis assay was performed using 3T3- L1 pre- adipocyte cell line. Results and significance: The computational phase provided critical mechanistic insights, successfully Educating the validation strategy. The NOMAT exhibited favorable in silico pharmacokinetic properties and no cytotoxicity. Most importantly, the in vitro anti-adipogenesis assay showed a highly significant, dose-dependent inhibition of 3T3-L1 differentiation into mature adipocytes. Treatment with the drug reduced lipid accumulation by up to 50 % at a lower concentration. This potent effect suggests the drug interferes directly with the processes underpinning cellular lipid storage, a major driver of atherosclerotic risk. Conclusion & Future Direction : This work successfully showcases how the integration of AI-driven computational tools with advanced in vitro models can efficiently Innovate the discovery of multi-target phytomedicines. The demonstrated anti-adipogenic activity positions the NOMAT as a highly promising lead compound for developing Empowered therapeutic strategies against atherosclerosis, warranting further in vivo investigation

**ARTIFICIAL INTELLIGENCE IN NEUROIMMUNOLOGY: ENHANCING DIAGNOSIS AND THERAPEUTIC TARGET DISCOVERY**

Raj Mishra, Mayur Kale, Nitu Wankhede, Manish Aglawe, Madhura Dixit, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India
rajmishra27621@gmail.com

Neuroimmunological disorders such as multiple sclerosis (MS), autoimmune encephalitis, and neuromyelitis optica spectrum disorders present significant diagnostic and therapeutic challenges due to their heterogeneous clinical presentation and complex immune–neural interactions. Artificial intelligence (AI) is emerging as a transformative tool to unravel these complexities by integrating multimodal datasets including MRI, cerebrospinal fluid biomarkers, immunoprofiling, and genomic signatures. Machine learning algorithms can identify subtle radiological patterns, predict relapse risk, and differentiate overlapping conditions with greater accuracy than conventional methods. AI-driven network analyses also enable the discovery of novel immune targets and pathways involved in neuroinflammation. In clinical settings, predictive models assist in optimizing immunomodulatory therapy, forecasting treatment response, and minimizing adverse effects. By bridging neuroimaging, immunology, and computational analytics, AI-based approaches hold immense potential to accelerate personalized care, improve diagnostic precision, and guide the development of targeted therapeutics in neuroimmunology.

**Keywords:** Neuroimmunology, Artificial Intelligence, Neuroinflammation, Biomarker Prediction.

**REVOLUTIONIZING INDIAN HEALTHCARE: THE IMPACT OF DIGITAL HEALTH, AI, TELEMEDICINE AND DATA SECURITY**

Raj Sen, Rudra Pratab Singh Rajput
Royal College of Pharmacy, Raipur-492001, Chhattisgarh, India
rsen07579@gmail.com

The Indian healthcare system is in the middle of a transformative shift, driven by innovations in digital health, artificial intelligence (AI), telemedicine, and data security. These technologies are restructuring healthcare delivery, with substantial implications for patient safety, access to care, and overall efficiency. Understanding their impact is important for stakeholders seeking to navigate and leverage these innovations for improved healthcare outcomes. This review involved a thorough analysis of current literature, case studies, and statistical data. Sources were selected based on their relevance to digital health, AI, telemedicine, and data security within the Indian healthcare context. The analysis focused on examining the benefits and challenges associated with the integration of these technologies, as well as the influence of government policies on their adoption.

**Keywords:** Digital Health, Artificial Intelligence, Telemedicine, Data Security.

**FROM TRADITION TO TECHNOLOGY: AI-ENABLED INNOVATION IN HERBAL DRUG RESEARCH**

Raja Patel Mohsina F P, Faheem I P
Luqman College of Pharmacy, Kalaburagi, Karnataka, India
Rajiv Gandhi University of Health Sciences, Bengaluru, Karnataka, India

Herbal medicines continue to play a vital role in global healthcare, yet scientific challenges such as variability in raw materials, lack of consistent standardization, and limited predictive tools hinder their advancement into evidence-based therapeutics. This research introduces a novel AI-integrated analytical framework designed to modernize herbal drug evaluation. By combining authenticated plant

ISBN: 978-81-980623-8-3

samples, high-resolution imaging, chromatographic fingerprints, and machine learning models, the study establishes an automated system capable of botanical authentication, phytochemical marker prediction, and activity correlation. The extended framework further incorporates data-driven pattern recognition and real-time digital analysis to improve accuracy in detecting subtle variations in herbal materials. This approach enhances reproducibility, reduces analytical time, and creates a scalable decision-support platform adaptable to multiple medicinal plants and formulations. The findings demonstrate how AI can educate researchers, innovate analytical processes, and empower the future of herbal drug technology. To establish an AI-assisted system for rapid and accurate identification of authenticated herbal raw materials. To develop predictive machine learning models for estimating key phytochemical markers from spectral or chromatographic datasets. To correlate predicted phytochemical profiles with preliminary pharmacological activities. To create a reproducible, technology-driven workflow that enhances quality assessment in herbal drug research. To demonstrate the role of AI in accelerating innovation and promoting evidence-based standardization in phytopharmaceutical sciences. Collection of medicinal plant samples from validated sources. Standard pharmacognostical evaluation (macro, micro, physicochemical tests). Acquisition of high-resolution images and HPTLC/HPLC/FTIR fingerprints. Compilation of phytochemical concentrations and preliminary bioactivity data. Data preprocessing (normalization, augmentation, noise reduction). Model training using CNNs for morphological identification and RF/ANN models for chemical prediction.

## LEVERAGING AI FOR INVENTORY OPTIMIZATION IN HOSPITAL PHARMACIES USING. MACHINE LEARNING

Ramesh.S
Department of Pharmaceutics, Sri Ramachandra Faculty of Pharmacy, SRIHER, Porur, Chennai-600116.

This study addresses critical inventory management challenges in hospital pharmacies through the application of artificial intelligence and machine learning techniques. The research analysed 3,013 procurement transactions across 186 pharmaceutical products from 28 suppliers over 12 months (April 2024 - March 2025), representing a total procurement value of ₹6.98 Crores. Long Short-Term Memory (LSTM) neural networks were employed for demand forecasting, achieving an exceptional average accuracy of 85.8%, significantly exceeding industry benchmarks of 60- 70%. The system demonstrated 100% success rate with all models achieving above 80% accuracy. Key performance indicators revealed 23.1% stockout rate and 15.4% expiry rate, highlighting areas for improvement. The ABC classification analysis showed that 10.8% of products accounted for 70.1% of total spending. Financial analysis identified potential savings of ₹26.4 Lakhs through early payment discounts and ₹2.95 Lakhs through optimal pricing strategies. The study provides actionable recommendations for implementing AI-driven inventory optimization systems in hospital settings, emphasizing the practical utility of machine learning in healthcare supply chain management.

## AI-DRIVEN PREDICTION OF DRUG–EXCIPIENT COMPATIBILITY USING MACHINE LEARNING MODELS FOR ENHANCED FORMULATION DESIGN

J. Rishitha
Department of Pharmaceutics,
A.S.N. Pharmacy College, Tenali, Guntur District, Andhra Pradesh – 522201, India
rishithajaladi9@gmail.com

Drug–excipient compatibility is a fundamental requirement for ensuring the stability and safety of pharmaceutical formulations. Traditional compatibility testing involves multiple analytical techniques and extended experimental timelines. The present study aims to develop an artificial intelligence (AI)-based predictive framework capable of identifying potential drug–excipient incompatibilities using machine learning algorithms. A structured dataset comprising physicochemical descriptors, molecular fingerprints, and reported compatibility outcomes of widely used excipients was compiled from scientific literature. Feature selection was performed using correlation matrices and principal component analysis to eliminate redundancy. Machine learning models including Random Forest, Support Vector Machine, and XGBoost were trained and evaluated using standard performance metrics. Among these, the Random Forest model achieved superior performance with an accuracy of 92% and strong predictive consistency. A validation case study using a BCS Class II drug confirmed high agreement between AI-predicted compatible excipients and reported experimental results. The proposed AI approach minimizes preliminary laboratory experimentation, accelerates formulation development, and supports informed decision-making during excipient screening. This framework demonstrates the potential of machine learning in pharmaceutical formulation science and highlights AI as a valuable tool for early-stage product development.

**Keywords:** Artificial intelligence, Machine learning, Drug–excipient compatibility, Random Forest, Predictive modeling.

**AI-343**

## AI AND TECHNOLOGY IN PHYTOPHARMACOLOGICAL EVALUATION OF HEPATOPROTECTIVE EFFECT OF ETHANOLIC LEAF EXTRACT

Sagar G. Mondal
IES University, Bhopal Ratibad, Main Rd, Bhopal, Madhya Pradesh 462044.
sagarmondal0143@gmail.com

This study aims to evaluate the hepatoprotective effect of an ethanolic leaf extract using a standard animal model of liver injury. The extract will be prepared by ethanol extraction, followed by phytochemical screening to identify active constituents such as flavonoids, phenolics, and alkaloids. Acute toxicity will be assessed according to OECD guidelines. Experimental animals will be divided into toxin control, standard, and extract-treated groups. Liver damage will be induced using carbon tetrachloride. Serum biochemical parameters (ALT, AST, ALP, and bilirubin), antioxidant enzymes (GSH, SOD, catalase), and histopathological examination of liver tissue will be evaluated. The study aims to establish scientific evidence supporting the hepatoprotective potential of the ethanolic leaf extract and its possible mechanism of action. Combining wet-lab experiments with AI tools aims to (1) reduce experimental bias and animal use via predictive models (2) accelerate candidate prioritization, and (3) generate FAIR datasets and decision support for downstream drug development. The workflow demonstrates how modern technology can educate researchers (via interactive dashboards), innovate discovery pipelines, and empower evidence-based phytopharmacology in pharma.

## AI-INTEGRATED NETWORK PHARMACOLOGY TO PREDICT MICROBIOME-MEDIATED MODULATION OF OMEPRAZOLE

Shivani Gawali, Komal Hajare, Nishant Awandekar, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur
shivanigawali2511@gmail.com

Omeprazole is one of the most prescribed proton pump inhibitors for managing acid-related disorders. Recent evidence indicates that long-term omeprazole use significantly alters gut microbiome composition, which may influence the drug's metabolism, therapeutic efficacy, and adverse effects. However, complex relationships among omeprazole, gut microorganisms, and host biological pathways remain poorly understood. A comprehensive, computationally driven approach is required to unravel these interactions. This study presents an AI-integrated network pharmacology model designed to predict microbiome-mediated modulation of omeprazole. Drug-related molecular targets were collected from databases such as SwissTargetPrediction, CTD, and STITCH. Microbial species altered in response to omeprazole were identified from existing microbiome studies. Host–microbe interaction genes were mapped using Disbiome and GMrepo. Machine learning techniques—including random forest classification, network embedding, and feature-importance analysis—were applied to prioritize key interaction nodes and identify microbe-linked metabolic and signaling pathways. A multilayer drug–microbiome–host interaction network was constructed and analyzed using Cytoscape. The AI-based model identified several microbial

ISBN: 978-81-980623-8-3

enzymes potentially involved in omeprazole modification, particularly those associated with xenobiotic degradation and proton transport regulation. Key host pathways related to inflammation, oxidative stress, and gastrointestinal homeostasis were found to be indirectly influenced through microbiome shifts. The model also predicted novel drug–microbe–host associations that have not yet been validated experimentally. In conclusion, integrating AI with network pharmacology provides a powerful framework to decode complex drug–microbiome–host interactions. This approach may support personalized therapeutic predictions and optimize the clinical use of omeprazole.

**Keywords:** Omeprazole, Network Pharmacology, Gut Microbiome, Artificial Intelligence, Machine Learning, Drug–Microbe–Host Interactions, Xenobiotic Metabolism.

**RECENT REGULATORY REQUIREMENTS FOR COSMECEUTICALS: GLOBAL UPDATES ON SAFETY, CLAIMS, AND NANOMATERIALS**

Shreeya Mutalik, Usha Y Nayak, Namdev Dhas
Manipal College of Pharmaceutical Sciences, Manipal Academy of Higher Education, Manipal 571604, Karnataka, India
shreeyamutalik@gmail.com

Cosmeceuticals, hybrid products that combine cosmetic benefits with drug-like biological activity, are now subject to enhanced regulatory oversight to ensure safety, efficacy, and sustainability. Between 2023 and 2025, major authorities in India, the United States (U.S.), the European Union (EU), and China updated frameworks focused on safety substantiation, claim validation, nanomaterial governance, and risk-based categorization. In India, the Cosmetics Rules (2020) and the Cosmetics Amendment Rules (2025) require registration with the Central Drugs Standard Control Organization via the SUGAM portal, compliance with Good Manufacturing Practices, disclosure of nanomaterials under revised Bureau of Indian Standards (BIS) standards, and reporting of adverse events within 15 days. Products containing potent actives (e.g., retinoids, peptides) must include non-clinical data and limited human evidence, while therapeutic-type claims may prompt reclassification as drugs. In the U.S., the Modernization of Cosmetics Regulation Act (2023) mandates facility registration, product listing, safety documentation, and adverse event reporting by 2024. Draft guidance (2025) notes that structure/function claims, such as collagen stimulation, may require drug-level evidence, while regulations addressing Per- and Polyfluoroalkyl Substances (PFAS) and talc are expected by late 2025. The EU continues oversight under Regulation (EC) 1223/2009 and introduced Regulation (EU) 2024/XXXX, requiring pre-market authorization for borderline products containing more than 1% pharmacologically active ingredients, restricting kojic acid, and reinforcing microbiome-related claim validation; nanomaterial reporting via Cosmetic Products Notification Portal (CPNP) remains mandatory. China's NMPA (National Medical Products Administration) dual-track system (2025) mandates stability testing for general cosmetics and full non-clinical and clinical evaluation for "special cosmetics," alongside enhanced labeling for nanomaterials and sustainability, aligned with ICCR (International Cooperation on Cosmetics Regulation) guidance.

**Keywords:** Cosmeceuticals; Regulation; CDSCO; Claim substantiation; ICCR.

**FROM PAPER TO PIXEL: DIGITALISING PHARMACY RECORDS WITH OCR**

Shurooq Fatima
Pharm D 5th year Avanthi Institute of Pharmaceutical Sciences, Gunthapally, R.R., Telangana 501512
hussainshuroofatima@gmail.com

In many Indian healthcare settings pharmacy records heavily depends on handwritten prescriptions, dispensing registers, and paper-based inventory documentation. These manual systems often leads transcription errors, incongruous record keeping, delayed information retrieval and difficulties during audits or regulatory evaluations. Optical Character Recognition (OCR) has become a valuable bridge between traditional paper documents and electronic pharmacy information systems as Indian advances towards a more digitalized healthcare system. Evidence from Indian digital-health initiatives demonstrates reduction in burden of manual data entry and minimization of clerical inconsistencies through OCR. Digitized records allow faster access to patient prescription history, more efficient tracking of controlled medications, streamlined stock and inventory management, and greater transparency in billing processes. Improvements in OCR accuracy driven by AI, machine-learning-based text correction, image enhancement and support for multiple Indian languages have increased the reliability of the technology in diverse pharmacy environment and public health. These tools integrated with cloud platform and pharmacy management systems further support interoperability with telemedicine platforms and electronic prescription. OCR offers a cost effective and practical solution for digitizing pharmacy records in India. This adoption enhances documentation quality, supports continuity of care, enables data driven decision making and accelerates the transition towards paperless and audit-ready pharmacy workflows.

**Keywords:** Optical Character Recognition (OCR), Pharmacy records, Digitalization, Indian pharmacy system, Paperless workflow.

**AI-347**

**ARTIFICIAL INTELLIGENCE IN PREDICTING AND MANAGING ADVERSE DRUG REACTIONS OF FIXED DOSE COMBINATIONS**

Simran Ladke, Ruchi Khobragade, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India – 441002
simranladke3@gmail.com

Fixed Dose Combinations (FDCs) are widely used to improve therapeutic efficacy and patient compliance, but they also increase the risk of Adverse Drug Reactions (ADRs) due to complex pharmacokinetic and pharmacodynamic interactions. Factors such as mismatched drug ratios, competition for metabolic pathways, and irrational formulations contribute to toxicity or reduced efficacy. Artificial Intelligence (AI) has emerged as a powerful tool to enhance pharmacovigilance by enabling early detection, prediction, and monitoring of ADRs from FDCs. AI algorithms like Bayesian networks, Gradient Boosting Machines, and Neural Networks analyze large datasets from electronic health records, spontaneous reporting systems, and social media to identify hidden safety signals and establish causality more accurately than traditional methods. Natural Language Processing (NLP) further aids in extracting relevant data from unstructured clinical narratives. Studies show that AI models significantly improve the sensitivity and speed of signal detection while supporting personalized therapy decisions by predicting patient-specific risks. Despite its promise, challenges remain in data quality, algorithm transparency, and regulatory acceptance. Overall, AI represents a transformative advancement in pharmacovigilance, offering a proactive and data-driven approach to managing ADRs in FDCs and enhancing drug safety and public health outcomes.

**Keywords:** Artificial Intelligence (AI), Pharmacovigilance, Fixed Dose Combinations (FDCs), Adverse Drug Reactions (ADRs), Bayesian Networks.

**AI AND TECHNOLOGY IN PHARMA: EDUCATE, INNOVATE, EMPOWER.**

Sindhu S R
Department of Pharmaceutics, Bapuji Pharmacy college, Davanagere, Karnataka, India- 577004
Sindhusr2011999@gmail.com

Artificial Intelligence (AI) and emerging digital technologies are redefining the pharmaceutical ecosystem—accelerating discovery, optimizing development, and transforming patient care. The convergence of AI-driven analytics, machine learning (ML), and deep learning (DL) has shifted drug development from empirical processes to predictive, data-centric paradigms. Evidence from high-impact studies shows AI-enabled platforms can reduce drug discovery timelines by up to 50%, improve hit-to-lead accuracy from ~2–3% to over 10%, and enable de novo molecular design with unprecedented precision. Integration of generative models and protein-structure prediction tools has unlocked novel therapeutic targets, while digital twins and in-silico trials are revolutionizing clinical research efficiency and cost-effectiveness. Beyond R&D, AI empowers real-time pharmacovigilance, adaptive trial recruitment, and personalized medicine—delivering safer, faster, and patient-centric solutions. Pharmaceutical manufacturing is entering Industry 4.0, leveraging AI for predictive maintenance, quality-by-design, and supply-chain resilience, achieving up to 20% reduction in

ISBN: 978-81-980623-8-3

downtime and 14% less logistics volatility. AI-driven pharmacovigilance systems now detect adverse events in days instead of months, enabling near real-time safety oversight. This underscore three imperatives: Educate stakeholders on AI literacy Innovate through cross-disciplinary collaboration Empower patients via equitable access and precision therapeutics. As the pharmaceutical sector embraces AI, the promise is clear: a future where intelligent systems drive efficiency, sustainability, and global health equity.

**Keywords:** Machine learning, Deep learning, de novo molecular design, leveraging AI.

**AI IN THE DESIGN AND IMPROVEMENT OF TOPICAL SKIN PRODUCTS**

Tanmay S. Markandeywar , Atul T. Hemke
S.K.B. College of Pharmacy, Gada, Kamptee, Nagpur, Maharashtra, India - 441002
tmarkandeywar@gmail.com

Artificial intelligence (AI) is transforming pharmaceutical research, specifically in developing topical dosage forms like transdermal, ophthalmic, and dermatological delivery systems. By utilizing machine learning and deep learning, researchers can accelerate drug formulation processes, enhance treatment efficacy, and reduce side effects. AI helps predict physicochemical properties and optimize formulations tailored to individual patient needs, addressing challenges such as skin permeability barriers. In transdermal drug delivery systems (TDDS), AI models can predict skin permeability and streamline the selection of drug candidates. Additionally, AI enhances formulations by optimizing delivery methods like microneedles and liposomes. Innovative solutions, such as sensor-integrated patches, allow real-time adjustments in drug release based on patient feedback, improving therapeutic outcomes. The review underscores AI's impact on TDDS through various models that effectively address existing challenges, thus improving patient care. Despite concerns related to data quality and privacy, AI's integration with advancements like 3D printing offers promising possibilities for personalized transdermal therapies. Overall, AI is crucial in advancing therapeutic efficacy and developing next-generation drug delivery systems.

**Keywords:** Artificial Intelligence, transdermal drug delivery systems, personalised medicine.

**THE FUTURE OF PHARMACY: ROLE OF AI**

Tanuja P. Pathade, Awinash S. Chavan, Lalita B. Bhagure, Shankar S. Khandare, Suraj G. Budhawat
Raosaheb Patil Danve College of Pharmacy, Badnapur Dist. Jalna M.S.-431 202 Dr. Babasaheb Ambedkar Technology University, Lonere, Raigad, M.S. India.
pathadepatil96@gmail.com

The future of pharmacy is being redefined by the convergence of technology, innovation, and patient-centered care. The integration of artificial intelligence (ai), machine learning (ml), robotics, and digital therapeutics is revolutionizing the pharmaceutical industry by transforming drug discovery, development, dispensing, and patient care. Ai-driven technologies enable rapid identification of novel drug molecules, optimization of clinical trials, and enhancement of pharmacovigilance, while automation improves operational accuracy and efficiency. Telepharmacy and digital health platforms are expanding access to healthcare, particularly in remote areas, and genomic data-driven personalized medicine is shifting the focus from reactive treatment to proactive prevention. To respond effectively to these technological forces, pharmacy must expand its informational and clinical roles by embracing the concept of “pharmaceutical care,” which integrates drug-use control with evidence-based decision-making. This professionalization of pharmacy positions pharmacists as digital health experts and clinical leaders. Moreover, personalized and precision medicine, guided by genomic data, is shifting the focus from reactive treatment to proactive prevention. Pharmacists are evolving into clinical decision-makers and digital health experts, integrating data intelligence with compassionate care to improve therapeutic outcomes. In essence, the pharmacy profession is adapting to new demands and technologies, requiring future pharmacists to be both clinically knowledgeable and tech-ready to provide high-quality, patient-centered care. Ultimately, AI in the pharmaceutical industry represents a convergence of innovation and compassion, creating a future where technology and humanity advance global health together.

**FROM LEAF TO ALGORITHM: THE ROLE OF AI IN PHYTOCHEMICAL DISCOVERY**

Tarigoppula. Sunitha
Department Of Pharmaceutical Chemistry
tharigoppula.sunitha@gmail.com

The exploration of phytochemicals—bioactive compounds derived from plants—has long been central to natural product research and drug discovery. However, traditional phytochemical screening techniques, reliant on labor-intensive laboratory assays and complex analytical procedures, often limit the speed and scale of discovery. Recent advances in Artificial Intelligence (AI) have introduced transformative possibilities for phytochemical research by automating data interpretation, enhancing predictive accuracy, and accelerating compound identification. Machine learning and deep learning algorithms now enable the rapid analysis of complex datasets obtained from chromatographic and spectroscopic methods such as HPLC, GC-MS, and LC-MS. These models facilitate the classification of plant species, identification of novel metabolites, and prediction of biological activities through computational tools like QSAR modeling and molecular docking. Furthermore, AI-driven data mining and computer vision technologies streamline the recognition of phytochemical patterns and bioactivity correlations. Despite challenges such as limited data standardization and interpretability of AI models, the integration of intelligent computational systems marks a significant shift from conventional phytochemical screening to data-driven discovery. This convergence of biology and technology promises to unlock new insights into plant-based compounds and their therapeutic potential.

**AI-DRIVEN PHARMACOGENOMICS: PERSONALIZING DRUG RESPONSE THROUGH GENOMIC INTELLIGENCE**

Vaidehi Shelke, Mayur Kale, Nitu Wankhede, Sandip Rahangdale, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India
vaideishelke19@gmail.com

Pharmacogenomic variability significantly influences therapeutic efficacy, adverse drug reactions, and inter-individual differences in drug metabolism. Traditional methods of interpreting genomic data are limited by the complexity of gene–drug interactions and the vast amount of sequencing information generated. Artificial intelligence (AI) offers a powerful framework for decoding these complexities by leveraging deep learning and machine learning models to analyze genomic variants, transcriptomic patterns, and clinical phenotypes. AI-based algorithms can predict drug–gene interactions, identify metabolizer status, and classify patients as responders or non-responders for various therapeutic classes including antidepressants, oncology drugs, and analgesics. Integrating AI with electronic health records and clinical decision-support systems further enables real-time personalization of drug selection and dosing. These innovations advance precision medicine by reducing trial-and-error prescribing, minimizing adverse effects, and improving therapeutic outcomes. AI-driven pharmacogenomics thus represents a critical leap forward in tailoring pharmacotherapy to individual genetic makeup.

**Keywords:** Pharmacogenomics, Artificial Intelligence, Precision Medicine, Drug–Gene Interaction.

Artificial intelligence (AI) is revolutionizing healthcare management by improving efficiency through data analysis, predictive analytics, and automation. In drug discovery, AI accelerates the process by identifying potential drug targets, designing new molecules, and optimizing clinical trials, which can significantly reduce time and cost. With over 90% accuracy in diagnostic disease from medicinal image, AI is reshaping the healthcare landscape, transforming medical imaging, diagnosis, drug discovery, patient care and more AI implementation in healthcare concerted efforts in ethical consideration and regulatory compliance are necessary. The application of AI in healthcare highlights the urgent need for cross-disciplinary collaboration and a patient focused approach fully harness AI's capabilities in the field. Engaging statistics and compelling case studies showcase AI's current impact and inspire further collaboration in and inspire further collaboration and in this awe-inspiring technological revolution, propelling us towards a further where AI collaborates seamlessly with healthcare professional for superior patient outcomes. AI's ability to analyze vast database and uncover hidden pattern has opened avenues for precision medicine and evidence based decision making. Healthcare professional must be equipped with the necessary skills and training to effective leverage AI technology. AI also plays a pivotal role in revolutionizing by expediting these process and cutting down costs. AI to achieve patient centric, efficient and equitable healthcare for all. Artificial intelligence (AI) is transforming drug discovery by accelerating the process through analyzing vast datasets to identify potential drug candidates, predict compound efficacy and toxicity, and optimize clinical trial design.

**Integration Of Artificial Intelligence In Green Nanoparticle Synthesis: A Sustainable Approach Toward Smarter Nanotechnology**

Vanga Sridhar, Satla Shobha Rani
Centre for Pharmaceutical Sciences, JNTU Hyderabad, Telangana-500085

Green synthesis of nanoparticles has emerged as an eco-friendly and sustainable alternative to conventional chemical and physical methods, utilizing biological sources such as plant extracts, microorganisms, and biomolecules as reducing and stabilizing agents. However, optimizing synthesis parameters and ensuring reproducibility remain major challenges. The integration of Artificial Intelligence (AI) into green nanotechnology offers innovative solutions to these limitations by enabling predictive modeling, data-driven optimization, and automated process control. AI algorithms, including machine learning and deep learning models, can accurately predict the influence of experimental parameters such as pH, temperature, and extract concentration on nanoparticle size, morphology, and yield. Moreover, AI-assisted spectral and image analyses streamline the characterization of nanoparticles obtained through eco-friendly routes. Virtual screening of phytochemical constituents using AI tools further supports the identification of potent natural reducing agents for metal ion reduction. Thus, the application of AI in green nanoparticle synthesis enhances process efficiency, reduces experimental cost and waste, and accelerates the discovery of sustainable nanomaterials for biomedical, catalytic, and environmental applications.

**Keywords:** Artificial intelligence, Green synthesis, Nanoparticles, Plant extract, Sustainable nanotechnology & Phytochemical screening.

**AI-355**

**FROM DRUG EXPERTS TO AI STEWARDS: DESIGNING COMPETENCIES FOR HUMAN–AI COLLABORATION IN PHARMACY**

V.Jayadev,
Department of Pharmacy Practice, Vaageswari College of Pharmacy, Thimmapur, Karimnagar, India-5505001
jayadevveerragoni@gmail.com

The rapid adoption of Artificial Intelligence (AI) across healthcare is transforming pharmacy practice and creating a demand for pharmacists equipped with advanced digital competencies. This examines the development of an AI-integrated competency model that emphasises data literacy, algorithm assessment, digital therapeutics, and the capacity to make informed, shared human–AI clinical decisions. It also highlights emerging skill areas, such as AI ethics, bias recognition, cybersecurity, and automation oversight, all of which are essential for the safe and responsible use of intelligent systems. By 2030, pharmacists are expected to function not only as medication experts but also as interpreters, evaluators, and supervisors of AI-driven clinical tools. The framework promotes experiential learning through exposure to real-world AI technologies, digital twin patients, and simulation-based training. Preparing pharmacists with these competencies will enhance therapeutic outcomes, strengthen medication safety, and support the evolution of a technologically advanced healthcare ecosystem. This model aims to guide future pharmacy education and professional practice.

**AI (ARTIFICIAL INTELLIGENCE) INTERPRETATION OF FINE-NEEDLE ASPIRATION CYTOLOGY**

I.Santhosikumari, D.Durgaprasad C. Krishanavani,Yeligapu.Divya
Bhaskara Institute Of Pharmacy, Komatipalli Village, Bobbili
Affiliated By Andhra University, India -535558
yeligapudivya@gmail.com

Fine-needle aspiration cytology (FNAC) remains the gold standard for evaluating thyroid nodules; however, its diagnostic accuracy is often limited by subjective interpretation, inter-observer variability, and indeterminate results. Recent advances in artificial intelligence (AI), particularly deep learning and convolutional neural networks, offer promising solutions by enabling automated, high-precision analysis of cytological images. Utilizing large-scale, diverse datasets enhances model generalizability across different populations, staining protocols, and imaging conditions. AI-assisted FNAC interpretation has demonstrated improved accuracy in distinguishing benign from malignant lesions, reducing false negatives and indeterminate diagnoses, and accelerating reporting times. The integration of AI into cytopathology workflows provides a reproducible, objective, and scalable approach to thyroid cancer detection, supporting personalized clinical decision-making. Despite challenges in dataset standardization, model interpretability, and validation through prospective trials, the application of AI-trained datasets marks a significant advancement in modern thyroid cytology. Continued research and clinical validation are essential to establish AI-assisted FNAC as a reliable adjunct, ultimately improving early detection, diagnosis, and management of thyroid malignancies.

**Keywords:** Fine-needle aspiration cytology, thyroid Cancer, Artificial intelligence (AI), Deep learning.

## SYNTHESIS, CHARACTERISATION, BIOLOGICAL EVALUATION AND ANALOGIZING THE ANTIMYCOTIC ACTIVITY OF 2,4,5-TRIPHENYLIMIDAZOLE DERIVATIVES

S. Dhanush, N. Ramanathan
Department of Pharmaceutical Chemistry, Pallavan Pharmacy College, Kanchipuram, India – 631502.
dhanushsreenivasan03@gmail.com

Microwave Assisted Synthesis (MWAS) technique which significantly lowers the chemical waste and reaction time. MWAS has been utilized to synthesise the 2,4,5-Triphenylimidazole by Debus-Radziszewski imidazole synthesis. From the literature survey, 2,4,5-Triphenylimidazole derivatives were synthesized under MWAS using Benzil, Ammonium Acetate and Aldehydes like 4-chlorobenzaldehyde, 4-Nitrobenzaldehyde and 4-Methoxybenzaldehyde by Condensation reaction. Compounds were synthesized in the presence of Glacial acetic acid as a catalyst in solvent-free condition. The purity of the compound was determined by Thin Layer Chromatography (TLC). The synthesised compounds were screened using FT-IR. All synthesized compounds were evaluated and analogized for anti-mycotic activity.

**Keywords:** Microwave Assisted Synthesis, Debus-Radziszewski imidazole synthesis, 2,4,5-Triphenylimidazole derivatives, FT-IR, Anti-mycotic activity.

## METHOD DEVELOPMENT AND VALIDATION OF A HILIC-HPLC TECHNIQUE FOR THE SIMULTANEOUS ESTIMATION OF POLAR ANTIDIABETIC DRUGS

Pranita Jirvankar, Surendra Agrawal
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education and Research
(Deemed to be University), Wardha-442001, Maharashtra, India.
pjirvankar123@gmail.com

Hydrophilic interaction liquid chromatography (HILIC) has proven to be a powerful tool for the analysis of highly polar pharmaceutical compounds, overcoming the limitations of conventional reversed-phase HPLC. In this study, a novel and efficient HILIC-HPLC method was developed and validated for the simultaneous estimation of three polar antidiabetic drugs: metformin, vildagliptin, and remogliflozin. Chromatographic separation was achieved on a silica-based HILIC column using a mobile phase consisting of acetonitrile and 1 mM sodium octane sulfonate aqueous buffer in optimized ratios. Key parameters such as mobile phase composition, flow rate, and injection volume were systematically optimized to ensure maximum resolution and peak efficiency. The developed method was validated according to ICH Q2(R1) guidelines. It demonstrated excellent linearity over a wide concentration range ($R^2$ > 0.998 for all analytes), with high accuracy (recoveries between 98.0% and 102.0%) and precision (intra- and inter-day %RSD < 2%). Specificity was confirmed through the absence of interference from excipients or mobile phase components. The method exhibited strong robustness, with minimal variation in peak response and retention under small deliberate changes in flow rate and organic content. System suitability parameters such as theoretical plates (>8500), resolution (>4.0), and tailing factor (<1.2) met the acceptable limits for all analytes. Sensitivity studies revealed low limits of detection (LOD) of 0.15 µg/mL for metformin, 0.10 µg/mL for vildagliptin, and 0.12 µg/mL for remogliflozin, with corresponding limits of quantitation (LOQ) of 0.50 µg/mL, 0.30 µg/mL, and 0.40 µg/mL, respectively. Overall, the developed HILIC-HPLC method is simple, sensitive, specific, and reliable for the routine quality control, assay, and stability testing of polar antidiabetic agents in bulk drug and pharmaceutical dosage forms.

**Keywords:** Remogliflozin, Vildagliptin, RP-HPLC, Method validation, Fixed-dose combination

## FABRICATION OF THE BIOANALYTICAL METHOD OF AN ANTIHYPERTENSIVE DRUG HYDROCHLOROTHIAZIDE AND VALIDATE BY LC-MS/MS IN HUMAN PLASMA

Dibya Das[1], Dhiman Halder[2], Easha Biswas[1], Himangshu Sekhar Maji[1]
Department of Pharmaceutical Technology, JIS University, Kolkata, India - 700109
Department of Pharmaceutical Technology, Jadavpur University, Kolkata, India – 700032
dibyadas1990@gmail.com

The present study was to develop and validate this method for determining Hydrochlorothiazide (Antihypertensive drug) in human plasma by LC-ESI-MS/MS. A simple, rapid bioanalytical LC-ESI-MS/MS (API-2000) method with appropriate accuracy sensitivity, and selectivity, precision was developed and validated to quantify Hydrochlorothiazide in human plasma. Losartan is used as an Internal Standard (IS). The liquid chromatographic separation was carried out in gradient method using Pump A: 0.1% Formic Acid in Milli-Q water as an aqueous solvent and Pump B: Acetonitrile as an organic solvent and with a flow rate of 0.5 ml/min using Phenomenex Kinetex 5µ, C18 100Å, 50*3mm column. Plasma extraction was done using a simple protein precipitation technique. The method was validated, LOD was 1 ng/mL, LLOQ was 2.25 ng/mL calibration standard was 500 ng/mL - 2.25 ng/mL, precision, and accuracy were within the acceptance range, and recovery was high. Freeze-thaw, short-term, long-term stability, and other stability studies percentage accuracy was within the limit as per USFDA and EMA guidelines. The bioanalytical method development for Hydrochlorothiazide is highly sensitive, specific, rugged, and reproducible. The overall analysis time is promising. This validated LC-ESI-MS/MS method was successfully applied in pharmacokinetic and bioequivalence studies.

**Keywords**: Hydrochlorothiazide, Method development and validation, Protein Precipitation Technique, and ESI-LC-MS/MS Instrument.

**CH-04**

## DEVELOPMENT AND VALIDATION OF AN RP-HPLC METHOD FOR THE SIMULTANEOUS QUANTIFICATION OF LEVONORGESTREL AND ETHINYLESTRADIOL IN PHARMACEUTICAL FORMULATION AND BIOLOGICAL SAMPLE

Likhitha CN, Sateesha SB, Rajamma AJ, Anil Kumar KV, Rajesh R
Visveswarapura Institute Of Pharmaceutical Sciences
likithareddycn@gmail.com

A precise, accurate, and robust reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed and validated for the simultaneous quantification of levonorgestrel (LNG) and ethinyl estradiol (EE) in both tablet dosage forms and biological samples. Chromatographic separation was achieved using a Hypersil ODS C18 column (100 mm × 4.6 mm, 5 µm) with an isocratic mobile phase comprising 10 mM phosphate buffer (pH 7.2), acetonitrile, and methanol in a ratio of 50:40:10 (v/v/v) at a flow rate of 1 mL/min. Detection was carried out at 220 nm, with retention times of 5.36 minutes for LNG and 3.95 minutes for EE. The method demonstrated excellent linearity over the concentration ranges of 7.51–22.53 µg/mL for LNG ($R^2$ = 0.9994) and 1.51 - 4.52 µg/mL for EE ($R^2$ = 0.9996). Validation parameters, including precision, accuracy, specificity, and robustness, met the criteria established by ICH Q2 (R1) guidelines. The method was successfully applied to the analysis of commercial tablet formulations and artificial plasma samples spiked with LNG and EE, indicating its suitability for routine quality control and pharmacokinetic studies. This validated method offers a reliable analytical tool for simultaneous estimation of these hormonal agents in various pharmaceutical matrices.

**Keywords:** Levonorgestrel, Ethinyl estradiol, Simultaneous estimation, RP-HPLC method development, Pharmaceutical Analysis.

**CH-05**

## SYNTHESIS AND *IN VITRO* CHARACTERIZATION OF PEGYLATED MELPHALAN CONJUGATES FOR ENHANCED THERAPEUTIC POTENTIAL

Mohammad Saif[1,2], Mohammad Adnan Raza[1,2]
Rungta College of Pharmaceutical Sciences and Research, Bhilai, C.G., India
Department of Pharmacy, Rungta International Skill University, Bhilai, C.G., India
mohammadsaif0388@gmail.com

Melphalan, an active pharmaceutical agent utilised in the treatment of breast and ovarian cancers, as well as a specific form of bone marrow cancer, was conjugated to linear methoxy poly(ethylene glycol) (M-PEG) with molecular weights of 2000 and 5000 Da. An ester bond between the polymer and the drug was employed in the coupling to produce a

ISBN: 978-81-980623-8-3

polymeric prodrug. Purified esters were characterised using MALDI-TOF. Infrared spectroscopy techniques. The alteration facilitated the resolution of the established issue of melphalan's aqueous solubility (0.1 µg/ml), resulting in the development of a polymer-drug bioconjugate more appropriate for oral and parenteral delivery. The molecular weight of M-PEG is essential for the stability of conjugates, water solubility (with M-PEG 2000 exhibiting 80 times and M-PEG 5000 exhibiting 123 times more solubility), and haemolytic activity. Melphalan induced 100% haemolysis at concentrations exceeding 3.5 µg/ml within one hour, but the conjugates of M-PEG 2000 and M-PEG 5000 exhibited haemolysis rates of 81.3±0.5% and 48.8±1.5%, respectively, at a concentration of 32 µg/ml after one hour. Additionally, the *in vitro* anticancer efficacy of melphalan and its conjugates was evaluated using MCF-7 breast cancer cell lines. The LD50 concentrations were 1.14 µM and 2 µM for M-PEG 2000 and M-PEG 5000, respectively, in contrast to pure melphalan, which was 0.74 µM. The aforementioned investigations demonstrated enhanced pharmacokinetic features upon conjugation.

**Keywords:** Methoxy-polyethylene glycol, anti-cancer, MCF-7 cell line, aqueous solubility, hemolytic activity

## GREEN AND SUSTAINABLE PROCESS DEVELOPMENT OF KEY INTERMEDIATE GREWE DIAMINE OF THIAMINE HYDROCHLORIDE THROUGH FLOW CHEMISTRY

Navnath S. Sathe, Shrikant M. Ghodse*
Department of Pharmaceutical Chemistry
Principal K. M. Kundnani College of Pharmacy, Cuffe Parade,
Mumbai -400 005, India
navnathssathe@gmail.com

Grewe diamine (4-Amino-5-aminomethyl-2-methylpyrimidine) is key chemical intermediate of thiamine hydrochloride synthesis, has considerable importance in the pharmaceutical and food industry. However, their selective synthesis is challenging. An industrial method for the synthesis is patented in 1951 by Matsukawa, has been applied till now for thiamine hydrochloride commercially. The global thiamine (vitamin B1) market is estimated to be 680 million to 710 million USD and is expected to grow at a compound annual growth rate (CAGR) of 5.0%–6.8% over the forecast period of 2023–2035. The proposed continuous-flow process is based on developments in process chemistry, chemical engineering, and equipment design, and affords improved performance and safety compared with batch-mode manufacturing. Several challenges were precisely investigated and controlled, including mixing, unexpected clogging, solvent changes, an exothermic reaction, and the prevention of side product, using various micro-channel flow reactors, mixers, separators, and continuous filters. Intermediate Grewe diamine was produced with an isolated yield of 84.7 % with high purity. This continuous-flow protocol enables technology involving key principles of green chemistry. Hence, the application of flow technology is of paramount importance for improving security, reducing waste, and, in particular, improving the efficiency of batch operations that require several days for manufacturing.

**Keywords:** Green Process, Grewe diamine, Thiamine hydrochloride, Flow chemistry

## NOVEL UV SPECTROPHOTOMETRIC METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF VONOPRAZAN IN TABLET DOSAGE FOR: EVALUATION OF GREENNESS OF THE ANALYSIS

B. Nikhitha, M. Lahari, P Vivek Sagar
Department of Pharmaceutical Analysis, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana
b.nikhitha17@gmail.com

The present study focuses on the development and validation of a novel UV spectrophotometric method for the quantitative estimation of Vonoprazan in its tablet dosage form, with a special emphasis on the greenness of the analytical process. Vonoprazan, a potassium-competitive acid blocker (P-CAB), is used in the treatment of acid-related disorders. As there is limited data on UV spectrophotometric analysis of this drug, especially with a green chemistry perspective, this work aims to fill that gap by offering a simple, cost-effective, accurate, and eco-friendly method. The method was developed using a Methanol: Phosphate buffer (50:50 v/v) as the solvent system. The maximum absorbance (λmax) of Vonoprazan was observed at 285 nm. The method obeyed Beer-Lambert's law in the concentration range of 2–12 µg/mL, showing a strong linear relationship (correlation coefficient $R^2 = 0.9994$). The method was validated as per ICH Q2(R1) guidelines for parameters such as linearity, accuracy, precision, LOD, LOQ, robustness, and system suitability. The accuracy studies showed percentage recoveries in the range of 98.5%–101.2%, indicating that the method is reliable and free from interference. Precision (both intra-day and inter-day) studies revealed %RSD values less than 2, confirming the reproducibility of the method. Additionally, the greenness of the method was evaluated using two widely accepted tools: the analytical Eco-Scale and the Green Analytical Procedure Index (GAPI). The eco-scale score indicated that the method is environmentally benign, while GAPI pictogram assessment confirmed low environmental and health hazards associated with the procedure. In conclusion, the proposed UV spectrophotometric method is simple, accurate, precise, rapid, cost-effective, and eco-friendly, making it highly suitable for routine quality control analysis of Vonoprazan in pharmaceutical industries. Its green chemistry profile enhances its applicability in sustainable analytical practices.

**Keywords:** Vonoprazan, UV spectrophotometry, Green chemistry, GAPI, ICH guidelines.

## UV SPECTRO PHOTOMETRIC METHOD FOR SIMULTANOUS ESTIIMATION OF ZPTO WITH KETOCONAZOLE IN SHAMPOO FORMULATION AND EVALUATION OF GREENNESS OF THE METHOD

M. Lahari, B. Nikhitha, P Vivek Sagar
Department of Pharmaceutical Analysis
Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana
laharimulukuntla@gmail.com

A simultaneous UV spectrophotometric method for the estimation of ketoconazole and Zinc Pyrithione (ZPTO) in commercial shampoo formulations was developed and validated, ensuring comprehensive quality control of topical antifungal products. Both active ingredients are commonly co-formulated due to their synergistic efficacy against dandruff and fungal infections in scalp care. The method involved the preparation of standard and sample solutions with suitable solvents (such as methanol), determining the maximum absorbance wavelengths (λmax) for ketoconazole (typically 225–255 nm) and ZPTO (in the range of 246–267 nm), and using the simultaneous equation or Q-absorbance ratio approach to enable quantification without interference Linearity of response for both analytes was established across relevant concentration ranges, and validation was performed as per ICH Q2(R1) guidelines for accuracy, precision, specificity, robustness, limit of detection, and limit of quantitation. Results demonstrated that both ketoconazole and ZPTO could be reliably estimated in the mixture, with minimal sample processing and without interference from shampoo excipients. The validated method was found suitable for routine analysis in industry and research environments, especially in resource-limited settings. With the implementation of this approach, consistent therapeutic efficacy and regulatory safety of shampoos containing both ketoconazole and zinc pyrithione can be ensured, supporting the comprehensive control required for modern cosmetic and pharmaceutical products.

**Keywords:** UV Spectroscopy, ketoconazole, ZPTO, Absorbance Ratio

The interdisciplinary fusion of nanotechnology and phytochemical science is paving the way for eco-friendly nanoparticle synthesis in biomedical applications. The study explores the biosynthesis of silver nanoparticles (AgNPs) utilizing the seed extract of Annona squamosa,a plant rich in phytochemicals known for their medicinal value. The bioactive constituents in the extract serve as natural reducing and stabilizing agents, facilitating the sustainable fabrication of nanoparticles without the need of toxic chemicals. The synthesis process was initially indicated by a visible color change and further confirmed through UV-Visible spectroscopy, showing a characteristic surface plasmon

ISBN: 978-81-980623-8-3

resonance peak at 428 nm. Comprehensive characterization using FTIR, SEM, and XRD analyses confirmed the presence of functional groups involved in capping, spherical morphology, and crystalline nature of the AgNPs. The *in vitro* anticancer efficacy of the synthesized nanoparticles was assessed using the MTT assay on HepG2 liver cancer cells, revealing a dose-dependent cytotoxic effect. These findings highlight the potential application of Annona squamosa-mediated AgNPs as a biocompatible and sustainable alternative in cancer nanomedicine, paving the way for further research and development of green nanotechnology applications.

## A SIMPLE SPECTROPHOTOMETRIC BIOANALYTICAL TECHNIQUE FOR QUANTIFICATION OF LACOSAMIDE IN PLASMA AND TABLET FORMULATIONS.

P. Lakshmi Vaibhavi[1], Kranthi Yalla[1]
1 Department of Pharmaceutical Analysis, Shri Vishnu College of Pharmacy, Bhimavaram, West Godavari,
Andhra Pradesh – 534202, India.
pragallapativaibhavi@gmail.com

Lacosamide, a medication used for epilepsy, demonstrates high solubility in organic solvents like ethanol, dimethyl sulfoxide (DMSO), and dimethyl formamide (DMF) (approximately 20 mg/mL) but shows limited solubility in water. To quantify Lacosamide in biological samples, effective extraction methods and dependable spectrophotometric techniques are necessary. The current research sought to create and validate a straightforward and repeatable spectrophotometric technique for measuring Lacosamide in human plasma and tablet formulations through liquid–liquid extraction (LLE). Plasma samples containing Lacosamide (12.5 µg/mL) were prepared and subjected to liquid–liquid extraction. After centrifuging at 4°C for 20 min at 7000 rpm, the supernatant was collected and evaporated under nitrogen flow (60 psi for 20 min). The resulting residue was dissolved in a mixture of Orthophosphoric acid and methanol (65:35 v/v). Absorbance readings were performed in a Bio-spectrophotometer at a wavelength of 221 nm using 1 mL quartz cuvettes. The parameters for calibration, linearity, precision, accuracy, robustness, and stability (both freeze–thaw and short and long-term) were validated following bioanalytical standards. The established technique demonstrated outstanding linearity, precision, and accuracy, with recovery rates remaining within acceptable limits. The examination of Lacosamide tablets resulted in a yield of 95.2%, consistent with pharmacopeial standards. A reliable, sensitive, and economical Bio-spectrophotometric technique for quantifying Lacosamide in both plasma and formulations has been successfully developed. This method provides a dependable option for regular therapeutic monitoring and quality control assessments in settings lacking advanced chromatographic equipment.

## QBD-BASED STABILITY-INDICATING RP-HPLC METHOD DEVELOPMENT AND VALIDATION OF RIBOCICLIB - ITS CHARACTERIZATION IN DEGRADATION PRODUCTS.

Babu B, J.Ramesh, M.Siva Selva kumar
Department of Pharmaceutical Analysis, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty, Nilgiris,
Tamil Nadu, India
babu@jssuni.edu.in

Stability refers to capacity of a drug product to remain unchanged throughout the shelf life. Study of stability testing techniques in pharmaceutical products is essential for three main reasons; Safety of patient, Maintain identity, purity and quality of drug. The development of drugs is generally taken for granted along with their quality, safety and efficacy. In 2023, 306 drugs have been recalled by USFDA out of which 17 drugs was recalled because of its stability and presence of undeclared ingredients. Hence the stability study is important for all the drugs. For Ribociclib, no HPLC method optimized with QbD were reported for their stability in different stress conditions and LC-MS/MS method characterization of the degradation products. The chromatographic conditions namely mobile phase, flow rate etc., were optimized by QbD method and followed by forced degradation studies on the selected drug. In accordance with the ICH guidelines the developed HPLC method was validated and the results were found to be within the acceptable limits. The concentration range of 5 µg/ml- 100 µg/ml. LOD and LOQ were determined and linear regression was found to be 0.999. Precision (Interday & Intraday) was obtained less than 2.0. Recovery for accuracy was found to be 96.12 - 97.92%. The robustness study was found to be within the limit which is less than 2%. The developed methods can be employed to estimate the degradants of chosen drug in formulations by industries, drug testing laboratories and R & D units.

**Keywords:** Ribociclib, Box Behnken Design, High Performance Liquid Chromatography, Forced Degradation studies, Validation.

## EXTRACTION, STANDARDIZATION, AND SYNTHESIS OF NANOPARTICLES FROM SEED EXTRACT OF ABELMOSCHUS MOSCHATUS

Poonam Shewale, Madhuri U Shelar, Sachin N Rathod
Department of Quality Assurance in Pharmacy, Alard School of Pharmacy, Alard University, Marunji, Hinjawadi, Pune-411057
shewalepoonam16@gmail.com

Herbal medicines have been widely used since ancient times for the prevention and treatment of various diseases. In this study, seed extract of Abelmoschus moschatus was utilized for the extraction, standardization, and green synthesis of nanoparticles. The main objective was to explore the potential of A. moschatus seed extract in the formulation of eco-friendly nanoparticles with medicinal relevance. The prepared nanoparticles were evaluated for particle size, stability, phytochemical constituents, and possible therapeutic applications. Standardization of the extract was performed using qualitative and quantitative phytochemical analysis. The synthesized nanoparticles were characterized by UV- visible spectroscopy, FTIR, SEM, and particle size analysis, confirming the successful formation of stable nanoparticles. The results indicate that the seed extract of Abelmoschus moschatus is a promising natural reducing and stabilizing agent in the green synthesis of nanoparticles. Thus, the present study highlights a simple, economical, and eco-friendly approach for nanoparticle synthesis with potential pharmaceutical applications.

**Keywords:** Abelmoschus moschatus, seed extract, nanoparticles, green synthesis, phytochemical analysis

## METHOD DEVELOPMENT AND VALIDATION BY HPTLC FOR SIMULTANEOUS ESTIMATION OF METOCLOPRAMIDE HCL AND PARACETAMOL IN SOLID DOSAGE FORM THROUGH QBD APPROACH

Atharv Kishor Khandalkar, Ganesh S Andhale, Rutuja D Patil
Department of Quality Assurance in Pharmacy, Alard School of Pharmacy, Alard University, Marunji, Hinjawadi, Pune-411057
vikaskhandalkar2001@gmail.com

Analytical method development plays a crucial role in pharmaceutical quality assurance to ensure accuracy, precision, and robustness in drug estimation. The present study focuses on the development and validation of a High-Performance Thin-Layer Chromatography (HPTLC) method for the simultaneous estimation of Metoclopramide HCl and Paracetamol in solid dosage form through a Quality by Design (QbD) approach**.** The main objective was to establish a cost-effective, reliable, and stability-indicating analytical method applicable to routine quality control.The developed method was optimized using QbD principles to evaluate critical quality attributes and design space for robust performance. Validation was performed in accordance with ICH guidelines**,** assessing parameters such as accuracy, precision, linearity, robustness, ruggedness, LOD, and LOQ. Forced degradation studies under acidic, basic, oxidative, thermal, photolytic, and neutral conditions confirmed the stability-indicating nature of the method. Furthermore, greenness assessment using AGREE and BAGI tools highlighted the eco-friendliness and practical applicability of the developed method. The results demonstrated that the proposed HPTLC method is simple, precise, accurate, and environmentally sustainable, making it suitable for the routine pharmaceutical analysis of combined dosage forms of Metoclopramide HCl and Paracetamol.

**Keywords:** Metoclopramide HCl, Paracetamol, HPTLC, Method Validation, Quality by Design (QbD), Stability-Indicating Method.

**DESIGN, SYNTHESIS, AND PHARMACOLOGICAL EVALUATION OF PYRAZOLE-BASED HETEROCYCLES: A MULTITARGET STRATEGY FOR ANTICANCER AND ANTIBACTERIAL THERAPY**

Anwar Liyakat Shaikh, Ganesh S Andhale, Omkar S Chaure
Department of Pharmaceutical Quality Assurance, Alard College of Pharmacy, Pune, Maharashtra, India – 411057.
anwarshaikh17032002@gmail.com

In the present study, we present the rational design and synthesis of a series of pyrazole-based heterocyclic compounds with the aim of targeting dual pharmacological action anticancer and antibacterial. The synthetic route involved is Claisen-Schmidt condensation to form chalcones, followed by cyclization with hydrazine hydrate and acetyl acetone to yield structurally diverse pyrazole derivatives. Each compound was characterized using FTIR, $^1$H NMR, and mass spectrometry, confirming their molecular integrity and functional diversity. Swiss ADME provides the results that shows high gastrointestinal absorption and no violations of Lipinski's Rule of Five, indicating strong drug-likeness. Molecular docking studies against the cancer protein involved in breast cancer (PDB ID: 5NQR) showed the good binding affinities, particularly for compounds O1 and O3, which formed stable hydrogen bonds and hydrophobic interactions with key residues such as ARG, GLU, and TRP. *In vitro* MTT assays on MCF-7 breast cancer cells demonstrated moderate cytotoxicity, with $IC_{50}$ values of 244.57 µg/mL (O3) and 245.75 µg/mL (O1), approaching the efficacy of cisplatin ($IC_{50}$ = 187.03 µg/mL). Antibacterial screening against Staphylococcus aureus and Escherichia coli revealed zones of inhibition up to 12.5 mm, confirming broad-spectrum activity. This work underscores the therapeutic potential of pyrazole scaffolds and their adaptability for multitarget drug development. With favorable ADME profiles and promising biological activity, these compounds offer a compelling foundation for further optimization and preclinical exploration.

**Keywords:** Pyrazole derivatives, chalcones, anticancer activity, antibacterial screening, molecular docking, Swiss ADME, MCF-7 cells.

In the present study, a series of novel hydrazinyl-substituted pyrimidinones were designed and synthesized to explore their potential as a dual-action therapeutic agents. The synthetic pathway involved Claisen-Schmidt condensation, urea cyclization, and hydrazinolysis, yielding structurally diverse compounds confirmed via FT-IR, $^1$H NMR, and mass spectrometry. SwissADME profiling results proves favourable drug-likeness, high gastrointestinal absorption and no violations of Lipinski's Rule of Five. Molecular docking studies against the breast cancer protein with PDB ID: 5NQR revealed strong binding affinities, particularly for compounds A1 and A3, which formed stable hydrogen bonds and hydrophobic interactions with key residues including ARG, GLU, and LEU. *In vitro* cytotoxicity assays on MCF-7 breast cancer cells showed moderate activity, with $IC_{50}$ values of 244.57 µg/mL (A3) and 245.75 µg/mL (A1), approaching the efficacy of cisplatin ($IC_{50}$ = 187.03 µg/mL). Antibacterial screening demonstrated zones of inhibition against Staphylococcus aureus and Escherichia coli, confirming the antimicrobial potential of the synthesized scaffolds. This work proves the pharmacological activity of pyrimidine derivatives and their promise as next-generation agents with anticancer and antimicrobial capabilities. The study lays a foundation for further structural optimization and preclinical development.

**Keywords:** Pyrimidinone, Hydrazinyl derivatives, anticancer agents, antimicrobial activity, molecular docking, ADME profiling, dual-action therapeutics.

ravindarpharma@gmail.com

This research work presents the validation of an analytical method for the estimation of heavy metals—Cadmium (Cd), Lead (Pb), Arsenic (As), Mercury (Hg), Cobalt (Co), Vanadium (V), and Nickel (Ni)—in Edaravone using Inductively Coupled Plasma Mass Spectrometry (ICP-MS). The study outlines the validation process including procedures, documentation, and results in accordance with established regulatory guidelines. Key parameters such as accuracy, precision, linearity, limit of detection (LOD), limit of quantification (LOQ), specificity, and robustness were evaluated against predefined acceptance criteria. The outcomes confirmed that the method is reliable, reproducible, and suitable for the routine estimation of trace metal content in Edaravone, ensuring product quality and patient safety.

**GREEN SYNTHESIS, CHARACTERIZATION, AND BIOLOGICAL EVALUATION OF NOVEL SCHIFF BASE DERIVATIVES AS POTENTIAL ANTI-TUBERCULAR AGENTS**

Guhashri Musalkol, Judy Jays
Department of Pharmaceutical Chemistry, M. S. Ramaiah Universtiy of Applied Sciences, University House, New BEL Rd, M S R Nagar, Mathikere, Bengaluru, Karnataka 560054
musalkolguhashri@gmail.com

Research focuses on the green synthesis, characterization, and biological evaluation of novel Schiff base derivatives as potential anti-tubercular agents. Selected derivatives of para-aminobenzoic acid and 2,4-dinitrophenylhydrazine were synthesized using an environmentally friendly grinding technique and subsequently condensed with various aromatic aldehydes to yield Schiff bases with high yields. All synthesized compounds were purified and characterized by infrared (IR) spectroscopy. In-silico screening using PASS online and molecular docking studies (AutoDock 4.2, targeting dihydrofolate reductase) indicated promising anti-tubercular activity for the derivatives, with docking scores superior to the reference compound PABA. Further, *in-vitro* biological assays using the microplate Alamar Blue method (MABA) demonstrated that all four compounds exhibited significant activity against Mycobacterium tuberculosis H37Rv strain, with minimum inhibitory concentrations comparable to standard drugs. The study concludes that these Schiff base derivatives are promising candidates for anti-tubercular drug development, supporting further investigations into their structure-activity relationships and therapeutic potential.

**Keywords:** Green chemistry, Schiff base derivatives, Anti-tubercular activity, Grinding technique, PASS online, Molecular docking, Infrared spectroscopy (IR), Microplate Alamar Blue assay (MABA), Dihydrofolate reductase, Para-amino benzoic acid (PABA), Synthesis and characterization, In-silico screening

Breast cancer remains one of the leading causes of cancer-related mortality worldwide, requiring the development of innovative therapeutic strategies with high selectivity and low systemic toxicity. The large surface area, functionalization, and biocompatibility of graphene oxide make it a suitable nanocarrier for targeted drug delivery. This study synthesized a graphene oxide-based magnetic nanocomposite (GO-MNC) and thoroughly evaluated its therapeutic effectiveness against breast cancer. The addition of magnetic nanoparticles to Graphene oxide improved its stability, drug-loading capacity, and ability to be guided by an external magnetic field. Extensive *in vitro* cytotoxicity tests using MCF-7 breast cancer cells demonstrated that the nanocomposite

ISBN: 978-81-980623-8-3

exhibited greater anticancer activity than the free drug, characterized by enhanced cellular uptake, sustained drug release, and induction of apoptosis. Furthermore, the GO-MNC demonstrated excellent biocompatibility in normal cell lines, confirming its selective action on tumor cells. The combined magnetic responsiveness and GO's functional structure further support its potential in hyperthermia-assisted therapy. Overall, the results indicate that GO-MNC is a versatile nanoplatform capable of delivering minimally invasive, targeted, and effective breast cancer treatment, marking a significant step forward in the clinical translation of graphene-based nanomedicine.

**Keywords:** Graphene Quantum Dots, Nanotechnology, Cancer, Drug Delivery System

## AN INSIGHT OF MOLECULAR DOCKING OF BIOACTIVE CONSTITUENTS FROM TINOSPORA SINENSIS (LOUR.) MERR. AGAINST INFLAMMATION AND CANCER.

Nikusmita Das, Manash Pratim Kataki, Susankar Kushari
Girijananda Chowdhury Institute of Pharmaceutical Science,
Girijananda Chowdhury University, Guwahati-781017, Assam, India
nikusmitadas34@gmail.com

Cancer, the uncontrolled growth of cells, is a major cause of death throughout the world. The past century has demonstrated that cancer can be effectively treated with surgery, chemotherapy, and radio therapy have had an important impact on survival. However, once the tumor has metastasized, treatment becomes more complicated. Natural products have well-established anticancer activity with limited side effects. The current study aims to analyze the binding interactions of bioactive molecules of Tinospora sinensis with diverse molecular targets against cancer. A total of 10 phytoconstituents were determined for a range of target proteins such as NFKB1, HS90, and CDK2 through computational docking analysis. Molecular docking study was conducted through Discovery Studio to measure the binding affinity of chosen compounds against target proteins. Ligand structures were retrieved from PubChem, and docking outcomes were analyzed to identify binding energies and interactions. Strong interactions with these proteins were indicated through significant binding affinities. The result revealed that kaempferol possessed the highest binding interaction, followed by astragalin and cianidanol. In conclusion, T. sinensis might provide a promising role as a drug source for the treatment of inflammation and cancer. These results provide a rationale for further *in vitro* and *in vivo* studies to validate their therapeutic potential.

**Keywords**: Tinospora sinensis, bioactive compounds, molecular docking, kaempferol

## DEVELOPMENT AND VALIDATION OF QUALITY CONTROL PARAMETERS OF AYURVEDIC FORMULATION USED FOR THE TREATMENT OF DIABETES

Satyaendra Shrivastava[1], Sumeet Dwivedi[2]
1, Parijat College of Pharmacy, Indore, Madhya Pradesh, India
2, Acropolis Institute of Pharmaceutical Education and Research,
Indore, Madhya Pradesh, India
shrivastavapharma@gmail.com

Diabetes mellitus is a chronic metabolic disorder marked by persistent hyperglycemia due to impaired insulin secretion or action. The present study was aimed to develop and validate ayurvedic formulation containing Momordica charantia (bitter gourd), Gymnema sylvestre (gurmar), Tinospora cordifolia (guduchi), Syzygium cumini (jamun), Trigonella foenum-graecum (fenugreek), and Curcuma longa (turmeric) However, to ensure therapeutic efficacy, safety, and reproducibility, strict quality control measures are essential. Standardization of Ayurvedic formulations involves pharmacognostical, physicochemical, and phytochemical evaluation. Pharmacognostical studies authenticate raw materials through macroscopic and microscopic features, preventing adulteration. Physicochemical parameters such as pH, ash values, extractive values, and moisture content provide insights into stability and purity. Advanced analytical tools including High-Performance Thin Layer Chromatography (HPTLC), High-Performance Liquid Chromatography (HPLC), and Fourier-Transform Infrared Spectroscopy (FTIR) are used for fingerprint profiling and quantification of bioactive markers like charantin, gymnemic acids, berberine, and curcumin. Safety assessment through microbial load determination, heavy metal analysis, and pesticide residue testing further ensures quality assurance. Establishing robust quality control parameters not only validates the efficacy of Ayurvedic antidiabetic formulations but also strengthens their scientific credibility, supporting integration into evidence-based healthcare. Thus, standardization of plant-based Ayurvedic formulations is indispensable for ensuring patient safety, global acceptance, and bridging traditional knowledge with modern science.

**Keywords:** Diabetes, Quality Control, Validation

Dharashiv, MH, 413501
yedeshivani1@gmail.com

Diabetes mellitus is a growing, long-term disease and a major global health problem. It is marked by high blood sugar because of problems with insulin, either in how it is made or how it works in the body. Standard medicines work but often cause side effects, can be expensive, and sometimes lose their effect over time. This means there is a need for new treatments. Natural products and their man-made versions are promising sources for new drugs. Chalcones are an important group of natural compounds, widely studied for their strong and varied health effects, including the potential to treat diabetes. They are easy to recognize by their special chemical structure, which helps them react with and affect many biological targets. The present research work aimed to provide a comprehensive exploration of the multifaceted mechanisms through which chalcones exert their anti-diabetic effects. Our analysis highlights their capacity to modulate key metabolic pathways and cellular processes central to the development of Type 2 diabetes. In particular, we discuss their function as agonists of Peroxisome Proliferator-Activated Receptor gamma (PPARγ), a nuclear receptor pivotal in regulating glucose and lipid metabolism. By activating PPARγ, chalcones can enhance insulin sensitivity in peripheral tissues, which is fundamental to effective diabetes management. As part of research work, synthesis of few chalcones have been carried out, and found to possess anti-diabetic activity, the structures were confirmed by HNMR, IR, Mass spectral analysis.

**Keywords:** Anti-diabetic activity, chalcone derivatives, drug resistance.

**CH-22**

## ANTIMALARIAL POTENTIAL OF PYRIDINE-SUBSTITUTED 1, 3-DI ARYL PROPENONE DERIVATIVES: *IN VITRO* ACTIVITY AND STRUCTURE–ACTIVITY INSIGHTS

Madhulaxmi Balaji Thorat, Dr. Md. Rayees Ahmad, Dr. shaikh Gazi,
Pathan Muzakkir Ahmed
Dept. of Pharmaceutical Chemistry, RP College of Pharmacy,
Dharashiv, MH, 413501.
madhulaxmithorat2004@gmail.com

Malaria is one of the most devastating parasitic diseases worldwide, caused mainly by Falciparum and transmitted by Anopheles mosquitoes. According to the WHO, more than 241 million cases and 627,000 deaths were reported in 2020, Despite existing therapies, the rapid emergence of multidrug-resistant Plasmodium strains threatens global malaria control efforts. Therefore, there is an urgent need to explore novel molecular scaffolds with high efficacy and distinct mechanisms of action. 1, 3-di aryl propenones (Chalcones), a group of naturally occurring flavonoids such as cajachalcone, licochalcones characterized by their α, β-unsaturated carbonyl bridge connecting two aromatic rings, are known for diverse biological activities including antimicrobial, and anticancer effects. Structural simplicity and ease of chemical modification make chalcones especially attractive for antimalarial drug development. To address drug resistance, we synthesized a series of pyridine-based chalcone Mannich-type derivatives via introduction of amino alkyl substituents into the chalcone framework. Antimalarial activity was evaluated against P. falciparum (sensitive 3D7 and resistant FCR3 strains) and P. knowlesi. Few of the synthesized compounds showed remarkable potency against P. knowlesi, and against P.

ISBN: 978-81-980623-8-3

falciparum 3D7.SAR analysis indicated that secondary amine groups enhanced bioactivity, while methoxy substitution and pyridine group positioning played vital roles in modulating potency. Structural confirmation was achieved using $^{1}$H-NMR, $^{13}$C-NMR, and mass spectrometry. These results identify pyridine-based chalcone Mannich derivatives as promising scaffolds for next-generation antimalarial agents. By overcoming resistance mechanisms, they offer potential to strengthen malaria control strategies. Nonetheless, *in vivo* studies remain essential to establish pharmacokinetics, safety, and therapeutic value.

**Keywords:** Antimalarial activity, chalcone derivative, pyridine substitution, drug resistance.

**PHYSICOCHEMICAL PROFILING, DRUG-LIKENESS, ADMET PREDICTION, AND COMPUTATIONAL BINDING MODE ANALYSIS OF A THIAZOLE-BENZAMIDE LEAD DERIVATIVE**

Mrunali Karemore[1], Rohit Singh, Nilesh Bajad
Department of Pharmaceutical Sciences, School of Health Sciences & Technology, Dr. Vishwanath Karad MIT-World Peace University, Pune, Maharashtra 411038.
mrunalikaremore4@gmail.com

The growing global burden of cancer highlights the direct need for the discovery of novel therapeutic agents for the effective management of the disease. In addition to the therapeutic activity, the physicochemical properties of any drug molecule critically influence its bioavailability, distribution, metabolism, and excretion, and hence its therapeutic efficacy. Therefore, further complete physicochemical profiling of novel synthesized lead molecules are necessary in order to move for further pre-clinical studies. This study mainly investigates the physicochemical profiling, drug likeness, ADMET prediction along with computational binding mode analysis of novel synthesized thiazole-benzamide derivative. The physicochemical profiling including, solubility, log P and log D of lead molecule showed the favorable physicochemical properties of lead molecule along with drug likeness. Moreover, *in silico* prediction of the ADMET indicated the favorable absorption, distribution, metabolism, excretion and lack of toxicity. The molecular docking and molecular dynamics studies was also carried out to understand the binding modes of this lead compound. The molecular docking interaction analysis showed high binding affinity of the lead compound against selected target. Furthermore, molecular dynamics simulation studies revealed the high protein–ligand stability of the lead compound with target.

**Keywords**: Physicochemical properties, ADMET, Molecular docking, Thiazole-benzamide

**SYNTHESIS, CHEMICAL CHARECTERIZATION AND EVALUATION OF BIOLOGICAL ACTIVITY OF SOME NOVEL INDOLES**

Mahesh Patil, Natraj Lakka, Rajeeva.B, N Srinivasulu and Sidrameshwar
Sri Siddhalingeshwar College of Pharmacy, Bidar-585404 Karnataka. (INDIA)
maahichemistry@gmail.com

The aim of this study consists of synthesis, characterization and evaluation of antimicrobial activity of some novel Indole derivatives. The starting compounds 2-(2-oxoindolin-3-ylidene) hydrazinecarbothioamide (5a), 2-(5-chloro-2-oxoindolin-3-ylidene) hydrazine carbothioamide (5b) were prepared from appropriate isatin and thiosemicarbazide in ethanol using piperidine as catalyst. The compounds (5a and 5b) were converted smoothly into their thiazolo derivatives (7a-f) by reacting with substituted phenacyl bromides in ethanolic medium. Whereas the Isatines (1 a-c) were also converted into 2-chloro-N'-(2-oxoindolin-3-ylidene) acetohydrazides (4 a-c) in two steps via the formation of 3-hydrazonoindolin-2-one upon reaction with hydrazine hydrate followed by reaction with chloroacetyl chloride. The Isatines were also converted into 2-benzamido-2-(2-oxoindolin-3-ylidene) aceticacid (2 a-c) upon reaction with benzoyl glycine in the presence of sod.acetate in acetic anhydride medium. From the data of the antimicrobial, it is clearly concluded that the synthesized Indole derivatives were found to be moderate to weak antibacterial agents. Here we have synthesized some novel Indole analogues combining with thiazole with view to get good antimicrobial agents with less toxic and side effects but the synthesized compounds exhibit moderate antimicrobial activity.

**Keywords:** Indole derivatives, antimicrobial activity, Staphylococcus aureus, Enterococcus faecalis, Escherichia coli, and Klebsiella pneumonia, agar well diffusion method.

anuradhakhadke23.sdsr@jspmuni.ac.in

Depression is a complex mental disorder associated with affective, cognitive, and physical symptoms characterized by reduced energy, loss of interest, and motivational symptoms such as anergia and fatigue. Many herbal medicines are known to improve mood and reduce symptoms of depression. The active compounds in these herbs can serve as starting points for designing better drugs. This study explores the in-silico design of semisynthetic derivatives of herbal antidepressant compounds incorporating thiophene moieties to enhance binding with depression-related targets. By adding small chemical changes—such as including a thiophene ring—it is possible to make these compounds work more antidepressant activity. Herbal lead Harmine, curcumin, resveratrol and coumarin were evaluated. Their natural forms were tested using molecular docking against two important proteins: the serotonin transporter (hSERT) and monoamine oxidase-A (MAO-A). They showed great potential *in silico* studies and proved to be good mono-amino oxidase inhibitors and SERT inhibitors. The derivatives showed good docking scores. When thiophene was added, binding strength improved to −8.3 to −9.3 kcal/mol Adding thiophene to active herbal molecules can make them attach more tightly to depression-related targets

**Keywords:** Docking, Thiophene Derivatives, Antidepressant, Herbal Drug

**ECO-FRIENDLY SYNTHESIS OF α, β -UNSATURATED CARBONYL COMPOUNDS AND THEIR ENHANCED ANTI-OXIDANT POTENTIAL**

Shaikh Mustafa Munir, Md.Rayees Ahmad,
Shaikh Gazi, Pathan Muzakkir
Dept. of Pharmaceutical Chemistry, RP College of Pharmacy, Gadpati, Alani, Osmanabad.MH, 413501
inzuking786@gmail.com

The α, β-unsaturated carbonyl, sulfonyl, and sulfinyl functional groups are key moieties involved in activating the NRF2 signaling pathway. Their α, β-unsaturated structure makes them suitable electrophiles for nucleophilic addition (Michael addition) with the thiol groups of cysteine residues. Chalcones are analogues of benzalacetophenone (BAP), which are naturally occurring polyphenolic ketones characterized by a 1,3-diphenyl-2-propen-1-one scaffold, where two aromatic rings are linked by a three-carbon α, β-unsaturated carbonyl system. These compounds interact with the NRF2/KEAP1 complex, exhibiting a wide range of pharmacological activities, notable structure–activity relationships, and pronounced antioxidant and anti-inflammatory effects. Their ability to modulate this complex expands their therapeutic potential in the management of oxidative stress-related disorders. Among these, sulforaphane and dimethylfumarate are particularly reactive and well-studied. Antioxidants play a crucial role in the prophylactic treatment of cancer, making it increasingly important for researchers to focus on the development of novel and environmentally friendly chalcone derivatives to promote better public health. This research work focuses on synthesizing various chalcones and evaluating the potential antioxidant activities of the synthesized compounds. Several derivatives of α,β-unsaturated carbonyl compounds were prepared, and their antioxidant potential was assessed. The structures were confirmed using HNMR, mass spectrometry, IR spectroscopy, and related techniques. Among these, some compounds exhibited superior antioxidant properties, while others showed moderate activity. Continued research in this area is expected to contribute to the development of novel, enhanced antioxidant drugs.

**Keywords:** α, β-unsaturated carbonyl compounds, Antioxidant activity, HNMR, IR, Mass.

## ANALYTICAL METHOD DEVELOPMENT AND STABILITY ASSESSMENT OF CAMYLOFIN DIHYDROCHLORIDE–FUMARIC ACID CO-CRYSTALS VIA RP-HPLC

Vaibhav Patil, Rohan Mahajan, Sanika Kole, Ashwin Kuchekar
Department of Pharmaceutical Sciences, School of Health Sciences and Technology, Dr. Vishwanath Karad, MIT World Peace University, Kothrud-411038, Pune, India.
vaibhav.patil1@mitwpu.edu.in

This study aimed to improve the chemical stability of Camylofin dihydrochloride by creating co-crystals with Fumaric acid, a Generally Recognized as Safe (GRAS) co-former recognized for its ability to stabilize active pharmaceutical ingredients (APIs) through non-covalent interactions. We made co-crystals by kneading them together in a 1:3 molar ratio. Then, we made immediate-release tablets by directly compressing them with standard excipients. An RP-HPLC method for indicating stability was created and tested to meet ICH Q2(R1) standards. The method showed great linearity ($R^2 > 0.995$), sensitivity (LOD 0.2 µg/mL; LOQ 0.7 µg/mL), precision (intra- and inter-day %RSD < 1%), and robustness. Forced degradation and ICH-specified long-term (30 ± 2°C/60% RH) and accelerated (40 ± 2°C/75% RH) studies showed that the co-crystal formulation was more stable than the pure drug. A projected shelf life of roughly 8.25 months at room temperature was indicated by the assay values, which gradually decreased from 98.5% to 95.4% under long-term conditions and to 89.9% under accelerated conditions. Degradation occurred according to zero-order kinetics ($R^2 \approx 0.993$). These results show that fumaric acid co-crystallization greatly increases camylofin dihydrochloride's stability. Furthermore, the validated RP-HPLC method supports the drug's use in routine quality assessments and regulatory submissions by guaranteeing accurate monitoring of the drug and its degradation products.

## AMIDE-LINKED AMLODIPINE–ASPIRIN CODRUGS: A NOVEL THERAPEUTIC APPROACH FOR MANAGING HYPERTENSION AND INFLAMMATORY COMORBIDITIES

Ambika S[1], Anjali Nayak[1], Paramita Das[1], Amit kumar Das[2]
[1]Department Of Pharmaceutical Chemistry, Krupanidhi College of Pharmacy, Chikka Bellandur, Bengaluru, Karnataka, 560035.
[2]Department Of Pharmaceutical Chemistry, Aditya Bangalore Institute of Pharmacy Education, and Research, Prakruthi Nagar, Yelahanka, Bengaluru, Karnataka 560064
ambikashiva2002@gmail.com

The codrug strategy offers an innovative therapeutic approach for comorbid disease management by enhancing patient quality of life while minimizing systemic toxicity, optimizing pharmacokinetics, reducing polypharmacy, and improving patient compliance in elderly. This study presents a comparative evaluation of two novel amide-linked mutual codrugs for addressing HTN and OA comorbidity; ASAM (Aspirin-Amlodipine) and ASAMVL (Aspirin-Amlodipine-Valine), synthesized via one-pot DCC-mediated amidation in inert rection and purified through recrystallization and silica gel chromatography. Structural confirmation was achieved using comprehensive spectroscopic analysis yielding satisfactory results for both compounds. Physicochemical characterization Indicated aqueous solubility with enhanced alkaline solubility and superior organic solvent compatibility compared to parent drugs. Melting point and DSC analyses indicated structural changes due to amide bond formation, with distinct thermal transitions. TLC showed increased lipophilicity via higher Rf values. Membrane protein binding was below 80% for both codrugs. *In silico* ADMET prediction using QikProp software confirmed compliance with Lipinski's rule of five and Jorgensen's rule of three criteria within acceptable violation limits, indicating promising oral bioavailability. Stability studies in various simulated biological fluids (SGF, SIF & 80% Plasma) revealed pH-dependent and enzyme-mediated hydrolysis with extended half-lives, suggesting sustained drug release characteristics. Comprehensive toxicity screening demonstrated safety parameters within established acceptable ranges. Pharmacological evaluation revealed superior anti-inflammatory activity for ASAM (60% Inhibition) compared to ASAMVL (54% inhibition), with both compounds exhibiting significant antihypertensive potential. Gastroprotective studies confirmed reduced gastric toxicity and preserved mucosa, establishing the codrugs as promising candidates with improved efficacy, safety, and pharmacological profiles for managing comorbid conditions.

**Keywords:** Comorbid, spectroscopic, polypharmacy, ADMET, bioavailability, lipophilicity.

## MOLECULAR DOCKING ANALYSIS OF NATURAL PRODUCT AS ANTIDIABETIC AGENT

Priyanka Wanjul, Sagar Wankhede
Department of Pharmaceutical Sciences, School of Pharmaceutical Sciences, Faculty of Health Sciences, JSPM University, Pune, Maharashtra, India – 412207.
priyankawanjul23.sdsr@jspmuni.ac.in

Type-2 diabetes mellitus is a complex metabolic disorder involving multiple therapeutic targets such as carbohydrate-digesting enzymes (α-glucosidase, α-amylase), incretin-degrading enzyme (DPP-4), insulin-signaling negative regulator (PTP1B), and complication-related enzymes (aldose reductase). Natural products provide a chemically diverse pool of scaffolds with significant potential for antidiabetic drug discovery. In present study, an in-silico molecular docking approach was applied to screen twenty plant-derived phytochemicals like epigallocatechin gallate (EGCG), luteolin, berberine, curcumin, piperine, ursolic acid, emodin, salvianolic acids, and betulinic acid etc. against validated antidiabetic protein targets. The docking workflow involved ligand preparation, target selection using experimentally resolved PDB structures, and docking via Auto-Dock software. Predictions were cross-validated with literature-reported docking and *in-vitro* inhibition data. Docking scores were compared with standard and co-crystallized ligand. Docking results consistently identified several promising scaffolds: (i) EGCG and related galloyl-polyphenols (ii) luteolin and other flavones (iii) piperine and 6-shogaol (iv) ursolic acid and betulinic acid (v) emodin. Most prioritized phytochemicals displayed docking scores between –7.5 and –10.2 kcal/mol, indicating stable binding interactions. These findings highlight natural products as promising scaffolds for novel antidiabetic drug development. Experimental validation of these predicted interactions through synthesis and biological evaluation will further support their therapeutic potential.

## COMPARATIVE ANALYSIS OF PFAS CONCENTRATIONS IN GROUNDWATER AND SURFACE WATER SOURCES IN BADDI'S INDUSTRIAL ZONES

Nitin Verma, Naveen Singh.
Chitkara University School of Pharmacy, Chitkara University, Barotiwala, Himachal Pradesh, India.
nitin.verma@chitkarauniversity.edu.in

Per- and Polyfluoroalkyl Substances (PFAS) are emerging contaminants of concern due to their widespread use and persistence in the environment. The PFAS are originated from man-made products that have been utilized from 19th century. The presence of C-F bond makes them remarkable long lasting, stable and persistent in environment. The PFAS contaminations are growing in environment which is the biggest concerns. Our study aimed to assess the contamination of per- and polyfluoroalkyl substances (PFAS) in drinking water sources in industrial areas Baddi in Himachal Pradesh, India and their risk assessment. The water samples were collected from various drinking water resources across Baddi into the 250 mL polypropylene bottle fitted with a polypropylene screw-cap then shipped and stores the sample at ≤6°C (not frozen) until extraction. The extraction of samples has been done by using manual vacuum SPE manifold. The final extract was adjusted to 1 mL in 96% methanol for analysis as per US EPA 537.1 guidelines. The analysis of the samples was done using Liquid Chromatography Mass Spectroscopy (LC-MS) techniques. In LC-MS firstly, we analyzed standard sample containing PFAS compounds (PFOA and PFOS). For conducting such analysis, the procedure given by US EPA 537.1 was followed. The outcome of this method gave satisfactory results, with LC-MS successfully detecting the expected retention times (RT) and mass peaks

ISBN: 978-81-980623-8-3

for the PFAS standards. Based on the successful analysis of the standard sample of PFAS, the LC-MS method appears to be suitable for detection of water samples. The results revealed levels of PFAS derivatives such as Per-fluoropropylene oxide dimer acid (PFTrDA), Per-fluoro tetradecanoic acid (PFTA), 11-chloro eicosalfluoro-3-oxaundecane-1-sulfonic acid (11CL-PF3OUdS), Hexa- fluoropropylene oxide dimer acid (HFPO-DA) in the water samples. Further investigation is in process to carry out for identification and evaluation of the other types of PFAS compounds. The presence of these hazardous compounds may be the one of the reasons for the emerging diseases and healthcare concerns of Baddi population. We acknowledge the funding under Core Research Grant (CRG) Scheme Earth and Atmospheric Division of the Science and Engineering Research Board (SERB), Department of Science and Technology, Govt. of India. (Grant No: CRG/2021/007791) under the project entitled "Initiative to estimate the presence of perfluoroalkyl substances (PFAS) to rivers and ground/drinking water in Himachal Pradesh. Emission and implications for human exposure.

**COMPUTATIONAL DOCKING STUDY OF ORIENTIA TSUTSUGAMUSHI DEUBIQUITYLASE (OtDUB) AS A POTENTIAL DRUG TARGET IN SCRUB TYPHUS**

Mahadurai G, Induja M, Mohan P, Poongothai S,
Syed Abuthahir Badusha A
Department of Pharmaceutics, Vellalar College of Pharmacy, Maruthi Nagar, Thindal, Erode, Tamil Nadu 638012.
mahadurai80122@gmail.com

Scrub typhus is caused by the gram-negative bacterium Orientia tsutsugamushi, life-threatening disease with Fatality rates are currently estimated to be between 40% and 45% for patients that are not treated with antibiotics. Scrub typhus can cause meningoencephalitis, myocarditis, acute renal impairment, acute respiratory distress syndrome (ARDS), and disseminated intravascular coagulation. The bacterial deubiquitylase (OtDUB) is a major virulence factor that affects the host protein system (ubiquitin signaling). This promotes the host's intracellular survival and makes it a promising molecular target. In this study, the target is the crystal structure of the deubiquitylase (Orientia tsutsugamushi OtDUB in association with three ubiquitin molecules) of PDB ID-6UPU has a resolution of 2.2 Å, which was obtained from the Protein Data Bank and subjected to molecular docking research using AutoDock Vina. The new FDA-approved antibiotic medications from 2020 to 2025, as well as conventional treatments for scrub typhus, were chosen for this investigation. Several ligands shows a high binding affinity with the catalytic domain of OtDUB, indicating possible inhibitory capabilities. Molecular dynamics simulations and ADMET prediction are currently underway to further validate pharmacokinetic properties and drug likeness. These findings provide a basic foundation for the development of medications that inhibit OtDUB, which aids in the development of focused treatments for scrub typhus.

**Keywords:** Scrub typhus, Orientia tsutsugamushi, Autodock vina, OtDUB, molecular docking, ADMET

**ADVANCED METHODOLOGIES FOR MODELING PEPTIDE–PROTEIN INTERACTIONS AND THE RATIONAL DESIGN OF PEPTIDE THERAPEUTICS**

Harshpal Singh Wahi, Sushil Burle, Milid J. Umekar
hswahi4576@gmail.com

Despite their selectivity and adaptability, peptide therapies have challenges due to the dynamic nature of peptide–protein interactions and limited drug-like qualities in their logical design. The computational and experimental methods for simulating peptide-protein interactions, including molecular docking, molecular dynamics, machine learning techniques, quantum mechanical investigations, and integrative approaches, are reviewed in this article. Rational design techniques in structure-based, sequence-based, fragment-based, and de novo styles, along with advancements in peptidomimetics, have been driving the optimisation of therapeutic peptides at a never-before-seen pace. Edge cutting technologies like high-throughput screening, directed evolution, phage display, microarrays, and *in silico* library design are improving peptide optimisation by making it simpler to tailor drug-like characteristics like stability, bioavailability, membrane permeability, immunogenicity, and targeted delivery. Case studies demonstrate the effectiveness of these state-of-the-art methods in the creation of cells-penetrating medications, peptide inhibitors, enzyme binders, antimicrobials, and vaccines. Artificial intelligence, computational developments, creative experimental techniques, and the promise of combination therapy and personalised medicine are driving the rapid speed of the research. The future of peptide medicines is being reshaped by persistent innovation, despite ongoing difficulties.

**MOLECULAR DOCKING ANALYSIS OF DISEASE-MODIFYING ANTIRHEUMATIC DRUGS (DMARDS) TARGETING GAUCHER'S SYNDROME INFLAMMATORY PATHWAYS**

Induja M, Mahadurai G, Mohan P, Poongothai S,
Syed Abuthahir Badusha A
Department of Pharmaceutics, Vellalar College of Pharmacy, Maruthi Nagar, Thindal, Erode, Tamil Nadu 638012.
indujabpharm2020@gmail.com

Gaucher's syndrome is a lysosomal storage disorder occurring from mutations in the GBA gene, leading to insufficient β-glucocerebrosidase activity and an accumulation of glucosylceramide. This storage disease triggers persistent inflammatory pathways, including NLRP3 inflammasomes and NF-κB signalling, which leads to systemic complications such as hepatosplenomegaly, a bone crisis, cytopenia, pulmonary disease, and neurological involvement. Current treatments, such as enzyme replacement and substrate reduction, are not highly effective for inflammation and are quite expensive. Disease-Modifying Anti-Rheumatic Drugs (DMARDs), known for their ability to alter immune responses, provide a distinctive repurposing potential for Gaucher's disease. This study used Autodock Vina for molecular docking to examine the interactions of particular DMARDs with inflammation-related targets, including NLRP3 (PDB ID: 7PZC) and NFκB signaling proteins (PDB ID: 4KIK). Docking studies showed that these ligands had favorable binding affinities with key residues of the catalytic and regulatory domains, suggesting that pro-inflammatory cytokine release (IL-1β, IL-6, and TNF-α) may be inhibited. This study's findings suggest that repurposing DMARDs may serve as an additional treatment strategy to enhance ERT or SRT, hence targeting the inflammatory and metabolic aspects of the condition.

divyakurjekar16@gmail.com

The analytical method developed for the determination of elemental impurities in Ayurvedic Cream by using Inductively Coupled Plasma Mass Spectrometry (ICP-MS). The method is precise, linear, accurate, selective and sensitive for the determination of class-1 and class-2A metals lead (Pb), Arsenic (As), Mercury (Hg), Cadmium (Cd) and Chromium (Cr) in Ayurvedic Product. Elemental impurities are classified into three categories as per ICH guidelines. Class 1: Arsenic, Mercury, Lead and Cadmium, Class-3: Chromium. The elemental impurities are genotoxic in nature, hence as per ICH guideline Q3D have control limit base on its risk assessment and considered for analysis. The analytical method is having the capability to detect the elemental impurities as 0.007ppm Pb, 0.007ppm As, 0.003ppm Cd, 0.006ppm Hg, 0.065ppm Hg. The analytical method found to be linear with working concentration of 3.0ppm Pb, 16.0ppm As, 8.0ppm Cd, 14.0ppm Hg, 3.1ppm Cr with correlation coefficient 0.9997 Pb, 0.9997 As, 0.9999 Cd, 0.9983 Hg and 1.000 Cr. The % recoveries of impurities at different concentration with spiking in samples were found in acceptable range 80% to 110%. The method was precise and robust and its RSD was below 15%. Therefore, the developed

ISBN: 978-81-980623-8-3

method can use for quantitative determination of elemental impurities in Ayurvedic Product.

**Keywords:** Elemental Impurities, Ayurvedic Cream, Inductively Coupled Plasma Mass Spectrometry.

## DEVELOPMENT OF STABILITY INDICATING ANALYTICAL METHODS FOR ESTIMATION OF CYCLOBENZAPRINE

Dhamsheela N. Gondane, Nishikant A. Raut
Shri K. R. Pandav Institute of Pharmacy, Nagpur

Cyclobenzaprine act as muscles relexant activity. A simple, selective and accurate stability indicating High-Performance Thin-Layer Chromatographic and Reverse Phase High-performance liquid chromatographic method was developed and validated for estimation of cyclobenzaprine hydrochloride in bulk drug and tablets according to ICH guidelines. Chromatographic separation of the drug was performed on aluminium plates precoated with silica gel 60 F254 as the stationary phase and the solvent system consisted methanol: triethylamine (9.0: 0.9: 0.1 v/v/v). Densiometric evaluation of the separated zones was `1performed at 290 nm and the method was validated. The Rf values and drug content of 0.3638 and 99.72% respectively. The calibration curve was found to be linear in the concentration range 10-1000 ng/ml. The linear regression curve was found to be Y-292.955 by height and Y-1844.367 by area. Limit of detection and limit of quantitation were found to be 23.89, 1.69 ng/ml 79.66, 5.39ng/ml by height and area respectively. The develop method was found to be precise as the % RSD values for system, intraday and interday precision studies were 0.4962, 0.4703, 0.8203 respectively. The RP-HPLC analysis was carried out in order to reduce analysis time and maintaining good efficacy on high-speed separations. The method was developed using column thermo ODS C18 / 5µm /150x4.5mm with mobile phase consisting of a mixture of Acetonitrile: Methanol: Ammonium acetate buffer (43:32:25(v/ v/v). The retention time under optimized conditions was found to be 5.2 min with sharp symmetrical peak. The method was validated as per ICH Q2(R2) guidelines for parameter such as accuracy, precision, robustness, ruggedness. An excellent linearity was observed in the concentration range 1-20ug/ml cyclobenzaprine with regression coefficient (r2) value of 0.998. Average recovery was found to be 98.92 ± 0.7186. The LOD and LOQ was found to be 0.0602 ug/ml 5. Linearity and range 0.1826 µg/ml. No interference was observed from excipients, confirming the method's specificity. The study shows that the developed method is simple and accurate. It can be suitable for the determination of Cyclobenzaprine Hydrochloride in bulk and tablet dosage form.

**Keywords:** Cyclobenzaprine, HPTLC, HPLC, LOQ, LOD, Retention factor, TLC chamber

## COMPREHENSIVE METABOLOMIC FINGERPRINTING AND STANDARDIZATION OF CURCUMA CAESIA RHIZOMES VIA GC-MS

Aaditya Das, Rishika Choudhury, Ananya Saha, Sudarshana Borah
Royal School of Pharmacy, The Assam Royal Global University,
Assam- 781035, India.
shonapharma@gmail.com

Curcuma caesia Roxb., locally known as "Kola Halodhee" in Assamese, is a medicinally significant plant of the Zingiberaceae family. Its rhizomes have been traditionally used in treating various ailments due to their rich phytochemical composition and therapeutic potential. The present study aimed to extract, standardize, and analyze the metabolite composition of C. caesia rhizomes using Gas Chromatography-Mass Spectrometry combined with multivariate statistical analysis. Fresh rhizomes were collected, washed, shade-dried, and lyophilized for 24 h. Approximately 40 mg of lyophilized rhizome powder was extracted using 500 µL n-methanol, vortexed for 3 min, and subjected to overnight shaking (15 h) at room temperature. After centrifugation (9000 rpm, 4 °C, 10 min), 200 µL of supernatant was dried overnight in a desiccator. Methoximation was performed with 40 µL methoxyamine-HCl (20 mg/mL in pyridine) at 30 °C for 90 min, followed by derivatization using 20 µL N-trimethylsilyl-N-methyl trifluoroacetamide (MSTFA) at 30 °C for 90 min. GC-MS analysis was conducted on an EB5-MS capillary column under splitless mode, using helium as the carrier gas. Metabolites were identified via the NIST library (≥85% similarity). Data were normalized, log-transformed, and analyzed using Partial Least Squares Discriminant Analysis (PLS-DA) via MetaboAnalyst 4.0, with statistical significance tested using GraphPad Prism (v7). GC-MS profiling revealed diverse bioactive metabolites, including phenolics, terpenoids, flavonoids, curcuminoids, fatty acids, and alkaloids. Standardization confirmed curcumin, demethoxycurcumin, and bisdemethoxycurcumin as key biomarkers. This study provides a comprehensive metabolomic fingerprint of C. caesia, underscoring its potential as a rich source of therapeutic phytochemicals.

**Keywords:** Metabolite profiling, phytochemical standardization, PLS-DA, Black turmeric

## METHOD DEVELOPMENT FOR THE DETERMINATION OF RELATED SUBSTANCES IN THE TENOFOVIR DISOPROXIL FUMARATE BY USING RP-HPLC.

V Swetha, B Anusha
Department of Pharmaceutical Analysis, School of Pharmaceutical Sciences and Technologies, JNTU-K, Kakinada,
Andhra Pradesh, India – 533003.
Swethavegesna1012@gmail.com

The method was optimised after experimenting many trails, all related substances were well separated in the presence of drug substance. The optimised method was done with column YMC, ODS AQ 250 × 4.6mm, 5 µm, pack of ingredient pump mode with flow rate of 1.2ml/min with injected volume 10µl with retention time of 60 min. This method was validated by using all parameters like specificity, accuracy, precision, LOD&LOQ, linearity, robustness etc. It is evident that all impurities and Tenofovir disoproxil are well separated from each other. The method was linear for the determination of related substances because the correlation coefficient for all the related substances and drug substance was NLT 0.999. It is also clear that the method is precise and accurate. It is evident that slight changes in flow rate, column temperature, buffer, pH do not have significant impact on the results confirming the method is robust. The mobile phase and solution are stable for Tenofovir and Adenine up to 48hrs.The batch analysis of 3 consecutive batches is within the specification. The review of above data indicates that the method is validated and can be used for routine analysis of tenofovir disoproxil fumarate batch release for related substances.

**Keywords:** Tenofovir disoproxil, Adenine, related substances, YMC, ODS AQ column

## *IN SILICO* MOLECULAR DOCKING ANALYSIS OF PHOSPHINE SULPHIDE DERIVATIVES AS ANTI-ALZHEIMER'S AGENTS

Apeksha Korde, Sagar Wankhede, Sampada Jangam
Department of Pharmaceutical sciences, School of Pharmaceutical sciences, Faculty of health sciences, JSPM University, Pune,
Maharashtra, India-412207
apekshakorde24.sdsr@jspmuni.ac.in

Alzheimer's disease (AD) is the most prevalent neurodegenerative disorder characterized by progressive cognitive decline, memory impairment, and neuronal loss. Approximately 57 million people worldwide were living with dementia in 2021, with over 60% residing in low- and middle-income countries. Current therapies provide only symptomatic relief, thereby requiring the development of novel therapeutic agents targeting multiple pathological pathways. In the present work, novel phosphine sulphide derivatives incorporating thiazole and piperazine moieties, (4-(2-aminothiazol-4-yl)phenyl)(4-(piperazin-1-yl)phenyl)(phenyl)phosphine sulfide), were designed and evaluated for their potential as anti-Alzheimer's agents. Sulphur bioisosteres were selected to improve lipophilicity and metabolic stability, while the piperazine nucleus was introduced for its reported ability to inhibit amyloid-β (Aβ) aggregation and scavenge reactive oxygen species. The designed molecules were subjected to Lipinski's rule-based drug-likeness evaluation and molecular docking studies using acetylcholinesterase (AChE), with PDB ID: 4EY7. Docking analysis revealed that several derivatives exhibited favorable binding affinities compared with co-crystallised ligand and standard acetylcholinesterase inhibitor donepezil. The best-scoring compound demonstrated a binding energy of –12.36 kcal/mol (for m-$NO_2$ derivative). Other derivatives also exhibited significant docking score within the range from –9.63 to –12.36 with interaction at the active site, supporting their potential

ISBN: 978-81-980623-8-3

cholinesterase inhibitor activity. These findings highlighted phosphine sulphide–based heterocyclic hybrids as promising scaffolds for further synthesis, characterization, and pharmacological evaluation in the development of novel anti-Alzheimer's agents.

**Keywords:** Alzheimer's Disease, Dementia, Antialzheimer agent, Acetylcholinesterase inhibitors, Molecular docking

**STABILITY INDICATING RP-HPLC METHOD FOR SIMULTANEOUS ASSAY OF ATOLTIVIMAB, ODESIVIMAB AND MAFTIVIMAB IN A COMBINED PARENTERAL DOSAGEFORM**

Abdul Zubair Khan, Iffath Rizwana
Department of Pharmaceutical Analysis and Quality Assurance, Deccan School of Pharmacy, Darussalam, Aghapura,
Hyderabad-500001, Telangana, India
786abdulzubair@gmail.com

The present study describes a validated reverse-phase high-performance liquid chromatography (RP-HPLC) method for the simultaneous quantification of Atoltivimab (ALT), Maftivimab (MFT), and Odesivimab (ODE) in the Inmazeb® injection formulation. Chromatographic separation was achieved on an Inertsil column using an isocratic mobile phase of sodium bisulfate and acetonitrile (50:50, v/v) at a flow rate of 1.0 mL/min. Detection was performed at 236 nm. The retention times (RT) for ALT, MFT, and ODE were approximately 2.7, 3.9, and 6.2 minutes, respectively. The method exhibited linearity over the concentration range of 8.33–25 µg/mL for all three analytes. The limits of detection (LOD) were 0.050 µg/mL (ALT), 0.100 µg/mL (MFT), and 0.088 µg/mL (ODE), while the limits of quantification (LOQ) were 0.185 µg/mL, 0.333 µg/mL, and 0.293 µg/mL, respectively. The developed RP-HPLC method provides a simple, accurate, and sensitive approach for routine quality control analysis of Inmazeb® injection.

**COMPREHENSIVE OVERVIEW ON ANALYTICAL ESTIMATION OF SODIUM [NA] GLUCOSE COTRANSPORTER-2 INHIBITORS [SGLT2]**

Rahul Khiste, Aishwarya Zanjad, Shraddha Dhole
Department of Pharmaceutical Chemistry, Marathwada Mitra Mandal college of Pharmacy Thergaon Pune India.
Department of Pharmaceutical Quality Assurance, Marathwada Mitra Mandal college of Pharmacy Thergaon Pune India
shraddhadhole2223@gmail.com

Sodium-Glucose Cotransporter-2 (SGLT2) inhibitors, including dapagliflozin, canagliflozin, and empagliflozin, represent a novel class of oral antidiabetic agents that lower blood glucose by inhibiting renal glucose reabsorption. Due to their therapeutic significance in the management of type 2 diabetes mellitus and associated cardiovascular and renal benefits, precise and reliable analytical methods for their estimation are essential in both pharmaceutical formulations and biological matrices. A wide range of techniques such as UV-visible spectrophotometry, high-performance liquid chromatography (HPLC), ultra-performance liquid chromatography (UPLC), liquid chromatography–mass spectrometry (LC–MS), and capillary electrophoresis have been employed for their quantification. This comprehensive overview highlights method development, validation parameters, and sensitivity aspects across different analytical approaches. The review also emphasizes regulatory considerations, challenges in simultaneous estimation, and advances in hyphenated techniques that enhance accuracy and specificity. Such analytical insights are critical not only for routine quality control but also for pharmacokinetic, bioequivalence, and therapeutic drug monitoring studies, thereby ensuring safe and effective use of SGLT2 inhibitors.

**GC-MS BASED PHYTOCHEMICAL ANALYSIS AND ANTIDIABETIC EFFICACY OF ARTOCARPUS HETEROPHYLLUS EXTRACT IN STREPTOZOTOCIN-INDUCED DIABETIC WISTAR ALBINO RATS**

Madiha Banu, Chandan.S
Aditya Bangalore Institute of Pharmacy Education and Research
madihabanu1253@gmail.com

This study investigated the antidiabetics of an aqueous extract from unripe Artocarpus heterophyllus (jackfruit). The research employed both in-vitro and in-vivo methods. Initial phytochemical screening confirmed the presence of alkaloids, tannins, and phenols, while a DPPH assay assessed the extract's antioxidant capacity. For animal study, Wistar albino rats were used, with diabetes induced by a single dose of streptozotocin. The rats were divided into six groups, including a control, a disease control, a standard drug-treated group, and groups receiving low, medium, and high doses of the jackfruit extract over a 21-day period. Blood glucose levels were monitored weekly. The findings demonstrate that the jackfruit extract exhibits promising antidiabetic activity, likely due to its rich phytochemical composition, which supports its historical use in traditional medicine.

Sodium-glucose cotransporter-2 (SGLT-2) inhibitors have emerged as a promising class of antidiabetic agents for the treatment of type 2 diabetes mellitus. Ertugliflozin, bexagliflozin and ipragliflozin are three such SGLT-2 inhibitors that have gained significant attention in recent years. This comprehensive overview focuses on the analytical estimation of these three drugs, highlighting their chemical structures, mechanisms of action, and pharmacokinetic profiles. The review also provides an in depth analysis of various analytical methods, including chromatography, spectroscopy, and mass spectrometry, that have been developed and validated for the estimation of ertugliflozin, bexagliflozin and ipragliflozin in pharmaceutical formulations and biological samples. The analytical methods discussed in this review are crucial for ensuring the quality, safety, and efficacy of these drugs, and will aid in the development of new formulations and therapeutic strategies for the management of type 2 diabetes.

**FORCED DEGRADATION STUDIES AND CHARACTERIZATION OF DEGRADATION PRODUCTS OF AMLODIPINE BESYLATE**

**Meghana Mogre[1], Zaid Ansari[2], Anwar Shaikh[1],**
Department of Pharmaceutical Sciences, P.A. Inamdar University Camp, Pune-411001, Maharashtra, India
meghana.mogre07@gmail.com

Amlodipine Besylate, a widely prescribed calcium channel blocker, is highly susceptible to environmental and stress-induced degradation, making its stability evaluation crucial for ensuring therapeutic efficacy and patient safety. The present work focuses on comprehensive forced degradation studies of Amlodipine Besylate under acid, base, oxidative, thermal, and photolytic conditions, in accordance with ICH guidelines. Degradation pathways were systematically elucidated using advanced analytical techniques, including HPLC, UV–Vis spectroscopy, and mass spectrometry, enabling precise identification and structural characterization of major degradation products. The study revealed distinct degradation profiles under different stress conditions, highlighting oxidative and alkaline environments as the most critical factors for drug instability. Structural elucidation of degradation products provided mechanistic insights into the breakdown of the dihydropyridine moiety, thereby contributing to a deeper understanding of Amlodipine's chemical behavior. The findings not only strengthen the stability-indicating analytical methods for routine quality control but also hold regulatory significance in defining appropriate storage conditions, shelf-life specifications, and impurity limits. This work underscores the importance of degradation profiling as an integral component of pharmaceutical development, bridging the gap between analytical research and regulatory compliance.

**Keywords:** Forced degradation studies, analytical techniques, characterization, HPLC, TLC, NMR, MS.

**SYNTHESIS, IN-SILICO AND *IN-VITRO* ANTICANCER ACTIVITIES OF NOVEL PYRIMIDINE, OXAZINE AND THIAZINE DERIVATIVES**

ISBN: 978-81-980623-8-3

Kishor P, Grace Shaji Chittilappilly, Meena Chandran
Karpagam College of Pharmacy, Coimbatore, Tamil Nadu (Affiliated to The Tamil Nadu Dr. MGR Medical University, Chennai – 32)
skpkishor1@gmail.com

The main aim and objective of the study is to synthesize and characterize novel pyrimidine, oxazine and thiazine derivative and to understand the in-silico and *in-vitro* anticancer activities of the above-mentioned derivatives. The synthesis take place in two steps – 1) Synthesis of heterocyclic chalcones using Claisen Schmith condensation method; 2) The chalcones upon reaction with urea and thiourea respectively gives pyrimidine, oxazine and thiazine derivatives. The synthesized compounds were confirmed by the physical (melting point, solubility and Thin Layer Chromatography) and spectral (InfraRed spectroscopy) characterization. Molecular docking studies were carried out for anticancer activity on Liganded X-ray structure of Cyclin dependent kinase 6 (CDK6) (PDB ID: 4AUA) and β-cell lymphoma 2, Human BCL-2, Isoform 1 (PDB ID: 1G5M). The selected compound after docking were studied for short term in–vitro Cytotoxicity using Dalton's Lymphoma Ascites Cells (DLA) by Trypan Blue Exclusion Method. The synthesized compounds were characterised and undergone in-silico biological screening for anticancer activities. In the in-silico anti-cancer study the oxazine derivative oc2 and oc3 showed highest binding affinity against the standard drug Ribociclib. Three compounds pc7, oc8 and tc8 where given for *in-vitro* study. When comparing the 3 derivatives the pyrimidine derivative (pc7) is showing higher activity. The pc7 compound shows about 43% inhibition at a concentration of 200 µg/ml which proves pc7 is showing moderately good antineoplastic focuses on generating novel heterocyclic derived less toxic and cheaper antioxidant cum anticancer drugs with the help of in-silico activity. This pyrimidine derived drugs, up on processing further can replace the resistant drug category and provide efficient and cheaper therapy for cancer treatment with enhanced antioxidant content in body.

**Keywords:** Pyrimidine, Oxazine, Thiazine, in-silico, Anti-cancer activity.

## COMPUTATIONAL MODELLING AND PHARMACODYNAMIC PROFILING OF AZADIRACHTIN AGAINST TGF-B1 MEDIATED LIVER FIBROSIS

Heena Rathod, Parag Jain
Department of Pharmacology, Rungta College of Pharmaceutical Sciences and Research, Kohka, Bhilai, Chhattisgarh, India – 490024
heena.rathod082001@gmail.com

Liver fibrosis, a hallmark of chronic hepatic injury, is orchestrated by transforming growth factor-beta 1 (TGF-β1)–driven activation of hepatic stellate cells (HSCs), culminating in excessive extracellular matrix deposition. This study investigates the anti-fibrotic efficacy of azadirachtin, a limonoid from Azadirachta indica, through integrated computational modelling and *in vivo* pharmacodynamic profiling in a carbon tetrachloride ($CCl_4$)-induced murine model of liver fibrosis. *In silico* docking revealed strong binding affinity of azadirachtin to the TGF-β1 receptor complex (TGFBR1/TGFBR2), with a binding energy of −9.4 kcal/mol. Molecular dynamics simulations confirmed stable ligand-receptor interactions over 100 ns, while ADMET predictions indicated favourable pharmacokinetics and low toxicity. These computational insights guided the *in vivo* study design. Male Wistar rats (n=30) were randomized into five groups: control, $CCl_4$-induced fibrosis, and three azadirachtin-treated cohorts (low, medium, high dose: 10, 20, 40 mg/kg). Azadirachtin was administered orally for 28 days post-fibrosis induction. Biochemical assays showed significant reductions in serum ALT, AST, and hydroxyproline levels ($p < 0.01$) in treated groups. Histopathological analysis revealed marked attenuation of fibrotic architecture, with reduced collagen deposition and α-SMA expression, confirmed via Masson's trichrome staining and immunohistochemistry. These findings substantiate azadirachtin's therapeutic potential in mitigating TGF-β1–mediated liver fibrosis through dual receptor-level inhibition and transcriptional modulation. The study underscores the translational relevance of combining computational modelling with animal pharmacodynamics for natural product–based antifibrotic drug development.

**Keywords:** Liver fibrosis, Azadirachtin, TGF-β1 signalling, Hepatic stellate cells.

## ANALYTICAL STUDY OF HERBAL FORMULATIONS

Hriday Shetty[1], Vishnu Choudhari[1], Ashwin Kuchekar[1], Chandrakant More[2], Ganesh Choudhari[1],
[1]School of Health Sciences and Technology, Dr. Vishwanath Karad MIT World Peace University, MIT Campus, Kothrud, Pune - 411038, Maharashtra, India.
[2]Shri Swami Samarth Ayurvedic Pharmaceuticals, Trimbakeshwar, Dist. Nashik-422212, Maharashtra, India
hridayshetty1818@gmail.com

Most of the people preferred herbal preparations for various diseases and disorders globally. The standardisation of such herbal preparations is required to validate the claims. Different modern analytical methods such as chromatographic, spectroscopic etc. are used for the standardisation of herbal extracts and herbal formulations. RP- HPLC method was explored for standardisation of the extract and herbal formulations i.e. Saptarangi plus Kadha and Saptarangi Tablets in the present study. HPLC method was developed and validated for the standardisation of extract and herbal formulations i.e. Saptarangi plus Kadha and Saptarangi Tablets. RP-HPLC isocratic method was developed for SAL using JASCO (LC4000) System, 4010 diode array detector, YMC-Pack Pro C-18, (250 mm × 4.6 mm, 3 µm) column, software (Crome-Nav 2), data integration at 254 nm was achieved. Water: ACN (30:70 v/v), mobile phase, pH adjusted to 3 with orthophosphoric acid at flow rate of was 1 ml/min was used. HPLC method was validated in terms of linearity, precision, accuracy, specificity, sensitivity and robustness according to ICH guidelines. The linearity was observed over the concentration range of 10-50 µg/ml at 254 nm with R2 0.995 for mangiferin (MAN). The results of assay were found close to 100 %. The method precision (inter-day and intra-day) was determined using six - independent test solutions and % RSD was found <2. Assay method was evaluated with the recovery of the standards. Three different quantities (80 %, 100 % and 120 %) of the standards were added to pre-analyzed formulation and were analyzed by using the developed HPLC method. The results of recovery found close to 100 % confirms accuracy of the method. The accuracy and reproducibility is evident from the data as results are good and standard deviation is low. The result of precision and recovery shows that the methods are precise and accurate. The values of Limit of Detection (LOD) and Limit of Quantification (LOQ) were calculated and method were found to be sensitive. RT of standard in chromatograms of extracts and herbal preparations matches perfectly.

**Keywords:** Standardisation, Saptarangi plus Kadha, Saptarangi Tablets, HPLC, herbal formulation

## QSAR MODEL BUILDING ON ANTIOXIDANT ACTIVITY OF TRYPTOPHAN AND TRYPTAMINE INDOLE DERIVATIVES

Sushmitha B
Nitte College of Pharmaceuticals
sushmagowda2154@gmail.com

Oxidative stress, a key outcome of chronic inflammation, contributes significantly to the pathogenesis of various diseases. Antioxidants mitigate oxidative damage by neutralizing free radicals and reactive oxygen species (ROS). Indole derivatives, including tryptophan and tryptamine analogues, have shown notable antioxidant potential. In this study, Quantitative Structure–Activity Relationship (QSAR) models were developed to evaluate and predict the antioxidant activity of 18 selected indole derivatives. Physicochemical descriptors were calculated using Chem Master 1.1, and ADME properties—including gastrointestinal absorption, blood–brain barrier permeability, solubility, and cytochrome enzyme inhibition—were predicted via Swiss ADME software. Four multiple linear regression models were constructed and statistically validated using regression coefficient ($R^2$), root mean square error (RMSE), mean absolute error (MAE), and cross-validation metrics. Among them, Model 3 demonstrated the highest correlation and predictive accuracy, establishing it as the most reliable. Compounds 8, 9, 13, and 14 exhibited superior antioxidant activity, highlighting their potential as therapeutic agents. These findings underscore the utility of QSAR modeling as an efficient computational tool in drug discovery, with future work aimed at extending the approach to 3D-QSAR and molecular dynamics simulations for deeper mechanistic insights.

ISBN: 978-81-980623-8-3

## MOLECULAR MODELLING, SYNTHESIS, BIOLOGICAL EVALUATION OF SOME NOVEL SCHIFF BASES

Manoj Damale, Harshali Takale, Shital Chavan, Santosh Shelke
Department of Pharmaceutical Chemistry, Srinath College of Pharmacy, Chh. Sambhajinagar, Maharashtra, India-431133
pharmalink1985@gmail.com

In light of the increasing antimicrobial resistance, several novel antimicrobial drugs have been developed to treat microbial infections. In order to explore the antimicrobial potential of benzene sulphonic acid derivatives, we have created novel hybrid pharmacophoric scaffold contain Schiff bases linkage in this study by applying bioisosteric replacement structural modification approach. The designed novel pharmacophoric scaffold acted as template to design several novel Schiff bases of benzene sulphonic acid. Several Schiff bases having drug-likeness is predicted by Lipinski parameters. Antifungal potential of Schiff bases evaluated against sterol 14-demethylase (CYP51) of Candida albicans suggest intense network interactions with free energy of binding ranges from -5.30 Kcal/Mol to -2.96 Kcal/Mol. The microwave assisted synthesis of top Schiff bases have resulted practical yield ranging from 60 to 92 percent. Invitro antifungal evaluations of Schiff bases confirm that HAT75 have two-fold higher minimal inhibitory concentration (250 µg/ml). Whereas Schiff bases HAT29, HAT52, HAT92 and HAT70 are having same inhibitory potential (500 µg/ml) as that of standard drug griseofulvin. *In vitro* antibacterial evaluation of synthesized Schiff bases indicates that their antibacterial activity is moderate compared to standard chloramphenicol. The HAT75 who shown excellent antifungal and moderate antibacterial activity. The current study will be a rational attempt to use conventional laboratories facilities, publicly accessible computer-aided drug design and discovery platforms, to find novel antimicrobial agents.

## METHOD DEVELOPMENT AND VALIDATION OF ETIFOXINE HYDROCHLORIDE BY USING UV SPECTROPHOTOMETER

Kasula Manisha Reddy
Department of Pharmaceutical Analysis
Sarojini Naidu Vanita Pharmacy Mahavidyalaya, Hyderabad, Telangana
manishareddy1410@gmail.com

A simple, accurate, precise, and cost-effective UV spectrophotometric method was developed and validated for the estimation of Etifoxine Hydrochloride in its pharmaceutical capsule dosage form. The drug exhibited maximum absorbance (λmax) at 255 nm when scanned in the UV region, which was selected as the analytical wavelength for quantification. The method was validated in accordance with ICH Q2(R1) guidelines, assessing key parameters such as linearity, accuracy, precision, robustness, limit of detection (LOD), and limit of quantitation (LOQ). The calibration curve was found to be linear within the selected concentration range, with correlation coefficient values indicating excellent linearity. Accuracy studies were carried out through recovery experiments and showed satisfactory results, confirming the reliability of the method. Precision studies, both intraday and interday, revealed minimal variation, ensuring reproducibility. Robustness was confirmed by making deliberate small changes in analytical conditions, without significant impact on the results. LOD and LOQ values demonstrated the sensitivity of the method. UV-visible spectrophotometry, which measures the absorption of radiation in the ultraviolet (190–390 nm) and visible (390–800 nm) regions by analytes in solution, proved to be a simple yet powerful tool for this analysis. The proposed method is not only economical and time-saving but also highly suitable for routine quality control and analytical applications in the pharmaceutical industry, ensuring accurate quantification of Etifoxine Hydrochloride in capsule formulations.

**Keywords:** Etifoxine Hydrochloride, UV spectrophotometry

## SYNTHESIZE AND CHARACTERISATION OF CHITOSAN DERIVATIVES AND EVALUATE FOR CURCUMIN LOADED IN SITU GEL FORMULATION

Kundan M Sawale, Sangam S Nimkar,
Prasad R Deshmukh, Dipti B Ruikar
P. R. Pote Patil College of Phasrmacy, Amravati, Maharashtra 444603
kundanspatil2001@gmail.com

In situ gel formulations are the advanced drug delivery approch in which formulation undergo sol-gel transition after administration at the site of action. This transformation is triggered Physioogical conditions such as pH,temperature ,Ionic strength and uv radiation. In situ gel forming tablets constitute a novel strategy in oral drug delivery. Demonstrating significant potential to enhance drug solubility while providing sustained & controlled release synthesize profile.The objectives are to synthesize and characterise chitosan derivatives and evaluate as curcumin loaded In Situ gel formuation. The synthesised of N- palmitoyl chitosan was carried out by using palmitoyl chloride and characterization was carried out by FTIR, DSC & X-ray Diffraction crystallography reveals successful attachment of palmitoyl group to chitosan. Curcumin loaded in chitosan and N-palmitoyl chitosan and evaluated for drug loading and swelling index. Curcumin loaded N-palmitoyl chitosan was showed significant swelling than chitosan. Tablets were formulated by using plane curcumin, loaded N-palmitoyl chitosan and chitosan. Evaluation of prepared tablet including hardness, thickness, disintegration time were meet the standanrd. *In vitro* dissolution studies were conducted using phosphate buffer (pH 6.8), the cumulative % drug release from plane curcumin tablet was 98.92%, curcumin loaded chitosan tablets showed 96.28%, while curcumin loaded N-palmitoyl chitosan tablets more sustain the relased of 72.48% in 6 hr 30 min. The modification significantly enhanced In-Situ gel-forming ability and modulated drug releases.

**Keyword:** Chitosan, Curcumin, Palmitoyl Chitosan, In Situ gel, Sustained Release.

**CH-51**

## A NEW ANALYTICAL RP-HPLC METHOD DEVELOPMENT AND VALIDATION FOR THE ESTIMATION OF NILUTAMIDE IN BULK FORM AND MARKETED PHARMACEUTICAL DOSAGE FORM

G.Nikitha, K.Sujatha, A.Yasodha
Department of Pharmaceutical Analysis, Palamuru University, Thirumala Hills, Mahabubnagar, India, 509001.
nikithankutty08@gmail.com

A rapid and precise reverse phase high performance liquid chromatographic method has been developed for the validated of Nilutamide, in its pure form as well as in tablet dosage form. Chromatography was carried out on a Symmetry C18 (4.6 x 150mm, 5µm) column using a mixture of Methanol and water (45:55% v/v) as the mobile phase at a flow rate of 0.8ml/min, the detection was carried out at 260nm. The retention time of the Nilutamide was 2.379 ±0.02min respectively. The method produce linear responses in the concentration range of 24-120mg/ml of Nilutamide. The method precision for the determination of assay was below 2.0%RSD. The method is useful in the quality control of bulk and pharmaceutical formulations. The method was validated for accuracy, precision, linearity, robustness, ruggedness and LOD & LOQ of standard solution. The developed RP-HPLC method was found to be accurate, precise, linear, and robust and was successful applied to a pharmaceutical tablet formulation for qualitative estimation of Nilutamide in Bulk form and Marketed Pharmaceutical Dosage forms.

**Keywords:** Nilutamide, RP-HPLC, Method Development, Validation, Accuracy.

**CH-52**

## DEVELOPMENT AND VALIDATION OF A ROBUST LC-MS/MS ASSAY FOR ABSOLUTE QUANTIFICATION OF NIVOLUMAB IN HUMAN PLASMA: A TOOL FOR PRECISION THERAPEUTIC DRUG MONITORING

Vankudoth Kavitha, Seema Tomar, R. Suthakaran
Faculty of Pharmaceutical Sciences, Motherhood University
Roorkee-Dehradun Road, Post Bhagwanpur, District Haridwar, Roorkee, Uttarakhand-247661, India
kavithavankdoth1@gmail.com

Nivolumab, a fully humanized IgG4 monoclonal antibody, is widely used in cancer immunotherapy. Precise quantification in plasma is essential for therapeutic drug monitoring (TDM) and pharmacokinetic (PK) assessment. Conventional immunoassays, such as ELISA, are limited by

ISBN: 978-81-980623-8-3

cross-reactivity and matrix interference. This study reports the development and validation of a highly specific LC-MS/MS assay for the absolute quantification of nivolumab in human plasma. A surrogate peptide-based strategy was employed. Nivolumab was extracted from plasma by IgG immunocapture, followed by enzymatic digestion. A stable isotope-labeled peptide was used as the internal standard to minimize variability. The peptide ASGITFSNSGMHWVR(AGNS) was selected as the quantifier and monitored in multiple reaction monitoring (MRM) mode (m/z 550.6 → 661.4) on a triple quadrupole mass spectrometer. The assay was validated according to international bioanalytical guidelines. The method exhibited excellent selectivity, reliably differentiating nivolumab-derived peptides from endogenous plasma proteins. Calibration curves demonstrated strong linearity (5–200 µg/mL, $R^2 > 0.99$). Precision and accuracy met acceptance criteria, with intra- and inter-day variation within ±15% for %CV and %RE. Application to patient samples confirmed the method's clinical utility, with measured concentrations consistent with population PK model predictions. The validated LC-MS/MS assay provides a robust, accurate, and reproducible tool for nivolumab quantification in human plasma. This approach offers significant advantages over traditional immunoassays and is well-suited for clinical TDM and PK studies, supporting personalized therapy optimization.

**Keywords:** Nivolumab, LC-MS/MS, Therapeutic Drug Monitoring (TDM), Pharmacokinetics, Monoclonal Antibody Quantification.

**CH-53**

**SIMULTANEOUS ESTIMATION AND DRUG–DRUG INTERACTION STUDY OF EMPAGLIFLOZIN AND LIRAGLUTIDE THROUGH PHARMACOKINETIC APPROACH IN SPIKED HUMAN PLASMA BY LC–-MS/MS.**

Galla Rajitha, Kolli Parimala
Research Scholar, Institute of Pharmaceutical Technology, Sri Padmavati Mahila Viswavidyalayam, Tirupati, Andhra Pradesh, India-517502.
kolliparimala@gmail.com

A new rapid, selective and sensitive liquid chromatography-tandem mass spectrometry (LC-MS/MS) method was established and validated for the simultaneous determination of empagliflozin and liraglutide in spiked human plasma. The method was successfully used for pharmacokinetic studies. Empagliflozin D4 and liraglutide D6 were used as deuterated internal standard to ensure accuracy. Plasma samples were preconcentrated by protein precipitation with acetonitrile. HPLC separation was performed on a Waters 2695 HPLC system with high-speed autosampler, column oven, and degasser with a Symmetry C18 column (150 mm 4.6 mm, 3.5 um). Mobile phase was 0.1% formic acid and acetonitrile (30:70, v/v) flowing at 0.8 mL/min. Detection was carried out on a SCIEX QTRAP 5500 mass spectrometer with electrospray ionization (ESI) source, working in positive ion mode and multiple reaction monitoring (MRM) controlled by the Empower-2 program. Method validation was performed in accordance with the USFDA bioanalytical guidelines. The calibration curves were linear for empagliflozin over 8-400 ng/mL and liraglutide over 4-1000 ng/mL. Mean extraction recoveries were high, at 98.240% for empagliflozin, 99.363% for empagliflozin D4, 99.747% for liraglutide and 99.149% for liraglutide D6 at all four QCs.

**Keywords:** Empagliflozin, Liraglutide Pharmacokinetic, quality control, validation.

**COMPUTATIONAL DESIGN OF SCHIFF BASE DERIVATIVES OF THIADIAZOLES AND DIAZOLES FOR THEIR POTENTIAL AGAINST NSCLC TARGETING PARP1**

Muskan Sharma[1]
[1]Department of Pharmaceutical Chemistry, JSS College of Pharmacy, Ooty, Tamil Nadu, India - 643001.
muskaansharmapunj@gmail.com

Non-Small Cell Lung Cancer (NSCLC) accounts for over 80% of lung cancer–related deaths and requires reliable biomarkers as well as effective targeted therapies. The PARP1 enzyme plays a crucial role in the pathogenesis of various human cancers, making it a key target for drug development. This study aims to identify novel PARP1 (PDB ID: 4zzz) inhibitors from a library of thiadiazole and diazole derivatives with the potential to inhibit cell proliferation, using a detailed in-silico approach to streamline drug discovery. A series of potential ligands derivatives of thiadiazole and diazoles—as selective PARP1 inhibitors targeting NSCLC were identified through a multi-step computational process, including molecular docking with Glide, ADMET screening with QikProp, and binding free energy calculations using the Prime-MMGBSA module of the Schrödinger suite. The stability of the most promising ligand–protein complex was further validated by a 150 ns molecular dynamics (MD) simulation. The results demonstrated that thiadiazole and diazole derivatives exhibited strong binding affinities, with Glide scores ranging from –8.01 to –11.85 kcal/mol, compared to the standard Niraparib (–8.16 kcal/mol). These lead compounds also showed favorable ADMET profiles and formed stable interactions with critical residues in the PARP1 active site, as supported by their MMGBSA values. The 150 ns MD simulation further confirmed the stability of the top-ranked docking complexes. Overall, this study identified potent thiadiazole- and diazole-based lead candidates for PARP1 inhibition, providing a foundation for further experimental validation and contributing to the advancement of targeted cancer therapies through computational drug discovery approaches.

**Keywords:** PARP1 Inhibitors, NSCLC, Thiadiazoles, Diazoles, In-silico methods

**DESIGN, SYNTHESIS, AND BIOLOGICAL EVALUATION OF NOVEL FUSED TRIAZINE DERIVATIVES: A MULTI-ACTION APPROACH TOWARD ANTICANCER AND ANTIMICROBIAL THERAPY**

Ganesh S Andhale, Girish Annayya Swami, Sapana M Nagare
ALARD School of Pharmacy, ALARD University Pune,
Pune, Maharastra 411 028
g.andhale@alarduniversity.edu.in

In this work, Novel Fused Triazine Derivatives were evaluated for their anticancer and antimicrobial activity in the field of pharmaceutical chemistry. A library of structurally diverse compounds was synthesized using established synthetic methodologies. These compounds were then subjected to rigorous screening assays utilizing a wide range of *in vitro* models, including cell lines derived from various cancer types. The results obtained from the screening assays revealed several promising lead compounds, demonstrating potent activity against specific targets involved in cancer progression and proliferation. The objective of this project was to discover new compounds with promising anti-cancer activity by designing a diverse library of compounds based on extensive literature research and SAR studies. The synthesized compounds were purified by recrystallization and column chromatography and characterized using single spot thin-layer chromatography, melting point determination, $^{13}$C-NMR, $^{1}$H-NMR, FT-IR, mass spectral, and elemental analysis studies. The biological screening of anticancer activity, the MTT assay was used to determine the cell proliferation rate, while the SRB assay was used to determine cell density based on cellular protein content. Compound RA20 was found to have potent antiproliferative activity against Vero Cell Line, HaCaT (Psoriatic skin cancer) cell lines, DAL (Dalton ascites carcinoma) cell line, HT-29 (colon cancer) cell line, and MG-63 (osteosarcoma) cell line. RA20 had an overall significant activity and a good binding energy of -7.143 kcal/mol, as observed through GLIDE Module Software. Antimicrobial activity, compound RA6 showed a broad spectrum of activity against all microbial strains tested. Nitro-substituted and chloro-substituted compounds also exhibited high antibacterial activities. For antifungal activity, compounds with para-substitution of methyl, methoxy, ethoxy, and ortho-substituted methyl and methoxy groups showed promising activity against Candida albicans.

**Keywords:** Fused Triazine, anticancer agents, antimicrobial activity, molecular docking, dual-action therapeutics, structure-activity relationship (SAR)

**CH-56**

**DESIGN, SYNTHESIS AND BIOLOGICAL EVALUATION OF PROTAC FOR ITS ANTICANCER ACTIVITY.**

Payal Kute, Ritesh Bhole, Chandrakant Bonde.
Department of Pharmaceutical chemistry,
SSR college of Pharmacy, Saily Silvassa.
Kutepayal99@gmail.com

Prostate cancer is a prevalent disease, affecting one in six men. The androgen receptor (AR) is vital in prostate cancer progression. However, current AR inhibitors like Enzalutamide and Bicalutamide face limitations

ISBN: 978-81-980623-8-3

in targeting undruggable proteins and developing resistance. To overcome these obstacles, PROTACs were introduced. We designed a PROTAC using Enzalutamide and Thalidomide as ligands and N-Boc-1,6-hexandiamine as the linker. Molecular docking (AutoDock 12.3) and molecular dynamics simulations (DESMOND module, Schrodinger) were performed using PDB IDs 7KHL and 7KHH. The synthesis involved four steps including amidation reaction followed by acidification, monitored by melting point, TLC, and IR interpretation. NMR and MASS spectroscopy confirmed the structure. *In-vitro* activity against PC-3, DU-145 and MCF-7 cell lines. Molecular docking revealed dock scores of -10.65 kcal/mol (7KHL) for the PROTAC molecule. Characterization data confirmed its structure: IR spectra displayed N-H stretching bands indicating the amide linkage, NMR spectra showed specific signals validating the presence of 2,6-dioxopiperidine and dimethyl-4-oxo-2-thioxoimidazolidin (Enzalutamide), and mass spectrometry confirmed the molecular weight. *In vitro* studies demonstrated significant anticancer activity of the PROTAC against selected cell lines. The synthesis of enzalutamide-based PROTACs represents a novel and promising approach for targeted protein degradation. Enzalutamide, an androgen receptor inhibitor primarily used in the treatment of prostate cancer, can be utilized as a component in PROTACs to overcome drug resistance and enhance therapeutic efficacy.

**Keywords:** PROTAC, Prostate cancer, Enzalutamide.

## SYNTHESIS, CHARACTERIZATION, MOLECULAR DOCKING STUDIES, ANTHELMINTIC AND ANTI-CANCER ACTIVITY OF IMIDAZOLE DERIVATIVES.

Hemalatha Sattu* and Rudrabhat Ashok Kumar
Department of Pharmaceutical Chemistry, S.N. Vanita Pharmacy Mahavidyalaya, Tarnaka, Hyderabad, Telangana, India-500017
hemalathasattu@gmail.com

Imidazole-5-one scaffold has been predicting in the important synthetic drugs analogs which gave a valuable information for treatment and high binding affinity to the multiple receptors helpful drug development. To synthesize and evaluate the anthelmintic, anticancer and Insilco docking studies of pyrazole contain novel Indole derivatives (4a-4h). In the present work, we intended to the synthesis of pyrazole contain novel Indole derivatives (4a-4h) by conventional method. All the newly synthesized molecules (4a-4h) were characterized by FTIR, 1HNMR and Mass spectral analysis. The compounds 4c and 4f showed high anthelmintic activity compare with Albendazole as standard and the compounds 4b, 4e, 4f and 4g exhibited good anticancer activity against MCF-7 cell line using MTT Assay method, and comparison with Cisplatin as a standard. From the results the IC50 values of all test compounds were found to be between 17.63 -47.79 mM and the compounds 4b, 4e, 4f and 4g exhibited good anticancer activity against breast (MCF-7) cancer cell lines at a concentration of 0.5mg / mL-1. In molecular docking research, dock rankings of all the synthesized derivatives ranged from -5.972 (compound 4h) to -3.127 (compound 4d). It is revealed that Imidazole-5-one derivatives have diverse biological activities and also have a cytotoxic potential to be explored for newer therapeutic possibilities.

**Keywords:** Isatin, Pyrazole, Anthelmintic, Anticancer activities, Molecular Docking.

## DESIGN, SYNTHESIS, CHARACTERISATION AND BIOLOGICAL EVALUATION OF NOVEL ISATIN PHENOLIC DERIVATIVES

Sreejith.M[1], Sreelekshmi S S[1], Akash Marathakam[2], Greshma John[1], Shilpa S Kurup[1]
[1]Department of Pharmaceutical Chemistry, Nazareth College of Pharmacy, Thiruvalla, Kerala.
[2]Department of Pharmaceutical Chemistry, Sree Gokulam SNGM College of Pharmacy, Kerala
sreejith.madhavankutty@gmail.com

In the present research, a series of novel isatin phenolic derivatives were synthesized and evaluated for their anticancer and anti-inflammatory activities. The objective of this work was to investigate the structural modifications of the isatin scaffold through phenolic substitution and assess their biological potential. The derivatives (ISPH-A, ISPH-B, and ISPH-C) were synthesized via Sandmeyer's reaction followed by phenolic substitution, and their structures were confirmed using IR, NMR, and mass spectrometry. In-silico molecular docking was performed against cancer-related (3BZI) and inflammation-related (1HNE) protein targets, which predicted strong binding affinities. The compounds were further subjected to *in-vitro* assays, including cytotoxicity studies against Dalton's lymphoma ascites (DLA) cells and protease inhibition assay for anti-inflammatory activity. Among the synthesized derivatives, ISPH-A exhibited the most potent anticancer activity, while ISPH-C demonstrated superior anti-inflammatory activity. The results establish isatin phenolic derivatives as promising dual-action candidates and provide a foundation for their further development as novel therapeutic agents.

**Keywords:** Isatin, phenolic derivatives, anticancer, anti-inflammatory, molecular docking, cytotoxicity

## DEVELOPMENT AND VALIDATION OF A ROBUST HPTLC METHOD FOR STABILITY AND SIMULTANEOUS QUANTIFICATION OF LIQUIRITIN AND GLABRIDIN IN NANO-FORMULATION AND BIOLOGICAL SAMPLES

Pooja Kagawad, Parixit Bhandurge
Department of Pharmaceutical Chemistry,
KLE College of Pharmacy, Belagavi, Karnataka, India-591304.
poojakagawad@klepharm.edu

Alzheimer's disease (AD) is the most common form of dementia, marked by progressive memory loss, cognitive decline, and ultimately death. Naturally derived Liquiritin of Glycyrrhiza uralensis roots, Glabridin of Glycyrrhiza glabra Linne, exhibiting potent pharmacological activities including antioxidant, anti-inflammatory, and neuroprotective effects. To facilitate their further investigation, an HPTLC method was developed and validated for the simultaneous quantification of Liquiritin and Glabridin in nanoformulations and biological samples. Method optimisation was carried out using a design of experiments approach, establishing robust chromatographic conditions with aluminium HPTLC plates coated with silica gel 60 F254 as the stationary phase and a mobile phase of ethyl acetate, toluene, and methanol (6:3:1, v/v). The method provided well-resolved retention factor values for Liquiritin at Rf ≈ 0.26, Glabridin at Rf ≈ 0.88, with linearity confirmed in the range of 100–500 ng/band and correlation coefficients indicating excellent accuracy. Limits of detection and quantification reflected high sensitivity, while precision studies showed relative standard deviations below 2%, confirming reproducibility. Recovery studies across lipid-based nanoparticles, plasma, and urine samples yielded satisfactory recoveries of 96.2%–102.1%. Stress degradation studies demonstrated the stability of both analytes. Overall, this HPTLC method provides a rapid, sensitive, and reliable approach for the concurrent estimation of Liquiritin and Glabridin, offering a valuable analytical tool to support their application in Alzheimer's disease research and combination therapies.

**Keywords:** Liquiritin, Glabridin, HPTLC, Alzheimer's, Design of experiment.

## RATIONAL DESIGN, SYNTHESIS AND BIOLOGICAL ACTIVITY OF PHENYLTHIAZOLE TRIAZINE DERIVATIVES AS ANTIMALARIAL AGENTS

Uma Rawat and Anita Singh
Department of Pharmaceutical Science, Bhimtal Campus,
Kumaun University, Nainital, Uttarakhand, India-263136.
umarawat1003@gmail.com

Plasmodium falciparum, a highly adaptive protozoan parasite, is the causative agent of malaria, which remains a major global health concern with millions of cases annually. The parasite's rapid mutation rate has led to widespread drug resistance, reducing the effectiveness of existing therapies. Antifolate antimalarials, long used in treatment, act by inhibiting the essential enzyme dihydrofolate reductase-thymidylate synthase (Pf-DHFR-TS). Inhibition of this enzyme halts DNA synthesis and dTMP production, thereby blocking parasite proliferation. In this work, a rational drug design strategy was employed to investigate Phenylthiazole-Triazine derivatives as potential Pf-DHFR-TS inhibitors. Molecular docking and *in silico* modelling were carried out to assess their binding interactions with wild-type Pf-DHFR-TS. Several derivatives demonstrated strong hydrogen-bonding interactions and substantial binding affinities, performing comparably or better than standard antifolate drugs such as cycloguanil and WR99210. From computational

ISBN: 978-81-980623-8-3

predictions, a series of novel derivatives were synthesized through multi-step reactions and structurally characterized using $^1$H-NMR, IR, and mass spectrometry. Their biological evaluation revealed significant *in vitro* antiplasmodial activity against both chloroquine-sensitive and resistant strains of P. falciparum. Several compounds exhibited inhibitory effects equal to or exceeding those of established antimalarials. A preliminary structure–activity relationship (SAR) analysis further indicated that electron-donating substituents and heteroaryl groups contributed to improved efficacy. Overall, phenylthiazole–triazine scaffolds emerge as a promising chemotype for next-generation Antimalarial agents. These findings provide a solid foundation for further optimization and preclinical evaluation to address the urgent challenge of drug-resistant malaria.

**Keywords:** Plasmodium falciparum; Pf-DHFR-TS inhibitors; Phenylthiazole–triazine; Molecular docking; Antiplasmodial activity.

**RATIONAL DESIGN AND MOLECULAR DYNAMICS SIMULATION OF 1,2,4-TRIAZOLE DERIVATIVES FOR TOPOISOMERASE II INHIBITION**

Dantu Lakshmi Sravani, Afroz Patan, Y Prapurnachandra
Department of Pharmaceutical chemistry, Ratnam institute of pharmacy, Pidathapolur, Nellore, Andhra Pradesh, India. -524002
Sravanidantu113@gmail.com

1,2,4-triazole derivatives have gained considerable attention as versatile scaffolds owing to their broad spectrum of pharmacological applications, particularly as antimicrobial and anticancer agents. In light of this potential quantitative structure activity relationship (QSAR) modelling was conducted using the QSARINS platform to develop and validate robust predictive models for a newly designed library of 1,2,4-triazole derivatives. The study emphasised the significance of crucial molecular descriptors such as MoRSEV22, AVP-1, MoRSEV1, and GATSe7, thereby facilitating the rational optimization of these scaffolds. Furthermore, molecular docking and molecular dynamics (MD) simulation studies were performed to evaluate the binding affinities and conformational stability of the designed molecules with the target protein Topoisomerase II. The inhibitory interactions were assessed through AutoDock and molecular simulations, while the stability was confirmed using RoG, RMSF, H-bond, RMSD, and SASA analysis. The SwissADME profiling further predicted favourable drug-likeness and pharmacokinetic properties. Among the designed derivatives, compound 111 emerged as the most promising candidate, exhibiting strong and stable binding with the 4KCL protein throughout the simulation period. The theoretical investigation highlights compound 111 as a potential lead for selective topoisomerase II inhibition, providing a valuable foundation for experimental validation and subsequent development.

**Keywords:** QSARINS, Triazole derivatives, Docking, Simulation, Topoisomerase II.

**EXPLORING ANTI-TUBERCULAR ACTIVITY OF VARIOUS SIX MEMBERED N – CONTAINING HETEROCYCLIC COMPOUNDS: A COMBINED *IN-SILICO* AND *IN-VITRO* APPROACH**

Geolin Subin D, Grace Shaji Chittilappilly,
Meena Chandran, K. Krishnakumar
Karpagam College of Pharmacy, Coimbatore, Tamil Nadu (Affiliated to The Tamil Nadu Dr. MGR Medical University, Chennai – 32)
shijusubin7@gmail.com

In this study, heterocyclic ring systems—pyrimidine, oxazine, and thiazine—were selected as the core scaffolds for the design and development of novel anti-tubercular agents. The primary objectives were to perform in-silico studies, synthesize selected derivatives, carry out their physicochemical and spectral characterization, evaluate their *in-vitro* anti-tubercular activity, and compare the *in-silico* and *in-vitro* findings. A total of 27 derivatives (9 from each ring system: pyrimidine, oxazine, and thiazine) were theoretically designed and evaluated using in-silico tools for their physicochemical properties, pharmacokinetic profiles, bioactivity, toxicity predictions, and molecular docking. The software tools employed included Molinspiration, SwissADME, Molsoft, Lazar, pkCSM, and AutoDock Vina (version 1.5.6). Based on the in-silico analysis, the compounds pc7, pc8, pc9 (pyrimidine derivatives), oc7, oc8, oc9 (oxazine derivatives), and tc7, tc8, tc9 (thiazine derivatives) were identified as the most promising candidates and were selected for synthesis. The synthesized compounds were characterized by physical methods such as melting point determination, TLC, and solubility, and confirmed through FT-IR, 1H NMR, 13C NMR, and GC-MS spectral analysis. The in-silico anti-tubercular activity was assessed using molecular docking studies against the M. tuberculosis enzyme DprE1 in complex with nitrobenzothiazinone (PDB ID: 6HF3). *In-vitro* anti-tubercular activity was evaluated using the Alamar Blue susceptibility assay. The results revealed that although the pyrimidine derivatives (particularly pc7 and pc9) demonstrated strong in-silico anti-tubercular activity—sometimes exceeding that of the standard drug—the *in-vitro* studies identified the thiazine derivatives as more potent. Specifically, compound tc8 exhibited the highest *in-vitro* activity with a minimum inhibitory concentration (MIC) of 4 µg/mL against Mycobacterium tuberculosis. Furthermore, in-silico toxicity predictions indicated that aza (nitrogen-containing) derivatives are more prone to toxicity, whereas thia (sulfur-containing) and oxa (oxygen-containing) derivatives showed reduced toxicity profiles. These findings suggest a potential advantage for thiazine and oxazine frameworks in drug development. The comparative analysis between in-silico and *in-vitro* results highlights a critical insight: reliance solely on in-silico predictions may be misleading.

**Keywords:** Heterocyclic compounds, AutoDock, Anti-tubercular activity, Characterization.

gracemaryits@gmail.com

Fatty acids, both free and as part of complex lipids, play a number of key roles in metabolism, as essential components of all membranes, and as gene regulators. Undecylenic acid is an organic compound with the formula CH2=CH(CH2)8CO2H. It is an unsaturated fatty acid derived from castor oil. It is an antifungal agent. Schiff base derivatives are available in numerous bioactive atoms and show a wide variety of biological activities, like antitubercular, antifungal, antiviral, anticancer. 11 Schiff bases were prepared by reacting hydrazide of undecylenic acid with different aldehydes. The structure of the compound confirmed by FT-IR, 1H NMR and Mass spectra. The physico-chemical properties and in-silico bioactivity of synthesised compounds carried out by using Molinspiration software. According to Lipinski rule of five, all the compounds are lipophilic in nature. From the bioactivity score, all the compounds show moderate activity. In-silico toxicity studies showed that the synthesized derivatives will not penetrate in to the human blood brain barrier. Molecular docking studies confirmed that **S1** possess maximum antitubercular activity (-6.1) on Enoyl acyl carrier protein reductase (PDB ID: 2YES) than the standard INH (-5.6kCal/mol) and **S9** shows maximum antioxidant activity on Tyrosinase oxidoreductase (3NM8) (-8.6kCal/mol) than the standard Ascorbic acid (-6.0kCal/mol). The *in-vitro* antitubercular activity (**S4**) shows good activity (MIC 2µg/ml) on M. tuberculosis H37Rv ATCC 27294 by using broth dilution assay method. All the compounds showed good antifungal than the standard Fluconazole. Schiff base derivatives of undecylenic acid have good anti-fungal and anti-tubercular activity. These derivatives are seeming to have good potential for novel drug discovery with low toxicity and good activity.

**Keywords:** Undecylenic acid, Schiff base, Molecular docking, Anti-tubercular activity, Characterization.

**HYDRAZIDE-2-OXINDOLE DERIVATIVES AS GSK-3B KINASE INHIBITOR: POTENTIAL LEAD AGAINST CANCER.**

Sujeet Kumar[1], Ashok Madarakhandi[2], Subhas S. Karki[2]
[1]Department of Pharmaceutical Chemistry, Nitte College of Pharmaceutical Sciences, Nitte (Deemed to be University), Yelahanka, Bengaluru, Karnataka 560064, India.
pharmchemsk@gmail.com

ISBN: 978-81-980623-8-3

Glycogen synthase kinase-3β (GSK-3β) is a promising target in cancer research due to its central role in regulating key oncogenic signalling pathways. Although no GSK-3β inhibitor has been approved for cancer therapy, the preclinical studies have shown these inhibitors can sensitize tumors to conventional treatments and help to overcome chemo-resistance. In continuation of our previous work, a series of novel hydrazide-linked oxindole derivatives were designed, synthesized, and evaluated for their potential anti-proliferative activity via inhibition of GSK-3β. All derivatives were screened against cancerous MCI-4460, Capan-1, LN-229, DND-41, K-562, MOLT-4, Z-138, HCT-116, HL-60 (cancerous cells) and normal HEK-293 cells. Among them, compounds 6Eb and 6Ec exhibited the most potent cytotoxic property against the pancreatic cancer cell line Capan-1, with $CC_{50}$ values of 9.40 µM and 8.25 µM, respectively. Consistently, these compounds also demonstrated strong GSK-3β kinase inhibition with $IC_{50}$ values of 11.02 µM (6Eb) and 59.81 µM (6Ec). Molecular docking studies revealed favorable binding affinities for 6Eb and 6Ec, with docking scores of -10.5 kcal/mol and -8.8 kcal/mol (reference compound bio-acetoxime: -7.7 kcal/mol) respectively. Furthermore, molecular dynamics (MD) simulations, density functional theory (DFT) calculations, and in-silico ADME profiling were performed to corroborate the *in-vitro* findings. These computational studies supported the stability, drug-likeness properties, and high binding efficiency of 6Eb and 6Ec highlighting their potential as promising lead compounds for GSK-3β-targeted anticancer therapy.

swapnilssanap555@gmail.com

Nitrosamine impurities have emerged as a critical concern in the pharmaceutical industry due to their potential carcinogenicity, prompting rigorous research into their formation, detection, and control. This study focuses on the development and validation of a rapid, precise, and accurate high-performance liquid chromatography (HPLC) method for estimating N-nitrosamine impurities, specifically NDMA, NDEA, NDIPA, and NDPA, in both the active pharmaceutical ingredient (API) and the final dosage form of Olmesartan. Chromatographic separation was achieved using an INTERSIL C18 (150 mm x 4.6 mm, 2.7 µm) column under isocratic conditions with a mobile phase of methanol and 0.1% formic acid (40:60 v/v). Detection was performed at 240 nm, using a 20-µL injection volume and a flow rate of 1.0 mL/min. The method was validated according to ICH guidelines for linearity, precision, accuracy, limit of detection (LOD), and limit of quantitation (LOQ). Excellent linearity was observed across a wide concentration range ($R \geq 0.998$). The method demonstrated high precision (%RSD < 15%) and accuracy, with recovery rates ranging from 96.6% to 109.1%. LOD and LOQ values were in the sub-ng/ml range, confirming the method's sensitivity. Application of the validated method revealed the presence of NDMA and NDEA in both API and tablet formulations at levels well below the USFDA's acceptable daily intake limits. NDIPA and NDPA were either not detected or found at trace levels. Overall, the method proves to be a robust tool for regulatory compliance and routine monitoring of nitrosamine impurities in Olmesartan-containing products.

## ANALYTICAL METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF MEXILETINE IN BULK AND TABLET DOSAGE FORM BY RP-HPLC

Sanavar Begum, G.Soumya,Dr.A.Yasodha
Department of Pharmaceutical Analysis, Palamuru University,
Thirumala Hills, Mahabubnagar, India, 509001.
sanashaik7075@gmail.com

A rapid and precise reverse phase high performance liquid chromatography method has been developed for the validated of Mexiletine, in its pure form as well as tablet dosage form. Chromatography was carried out on a targetsil C18 (4.6 X 150 mm, 5 microns). Column using a mixture of methanol 100 % v / v as mobile phase at flow rate of 1 ml / min, the detection was carried out at 274 nm. The retention time was 2.267 + 0.02 min. the method produces linear response in the concentration range 5-25 ppm of mexiletine. The method precision for the determination of assay was below 2.0 % RSD. The method is useful in the quality control of pharmaceutical formulations.

**Keywords:** Mexiletine, RPHPLC, Validation.

## "SIMULTANEOUS ESTIMATION AND FORCED DEGRADATION STUDIES OF VILDAGLIPTIN AND EMPAGLIFLOZIN BY SIMPLE AND ECONOMICAL REVERSE PHASE HPLC METHOD".

Ramgopal M Dhanwad[1], Megha V R[1] Ambika[1]
Department of Pharmaceutical Chemistry, Government College of Pharmacy, Rajiv Gandhi University of Health sciences, Bengaluru.
ramgopal.dhanwad@gmail.com

The present study focused on the development and validation of a reliable Reverse Phase High-Performance Liquid Chromatography (RP-HPLC) method for the simultaneous quantification of Empagliflozin (EMPA) and Vildagliptin (VILDA) in pharmaceutical products. The RP-HPLC technique was selected for its high separation efficiency and superior peak resolution, utilizing a non-polar stationary phase in conjunction with a polar mobile phase. Following aextensive optimization, the chosen mobile phase consisted of Potassium dihydrogen orthophosphate Buffer (pH 3, adjusted with Orthophosphoric acid) and Acetonitrile (ACN) in a 60:40 v/v ratio. The detection was carried out at an isosbestic wavelength of 205nm using a UV detector, with a flow rate of 1.0 mL/min on a Zodiac C-18 column. The method exhibited excellent linearity for both EMPA and VILDA within the 6-12 µg/mL and 30-70 µg/mL, respectively. concentration range, with correlation coefficients of 0.9996 and 0.9986, respectively. Specificity was confirmed, with no interference observed from excipients or diluents. Sensitivity was validated through the calculation of appropriate Limits of Detection (LOD) and Limits of Quantification (LOQ). Accuracy was supported by recovery studies, which ranged from 99.55% to 104.45%. Additionally, forced degradation studies verified the stability-indicating nature of the method. Overall, this RP-HPLC method is precise, accurate, specific, robust, and suitable for the simultaneous estimation of EMPA and VILDA in pharmaceutical formulations.

## UHPLC-BASED ANALYTICAL METHOD DEVELOPMENT AND VALIDATION FOR ANTIVIRAL DRUG: A SYSTEMATIC APPROACH IMPURITY DETECTION AND BY QUANTIFICATION

Usha.k, Yogendra Bahuguna
Department of Pharmaceutical Sciences, Motherhood University,
Roorkee-Dehradun, Post Bhagwanpur, Roorkee, Uttrakhand-247661.
ushapharma@gmail.com

A Sytamatically design, develop and validating an Ultra High Performance Liquid chromatography. Successful implementation of the Design of Experiments (DoE) approach will result in an optimized UHPLC method for detecting and quantifying impurities in antiviral drugs. This method will exhibit improved separation, resolution, and overall performance. Through the application of DoE, the UHPLC method is anticipated to demonstrate enhanced sensitivity, enabling the detection and quantification of impurities at low concentrations. This heightened sensitivity aligns with stringent regulatory requirements for pharmaceutical analysis. Successful validation of the UHPLC method, guided by ICH guidelines, will ensure its accuracy, precision, specificity, linearity, and robustness. This validation outcome is crucial for establishing the method's impurity detection and quantification reliability. Applying the validated UHPLC method to molnupiravir, is expected to accurately quantify impurities in these antiviral drugs. This outcome is vital for the pharmaceutical industry's quality control and regulatory compliance. The developed UHPLC method, optimized using

ISBN: 978-81-980623-8-3

DoE and validated according to ICH guidelines, is anticipated to meet regulatory standards for pharmaceutical analysis. This outcome establishes the method's acceptance in quality control processes and regulatory submissions. The UHPLC method's robustness and reproducibility, achieved through the systematic application of DoE principles, will contribute to its reliability under varying experimental conditions and across different analysts. This is essential for routine application in pharmaceutical laboratories.

**Keywords:** Molnupiravir, UHPLC method, Quantification

## DEVELOPMENT OF A VALIDATED SPECTROPHOTOMETRIC METHOD FOR LULICONAZOLE QUANTIFICATION IN PHARMACEUTICAL FORMULATION USING ION PAIR FORMATION WITH BROMOCRESOL GREEN

Anjali M, Sreejith K R, Blessna Vargheese, Harsha Sunil
College of Pharmaceutical Sciences, Government Medical College, Thiruvananthapuram
College of Pharmaceutical Sciences, Government Medical College. Kannur
anjupradeepan369@gmail.com

Luliconazole is a novel, broad-spectrum antifungal agent belonging to the imidazole class. With the continuous emergence of new and modified drug entities, reliable analytical methods are essential for accurate quantification. This study aimed to develop and validate a simple UV spectrophotometric method for the estimation of Luliconazole in pharmaceutical formulations based on ion-pair formation with bromocresol green. The pure drug was procured from Luxica Pharma, Gujarat, and its authenticity confirmed through melting point analysis, differential scanning calorimetry (DSC), and Fourier-transform infrared spectroscopy (FTIR). The melting point was recorded at 152 °C, consistent with DSC results, while FTIR spectra confirmed the structural identity of Luliconazole. The spectrophotometric method was optimized using a solution of bromocresol green in phosphate buffer, with maximum absorbance observed at 419 nm. The method exhibited linearity within the concentration range of 6–30 µg/ml. Validation was performed according to ICH guidelines, assessing parameters such as precision, accuracy, linearity, limit of detection (LOD), and limit of quantification (LOQ). Precision studies showed a standard deviation of 0.2410 and a coefficient of variation of 2.54%. Accuracy results demonstrated recovery values ranging from 95.34% to 107.19%, with a mean recovery of 102.29%. Linearity was confirmed by a correlation coefficient of 0.997. The LOD and LOQ were determined as 1.6987 µg/ml and 5.1478 µg/ml, respectively.

**Keywords:** Luliconazole, ion pair formation, bromo cresol green, validation, spectrophotometric method.

**CH-70**

## METHOD DEVELOPMENT AND VALIDATION BY RP-HPLC OF LOPINAVIR AND RITONAVIR

Md Sohail, A. Rajamani, A. Yasodha
Department of Pharmaceutical Analysis, Palamuru University, Thirumala Hills, Mahabubnagar, India, 509001.
mohammedsohail0529@gmail.com

A reverse phase liquid chromatographic method for estimation of Lopinavir and Ritonavir in bulk drugs and marketed pharmaceutical dosage form was developed and validated. The chromatographic conditions to achieve the highest performance parameters using Sunfire C18 (4.6×250mm) 5µm Column with guard filter were optimized. The separation was carried out using a mobile phase containing Acetonitrile: Water (40:60% v/v) in the ratio of 40:60% v/v pumped at a flow rate of 0.9 mL/min with detection at 220 nm. The method was shown to be linear in 5–25 µg/mL and 75–375 µg/mL concentration range (regression coefficients of 0.9995 and 0.9982) for Lopinavir and Ritonavir respectively. The limit of detection (LOD) and limit of quantification (LOQ) was found to be 0.7µg/ml and 2.1µg/ml & 13.8µg/ml and 41.8µg/ml for Lopinavir and Ritonavir respectively. The accuracy of the method was assessed by adding fixed amount of pre-analyzed sample to different standard solutions (50%, 100%, and 150% of the tested concentration) in triplicate. The percentage mean recoveries were found to 98%-102%. The method was found to be precise with %RSD value was found to be within the limits for intraday and interday precision study, respectively. The method specificity and robustness were also established. New and sensitive RP-HPLC method for estimation of Lopinavir and Ritonavir has been developed, in respect to the reviewed analytical methods.

**Keywords:** Lopinavir and Ritonavir, RP-HPLC, Accuracy, Precision, Robustness.

**CH-71**

## SYNTHESIS AND EVALUATION OF MCC–PEG CONJUGATE AS TABLET SUPER DISINTEGRANT

Immanni Praseeda, Sadhu Venkateswara Rao
Department of Pharmaceutics,
Vijaya Institute of Pharmaceutical Sciences for Women
Enikepadu, Vijayawada, Andhra Pradesh, India – 521108
immanni.praseeda@gmail.com

The objective of the study is synthesis of MCC–PEG Conjugate and improves the water uptake capacity of MCC, so as to improve the bioavailability of drug. PEGylated conjugate of microcrystalline cellulose (MCC) was synthesized by reacting MCC with polyethylene glycol (PEG) in the presence of catalyst at elevated temperature. The prepared MCC–PEG Conjugate has shown excellent flowability characteristics. Mouth dissolving tablets of Memantine hydrochloride were prepared employing MCC-PEG conjugate as superdisintegrant and comparison with commercial superdisintegrants. Total nine batches of mouth dissolving tablets were prepared using superdisintegrants like Crosscarmellose sodium (CCS), Sodium Starch Glycolate (SSG) and MCC–PEG Conjugate by direct compression method. The results of precompression parameters (Angle of repose, Carr's index and Hausner ratio) were in acceptable range as per the specifications given in IP. Prepared tablets were evaluated for thickness, uniformity of weight, hardness, friability and results are well within IP limits. Out of nine formulations, the tablets which contain 40 mg of MCC–PEG Conjugate (F9) had shown low *in vitro* disintegration time 5 sec and highest drug release profile i.e. 99.81% which releases the drug within 12 minutes. After comparing its results with that of commercial superdisintegrants, it can be concluded that MCC–PEG conjugate can prove to be a good superdisintegrant and the developed mouth dissolving tablet formulation of memantine hydrochloride could release the drug faster compared to conventional immediate release tablets which is useful in paediatric, geriatric and psychiatric patients.

**Keywords:** MCC–PEG Conjugate, Memantine Hydrochloride Superdisntegrents, Mouth dissolving tablets and Bioavailability

## AGRICULTURE WASTE VALORIZATION: ECO-FRIENDLY SOLUTIONS FOR PHARMACEUTICAL & BIOMEDICAL TECHNICAL APPLICATIONS

Manoj Kumar Sharma[1], Anupama Diwan[1], Heena Jindal[1], Sumit Tewatia[1], Dr. Kapil Kumar[2]
[1]School of Pharmaceutical Sciences, Apeejay Stya University, Gurugram–122103, India
[2]Department of Pharmaceutical Sciences, School of Health Sciences and Technology, University of Petroleum and Energy Studies (UPES), Dehradun- 248007, India
manoj.asvaline@gmail.com

Waste is broadly defined as any material that is discarded, intended for disposal, or mandated for elimination. In India, large volumes of lignocellulosic residues are generated during planting, harvesting, and post-processing of crops. The conventional practice of stubble burning leads to the release of particulate matter and toxic emissions, exacerbating air pollution and respiratory health risks. Recent advances in pharmaceutical sciences highlight the potential of cellulose-rich agricultural residues as renewable feedstocks for developing excipients and value-added biomaterials. Cellulose and its derivatives, obtained through eco-friendly extraction and modification processes, demonstrate promising functional roles as binders, disintegrants, stabilizers, and film-formers in dosage form design. Utilizing such waste not only addresses environmental concerns but also provides a cost-effective and sustainable alternative to synthetic excipients. This valorization approach integrates waste management with pharmaceutical as well as biomedical technology, aligning with the principles of green chemistry and circular bioeconomy.

## COMPUTATIONAL DESIGN, SYNTHESIS AND PHARMACOLOGICAL EVALUATION OF DUAL TARGETING DIPHENYL DERIVATIVES AS COX-2 AND TNF-A INHIBITORS AS ANTI-ARTHRITIC AGENT

Visakha Rajan, Jemi Jacob
Department of Pharmaceutical Chemistry, Moulana college of Pharmacy, Malappuram, Kerala, India-679321
visakha.rajan@gmail.com

COX-2 and TNF-α are considered to be the proinflammatory cytokines responsible for arthritis. Literature reported substituted Diphenyls and isoquinolines to be effective in inhibiting COX-2 and TNF-α which is useful in the improvement of inflammation in RA patients. So a plan was made to design a new compound which could simultaneously inhibit both COX-2 & TNF-α as better Anti-Arthritic agent. The present investigation includes design, synthesis, characterization and biological evaluation of these diphenyl derivatives against arthritis. Results of these studies indicates that these derivatives have affinity towards COX-2 & TNF-α active site. Docking studies were performed to study the binding mode of these derivatives. The docking analysis of highest active molecule PD-FL shows significant interaction with the active site amino acid residue. The synthesis was carried out by multiple steps. The physiochemical characterization was done using IR, 1H NMR and mass analysis. The pharmacological evaluation was carried out by carrageenan induced rat paw edema and formaldehyde induced arthritic model. The compound PD-FL shows potent anti-arthritic activity as compared to that of standard. The designed compounds are devoid of sulphonamide and carboxy group for having minimal side effect on heart and stomach. Histopathological studies on animal heart, stomach and foot reveal the extend of side effective.

**Keywords:** COX-2 & TNF-α inhibitors; Diphenyl derivatives; Anti-arthritic agent

**CH-74**

## DECIPHERING MICRORNA-MEDIATED DNA REPAIR PATHWAYS IN POST-MI COGNITIVE IMPAIRMENT: A COMPUTATIONAL DRUG DISCOVERY PERSPECTIVE

K.Durga Prasad, G.Hema Sree,
Sri Ramya R.V.S, Mohammed Aafreen
Department of Pharmacology, K.V.S.R. Siddhartha College of Pharmaceutical Sciences, Vijayawada, Andhra Pradesh, India - 520010.
durgaprasad.kondeti@gmail.com

Comorbidities like cognitive decline and mood alterations often follow myocardial infarction (MI). The present study explored the underlying molecular mechanisms using in-silico molecular analyses to determine the association of MI-induced cognitive degeneration and altered gene expression, which contributed to neuroinflammation, oxidative stress and dysregulated DNA damage response (DDR). A computational drug discovery tool is leveraged to target microRNAs (miRNAs) responsible for regulating DDR pathways, seeking to mitigate degeneration. BRCA1/2, ATM, RAD51, ERCC3/4, and other genes related to DDR were curated from the Gene Expression Omnibus (GEO) and literature. miRTarBase and miRDB were used to identify 32 miRNAs that interacted with the genes. The secondary and tertiary structures of miRNA-mRNA duplexes were predicted using ViennaRNA and RNAComposer. 330 ligands were screened virtually through the PSRR server, and compounds with strong miRNA downregulation scores (>0.85) were prioritised. SWISSADME was used to evaluate ADMET and drug likeness. Molecular docking by AutoDock Vina revealed multiple compounds, including statins, kinase inhibitors, and glucocorticoids, expressed strong binding affinities (<= 9.8 kcal/mol) to miRNA-mRNA complexes, indicating their potential to inhibit miRNA-mediated gene silencing. For the identification of disease associations and enriched pathways, FNDEx IQuery and miRNet were applied for comprehensive network analysis. Additionally, Enrichr KG provided insights into multi-omics gene set enrichment. These findings emphasise the potential of repurposing approved drugs to restore DDR gene expression, modulate miRNA activity, and offer a novel therapeutic approach for MI-associated cognitive impairment. Through integrative computational and translational research, this research seeks to advance precision pharmacology.

## DEVELOPMENT AND VALIDATION OF A ROBUST RP-HPLC METHOD FOR SIMULTANEOUS ESTIMATION OF REMOGLIFLOZIN AND VILDAGLIPTIN IN FIXED-DOSE COMBINATION TABLETS

Pranita Jirvankar, Surendra Agrawal
Datta Meghe College of Pharmacy,
Datta Meghe Institute of Higher Education and Research (Deemed to be University), Wardha-442001, Maharashtra, India.
pjirvankar123@gmail.com

A simple, precise, and robust reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed and validated for the simultaneous estimation of Remogliflozin and Vildagliptin in bulk and fixed-dose combination tablets. The chromatographic separation was achieved using a C18 column with an isocratic mobile phase comprising acetonitrile, orthophosphoric acid, and methanol in the ratio of 80:10:10 (v/v/v), delivered at a flow rate of 0.7 mL/min. UV detection was performed at 215 nm. The method demonstrated sharp and well-resolved peaks with retention times of 2.8 min for Vildagliptin and 4.2 min for Remogliflozin. The method was validated according to ICH Q2(R1) guidelines and showed excellent linearity in the concentration ranges of 2–20 µg/mL for Remogliflozin and 1–10 µg/mL for Vildagliptin, with correlation coefficients of 0.9999 and 0.9991, respectively. The limits of detection (LOD) were found to be 0.178 µg/mL for Remogliflozin and 0.310 µg/mL for Vildagliptin, while the limits of quantification (LOQ) were 0.540 µg/mL and 0.940 µg/mL, respectively. Precision studies exhibited %RSD below 2% for both intra- and inter-day evaluations. Accuracy was confirmed through recovery studies at three spiking levels, with mean recoveries within the range of 98.6% to 100.5%. Robustness was proven by small deliberate changes in method parameters, and specificity was confirmed through the absence of interfering peaks. The method was successfully applied to assay the marketed formulation Remo V, and statistical comparison with a reference method showed no significant difference. The developed method is suitable for routine quality control and quantitative analysis of Remogliflozin and Vildagliptin in pharmaceutical dosage forms.

**Keywords:** Remogliflozin, Vildagliptin, RP-HPLC, Method validation, Fixed-dose combination

## QUALITY BY DESIGN METHOD DEVELOPMENT AND VALIDATION OF CINNAMALDEHYDE BY RP- HPLC

Vaishnavi Jagtap
YB Chavan college of pharmacy, Chh. Sambhajinagar, Maharashtra
jagtapvm333@gmail.com

Quality by design analytical method development for determination of cinnamaldehyde an anticancer phytoconstituent was performed by RP-HPLC and its validation was done as per ICH guidelines. The 32 factorial design was selected in which independent factors i.e. mobile phase composition and flow rate & its effects on retention time and tailing factor was determined. Effect of such critical process parameter on critical quality attribute of the method was studied. The optimized chromatographic parameters obtained by applying QbD were mobile phase i.e. methanol and water in the ratio of 75:25 %v/v and the flow rate of 1.0 mL/min. The responses i.e. retention time and tailing factor obtained was 3.723 min and 0.941 respectively. Further the experimental model was subjected to statistical analysis by ANOVA and it was revealed that the selected model was significant with F-value of 17.17 & P-values less than 0.0500. The optimized method obtained by QbD was validated successfully with validation parameters such as linearity of R2=0.9991, LOD of 0.00003, LOQ of 0.00012, & mean recovery was found to be 99.95%. The developed method has the advantages of simplicity, repeatability, sensitivity and requires less expensive reagents.

## A STABILITY-INDICATING RP-HPLC APPROACH FOR ASSESSING GLIMEPIRIDE CONTENT IN FORMULATIONS

ISBN: 978-81-980623-8-3

Nithya Sri Dasam[1], Bhagavan Rajesh Babu Koppisetty[1], Srinivasa Rao Yarraguntla[1], Varaprasada Rao Kollabathula[1], Sridevi Ranjitha Karanam[1]
1Department of Pharmaceutical Analysis, Vignan Institute of Pharmaceutical Technology, Visakhapatnam,
Andhra Pradesh-530046, India.
ranjitha.karanam@gmail.com

In this study, we present a robust and reliable RP-HPLC method designed to accurately assess the content of glimepiride in various formulations while ensuring stability. The process of method development included refining chromatographic conditions to effectively separate glimepiride from degradation byproducts typically generated during storage within formulations. The column used for optimal separation had a C18 composition and dimensions of 250 mm length, 4.6 mm inner diameter, and 5 µm particle size. The mobile phase consisted of acetonitrile and 20 mM phosphate buffer at pH 5 (60:40 v/v) at a flow rate of 1 mL/min. Detection occurred at 228 nm, with glimepiride showing a retention time of 7.214 minutes. The drug exhibited susceptibility to acidic, basic, neutral, oxidative and thermolytic conditions but remained stable photolysis conditions. Validation investigations affirmed the method's appropriateness for quantification, showcasing exceptional linearity, precision, accuracy, and specificity. Furthermore, stress testing conducted under various conditions verified the method's capability to indicate stability, allowing precise determination of glimepiride content even amidst potential degradation products. In summary, this RP-HPLC methodology presents a valuable resource for the routine assessment of glimepiride formulations, guaranteeing the maintenance of product quality and integrity.
**Keywords:** Glimepiride; RP-HPLC; Stability indicating; validation; Forced degradation.

## FORCED DEGRADATION STUDIES OF FOSFOMYCIN TROMETAMOL USING UV-VISIBLE SPECTROPHOTOMETER

Tharanijeevagan, Parthiban Nagarajan
Department of Pharmaceutical Analysis, Vivekanandha Pharmacy College for Women, Sankagiri, Salem, Tamilnadu, India – 637303
tharanijeeva03@gmail.com

Forced degradation studies are performed for the product degradation pathways under stressful conditions, such as heat, light, acid, base, or oxidation. Its to develop and validate stability-indicating analytical methods to ensure drug's safety and efficacy over its shelf life of active drug and its degradation products. This stable formulations in case of Fosfomycin Trometamol for UTI was used to determine its λ max at 397 nm, revealing degradation of its instability by its epoxide ring. So, we were tested marketed samples (Monurol -8mg sachet - Modi Mundi Pharma) within 24 hours and found that consistent decreases in absorbance across different concentrations (0.1, 0.5, and 1 mg/ml, confirmed degradation against normal as control of fosfomycin sample sachet without degradation process. These findings has validated and method's for validated to indicate stability and support the development of robustness in analytics for Fosfomycin Trometamol. Thus, a work on project to confirm of short half-life of drug Fosfomycin trometomol reveals to report that under confirmed in that degradation.
**Keywords:** Fosfomycin, forced degradation, Stress condition, spectrophotometric assay

**CH-79**

## DESIGN, DOCKING, ADMET, PASS, SYNTHESIS & BIO-EVALUATION OF NOVEL 7-O-SUBSTITUTED FLURO APIGENIN HYBRIDS AS AN ANTIOXIDANT & ANTICANCER AGENTS TARGETING VEGFR-2.

Kalyani R. Thombre, Krishna R. Gupta, Milind J. Umekar
Department of Pharmaceutical Chemistry, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, 441002
kalyanithombre99@gmail.com

VEGFR-2 is a key mediator of tumor angiogenesis and an important target in cancer therapy. However, existing VEGFR-2 inhibitors often exhibit toxicity and drug resistance. Apigenin, a flavonoid with known anticancer activity and VEGFR-2 affinity, is limited by poor pharmacokinetics. To address this, a series of 7-O-substituted fluroapigenin derivatives (F1–F14) was designed by incorporating hydrogen-bonding and hydrophobic groups to improve binding affinity and drug-like properties, guided by VEGFR-2 structural analysis. The study aimed to design, synthesize, and evaluate novel apigenin derivatives through computational and *in vitro* approaches. Molecular docking was performed against VEGFR-2, and ADMET profiling was used to predict pharmacokinetic and toxicity profiles. In-silico cytotoxicity screening was carried out using CLC-Pred and BC CLC-Pred across nine breast cancer cell lines. Selected derivatives were synthesized via alkylation and esterification, and characterized by UV, IR, NMR, and mass spectrometry. Antioxidant activity was assessed using the DPPH assay, while anticancer activity against the MCF-7 cell line was determined using cell viability assays, comparing $IC_{50}$ values with ascorbic acid and sorafenib. Docking and ADMET results identified several promising candidates, especially among alkylamino derivatives. Compound F8 showed exceptional antioxidant activity ($IC_{50}$ = 0.6 µM), outperforming both apigenin and ascorbic acid. F8 and F13 also exhibited strong anticancer activity ($IC_{50}$ = 1.0 and 1.5 µM, respectively), approaching sorafenib efficacy. These findings suggest that rational modifications of apigenin can enhance its therapeutic potential. F8 and F13, in particular, show promise as multifunctional agents for VEGFR-2-targeted breast cancer therapy.

## *IN SILICO* SCREENING OF HETEROCYCLIC DERIVATIVES TARGETING PARP 1 FOR CANCER THERAPY

Gunavathi M[1], B. Gowramma[1]
1Department of Pharmaceutical Chemistry, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty,
the Nilgiris, Tamil Nadu, India
gunavathi9977@gmail.com

PARP-1, a key enzyme in DNA repair, plays an essential role in the treatment of BRCA-mutated cancers through its inhibition. Heterocyclic derivatives have shown significant anticancer potential, and *in silico* approaches provide cost-effective strategies to evaluate their efficacy as PARP-1 inhibitors. In this study, molecular docking was performed using the PARP-1 crystal structure (PDB ID: 7kk4), and ten heterocyclic derivatives with strong binding affinities (–6 to –9 kcal/mol) were identified. These compounds were further analysed through ADMET profiling, which revealed favourable pharmacokinetic properties including high absorption, low toxicity, and good metabolic stability. Binding free energy calculations using MM-GBSA confirmed strong protein–ligand interactions, with values ranging from –57 to –86 kcal/mol. Molecular dynamics simulations further validated the stability of the top-ranked protein–ligand complexes. Overall, the findings highlight promising heterocyclic derivatives as potential PARP-1 inhibitors, providing a strong foundation for further experimental validation and contributing to the development of targeted cancer therapies through computational drug discovery approaches.
**Keywords:** PARP-1 inhibitors, Heterocyclic derivatives, Molecular docking, ADMET analysis, MM-GBSA, Molecular dynamics simulation

## DESIGN, SYNTHESIS, *IN SILICO* STUDY AND *IN VITRO* STUDIES OF 2-AMINOBENZOTHIAZOLE - PHENYL BENZOPYRANONE ANALOGUES AS ANTIOXIDANT & ANTICANCER AGENTS

Shubham Tiwari, Kalyani Thombre, Krishna Gupta, Milind Umekar
shubh945429@gmail.com

A novel series of 2-aminobenzothiazole Phenyl Benzopyranone analogues was designed and synthesised as potential antioxidant & anticancer agents. The design process involved evaluating molecular properties such as receptor binding affinity, binding energy, toxicity profile, and compliance with Lipinski's Rule of Five. Selected compounds showing promising *in silico* results were synthesised through a multi-step process. Initially, acacetin was reacted with 1,4-dibromobutane using potassium carbonate as a base in anhydrous DMF to form an intermediate. This intermediate was then reacted with various substituted 2-aminobenzothiazoles via the Betti reaction to obtain the final 2-aminobenzothiazole Phenyl benzopyranone analogues (S1–S6). The synthesised compounds were characterised using elemental and spectral analysis, confirming their proposed structures. All analogues were evaluated for anticancer activity using the MCF-7 breast cancer cell

ISBN: 978-81-980623-8-3

line via the MTT assay. Among the tested compounds, S1, S5, and S6 exhibited notable anticancer activity compared to the others. Antioxidant activity was assessed using the DPPH radical scavenging assay, where compound S5 showed the highest activity, followed by S2 and S1.

**Keywords:** Flavone, Phenyl benzopyranone, 2-aminobenzothiazole, Anticancer, Acacetin

**CH-82**

## ANALYTICAL METHOD DEVELOPMENT AND VALIDATION FOR THE SIMULTANEOUS ESTIMATION OF ABACAVIR AND LAMIVUDINE BY USING RP-HPLC

Paduri Amani[1], Narender Malothu[2], Chamakuri. Kantlam[3]
[1,2] Department of pharmaceutical Analysis, KL College of pharmacy, KL Deemed to be university, Koneru Lakshmaiah education foundation, vaddeeswaram, Guntur, AP, India.
[3] Departent of pharmaceutical chemistry, Brilliant group of Technical Institutions, Hyderabad, Telangana, India.
amanipaduri0002@gmail.com

A new, simple and accurate, precise RP-HPLC method was developed for simultaneous determination of Abacavir and Lamivudine in bulk and in combined pharmaceutical dosage form. The separation of Abacavir and Lamivudine was achieved within 8 minutes on an Agilent Zorbax (C18) (150 mm x 4.6 mm, 5µm) column using Methanol: Acetate Buffer pH-3.8 (24:76 v/v) as the mobile phase. Detection was carried out using wavelength at 254 nm. The method showed adequate sensitivity concerning linearity, accuracy and precision over the range 100-500 µg/mL and 50-250 µg/mL for Abacavir and Lamivudine, respectively. Careful validation proved advantages of high sensitivity, accuracy, precision, selectivity, robust and suitability for quality control laboratories. The developed method was robust as the % RSD was within the range and without effecting system suitability parameters. The proposed method is suitable for simultaneous determination of Abacavir and Lamivudine in bulk and pharmaceutical dosage form.

**Keywords:** Abacavir and Lamivudine, RP-HPLC, Validation, Robustness, ICH Guidelines, UPLC-MS/MS; Method development; Simultaneous estimation.

## NOVEL ISATIN-CHALCONE DERIVATIVES: SYNTHESIS, CHARACTERIZATION AND EVALUATION FOR ANTIMICROBIAL AND ANTICANCER APPLICATIONS

Marapatla Shiny, Girija Sastry Vedula
Department of Pharmaceutical Chemistry, AU College of Pharmaceutical Sciences, Andhra University, Visakhapatnam-530003.
marapatlashinyphd@gmail.com

A series of novel isatin-chalcone hybrids (IA-IM) were synthesized via a microwave-assisted method and evaluated for their antimicrobial, antifungal, antitubercular and anticancer activities. The compounds were characterized using spectroscopic techniques and screened for antibacterial activity against Staphylococcus aureus and Escherichia coli, antifungal activity against Candida albicans and Aspergillus niger, antitubercular activity against Mycobacterium tuberculosis H37Rv and cytotoxicity against breast (MCF-7) and cervical (HeLa) cancer cell lines. Compounds IK (4-NH2), IF (2-Cl) and IL (2-F) exhibited potent antibacterial activity, with zones of inhibition (ZOI) comparable to or exceeding amikacin at higher concentrations. Against fungal strains, IM (4-NO2), IK (4-NH2) and IL (2-F) demonstrated significant activity, approaching the efficacy of fluconazole. In antitubercular assays, compounds ID (2-F), IE (3,4-OCH3), IF (2-Cl) and IG (4-Cl) showed sensitivity at 12.5-25 µg/mL. Anticancer evaluations revealed that compounds IH (4-Br), IK (4-NH2) and IE (3,4- OCH3) were highly potent against MCF-7 and HeLa cells, with IC50 values as low as 6.53 ± 1.12 µM, while sparing normal HEK-293 cells. Structure-activity relationship (SAR) studies highlighted the importance of electron-donating groups (e.g. -NH2, -OCH3) and halogen substitutions (e.g. -Cl, -Br) in enhancing biological activity. These findings demonstrate the potential of isatin-chalcone hybrids as multifunctional therapeutic agents, providing a foundation for further optimization and development.

**Keywords:** Isatin, Chalcone, Antibacterial, Antifungal, Anti-tubercular, Anticancer.

## IMPLEMENTATION OF QBD APPROACH TO THE ANALYTICAL METHOD DEVELOPMENT AND VALIDATION FOR THE SIMULTANEOUS ESTIMATION OF ALFUSOSIN AND TADALAFIL IN TABLET DOSAGE FORMS

Tadepalli.Vanitha Madhuri, G.Rajitha
Institute of Pharmaceutical Technology,
SRI PADMAVATI MAHILA VISVAVIDYALAYAM, (Women's University),
Tirupati, Andhra Pradesh-517502, India
vanithamadhuriphd2024@gmail.com

A Quality by Design (QbD)-driven RP-HPLC method was developed for the simultaneous estimation of Alfuzosin and Tadalafil in pharmaceutical formulations. Utilizing a systematic approach, critical method parameters (CMPs) such as buffer pH, flow rate, and organic composition were optimized through a Box-Behnken design, ensuring robustness and consistent performance. Chromatographic separation was achieved using a Platisil C18 column (250×4.6 mm, 5 µm) with a mobile phase of phosphate buffer (pH 6.0): methanol (40:60), a flow rate of 1.0 ml/min, and detection at 272 nm. The retention times for Alfuzosin and Tadalafil were 2.25 min and 3.04 min, respectively.The method was optimized and evaluated using ANOVA, which confirmed the significance of model parameters on resolution and tailing factor. System suitability parameters were within acceptable ranges: resolution > 4.0, tailing factor < 1.2, and plate count > 4000, establishing the method's effectiveness for routine analysis. Linearity was over a wide concentration range with correlation coefficients ($R^2$) of 0.999 for Alfuzosin and0.999 for Tadalafil, confirming excellent analytical response. Validation as per ICH guidelines demonstrated that the method is precise (%RSD < 0.5%), accurate (mean recoveries of 99.2% and 99.3%), and sensitive with low LOD (0.90 µg/ml for Alfuzosin and 3.32 µg/ml for Tadalafil) and LOQ values. This validated method is suitable for the routine assay and quality control of Alfuzosin and Tadalafil in bulk drug substances and finished dosage forms, meeting both regulatory expectations and industry best practices.

**Keywords:** Quality by Design, Alfuzosin, Tadalafil, RP-HPLC, Validation.

**CH-85**

## WHITE ANALYTICAL RP-HPLC METHOD FOR ESTIMATION OF FINERENONE AND ITS IMPURITIES

Mohammad Sameena, U.Harini
Department of Pharmaceutical Analysis, Raghu College of Pharmacy, Dakamarri, Visakhapatnam, Andhra Pradesh, India.
kwajamohammad@gmail.com

An eco-friendly reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed for the quantitative and qualitative analysis of Finerenone and its impurities in pharmaceutical dosage forms. Chromatographic separation was achieved on a Waters Alliance e2695 system equipped with a Waters X-Terra RP-18 column (150 × 4.6 mm, 5 µm). The mobile phase consisted of ammonium formate (pH adjusted to 3.0 with orthophosphoric acid) and acetonitrile in a 60:40 v/v ratio. The flow rate was maintained at 1 mL/min, and detection was performed at 235 nm using a photo-diode array detector under ambient temperature conditions. The number of theoretical plates for Finerenone and its impurities exceeded 2000, with a tailing factor not greater than 2. The relative standard deviation (%RSD) of peak areas for all measurements was below 2.0. The method was validated in accordance with International Council for Harmonization (ICH) Q2(R2) guidelines. Furthermore, the method was found to be simple, eco-friendly, and cost-effective. Its environmental impact and sustainability were evaluated using whiteness profile assessment tools such as AGREE and ComplexGAPI, and the obtained scores confirmed that the developed method qualifies as a white analytical procedure for analysis of Finerenone and its impurities.

**Keywords:** Finerenone, impurities, RP-HPLC, eco-friendly.

## ANALYTICAL AND BIOANALYTICAL RP-HPLC METHOD DEVELOPMENT FOR THE ESTIMATION OF AN ANTI-ALZHEIMER'S DRUG IN LIPID FORMULATIONS

Akshatha P Kamath [a], Pawan G Nayak [a], Nandakumar K [a]
[a] Department of Pharmacology, Manipal College of Pharmaceutical Sciences, Manipal Academy of Higher Education, Manipal 576104, Karnataka, India.

ISBN: 978-81-980623-8-3

akshathapkamath@gmail.com

This study aimed to develop, optimize, and validate a robust reversed-phase high-performance liquid chromatography (RP-HPLC) method for Mangiferin (MGN) quantification in bulk, nanoformulations, and biological matrices. A Quality by Design approach was employed, wherein critical method parameters were screened using Taguchi orthogonal array and further optimized by Box–Behnken design. The optimized chromatographic conditions consisted of a mobile phase of methanol:acetonitrile (22% v/v) with phosphate buffer (pH 3.2, 78% v/v), flow rate 1.0 mL/min, and oven temperature 26 °C. Under these conditions, MGN showed a retention time of 8.36 min, tailing factor of 1.2, and theoretical plates of 2953. The method exhibited excellent sensitivity (LOD 0.52 ng/mL, LOQ 1.56 ng/mL) and linearity over 50–5000 ng/mL ($R^2$ = 0.9999). Validation confirmed accuracy, precision, specificity, and robustness, with stability maintained in the presence of degradation products. A bioanalytical RP-HPLC method was further developed using caffeine as an internal standard (IS). Retention times for caffeine and MGN were 7.4 and 9.4 min, respectively, under identical conditions. The calibration curve demonstrated wide linearity (60 ng/mL–150 µg/mL) with $R^2$ = 0.999, confirming suitability for pharmacokinetic and *in vivo* applications. The developed RP-HPLC method proved reliable for quantification of MGN in nanoformulations, *in vitro* dissolution studies, and bioanalytical investigations, supporting its potential for regulatory and translational research applications.

**CH-87**

## ENVIRONMENTALLY BENIGN ALTERNATIVES TO HAZARDOUS ORGANIC SOLVENTS IN PHARMACEUTICAL LABORATORIES: A COMPREHENSIVE REVIEW

Santosh R. Tambe, Anuja P. Bhosale, Ram S. Rathod
Department of Pharmaceutical Chemistry, Mahatma Gandhi Vidyamandir's Pharmacy College, Panchavati, Nashik, Maharashtra, India - 422003.
santoshsrt.mgv@gmail.com

The widespread use of hazardous solvents, including benzene, carbon tetrachloride, 1,2-dichloroethane, chloroform, and 1,1,1-trichloroethane, in undergraduate laboratories presents significant environmental, health, and regulatory concerns. These solvents are highly toxic, carcinogenic, or genotoxic; consequently, their application in pharmaceutical laboratories should be strictly avoided. Permissible exposure is recommended only when absolutely unavoidable, in minimal quantities, and with rigorous justification. Increasing regulatory restrictions have intensified the demand for safer and more sustainable solvent alternatives. This communication highlights the integration of green chemistry strategies to reduce hazardous solvent use while maintaining or enhancing synthetic efficiency and good laboratory effectiveness. Practical substitution approaches include replacing dichloromethane with ethyl acetate, acetone, methyl formate, or methyl acetate; substituting hexane with heptane; and replacing diethyl ether or diisopropyl ether with ethyl acetate or isopropyl acetate in extraction protocols. These alternatives provide lower toxicity and compatibility with conventional extraction, chromatographic, and reaction procedures. Solvent selection is guided by physicochemical characteristics, safety considerations, and sustainability metrics, consistent with safety principles. Adoption of green solvents not only ensures regulatory compliance but also promotes sustainable laboratory practices essential for modern scientific research and education. By consolidating current knowledge and practical guidance, this study provides chemists with a structured framework to mitigate solvent-related hazards and integrate safer, sustainable alternatives into laboratory teaching.

**CH-88**

## DEVELOPMENT AND VALIDATION OF RP-HPLC METHOD FOR SIMULTANEOUS ESTIMATION OF CLOTRIMAZOLE, TINIDAZOLE AND POVIDONE IODINE IN PHARMACEUTICAL DOSAGE FORM

Urvashi More, Amar Shinde, Ishvarchandra Parmar, Sonal Desai
Department of Pharmaceutical Quality Assurance, SSR College of Pharmacy, Sayli Road, Silvassa, UT of Dadra and Nagar Haveli-396 230, India
urvashimore2002@gmail.com

The present research focuses on the development and validation of a novel Reverse Phase High-Performance Liquid Chromatography (RP-HPLC) method for the simultaneous estimation of Clotrimazole, Tinidazole, and Povidone Iodine in pharmaceutical dosage forms. Chromatographic separation was achieved using a Fortis C18 column (150 × 4.6 mm, 5 µm) with a mobile phase consisting of methanol and phosphate buffer (85:15 v/v; pH 2.5, adjusted with orthophosphoric acid) at a flow rate of 1 ml/min, and detection at 232 nm. The proposed method demonstrated excellent linearity ($r^2$ > 0.999), accuracy (98–102% recovery), and precision with low %RSD values for intra-day and inter-day studies, in accordance with ICH Q2(R1) guidelines. Specificity studies confirmed the absence of interference from excipients and degradation products, while robustness testing verified the reliability of the method under deliberate variations of analytical parameters. The validated method proved to be simple, precise, accurate, and robust, making it highly suitable for routine quality control and analysis of marketed formulations containing this triple combination.

**Keywords:** RP-HPLC, Clotrimazole, Tinidazole, Povidone Iodine, Method Validation, Pharmaceutical Quality Assurance

**CH-89**

## MOLECULAR DOCKING ANALYSIS OF CAPSAICIN WITH PRO-INFLAMMATORY CYTOKINES AS POTENTIAL THERAPEUTIC TARGETS

Shilpi Arora and Vineet Mittal
Department of Pharmaceutical Sciences, Maharshi Dayanand University, Rohtak, Haryana, 12400, India
shilpi.muskan20@gmail.com

Pro-inflammatory cytokines such as TNF-α, IL-17a, IL-1β, IL-23, and IL-12 play a major role in the initiation and progression of inflammatory disorders like osteoarthritis. Capsaicin, the pungent alkaloid of chili peppers, is well known for its analgesic and anti-inflammatory properties, yet its molecular interactions with cytokine targets remain underexplored. In this study, molecular docking simulations were performed to evaluate the binding potential of capsaicin with key cytokine proteins, namely TNF-α (PDB ID: 7JRF), IL-17a (7AMA), IL-1β (6Y8I), IL-23 (4GRW), and IL-12 (IF45). Docking scores were used to assess binding affinity and interaction strength. Capsaicin exhibited favourable interactions with all the selected targets, yielding scores of −7.028 for TNF-α, −5.100kcal/mol for IL-17a, −8.235 kcal/mol for IL-1β, −7.050 kcal/mol for IL-23, and −4.593 kcal/mol for IL-12. Among these, the strongest interaction was observed with IL-1β, followed by IL-23 and TNF-α, suggesting that capsaicin may exert significant inhibitory effects on these cytokines. These findings provide molecular insights into the anti-inflammatory potential of capsaicin and highlight its promise as a natural therapeutic candidate for managing cytokine-mediated inflammatory diseases. The work presented a multi-target docking analysis across major cytokines central to inflammatory pathways. Further *in vitro* and *in vivo* studies are warranted to validate these interactions and explore clinical applicability.

**Keywords:** Capsaicin, Cytokines, Molecular docking, Inflammation, Osteoarthritis

**CH-90**

## DEVELOPMENT AND VALIDATION OF RP-HPLC-BASED BIOANALYTICAL METHOD OF SORAFENIB-LOADED MICROEMULSION GEL AND ITS PHARMACOKINETIC EVALUATION IN WISTAR RATS

Ankita Ronge patil, Sayali Jadhav
Department of Pharmaceutical Chemistry, Marathwada Mitra Mandal's College of Pharmacy, Pune, Maharashtra, India.
ankitarongepatil2@gmail.com

The present study aimed to develop and validate a robust RP-HPLC method for the quantification of sorafenib in rat plasma and to evaluate a microemulsion formulation with potential for brain targeting. Protein precipitation using methanol was employed for sample preparation. Chromatographic separation was achieved on an Agilent Symmetry C18 column with a mobile phase consisting of methanol:water (80:20 v/v) at a flow rate of 0.8 mL/min, using isocratic elution and UV detection at 265 nm. The method provided satisfactory resolution with a retention time of 3.5 min for sorafenib. The method demonstrated excellent linearity (5–85 µg/mL) with a high correlation coefficient ($r^2$ = 0.9999). Validation met USFDA bioanalytical guidelines, confirming accuracy, precision, and stability. The microemulsion formulation showed globule sizes below

ISBN: 978-81-980623-8-3

100 nm with >95% drug loading efficiency. In conclusion, the validated RP-HPLC method proved reliable for the determination of sorafenib in rat plasma and is suitable for pharmacokinetic investigations. Furthermore, brain distribution studies indicated that the nasal route achieved the highest brain concentrations of sorafenib, confirming successful blood–brain barrier penetration of the microemulsion formulation. These findings highlight its potential for effective brain targeting applications.

**Keywords:** Sorafenib, RP-HPLC, Bioanalytical method, Microemulsion, Brain targeting

## *IN SILICO* DESIGN, SYNTHESIS, CHARACTERIZATION AND PHARMACOLOGICAL EVALUATION OF NOVEL QUINAZOLINE DERIVATIVES

Merin Benny, Gisna Shaji, Arun Kumar R
Department of Pharmaceutical Chemistry, St Joseph's College of Pharmacy, Cherthala, Kerala, India, 688524
merinbenny27@gmail.com

Heterocyclic compounds are of crucial importance in pharmaceutical research because of their tremendous biological relevance. Quinazoline is one of the notable heterocyclic cores and privileged structural motifs in medicinal chemistry. Quinazoline derivatives are commonly known for their rich pharmacological activities, especially their anticancer activity. Structurally, quinazoline is composed of two six-membered fused aromatic rings, one pyrimidine ring, and one benzene ring, giving a broad platform for developing biologically active compounds. In the current study, new quinazoline derivatives were rationally designed through *in silico* molecular modeling methods. Different journal literature was studied, and eight synthetic routes were chosen. 100 Quinazoline derivatives were synthesized and tested using MolSoft, PASS Online, and ADMET analysis. Among them, 40 compounds satisfied Lipinski's rule of five, while 60 derivatives passed MolSoft predictions. Further, 100 compounds were virtually screened for anticancer potential using PubMed/MEDLINE references, and docking scores were obtained. From this set, seven compounds were synthesized in the laboratory through a single-step reaction using microwave-assisted synthesis. These derivatives were further characterized and evaluated for solubility and stability. Anticancer screening was conducted, and docking outcomes showed that among all the synthesized compounds, one had the highest docking score and considerable activity. Therefore, in this research, the successful design, synthesis, and assessment of quinazoline derivatives are presented, finding them to be promising anticancer drug discovery scaffolds.

**Keywords**: Quinazoline, *in silico*, Anticancer, Docking, MolSoft

## DEVELOPMENT AND VALIDATION OF QBD APPROACH IN RP-HPLC ANALYTICAL METHOD FOR SEPARATION AND IDENTIFICATION OF ANTI-TUBERCULOSIS DRUG DELAMANID

Pawar Sonali Dilip
MGV'S Pharmacy College, Panchavati, Nashik
patilsonali26@gmail.com

This study presents a simple method to set up and test RP-HPLC for Delamanid This drug is used to treat tuberculosis. We used a we Quality by Design (QbD) approach. A strong and fast RP-HPLC method was created to measure delamanid in drugs. It is accurate and specific for both qualitative and quantitative analysis. The method uses a mobile phase with Methanol and 0.1% orthotic Phosphoric Acid. It also employs a C18 column and detects at a wavelength of 242 nm. Using QbD principles for method development helped identify critical method parameters (CMPs). This led to a clearer understanding of variability and made the methods more robust. Validation was carried out per ICHQ2(R1) guidelines. The method showed great linearity (r2 = 0.9999), precision, accuracy, and specificity. The limits of detection (LOD) and quantification (LOQ) were 3 µg/mL and 12 µg/mL,respectively. This optimized method can be reliably used for routine analysis of delamanid.

## DISCOVERY DRIVEN *INSILICO* EXPLORATION OF PIPERNONALINE MODULATION IN PANC-1 PANCREATIC CANCER

Vemavarapu N.V. Uma Chandravathi
Department of Pharmacognosy & Phytochemistry
VJ's College of Pharmacy, Diwancheruvu, Rajahmundry,
Andhra Pradesh – 533296
umaachandravathi17@gmail.com

Pancreatic cancer remains a major unresolved Challenge in Oncology due to its aggressive nature and limited response to existing treatments. This work presents a computational investigation of pipernonaline an alkaloid derived from piperlongum as a potential modulator of critical molecular pathways in PANC-1 pancreatic cancer cells. The study was designed to identify novel protein interactions that might support future drug development. The docking experiment was conducted using different protein structures and unbiased ligand conformers followed by dynamic Stability assessments. Initial results reveal that pipernonaline achieves stable binding with several target proteins, exhibiting interactions indicative of possible interference with cellular stress adaptation mechanisms. Notably, the profile and targets identified in this work have not been previously reported in molecular docking studies with pipernonaline.

**Keywords:** Docking Studies, PANC-1, Pipernonaline, Pancreatic cancer.

## DEVELOPMENT AND VALIDATION OF A STABILITY-INDICATING RP-HPLC METHOD FOR THE ESTIMATION OF INAVOLISIB AND ITS RELATED IMPURITIES

D. Sandeep Kumar Naik, P. Dwarakanadha Reddy
Annamacharya College of Pharmacy, JNTUA, Rajampet,
Andhra Pradesh, India – 516126
sandeepnaikdds@gmail.com

A robust RP-HPLC method was developed and validated for the simultaneous estimation of Inavolisib and its related impurities using a Waters X-Terra RP-18 column (150 mm × 4.6 mm, 3.5 µm). The mobile phase consisted of ammonium formate buffer (pH 2.5 with formic acid) and acetonitrile (60:40 v/v) at a flow rate of 1.0 mL/min, with detection at 251 nm. The chromatographic conditions provided well-resolved peaks with retention times of 2.61, 3.74, 5.36, 6.62, and 8.05 minutes for Imp-1, Imp-2, Imp-3, Imp-4, and Inavolisib, respectively. System suitability parameters, including theoretical plates, resolution, and tailing factors, were within acceptable limits. Linearity was observed in the range of 25–150 µg/mL for Inavolisib and 1.25–7.50 µg/mL for impurities with correlation coefficients ($r^2$) > 0.999. Precision studies showed %RSD values below 2.0%, while recovery at 80%, 100%, and 120% levels ranged from 98.2% to 100.8%, confirming accuracy. Specificity tests confirmed no interference from blanks, and robustness and ruggedness studies demonstrated stability under deliberate variations. The LOD and LOQ were 1.50 and 5.00 µg/mL for Inavolisib, and 0.10 and 0.25 µg/mL for impurities, respectively. Forced degradation under acid, alkali, oxidative, reductive, thermal, photolytic, and hydrolytic conditions confirmed the stability-indicating nature of the method, with all degradation products resolved from the analyte. Overall, the validated method is precise, accurate, specific, and stability-indicating, making it suitable for routine quality control of Inavolisib and its impurities.

**Keywords:** Inavolisib, RP-HPLC, Method validation, Forced degradation, Stability-indicating method

## ANALYTICAL CHROMATOGRAPHIC METHOD DEVELOPMENT AND VALIDATION OF ANTIDIABETIC DRUGS IN BULK & TABLET FORMULATION

Pratiksha Kathare[1] Rahul Khiste, Neha Chatlod
[1]Department of Pharmaceutical Chemistry, Marathwada Mitra Mandal's College of Pharmacy, Pune-411033 Maharashtra, India.
pratikshakathare2000@gmail.com

Dapagliflozin, Teneligliptin, Metformin are anti-diabetic drugs. Dapagliflozin (SGLT2 inhibitor) lowers glucose by urinary excretion, Teneligliptin (DPP-4 inhibitor) enhances incretin to increase insulin and reduce glucagon, and Metformin (Biguanide) decreases hepatic glucose production and improves insulin sensitivity. Several attempts were made on simultaneous analysis of Metformin with either Dapagliflozin or Teneligliptin but no work were carried out on simultaneous analysis of

ISBN: 978-81-980623-8-3

all three drugs combination. In the present work, efforts are made to develop a simple, precise, accurate, economical analytical method and linear reverse phase high performance liquid Chromatographic (RP-HPLC) method for simultaneous estimation of Dapagliflozin (DAPA), Teneligliptin (TEN) and Metformin (MET) in bulk drug and marketed tablet formulation. Different analytical performance parameters such as linearity, precision, accuracy, specificity, limit of detection (LOD) and limit of quantification (LOQ) were determined according to International Conference on Harmonization ICH Q2B guidelines. Chromatographic separation was achieved on water's ARC HPLC system using isocratic elution with ortho-phthalaldehyde (OPA) acetonitrile (85:15, v/v) as a mobile phase. The ultraviolet detector was operated and the retention time for DAPA, TEN, and MET were found to be 2.48 ± 0.5 min, 3.12 ± 0.5 min, and 1.11 ± 0.5 min respectively. The standard curve was linear over the concentration range of 2-12 µg/ml ,10-60 µg/ml and 5-30 µg/ml with correlation coefficient values close to one ($r^2 \approx 0.999$). The proposed method was validated for system suitability, specificity, linearity, accuracy, precision, LOD, LOQ. All parameters were found to be within the acceptance limit.

**Keywords:** Dapagliflozin, Teneligliptin, Metformin, RPHPLC.

## *IN VITRO* ANTIDIABETIC POTENTIAL OF 5-((E)-4-((E)-(SUBSTITUTEDARYL/ALKYL)METHYL) BENZYLIDENE)THIAZOLIDINE-2,4-DIONE DERIVATIVES

Harsh Kumar[1], Rakesh Kumar Marwaha[2]
[1]Department of Pharmaceutical Chemistry, Vaish Institute of Pharmaceutical Education and Research, Rohtak, Haryana, India – 124001
[2]Department of Pharmaceutical Sciences, Maharshi Dayanand University, Rohtak, Haryana, India – 124001
goyalpharma86@gmail.com

In view of extensive range of biological activities of thiazolidine-2,4-dione, *in vitro* antidiabetic potential of 20 thiazolidine-2,4-dione analogues already synthesized by Kumar et al., 2020 was evaluated by α-amylase using diastase (amylase enzyme) at absorbance 540 nm by taking acarbose as standard drug. A solution of 0.25 gm of soluble potato in 50 ml of 20 mM phosphate buffer (pH 6.9) was prepared. 1 mg diastase (amylase enzyme) was mixed in 100 ml of 20 mM phosphate buffer (pH 6.9) to obtain the enzyme solution. The coloring agent was prepared by mixing 20 ml of 96 mM 3,5-dinitrosalicylic acid with 5.31 M sodium potassium tartrate in 8 ml of 2 mM sodium hydroxide and 12 ml of deionized water. 1 ml of enzyme solution was mixed with 1 ml of each synthesized derivative and then incubated for 10 minutes at 25 ºC. 1 ml of this mixture was mixed with 1 ml of soluble potato and incubated for 10 minutes at 25 ºC. Then 1 ml of color reagent was added and placed into water bath for 15 minutes at 85 ºC. The absorbance was taken after diluting mixture with distilled water. The antidiabetic activity indicated that compounds 8 and 15 (IC50 = 29.4 µg/mL and 30.5 µg/mL) exhibit almost equipotent activity when compared with standard acarbose (IC50 = 30.08 µg/mL). Thus, it can be concluded that analogues 8 and 15 can further be evaluated for *in vivo* studies to establish new antidiabetic molecule.

**Keywords:** Thiazolidin-2,4-dione, α-amylase, diastase, 3,5-dinitrosalicylic acid, Antidiabetic.

## REPURPOSING OF FDA-APPROVED ANTIVIRAL DRUGS AGAINST MONKEYPOX VIRUS: COMPUTATIONAL TARGETING OF VP39 METHYLTRANSFERASE

Harshal Patil, Chandrakant Bonde, Payal Kute, Varsha Agarwal
Department of Pharmaceutical Chemistry, SSR College of Pharmacy, Sayli Road, Silvassa, Dadra & Nagar Haveli, India
harshalpatil4788@gmail.com

Monkeypox virus (MPXV), a re-emerging zoonotic orthopoxvirus, has become a global health concern due to its rapid spread and lack of specific antiviral therapies. VP39, a 2′-O-methyltransferase enzyme essential for viral mRNA capping and immune evasion, is absent in humans, making it a highly selective therapeutic target. Repurposing FDA-approved antivirals offers a rapid and economical strategy to identify effective drug candidates. A total of 25 FDA-approved antiviral drugs were screened against the sinefungin-binding pocket of VP39 (PDB ID: 8B07) using Glide molecular docking (Schrodinger). The top-ranked ligands were further validated by 100 ns molecular dynamics (MD) simulations using Desmond (Schrodinger) to assess conformational stability. Binding free energies were calculated using the MM-GBSA approach to quantify interaction strength. Adefovir exhibited the highest affinity, with a docking score of –8.717 and a binding free energy of –42.25 kcal/mol. It formed stable hydrogen bonds and ionic interactions with catalytic residues Arg140, Asp138, and Arg143. MD simulations confirmed the stability of the Adefovir–VP39 complex through consistent RMSD, low RMSF, compact radius of gyration, and persistent hydrogen bond occupancy. Other drugs such as Sofosbuvir, Ribavirin, Zanamivir, and Remdesivir also showed favorable binding interactions. This study identifies Adefovir as a promising repurposed candidate against MPXV and demonstrates the utility of computational pipelines as rapid and cost-effective approaches for antiviral discovery.

**Keywords:** Monkeypox virus, VP39 methyltransferase, drug repurposing, Adefovir, molecular docking

## ANALYTICAL METHOD DEVELOPMENT AND VALIDATION FOR SIMULTANEOUS DETERMINATION OF DAPAGLIFLOZIN PROPANEDIOL MONOHYDRATE AND TELMISARTAN USING UV AND RP-HPLC TECHNIQUES

Vidhi Navin Patel, Patel Parth Pankajkumar, Sachin B. Narkhede
Smt B.N.B Swaminarayan Pharmacy College,
Salvav, Vapi, Gujarat, India – 396191
vidhipatel2904@gmail.com

To determine Dapagliflozin Propanediol Monohydrate and Telmisartan in their synthetic mixture, A simple, rapid, and precise UV Spectrophotomertic (Absorbance Correction Method) and RP-HPLC methods were developed and validated in accordance with ICH Q2(R2) guidelines. Methanol has been used as a solvent in the development of UV Spectrophotomertic Method for Dapagliflozin Propanediol Monohydrate and Telmisartan at 244nm and 296nm respectively. The RP-HPLC method has been developed using a mobile phase consisting mixture of Acetonitrile: Water (60:40%v/v) at a flow rate of 1.2 ml/min at 35°C column oven temperature. C18 column (250 mm×4.6 mm, 5 µm) was used as a stationary phase and the detection wavelength was 235nm. The retention time of Dapagliflozin Propanediol Monohydrate and Telmisartan were 12.056min and 7.903min. respectively. Linearity was observed in the concentration ranges of 2-12µg/ml for DAPA and 5-30µg/ml for TELM using absorbance correction method and 4-20µg/ml for DAPA and 10-50µg/ml for TELM using RP-HPLC method with correlation coefficient of 0.999. The percentage recoveries obtained for DAPA and TELM were 98.66-99.33% for UV Spectrophotomertic and 98.96-99.44% for RP-HPLC method.The %RSD value for precision of Dapagliflozin Propanediol Monohydrate and Telmisartan were within acceptable range in both methods. For the simultaneous estimation of Dapagliflozin Propanediol Monohydrate and Telmisartan, which was employed for quantitative analysis, the established method is precise, accurate and specific.

**Keywords:** Dapagliflozin Propanediol Monohydrate, Telmisartan, Absorbance Correction Method, RP-HPLC method.

## A REVIEW OF ANALYTICAL DEVELOPMENT METHODS FOR THE DETERMINATION OF VILDAGLIPTIN

Rasika Purushottam Devale
rasikadevale123@gmail.com

Vildagliptin is an antihyperglycemic agent (anti-diabetic drug) of the new dipeptidyl peptidase-4 (dpp-4) substance category of medicine. Vildagliptin was approved by the USFDA in 2007. Pharmaceutical analysis plays an outstanding conspicuous role in quality assurance similarly to internal control of bulk medication and pharmaceutical formulations. Development of analytical methodologies has therefore emerged as the primary research focus. New drug molecules are being developed and the analysis is also gaining equal importance. A huge survey was conducted for the determination of Vildagliptin from the research articles published in various pharmaceutical and analytical chemistry Journals. Nowadays, Vildagliptin is available in tablet dosage forms. The present article focuses on the different analytical methods for the quantitative estimation of Vildagliptin. The present paper

ISBN: 978-81-980623-8-3

accentuates the review of analytical methods including UV/Vis-Spectroscopy, HPLC, RP-HPLC, HPTLC, GC-MS, etc. which involve the estimation of Vildagliptin in pharmaceutical dosage form. The investigatory review may provide comprehensive details of various analytical techniques and their experimental condition to the researchers who are working in the area of analytical research of Vildagliptin. The present studies revealed that the HPLC method combined with UV spectrophotometric has specific advantages and sensitivity for Vildagliptin analysis in pharmaceutical dosage form and biological matrices.

## COCONUT SHELL ASH: A SUSTAINABLE AND AFFORDABLE SOURCE FOR ALKALINE WATER

Shrushti Shrirao , Dhanashree Tumme
School Of Pharmacy, G H Raisoni University, Saikheda,
Madhya Pradesh, India 480337.
meshrushtishrirao@gmail.com

A research was conducted to examine the origins and the process of preparation of alkaline ionized water and alkaline mineral water. Although water ionizers can be used to produce alkaline ionized water, they are extremely expensive machines, and the mineral makeup of the treated water are also heavily reliant on the quality of the source water. this study concentrated on the effectiveness of utilising coconut shell ash as a new and eco-sustainable source of obtaining alkaline water. It was studied in terms of the properties of physicochemical character and chemical constituents of coconut shell ash in terms of mineral profile and their uses in increasing the pH of water. To test the changes in pH, mineral enrichment, and safety parameters such as a biocompatibility and a toxicity test of minerals, laboratory experiments were carried out. A controlled human trial was also conducted, to identify the therapeutic and pharmacological usefulness of the coconut shell ash-treated alkaline water. There was an improvement in the level of hydration, reduction of gastric acid, and electrolytes balance in participants using treated water. The results confirm the hypothesis that this natural and inexpensive method has the potential to serve as a viable long-term alternative to costly commercial methods of alkaline water production, and also has health-promoting properties, and low environmental impact.

## DEVELOPMENT AND VALIDATION OF UPLC METHOD FOR THE DETERMINATION OF ALPHA LIPOIC ACID IN PHARMACEUTICAL FORMULATION: ADMINISTERED IN THE THERAPEUTIC REGIMEN FOR DIABETIC PERIPHERAL NEUROPATHY

V. Sree Janardhanan, A. Jayanth Kanna, Rashmi D R, Nandini Goudar
School Of Pharmacy, Sri Balaji Vidyapeeth (Deemed To Be University),
Pillayarkuppam, Puducherry,607402
sreejanardhanan@sbvu.ac.in

The goal of the research was to develop a UPLC (Ultra-performance liquid chromatography) method for the determination and validation of Alpha-lipoic acid in API and in pharmaceutical formulation. UPLC is a more advanced technique than HPLC as it offers several advantages making it a better technique in many applications in terms of faster analysis, lower solvent consumption, higher efficiency and much more, so this method was selected. The method was performed using Waters C18 (250×4.6mm,5µ) column using a mobile phase of 0.025M Phosphoric acid and Acetonitrile in the ratio (62:38) at a flow rate of 1ml/min. The injection volume is 20 µL and the detection has been carried out at 274nm by using UV detector. The developed method has been validated as per ICH guidelines (Q2 R1) for Linearity, specificity, precision, accuracy, robustness and system suitability. The method is linear in the drug concentration range of 50-150 µg/ml with a correlation coefficient of 0.9993. The accuracy (recovery) was calculated between 98-102 %. Furthermore, after validating the method and correlating the obtained values with the standard values, satisfactory results were obtained and performed assay. The assay showed consistent retention times, reliable peak performance with a low tailing factor, and excellent precision with % RSD values within limits. It can be concluded that the developed method was simple, precise, accurate, linear and robust for determination of Alpha-lipoic acid in API and in pharmaceutical formulation by UPLC.

**Keywords**: Alpha-lipoic acid; UPLC; Method development; Method validation.

## AN *IN-SILICO* AND *IN-VIVO* APPROACH: ORCHESTRATING FOOD INTAKE AND ENERGY EXPENDITURE BY TARGETING CNOT6L DEADENYLASE USING DARK CHEMICAL MATTER

Ranjani Manjunath, Swapna B, Satvik K G and Rabiya Basra
Department of Pharmacology, Government College of Pharmacy,
Bengaluru, Karnataka, India – 560027.
ranjumanju2707@gmail.com

This study aimed to investigate the potential of Dark Chemical Matter (DCM)-derived novel compounds targeting CNOT6L, a key deadenylase subunit of the CCR4-NOT complex involved in post-transcriptional regulation of metabolic genes such as GDF15 and FGF21. Dysregulation of these regulatory pathways contribute to obesity by affecting energy balance and adipocyte function. To identify selective CNOT6L modulators, 1,20,479 compounds from the Dark Chemical Matter (DCM) library were screened in-silico using molecular docking and pharmacophore modelling. DCM compounds are known for their high selectivity and minimal off-target effects, making them promising candidates for drug discovery. Deep learning models based on Directed Message Passing Neural Networks (D-MPNN) were employed to predict ADMET properties. Molecular dynamics (MD) simulations were conducted to evaluate the binding stability of top ligands. Protein-ligand contact analysis highlighted key residues (Asn412, Glu240, His360, Tyr201 and Phe484). AI-guided screening of DCM ligands identified stable CNOT6L binders with favorable pharmacokinetic properties. Top candidates were subsequently evaluated in-vivo using high-fat diet (HFD) induced obese mouse model. Lead compounds significantly reduced weight and improved energy metabolism in obese mice. These findings establish DCM-derived scaffolds as promising modulators of deadenylase activity for obesity therapy, and a valuable source of novel drug-like molecules.

**Keywords**: Dark Chemical matter (DCM), CNOT6L Deadenylase, Obesity, D-MPNN, AI

**CH-103**

## METHOD DEVELOPMENT, VALIDATION AND FORCED DEGRADATION STUDY OF FLUTICASONE FUROATE AND OXYMETAZOLINE HYDROCHLORIDE USING RP-HPLC

Sakshi Maske, Sakshi Dombe, Sadhana Raut
Department of Pharmaceutical Quality Assurance, Sinhgad College of Pharmacy, Vadgaon Bk., Pune, MS, India- 411041.
Sakshimaske131@gmail.com

Fluticasone furoate and oxymetazoline hydrochloride are widely used in nasal sprays due to their synergistic effect in treating nasal congestion and allergic rhinitis. Fluticasone furoate, a corticosteroid, provides long-lasting anti-inflammatory action, while oxymetazoline hydrochloride, and α-adrenergic agonist, offers rapid vasoconstriction for symptomatic relief. Despite their frequent combination in marketed formulations, no stability-indicating HPLC assay method has been extensively reported for simultaneous estimation. This study aimed to develop and validate a robust reversed-phase high-performance liquid chromatography (RP-HPLC) method for quantitative analysis of both drugs in nasal spray formulations, in accordance with ICH guidelines. Chromatographic separation was achieved on a C18 column using a gradient elution with phosphate buffer and acetonitrile, with detection at 240 nm. Validation demonstrated excellent linearity for fluticasone furoate (5–42 ppm; $r^2$ = 0.9995) and oxymetazoline hydrochloride (10–75 ppm; $r^2$ = 0.9996). Precision results showed %RSD values below 2.0 for system and method precision, while accuracy studies confirmed mean recoveries within 98–102%. Robustness testing indicated the method's reliability against minor variations in chromatographic conditions. Forced degradation studies under acid, base, oxidative, photolytic, thermal, and humidity stress confirmed the method's specificity and stability-indicating nature, with degradants well resolved from analyte peaks. The validated method proved selective, accurate, precise, robust, and suitable for routine

ISBN: 978-81-980623-8-3

quality control and stability assessment of nasal spray formulations containing fluticasone furoate and oxymetazoline hydrochloride.

**Keywords**: Fluticasone Furoate, Oxymetazoline Hydrochloride, Reversed-Phase HPLC, Validation, Forced Degradations

**CH-104**

## NOVEL MANNICH BASE DERIVATIVES: DESIGN, SYNTHESIS, CHARACTERIZATION, AND ASSESSMENT OF ANTIMICROBIAL AND ANTI-INFLAMMATORY ACTIVITIES

Gamini Meenakshi Akshaya sri vishnu priya,
Chandravadivelu Gopi, Magharla Dasaratha Dhanaraju,
Department of Pharmaceutical Chemistry, GIET School of Pharmacy,
Rajamahendravaram-533296, India

The chief purpose of this study was to estimate the microbicidal and anti-inflammatory properties of novel mannich base analogues. These analogues were synthesised by condensation reaction between the active hydrogen donating compounds (phenol, Malonic acid, Acetophenone), guanidine and different aldehydes. The synthesised analogues were characterized by FT-IR, 13C-NMR, 1H-NMR and Mass spectroscopy. Later the estimation of biological activities of these analogues was performed on anti-microbial and anti-inflammatory effects by using disc diffusion, insilico docking method, inhibition of protein denatured and membrane stabilizing activity methods. Each compound was shown admirable anti-microbial activities against E. coli, B. subtilis, A. flavus and A. niger. The anti-inflammatory activity result reveals an excellent effect on inhibition of protein denatured and RBC haemolysis was observed. The results obtained are firmly similar to insilico study results. These values were close to the reference drugs.

**Keywords:** Mannich base derivatives, Anti-microbial, anti-inflammatory activity.

## SIMULTANEOUS HPLC DETERMINATION OF METFORMIN, ALPHA LIPOIC ACID AND DAPAGLIFLOZIN USED IN COMBINED THERAPY FOR TYPE 2 DIABETES

V. Sree Janardhanan, A. Jayanth Kanna, T. Saran, G. Vimal
School Of Pharmacy, Sri Balaji Vidyapeeth (Deemed to Be University),
Pillaiyarkuppam, Puducherry,607402
vsreejana@gmail.com

Metformin (MET), Alpha lipoic acid (ALA) and Dapagliflozin (DAP) is a well-known antidiabetic agents used to control blood glucose levels in type -2 diabetes through different mechanisms. Due to the lack of analytical reports for the simultaneous estimation on Metformin, Alpha lipoic acid and Dapagliflozin in pharmaceuticals, we developed a specific, accurate, precise and reproducible HPLC method and subsequently validated for the simultaneous determination of Metformin, Alpha lipoic acid and Dapagliflozin in commercial tablets with retention time of 3.56 ,7.86 and11.63 respectively. The proposed HPLC method utilizes C18 column (250 mm × 4.6 mm i.d., 5 µm) and mobile phase consisting of methanol-acetonitrile-Potassium dihydrogen phosphate adjusted to pH 3 with ortho phosphoric acid (40:52:8 v/v/v) at a flow rate of 1.00 mL/min. Quantitation was achieved with UV detection at 224 nm. Based on peak area with linear calibration curves at concentration ranges 0.8-1.2µg/ml for metformin, 40-60 µg/ml for alpha lipoic acid and 0.8-1.2µg/mL for dapagliflozin (R2 > 0.993 for all drugs). The method was validated in terms of accuracy, precision, linearity, robustness and there is no interference from the tablet excipients was found. The assay showed consistent retention times, reliable peak performance with a low tailing factor, and excellent precision with % RSD values within limits. Hence, the developed method can be employed for the routine analysis in quality control laboratories.

**Keywords**: Metformin, Alpha lipoic acid, Dapagliflozin; HPLC; Method Validation.

## NANOSYNTHESIS OF SULFONAMIDE AND THEIR ENHANCED ANTIDIABETIC ACTIVITY

Raut Vaidehi Satish, Md.Rayees Ahmad, Gazi Shaikh,
Pathan Muzakkir Nisar Ahmed.
Dept. of Pharmaceutical Chemistry,
RP College of Pharmacy, Alani, Dharashiv, MH,413501
vaidehi.raut03@gmail.com

The advent of nanotechnology has revolutionized the development of sulphonamide-based therapeutics, offering enhanced pharmacological potential. Diabetes mellitus, a major global health concern, is projected to affect over 300 million people by 2025. Traditionally known for their pharmacological properties, sulphonamides have recently gained attention for their antidiabetic activity due to their ability to modulate key enzymes involved in glucose metabolism, such as aldose reductase, carbonic anhydrase, and dipeptidase-4. Nano synthesis enables the fabrication of sulphonamide-loaded nanostructures that improve drug stability, solubility, and targeted delivery. Nanoparticles, liposomes, and polymeric carriers enhance drug absorption and prolong circulation time, thereby increasing therapeutic efficacy. Recent studies have demonstrated that nano synthesized sulphonamides exhibit superior glucose-lowering potential and improved pancreatic β-cell protection compared to conventional forms. Present research investigation focusses on the synthesis and anti-diabetic activity have been successfully carried out and confirmed by HNMR, IR, Mass. This innovative approach not only boosts antidiabetic activity but also minimizes dose-related side effects, presenting a promising platform for future drug development. The integration of nanotechnology into sulphonamide synthesis marks a significant advancement in the treatment of metabolic disorders, particularly diabetes by offering more effective and safer therapeutic options.

**Keywords:** Sulphonamides, Nano synthesis, Antidiabetic Activity, Nanotechnology

## NETWORK PHARMACOLOGY & MOLECULAR DOCKING BASED PREDICTION OF MOLECULAR TARGET AND SIGNALING PATHWAYS OF PIPERINE IN THE TREATMENT OF PD

Mahendra Kumar Sahu[1], Saurabh Shrivastava[1],
Alok Singh Thakur[1], Bina Gidwani[2]
[1]Columbia Institute of Pharmacy, Raipur (C.G.)
[2]Department of Pharmaceutical Chemistry, Shri Shankaracharya College of Pharmaceutical Sciences, Bhilai, Chhattisgarh, India- 490020
[3] Department of Pharmacology, Shri Shankaracharya College of Pharmaceutical Sciences, Shri Shankaracharya Professional University, Bhilai, Chhattisgarh, India- 490020
mahendracolumbia@gmail.com

This study examines the therapeutic potential of Piper nigrum, a traditional medicinal herb, for Parkinson's disease (PD) using an integrated network pharmacology and molecular docking approach. Active compounds of Piper nigrum were identified and screened for bioavailability and drug-likeness to highlight pharmacologically relevant molecules. The overlap between compound-related genes and PD-associated genes revealed key targets, including GAPDH, AKT1, EGFR, and ALB, which are involved in critical pathways such as PI3K-Akt, MAPK signaling, and inflammatory regulation. A network analysis demonstrated that bioactive compounds piperine, quercetin, carvacrol, and nerolidol—exert multi-target effects, modulating several genes and pathways linked to PD pathology. Molecular docking confirmed stable and strong binding interactions between these compounds and target proteins, with binding affinities often exceeding those of standard control drugs. ADMET profiling indicated favorable pharmacokinetic and safety features for these compounds, supporting their potential as therapeutic candidates. Functional enrichment analyses further implicated these targets in neuronal apoptosis regulation, immune response, and dopaminergic synapse function. Notably, piperine demonstrated neuroprotective effects in preclinical models, linked to antioxidant, anti-inflammatory, and autophagy-promoting activities. This study provides a comprehensive bioinformatics foundation that deepens understanding of Piper nigrum's mechanisms in PD treatment and highlights multiple molecular pathways for therapeutic intervention. The findings advocate for further experimental and clinical investigations to validate the efficacy and safety of these natural compounds and accelerate the development of Piper nigrum-based therapies for Parkinson's disease. Ultimately, this work supports the growing interest in natural products as multi-targeted agents in the management of neurodegenerative disorders.

**DEVELOPMENT AND VALIDATION OF A SIMPLE UV SPECTROPHOTOMETRIC METHOD FOR ESTIMATION OF IMEGLIMIN HYDROCHLORIDE**

Punam Raut, Yaminee Sathawane
Anurag College of Pharmacy, Near Bhandara Road Railway Station, Warthi, Tah. Mohadi, Dist. Bhandara-441905 (M.S.), India
punamraut2021@gmail.com

Imeglimin hydrochloride is a recently approved oral drug for type 2 diabetes, and having a reliable, simple, and cost-effective method to measure it is important for quality control. In this study, we developed and validated a straightforward UV spectrophotometric method for its estimation in bulk form. Double distilled water was chosen as the solvent since the drug showed good solubility and reproducibility. Samples in the concentration range of 2.5–15 µg/ml were analyzed using three approaches: absorbance maxima at 239 nm, area under the curve between 232–245 nm, and derivative spectrophotometry. The method was validated according to ICH guidelines. The results demonstrated excellent linearity ($R^2$ = 0.999), recovery values close to 100% (99–101%), and precision within acceptable %RSD limits, confirming accuracy and reproducibility. Overall, the method proved to be simple, rapid, and robust, requiring minimal resources, which makes it particularly suitable for routine quality control testing of Imeglimin hydrochloride in pharmaceutical industries and small-scale laboratories.

**Keywords:** Imeglimin hydrochloride, UV spectrophotometry, Derivative method, Area under curve, Validation

**FABRICATION AND CHARACTERIZATION OF BETA-CYCLODEXTRIN NANOSPONGES LOADED WITH 6-MERCAPTOPURINE**

Krishnapriya E K, Praveen Raj R, Abeena PB
Department of pharmaceutics, St Joseph's College of Pharmacy, Cherthala, Kerala, India -688524
krishnaek789@gmail.com

The present study focuses on the fabrication and characterization of β-cyclodextrin-based nanosponges loaded with 6-mercaptopurine, an anticancer drug widely used in the treatment of leukaemia, autoimmune disorders, inflammatory bowel diseases, and choriocarcinoma. Owing to its poor aqueous solubility, the drug's dissolution rate and stability were targeted for improvement through nanosponge complexation. Nanosponges, being porous, sponge-like nanostructures, provide an efficient matrix for drug entrapment and release. In this work, five nanosponge formulations were prepared by varying the molar ratio of β-cyclodextrin and diphenyl carbonate as cross-linker, followed by drug loading using the freeze-drying method. The formulations were systematically evaluated for percentage yield, entrapment efficiency, solubility, particle size distribution, zeta potential, scanning electron microscopy (SEM), and subjected to *in-vitro* and *in-vivo* studies. SEM analysis confirmed spherical, nanosized particles with a uniform morphology. Solubility studies revealed a marked enhancement in the aqueous solubility of 6-mercaptopurine from the nanosponge formulations compared to the pure drug. Among the prepared formulations, the best candidate was identified based on entrapment efficiency and *in-vitro* dissolution profile, demonstrating significantly improved drug release characteristics. The porous architecture of nanosponges facilitated controlled release of the drug, while the preparation method was reproducible and efficient. Overall, the results establish β-cyclodextrin nanosponges as a safe and effective nanocarrier system for enhancing solubility, dissolution rate, and therapeutic performance of poorly water-soluble drugs such as 6-mercaptopurine, with promising potential for cancer and autoimmune therapy.

**Keywords:** 6-mercaptopurine, β-cyclodextrin, diphenyl carbonate, freeze drying, nanosponges.

**DEVELOPMENT OF BIS-CHALCONE DERIVATIVES: POTENTIAL ANTI-INFLAMMATORY AND ANALGESIC COMPOUNDS**

Bagwan sufiya Firoj, Md. Rayees Ahmad, Nikam Rohini.
Dept. of Pharmaceutical Chemistry,
RP College of Pharmacy, Dharashiv, MH, 413501.
bagwansufiya8@gmail.com

Inflammation is a complex and essential protective response to tissue injury and external stimuli, characterized by the release of mediators such as prostaglandins and leukotrienes, which often induce pain. Chronic inflammation can result in tissue damage and is a contributing factor to various diseases, including arthritis, cardiovascular disorders, neurodegeneration, and cancer. Chalcones are naturally occurring compounds found in citrus fruits and vegetables (such as butein and naringenin). They serve as precursors in the synthesis of various heterocyclic compounds and have been extensively studied for their broad biological activities, notably their anti-inflammatory effects, mediated through inhibition of cyclooxygenase (COX) and lipoxygenase (LOX) pathways. However, bis-chalcone derivatives, which are structural analogues of chalcones, have received less attention, despite emerging evidence indicating their potentially superior anti-inflammatory properties. The increasing demand for novel anti-inflammatory agents in the treatment of conditions such as arthritis and gout has driven research focused on pain and inflammation management. In the present study, novel α, β-unsaturated carbonyl bis-chalcone derivatives were synthesized via Claisen–Schmidt condensation reactions between aromatic aldehydes and ketones. The synthesized compounds were evaluated for their anti-inflammatory and analgesic activities. All compounds exhibited stability and were characterized by UV spectroscopy, thin-layer chromatography (TLC), nuclear magnetic resonance (NMR), mass spectrometry (MS), and elemental analysis.

**Keywords:** α, β-unsaturated carbonyl compound, bis-chalcone, inflammation, analgesic.

**CH-111**

**LC-MS METHOD FOR DETERMINATION OF BARICITINIB IN PLASMA: AND ITS APPLICATION IN A PHARMACOKINETIC STUDY IN RATS**

J. Sunayana, P. Vivek Sagar, J. Swathi
Department of Pharmaceutical Analysis, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana
sunayanajonnalagadda@gmail.com

Baricitinib, is a selective and reversible Janus kinase inhibitor, is commonly used to treat adult patients with moderately to severely active rheumatoid arthritis (RA). A fast, reproducible and sensitive method of liquid chromatography-tandem mass spectrometry (LC-MS/MS) for the quantification of baricitinib in rat plasma has been developed. Irbersartan was used as the internal standard (IS). Baracitinib and IS were extracted from plasma by liquid–liquid extraction using a mixture of n-hexane and dichloromethane (1:1) as extracting agent. Chromatographic separation was performed using Acquity UPLC HILIC BEH 1.7 µm 2.1 × 50 mm column with the mobile phase consisting of 0.1% formic acid in acetonitrile and 20 mM ammoniu acetate (pH 3) (97:3). The electrospray ionization in the positive-mode was used for sample ionization in the multiple reaction monitoring mode. Baricitinib and the IS were quantified using precursor-to-production transitions of m/z 372.15 > 251.24 and 429.69 > 207.35 for baricitinib and IS, respectively. The method was validated according to the recent FDA and EMA guidelines for bioanalytical method validation. The lower limit of quantification was 0.2 ng/mL, whereas the intra-day and inter-day accuracies of quality control (QCs) samples were ranged between 85.31% to 89.97% and 87.50% to 88.33%, respectively. Linearity, recovery, precision, and stability parameters were found to be within the acceptable range. The method was applied successfully applied in pilot pharmacokinetic studies.

**Keywords:** baricitinib, UPLC-MS/MS, pharmacokinetic study, irbersartan

**DEVELOPMENT AND VALIDATION OF QBD APPROACHED ASSAY METHOD FOR PALBOCICLIB BY USING LC-MS/MS**

Daram Sushma Reddy[1], B.M. Gurupadayya[2]
[1]Department of Pharmaceutical Analysis,
[2]Department of Pharmaceutical Chemistry, JSS College of Pharmacy (JSSAHER) Mysore, Karnataka, India - 570029.
Sushmareddy7910@gmail.com

This work presents a simple and fast method for the estimation of Palbociclib by using LC-MS/MS method. Samples were evaluated directly by using C18 Column (150 mm x 4.6 mm ID, 5 µm) by using ACN: Orthophosphoric acid as mobile phase with flow rate 1ml/min. The

ISBN: 978-81-980623-8-3

determination of Palbociclib was carried out at 235nm wavelength. Mass Septroscopy method development was carried out by using Quadrupole Analyzer and Electron Spray Ionizer and the Molecular weight of Palbociclib was found 447.533gm/mole. Established the design space by using QbD software by considering two parameters like pH and Organic Phase. The method was validated according to ICH guidelines with respect to Specificity, Precision (System and Method), Ruggedness, Linearity (R2 =0.999), and Accuracy. All the parameters examined were found to be well within the stated guidelines. The present method can be used for the routine analysis.

**Keywords:** Palbociclib, Liquid Chromatography, Mass Spectroscopy, QbD.

## COMPARATIVE MOLECULAR DOCKING STUDIES OF PHYTOCONSTITUENTS FOR CARISSA CARANDAS FOR ITS LUNG CANCER ACTIVITY

K. S. Salve, Akanksha Patil
PES Modern College of Pharmacy (For Ladies) Moshi,
Pune, Maharashtra, India, 412105
patilketki9@gmail.com

Globally, Lung cancer is a primary cause of Cancer related mortality in both men and women. accounting for 85% of lung cancer cases. Non-Small Cell Lung Cancer (NSCLC) is the most common subtype, for which various therapies and treatments are available, such as chemotherapy, immunotherapy, radiotherapy, targeted therapy etc., but they carry problems like poor *in vivo* stability, off target toxicity and medication resistance. Plant based metabolites have demonstrated high efficacy and low toxicity when used to treat lung cancer. Carissa Carandas is a promising herbal plant with several reported anti-cancer activities. In this study, total twelve phytochemicals from the plant have been screened for their potential activity specifically against three target proteins of NSCLC namely, EGFR inhibitor, ALK inhibitor and KRAS inhibitor using in-silico molecular docking studies. Lorlatinib, a marketed anticancer drug used in NSCLC was taken as standard drug. ADME studies were also applied to find the pharmacokinetic parameters of phytoconstituents using Swiss ADME software. Pharmacokinetic parameters were found to be comparable with standard drug. Molecular docking results were found to be satisfactory. The selected ligands showed good binding affinity with 8A27 and 8ONV with the highest binding score being -9.6 Kcal/mol and -9.9 Kcal/mol respectively for both the receptors

**Keywords**: In lung cancer, Non-Small Cell Lung Cancer (NSCLC), *in-silico* molecular docking, carissa carandas

## METHOD DEVELOPMENT AND VALIDATION FOR SIMULTANEOUS ESTIMATION OF CABOTEGRAVIR AND RILPIVIRINE IN TABLET DOSAGE FORM BY RP- HPLC

Konda Ravi Kumar, P.V.Balaji
Department of Pharmaceutical Analysis, Hetero Institute of Pharmaceutical Sciences, B.Gangaram, Telangana, India. Pin - 507303.
drkondaravikumar@gmail.com

We developed and validated a simple, efficient, and less time-consuming analytical method for simultaneous estimation of Cabotegravir and Rilpivirine in tablet dosage form by RP-HPLC. A simple, rapid, precise, sensitive and reproducible reverse phase high performance liquid chromatography (RP-HPLC) method has been developed for the quantitative analysis of Cabotegravir and Rilpivirine in pharmaceutical dosage form. Chromatographic separation of Cabotegravir and Rilpivirine was achieved on Waters Alliance-e2695, by using Waters XBridge phenyl, 150x4.6mm, 3.5µm column and the mobile phase containing Ammonium formate pH-3.5/formic acid & ACN in the ratio of 70:30% v/v. The flow rate was 1.0 mL/min; detection was carried out by absorption at 269nm using a photodiode array detector at ambient temperature. The number of theoretical plates and tailing factor for Cabotegravir and Rilpivirine were NLT 2000 and should not more than 2 respectively. % Relative standard deviation of peak areas of all measurements always less than 2.0. The proposed method was validated according to ICH guidelines. The method was found to be simple, economical, suitable, precise, accurate & robust method for quantitative analysis of Cabotegravir and Rilpivirine and study of its stability.

**Keywords:** RP-HPLC, Validation, Cabotegravir, Rilpivirine, ICH guidelines

## HPTLC METHOD DEVELOPMENT AND VALIDATION FOR QUANTIFYING MARKER COMPOUND EUGENOL IN AYURVEDIC FORMULATION AYUSH KVATHA CHURNA

Umakant Sahu
University Institute of pharmacy, Pt. R.S.University, Raipur
uksahu28@gmail.com

The SARS-CoV-2 has posed a serious threat to mankind, affecting millions of people worldwide. A traditional Ayurvedic formulation; Ayush Kwath Churna, known for its immunity-boosting properties, has gained attention during the pandemic. However, concerns regarding the adulteration of this formulation have raised significant issues related to its quality, safety, and efficacy. The aim of the present study was to develop a simple, accurate, and sensitive High-Performance Thin-Layer Chromatography (HPTLC) method for the detection and quantification of the marker compound eugenol, an alkaloid, in the Ayurvedic formulation Ayush Kwath Churna for the purpose of standardization. HPTLC study was done with methanolic extraction Ayush Kwath Churna (AKC) using Eugenol as a marker compound. The analysis was carried out on silica gel 60 F254 HPTLC plates using optimized mobile phase; toluene: chlorofom: methnol: formic acid (4:4:1:0.3) v/v/v/v and detection of amount of eugeol was carried out at lambdamax 282 nm. The method was validated by following the ICH guideline Q2 (R1), covering parameters such as linearity, precision, accuracy, limit of detection (LOD), and limit of quantification (LOQ). The calibration curve exhibited linearity in the range of 100–700 ng/spot for Eugenol, with an Rf value of approximately 0.4 ± 0.018. The LOD and LOQ were determined to be 0.13 µg/spot and 0.40 µg/spot, respectively. The method showed high repeatability with relative standard deviations (RSD) less than 2%. Recovery studies demonstrated good accuracy with results of 97.13% recovery. The Rf of marker compound eugenol was observed at 0.4 ± 0.018 and presence of eugenol in ayush kwath churna formulation was qualified at lambdamax 282 nm. This method can be successfully employed for the standardization and quantitative analysis of eugenol in Ayush Kwath Churna. Furthermore, it may assist researchers in elucidating the significant role of eugenol present in the formulation, thereby contributing to the understanding of its therapeutic potential.

**Keywords:** Eugenol, Ayush Kwatha Churna, Quantification, Standardisation, SARS-CoV-2.

**CH-116**

## NOVEL LC-MS/MS METHOD DEVELOPMENT AND VALIDATION FOR SIMULTANEOUS DETERMINATION OF SITAGLIPTIN AND ERTUGLIFLOZIN IN RAT PLASMA AND ITS APPLICATION TO PHARMACOKINETIC STUDY

G. Bhavani
Vijaya Institute of Pharmaceutical Sciences for Women,
Enikepadu, Vijayawada, A.P., India.
bhavanigodavari999@gmail.com

The development of bioanalytical LC-MS/MS method is of paramount important analytical tool of choice for both selective and sensitive detection of compounds of interest in pharmaceutical formulations. To develop a novel, rapid and sensitive LC-MS/MS method for the simultaneous determination of Sitagliptin and Ertugliflozin in rat plasma by liquid-liquid extraction method (LLE) using deuterated Sitagliptin (SGd6) and Ertugliflozin (EGd6). Chromatographic separation was carried out on a reverse phase Waters Xetrra C18 (150mm x 4.6mm, 2µm) column using mixture of acetonitrile and orthophosphoric acid buffer (50:50v/v) at a flow rate of 1ml/min in isocratic mode. Quantification was achieved using an electrospray ion interface operating in positive mode, under multiple reaction monitoring (MRM) conditions. The method showed excellent linearity over the concentration range of 5.00-75.00pg/mL for Sitagliptin and 0.75-11.35pg/mL for Ertugliflozin. The intra-batch and inter-batch precision (%CV) was ≤ 4.3% and matrix effect (%CV) was 0.02% and 0.12% for Sitagliptin at HQC and LQC, respectively. Matrix effect (%CV) was 0.08% and 0.33% for Ertugliflozin at HQC and LQC, respectively. The simplicity of the method allows for application in pharmaceutical laboratories presents a valuable tool for pharmacokinetic studies. The developed assay method has been proficiently applying on pharmacokinetic study in rats subjects.

## SYNTHESIS AND CHARACTERIZATION OF 5-ASA-METHOTREXATE AZO PRODRUG FOR COLON-TARGETED DUAL DRUG DELIVERY

Rajeev Kumar Sharma,GT Kulkarni,Ashok Behera
Faculty of Pharmacy, Mussorie Diversion Road, DIT University,Dehradun,- 248009.
rk.sharma@dituniversity.edu.in

The present study describes the design and synthesis of a colon-targeted drug delivery system employing an azo-based prodrug strategy to achieve site-specific release of two active pharmaceutical ingredients (APIs) while ensuring stability in gastric and intestinal fluids. Methotrexate (MTX), a folate antagonist and established chemotherapeutic agent in colorectal cancer, was selected in combination with 5-aminosalicylic acid (5-ASA), a first-line therapeutic agent for ulcerative colitis. 5-ASA was diazotized in concentrated hydrochloric acid at 0–5 °C using sodium nitrite, and the resulting diazonium salt was coupled with methotrexate under mild alkaline conditions. The reaction mixture was stirred for 24 hrs and monitored by TLC with a hexane: ethyl acetate: methanol: water system (1:3:2:4), while the starch–iodide test confirmed excess nitrite. The crude product was recrystallized with ethanol to yield a yellow azo adduct (45%) with a melting point of 320 °C, Rf value of 0.53, solubility in phosphate buffer (pH 7.4), and insolubility in dilute HCl. Structural characterization by IR, NMR, Mass, and UV spectroscopy confirmed the azo linkage (–N=N–) with a characteristic IR band at 1593 $cm^{-1}$. *In-vitro* release studies using rat fecal material in phosphate buffer (pH 7.4) demonstrated colon specificity, with methotrexate and 5-ASA released at approximately 59.64% and 57.34%, respectively, after 30 min. No acute toxic effects were observed in animals. The synthesized 5-ASA–methotrexate azo adduct shows promise as a colon-specific prodrug for dual-drug delivery, offering improved therapeutic efficacy, dose reduction, minimized adverse effects, and better patient compliance.

**Keywords:** Azo prodrug, 5-ASA–methotrexate adduct, azo reductase, dual-drug therapy, colonic disorders

## METHOD DEVELOPMENT AND VALIDATION FOR SIMULTANEOUS ESTIMATION OF CLOBETASOL PROPIONATE AND SALICYLIC ACID BY RP-HPLC

Puja Onkar Katre
Pharmaceutical Quality Assurance in the Faculty of Science and Technology, Alard University, Pune.
katrepuja58@gmail.com

A rapid, accurate, and precise reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed and validated for the simultaneous estimation of Clobetasol Propionate and Salicylic Acid in pharmaceutical formulations. The chromatographic separation was achieved using a C18 column with a suitable mobile phase consisting of e.g., Acetonitrile: Sodium Dihydrogen Phosphate], adjusted to a pH of [7.3], at a flow rate of e.g. 1.0 mL/min] Detection was carried out at a wavelength of e.g. 254 nm], with retention times for Clobetasol propionate and Salicylic acid observed at [4.4 min and 2.3 min] respectively. The method was validated as per ICH guidelines for parameters including specificity, linearity, accuracy, precision, limit of detection (LOD), limit of quantification (LOQ), and robustness. The calibration curves for both drugs showed excellent linearity over the concentration ranges of [insert concentration range] with correlation coefficients ($r^2$) greater than 0.999. Recovery studies confirmed the accuracy of the method, with recoveries within acceptable limits. The method demonstrated good precision with %RSD values below 2% . This validated RP-HPLC method is suitable for routine quality control analysis of Clobetasol propionate and Salicylic acid in combined dosage forms, ensuring reliable and efficient quantification in pharmaceutical industries. A neutral pH works well for both acidic and basic compounds analytes remain chemically stable at neutral pH, preventing degradation. Objectives include drug characterization, method development, validation as per ICH guidelines, and greenness assessment using AGREE and BAGI tools. The need arises from limitations of existing methods with high retention times, highlighting the requirement for a simpler, accurate, cost-effective, and eco-friendly approach. This validated RP-HPLC method is suitable for routine quality control analysis of Clobetasol propionate and Salicylic acid in combined dosage forms, ensuring reliable and efficient quantification in pharmaceutical industries.

**Keywords:** RP-HPLC, Clobetasol Propionate, Salicylic Acid, ICH Guidelines, Analytical Method.

## METHOD DEVELOPMENT AND VALIDATION FOR THE ESTIMATION OF TENELIGLIPTIN IN TABLET DOSAGE FORM BY RP- UPLC

M. Ramya Sri, Raikot Vaishali, Vivek Sagar. P
Sarojini Naidu Vanita Pharmacy Maha Vidyalaya
banoththarun799@gmail.com

A novel, simple, precise, and accurate analytical method for the estimation of Teneligliptin in a tablet dosage form was developed and validated using a Reverse-Phase Chromatographic Technique with Ultra-High Performance Liquid Chromatography (UHPLC). The method utilized a Phenomenex Luna C-18 (50 mm x 3.0 mm, 3µm) column with a mobile phase consisting of Buffer and Acetonitrile in a 50:50 ratio at a flow rate of 0.5 ml/min. Detection was performed at 245 nm. The optimized method yielded a sharp peak for Teneligliptin with a retention time of 1.02 minutes and a theoretical plate count of approximately 2100. The method demonstrated excellent linearity in the range of 50% to 150% of the target concentration. The proposed method was validated for several parameters, including system suitability, linearity, precision, accuracy, specificity, robustness, and ruggedness. The results confirmed that the method is specific, with no interference from the placebo, and is highly robust and rugged. The percentage recovery studies were within acceptable limits, indicating the high accuracy of the method. These findings suggest the developed UHPLC method is suitable for the routine and reliable estimation of Teneligliptin in pharmaceutical dosage forms.

**Keywords:** UPLC, Method Development, Teneligliptin

## SYSTEMIC OPTIMIZATION AND VALIDATION OF RP-HPLC METHOD FOR THE ESTIMATION OF RITONAVIR FROM HYBRID POLYMERIC NANOPARTICLES IN RAT PLASMA

Salamath Nisa B, Vijayaraj S
Department of Pharmaceutical Chemistry and Analysis, Dr.Kalam College of Pharmacy, Avanam, Thanjavur, Tamil Nadu, India-614623.
salamathnisab7@gmail.com

Hybrid polymeric materials have been in research focus owing to their outstanding progression in drug targeting. A new Quality by Design approach by RP-HPLC was developed and validated to estimate the hybrid polymeric nanoparticles of Ritonavir in rat plasma. The main objective of the present study was to develop and validate a simple, robust, and accurate method for the detection of hybrid polymeric nanoparticles of Ritonavir in plasma. The mobile phase consisting of a mixture of Acetonitrile: HPLC grade water (60:40 v/v), 1.0 ml/min flow rate and UV detection at 240 nm. Critical Analytical Attributes (CAAs) were screened and selected by Taguchi orthogonal array model. Box-Behnken's three-level, the 3- factorial design, was employed to create and analyze a "Design Space" (DoE). This design was statistically analyzed by ANOVA, contour-plot, and 3D response surfaces plots, confirming its significance. The developed method was validated as per the ICH guidelines Q2 (R1). It showed excellent linearity between 100 and 600 ng/mL with good regression (R2>0.998), LOD (10 ng/mL) and LOQ (30 ng/mL). The validation results of the tested parameters were found within the acceptable limit. From the study, it was concluded that QbD driven bioanalytical method is suitable for the *in-vitro* and *in-vivo* estimation of Ritonavir from bulk as well as from hybrid polymeric nanoparticles formulation.

**Keywords:** Design of Experiments (DoE), hybrid polymeric nanoparticles, RP-HPLC Method, Ritonavir, rat plasma.

## IMPURITY GENERATION AND PREVENTION IN INVESTIGATION AND MITIGATION STRATEGIES IN RAMIPRIL

Sadanand G. Chauhan, Nikita D. Rahangdale,
Krishna R. Gupta, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur-441002
sadanandchauhan321@gmail.com

ISBN: 978-81-980623-8-3

Impurity profiling is a crucial aspect in safeguarding the safety, stability, and therapeutic performance of Active Pharmaceutical Ingredients (APIs). The present study emphasizes impurity assessment through systematic forced degradation and drug–excipient compatibility investigations. Stress degradation experiments were performed under acidic, alkaline, and oxidative conditions at elevated temperatures (40°C and 60°C) to identify possible degradation pathways. A precise and validated Reverse Phase–High Performance Liquid Chromatography (RP-HPLC) method was developed for simultaneous quantification of the API and its degradation products, employing an optimized mobile phase of acetonitrile and water (70:30, v/v), which enabled effective separation. Compatibility studies carried out using HPLC and FTIR revealed potential interactions with certain excipients, particularly lactose monohydrate, suggesting the likelihood of Maillard-type reactions. The findings highlight the importance of strict impurity control, rational excipient selection, and advanced analytical method development in achieving a stable and safe pharmaceutical formulation. This work provides essential insights to support impurity prevention and management strategies in pharmaceutical product development.

**Keywords:** Impurity profiling, forced degradation, Drug–excipient compatibility, RP-HPLC method validation, Degradation products, Maillard reaction, pharmaceutical formulation development.

## NETWORK MODELLING AND COMPUTATIONAL INSIGHTS OF THE PHYTOCHEMICALS FROM CLERODENDRUM INERME L. AGAINST PROSTATE CANCER

Lekhashree Kirubanandan, Praveen Sekar, Senthil Kumar Raju
Department of Pharmaceutical Chemistry, Swamy Vivekanandha College of Pharmacy, Tiruchengode, Namakkal,
Tamil Nadu, India – 637205.
lekhagopika1716@gmail.com

Prostate cancer is the world's second most common cancer among men. It accounts for approximately 14.2% of new cancer cases in men, with an age-adjusted incidence rate of 29.4 per 100,000 population. Clerodendrum inerme L. is a medicinal plant with wide therapeutic applications. It contains cardiac glycosides, anthraquinones, phenolics, flavonoids, saponins, tannins, terpenes, steroids, carbohydrates, volatile oils and lignin. In this current research, we examined the efficiency of bioactives of this plant against prostate cancer using a network pharmacology approach. The phytochemicals were retrieved from IMPPAT, Coconut database, Phytohub version 1.4, Medicinal Plants database, The Natural Products Atlas, Dr. Duke's Phytochemical and Ethnobotanical database and KNApSAcK Core system databases. The physicochemical, pharmacokinetic and toxicity profile of the retrieved phytochemicals were predicted by SwissADME, ProTox 3.0 and CardioTOXCSM webservers. The drug score was predicted using OSIRIS Property Explorer and the findings showed the druggable nature of the compounds. The appropriate targets of the phytochemicals were predicted by the network modelling and enrichment analyses, which merely showed that they will be highly active against prostate cancer, i.e., EGFR, AKT1, ESR1, PIK3R1 and SRC. The molecular docking against the predicted targets using Autodock tools was performed and compared with the co-crystallized ligand and standard. Owing to the various computational studies and drug scores, the findings revealed that the compounds Acacetin, Apigenin, Diosmetin, Glutinol, Salvigenin and Tricin were highly active with better binding energies and interaction profiles against the tested targets. Thus, these compounds can be used in prostate cancer management. However, *in vitro* and *in vivo* studies are warranted.

**Keywords:** Prostate Cancer, Clerodendrum inerme L., Computational studies, Network Pharmacology, Molecular docking

## MOLECULAR DOCKING, SYNTHESIS AND BIOLOGICAL EVALUATION OF NEW BENZIMIDAZOLE-PYRIDINE DERIVATIVES AS POTENTIAL AROMATASE INHIBITOR FOR THE TREATMENT OF CANCER

Nusrat B. Sayyad, Nitin S. Bhajipale, Prafulla M. Sabale
SGSPS Institute of pharmacy, Kaulkhed, Akola Maharashtra India
nusratsayyad11@gmail.com

Cancer is one of the major global concerns for human health, with its incidence rising due to a variety of factors, Cancer is a leading cause of death worldwide. In 2020, WHO reports estimated 10 million cancer deaths, accounting for nearly one in six deaths globally. The most common cancers are breast, lung, colon and rectum, and prostate cancers. While the therapeutic landscape for cancer treatment has improved significantly in recent decades, there are still several challenges in this area, including the lack of response of some tumor types, resistance to current drugs, and high toxicity to normal cells.This study describes the synthesis of N5-(4-(1H-benzo[d]imidazol-2-yl)phenyl)-N2-phenylpyridine-2,5-diamine derivatives from Orthophenylenediamine (1) and 4-aminobenzoic acid (2) and all the synthesized chemical moieties screened against a panel of cancer cell lines resulted in the identification compound 6a with good anti-cancer potential and a GI50 of 2.95 µM, 3.35 µM, 2.27 µM, 8.46 nM and 1.56 µM against MDAMB-231, MCF-7, A-549, NCI-H23 and A-498 respectively. As the second greatest cause of death globally, cancer continues to pose a serious threat to public health. An essential enzyme called aromatase catalyses the last, rate-limiting step in the production of oestrogens. As a well-researched endocrine therapeutic strategy, aromatase inhibitors (AIs) efficiently block the production of oestrogen, which is necessary for aromatase activity.

**Keywords:** Aromatase · Benzimidazole · Pyridine · Anti-cancer ·Estrogen biosynthesis.

## STABILITY INDICATING METHOD DEVELOPMENT AND VALIDATION OF LORCASERIN HYDROCHLORIDE BY RP-HPLC

Swati Priya Nayak, Pragati Ranjan Satpathy,
Nilima Shukla, Mihir Kumar Kar
Sri Jayadev College of Pharmaceutical Sciences
pharm.prsatpathy@gmail.com

Lorcaserin hydrochloride is a selective serotonin 2C receptor agonist approved for chronic weight management. Stability-indicating analytical methods are critical for regulatory compliance and quality assurance because they allow you to accurately quantify the drug in the presence of degradation products. Develop and validate a simple, precise, accurate, and stable RP-HPLC method for estimating Lorcaserin hydrochloride in bulk and tablet dosage forms. The method was developed using a symmetry ODS (C18) RP Column (250 mm x 4.6 mm, 5µm) with a mobile phase of Phosphate Buffer (0.02M): Acetonitrile = 60:40 v/v (pH-2.8) at a flow rate of 1.0 mL/min. Detection was carried out at 225 nm using a UV detector. Forced degradation studies (acidic, alkaline, oxidative, photolytic, and thermal) were performed as per ICH guidelines to assess method specificity. The method was validated for linearity, precision, accuracy, robustness, LOD, and LOQ according to ICH Q2 (R1). Lorcaserin hydrochloride showed linearity in the concentration range of 10–50 µg/mL ($R^2$ = 0.999). The method demonstrated recovery in the range of 99.5–101.5%, intra-day and inter-day %RSD < 2%, and LOD/LOQ values of 0.07 µg/mL and 0.21 µg/mL respectively. Forced degradation confirmed the method's ability to separate drug peaks from degradation products, ensuring specificity. The developed RP-HPLC method is simple, accurate, precise, and indicates stability, making it appropriate for routine quality control and stability testing of Lorcaserin hydrochloride in pharmaceutical formulations.

**Keywords**: Lorcaserin hydrochloride, Stability indicating method, RP-HPLC, Method validation, ICH guidelines

**CH-125**

## *IN SILICO* ANALYSIS OF TRIAZOLE DERIVATIVES AS POTENTIAL PARP-1 INHIBITORS FOR CANCER THERAPY

[1]Balachandran Hardha, [1]Byran Gowramma
[1]Department of Pharmaceutical Chemistry, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty, Nilgiris,
Tamil Nadu, India 643001
hardhajss2024@gmail.com

PARP-1, a key enzyme in DNA repair, plays a crucial role in treating BRCA-mutated cancers through its inhibition. Triazole derivatives demonstrate significant anticancer potential, and *in silico* methods offer cost-effective insights into their efficacy as PARP-1 inhibitors, advancing drug discovery. This study aims to accelerate the drug discovery process by identifying potent PARP-1 inhibitors through molecular docking and ADMET analysis. A library of approximately 240 1,3,4-triazole derivatives was designed using diverse aldehydes. Molecular docking studies with the

ISBN: 978-81-980623-8-3

4ZZZ.pdb structure identified the top 10 compounds with high binding affinities. These compounds were then assessed through ADMET profiling and MM-GBSA analysis for further validation. Molecular docking identified 10 triazole derivatives with high binding affinities to PARP-1 (PDB ID: 4ZZZ), with scores ranging from -5.5 to -9.2 kcal/mol. ADMET analysis revealed favourable pharmacokinetic properties, including high absorption, low toxicity, and good metabolic stability. MM-GBSA calculations showed binding free energies between -45 and -65 kcal/mol, confirming strong interactions with the PARP-1 active site. Molecular dynamics simulations further validated the stability of the protein-ligand complexes. These findings suggest that the top compounds are promising PARP-1 inhibitors for cancer therapy. The identified inhibitors, showing potential as PARP inhibitors, provide a foundation for further validation and contribute to advancements in targeted cancer therapies through computational drug discovery approaches.

**Keywords:** Triazole derivatives, PARP-1 inhibitors, Molecular docking, Binding affinity, MM-GBSA, Cancer Therapy.

## FORMULATION AND SIMULTANEOUS ESTIMATION OF ATORVASTATIN AND ATENOLOL BY STABILITY INDICATING RP-HPLC METHOD

**BANDHAVYA H D[1], CHALUVARAJU K C[2]**

[1] Department of Pharmaceutical Chemistry, Visveswarapura institute of pharmaceutical sciences, Bengaluru, Karnataka, India

[2]Department of Pharmaceutical Chemistry, Government College of Pharmacy, Bengaluru, Karnataka, India

chaluvarajukc@gmail.com

This study aimed to formulate bilayer tablet and to develop stability indicating RP-HPLC method for simultaneous estimation of Atorvastatin and Atenolol in bulk and formulation. Atorvastatin is used to treat hyperlipidemia and it is a lipid-regulating HMG CO-A inhibitor, Atenolol is a beta blocker. Bilayer tablets were formulated where, Atorvastatin was in immediate release layer and Atenolol was in sustained release layer. Pre-formulation and post-formulation studies were carried out for all six formulations. RP-HPLC technique is used to estimate Atorvastatin and Atenolol using Waters (SunFire C18 Column, 100Å, 5 µm, 4.6 mm X 250 mm) column. Mobile phase selected was Phosphate Buffer: Acetonitrile: Methanol (35:5:60 v/v) with the flow rate of 1.2 ml/min and 10µl injection volume. Retention time was detected to be 6.539 for Atorvastatin and 3.731 for Atenolol with PDA detector. Validation for both the drugs was carried our according to ICH guidelines. Forced degradation for both the drugs was conducted with RP-HPLC. This currently developed method can be applied at industrial and research laboratories for effective and reproducible simultaneous estimation of Atorvastatin and Atenolol in bilayer tablet dosage form for their day-to-day regular analysis.

Nagpur, Maharashtra-441002

psmore1203@gmail.com

Ion chromatography (IC) application, an analytical method that separates and quantifies ionic species based on their interaction with a resin-packed column under controlled eluent conditions. This study focuses on the quantitative detection of nitrate and nitrite in microcrystalline cellulose. A thorough sample preparation procedure was developed, which included centrifugation, filtration using 0.22 µm nylon syringe filters, aqueous extraction using Milli-Q water, and homogenization. A linear concentration range of 5-100 µg/L was covered by the carefully prepared calibration standards, which were made from certified stock solutions of nitrate and nitrite. The chromatographic separation, which was performed in isocratic mode with a mobile phase of 20 mM NaOH at a flow rate of 1.0 mL/min, was performed using a DIONEX IonPac AS19 analytical column and a corresponding AG19 guard column. A DIONEX ASRS 300 suppressor facilitated detection with a 50-mA current. The method's validation revealed good linearity (R2=0.99957-1), acceptable limits of detection (LOD 1.67 µg/L, LOQ: 5 µg/L), high recovery (91.54%-94.28%), and good repeatability (RSDr: 13.75%) and reproducibility (RSD: 13%). Internal Quality Control (IQC) characteristics that satisfied the established acceptance criteria guaranteed the method's dependability. The extended measurement uncertainty at 50 µg/kg was calculated to be between 6.89 and 7.769 µg/kg. Overall, the validated IC method provides a sensitive, accurate, and reliable approach for routine monitoring of nitrate and nitrite in pharmaceutical excipients.

## SEPARATION AND QUANTIFICATION OF PHENAZOPYRIDINE HYDROCHLORIDE USED IN GENITO - URINARY THERAPY AND ITS IMPURITIES: OPTIMIZATION OF CHROMATOGRAPHIC SYSTEM EMPLOYING CENTRAL COMPOSITE DESIGN.

Ganna Anitha[1], V. Sree Janardhanan[2]

Department of Pharmaceutical Chemistry, Shri Venkateshwara College of Pharmacy, Ariyur, Puducherry- 605 102, India

anitha.royal@gmail.com

A new RP-HPLC method for simultaneous determination of Phenazopyridine HCl (PZP); along with its three impurities namely 2,6-diamino-5-phenyl-3-phenazopyridine (Imp A); 3,5-bis(phenylazo)-2,6-diaminopyridine (Imp B); and 2,6 – Diaminopyridine (Imp C) was developed. The method was developed using Thermo Hypersil C18 column in Shimadzu HPLC system (Tokyo, Japan) with LC10AD and LC10 ADvp with UV detector (SPD-10A). The mobile phase comprising of Acetonitrile (ACN): 10 mM Potassium di-hydrogen Ortho-Phosphate (60:40) delivered at a flow rate of 1 mL min-1 and monitored at a wave length of 254nm. The method developed was optimized using a chemometric tool, Central Composite design, to optimize the factors (ACN, Buffer concentration and Flow rate) effecting and interacting with the responses (tf1, Rs2,1 and tR4). The analysis time is 12.8 (<13 min). The method developed was validated according to ICH Q3A(R2) guidelines and confirmed the linearity, accuracy, precision and specificity. The LOD and LOQ were found to be 1.822 and 5.521 ng/mL for PZP; 1.380 and 4.1823ng/mL for Imp A; 0.973 and 2.95 ng/mL for Imp B; 2.346 and 7.11 ng/mL for Imp C; The method developed is of high sensitive of detecting 0.01% traces of impurities and aptness of the method was recognized by applying to assay the commercially available formulation Pyridium 200mg, confirmed applicability for routine analysis.

**Keywords:** HPLC, CCD, Phenazopyridine HCl, 2,6 – Diaminopyridine,2,6-diamino-5-phenyl-3-phenazopyridine,3,5-bisphenylazo)-2,6-diaminopyridine.

[2]Department of Pharmacognosy

Moulana College of Pharmacy, Perinthalmanna, Kerala-679322

The aim of this study was to identity the metabolites that is produced by converting D-limonene to bioactive metabolites by Aspergillus niger and Aspergillus fumigates. To 250 ml of conical flask containing 50 ml of full growth of culture (Aspergillus niger and Aspergillus fumigates), D-limonene (1%v/v) was added as a substrate by using sterile technique. The flasks were incubated in a dark room at 25°C in an incubator shaker (120 rpm) for 5 days. By centrifugation the extraction of bio transformed product of D-limonene was obtained (12800 rpm at 5oc, 10min). The supernatant was extracted with ethyl acetate (3x25ml). The solvent was removed under reduced pressure to obtain crude reaction product. Gas chromatography-Mass spectroscopy is used to identify metabolites. For the first time, α-terpineol and neodihydrocarveol (Aspergillus niger) have been reported as biotransformed products of d-limonene. Trans-p-mentha 2, 8 dienol, trans-p-2, 8 menthadien-1-ol, 4-piperidinemethamine, and dihydrocarveol have been identified as the D-

ISBN: 978-81-980623-8-3

limonene metabolites (Aspergillus fumigates). D-limonene was transformed into a number of significant molecules with applications in pharmacology and medicine. However, more research is required to determine the pharmacological activity of biotransformed compounds as well as to separate and purify the isolated biotransformed products.

**Keywords:** Biotransformation, D-Limonene, metabolites, GC-MS, Aspergillus niger, Aspergillus fumigates.

Nanotechnologies exhibit significant potential in the field of medicine, including in imaging techniques and diagnostic tools, implants, tissue-engineered constructs. Nanoparticles are involved in the targeted drug delivery system, where the medicament is selectively targeted or delivered only to its site of action. Albumin protein found in human blood has no immunogenicity as an endogenous protein and ensure its biocompatibility for albumin-based nanoparticles. The present study reports the green synthesis of Bovine serum albumin (BSA), Conjugated silver nanoparticles (SNPs) using aqueous leaf extract of Jatropha glandulifera roxb with silver nitrate solution as an antiseptic and cauterizing agent, where albumin solution as a plasma volume expander and oncotic agent. For this purpose, SNPs are prepared by the bio reduction method and allowed to interact with the native BSA to form protein-conjugated nanoparticles. Specifically, they are a type of metal-based nanoparticle. The synthesized BSA conjugated SNPs were analyzed through UV-Visible, FT-IR spectroscopy, NMR and FESEM. They were spherical in shape with an average size of 50-90 nm. Different *in-vitro* antimicrobial activities of the synthesized Nano composites of Jatropha glandulifera were carried out. The diameter of inhibition zones around the disc of two gram positive and one-gram negative bacterial strains viz Staphylococcus aureus, Bacillus subtilis, Escherichia coli. and antifungal activity of candida vulgaris has highest antimicrobial activity. It is concluded that the green synthesis of BSA conjugated SNPs creates a stabilized Nano bio- conjugate which has high plasma protein binding capacity that shows maximal bioavailability with minimal concentration without any side effect.

**Keywords:** Silver nanoparticles, bovine serum albumin, Jatropha glandulifera roxb, UV; FT-IR; NMR; FESEM, antimicrobial activity.

Pyrazolinyl coumarins are an important class in heterocyclic and medicinal chemistry because of their various pharmacological benefits. Pyrazoles have a five-membered ring with two adjacent nitrogen atoms and are known for their analgesic, anti-inflammatory, antiarthritic, cytotoxic, and antiproliferative properties. Coumarins, meanwhile, are recognized for their anti-HIV, antituberculosis, anticancer, antioxidant, and anti-inflammatory effects. Combining a pyrazole core with a coumarin structure is expected to create synergistic effects, improving potency beyond what each part can achieve alone. In this study, we synthesized 8-pyrazolinyl coumarin derivatives by refluxing hydrazine hydrate with an intermediate made from condensing 8-acetyl-7-hydroxycoumarin and various aromatic aldehydes. The target compounds, known as 7-hydroxy-4-methyl-8-(substituted phenyl-4,5-dihydro-1H-pyrazol-3-yl)-2H-1-benzopyran-2-one derivatives, were tested for their biological potential. Previous studies show these derivatives as promising agents against cancer, fungi, and bacteria. Additionally, activity prediction using PASS online software suggested significant probabilities (Pa ~0.7) for these biological effects. We also screened all synthesized compounds for drug-likeness using Lipinski's rule of five and conducted molecular docking studies to evaluate their anticancer potential. Derivatives that achieved the highest docking scores underwent experimental validation through trypan blue staining assays. The results indicate that 8-pyrazolinyl coumarins could serve as a promising framework for developing new bioactive agents with improved therapeutic effects and fewer side effects.

**Keywords**: 8-Pyrazolinyl coumarin, 8-acetyl-7-hydroxycoumarin, PASS, Lipinski, Anti-cancer

**EVALUATION OF GENOTOXIC POTENTIAL OF IMPURITIES IN AN ANTINEOPLASTIC CHEMOTHERAPEUTIC AGENT**

Subhashis Debnath, Santanu Mallik
Bharat Pharmaceutical Technology, Amtali, Agartala, West Tripura, India-799130.
santanumallikbpt@gmail.com

Genotoxicity refers to the ability of chemical agents to damage cellular genetic material, potentially leading to mutations. Understanding genotoxicity is increasingly important in genetics, where it helps reveal how DNA damage occurs, how cells repair such damage, and how mutations influence health and disease. Both *in vitro* and *in vivo* genotoxicity studies are essential for identifying the harmful effects of chemical compounds and understanding their impact on genome stability. These studies also have future applications in areas like gene therapy, mutation modelling, and precision medicine. Regulatory bodies such as the FDA and EMA currently monitor genotoxic impurities in pharmaceuticals, highlighting the need for stringent evaluation to protect genetic integrity in therapeutic contexts. Several assays are used to assess genotoxicity, including the Ames test, the Screen test, and Potato disk test. The Ames test, standardized by OECD, is one of the most widely used methods. It employs strains of Salmonella typhimurium to detect mutations induced by chemical exposure, serving as a key tool in evaluating mutagenic potential. A recent study using the Ames test demonstrated the mutagenicity of cytosine, a process impurity found in gemcitabine hydrochloride, a chemotherapeutic agent. Such findings not only support drug safety but also contribute to broader genetic research by identifying mutation-inducing agents and potential genetic vulnerabilities. As genetics continues to advance, genotoxicity testing will play a growing role in guiding safe drug development, understanding mutation-driven diseases, and advancing personalized medicine.

**Keywords:** Genotoxicity, Mutagenicity, Ames Test, Genetic Integrity

Krishnanabinaya23@gmail.com

Atherosclerosis is a chronic inflammatory and metabolic disorder characterized by progressive arterial narrowing due to lipid deposition and plaque formation, leading to vascular dysfunction and increased cardiovascular risk. Targeting molecular regulators such as cholesteryl ester transfer protein (CETP), adenosine monophosphate-activated protein kinase (AMPK), and tumor necrosis factor (TNF) represents a key therapeutic strategy. Allicin, a sulfur-containing bioactive compound derived from Allium sativum, exhibits lipid-lowering, antihypertensive, and anti-inflammatory properties, thereby offering potential as a natural therapeutic candidate. This study investigated into the pharmacological significance of allicin in treating atherosclerosis using *in silico* techniques. The SwissADME model for pharmacokinetic profiling validated satisfactory ADME characteristics, while ZINCPharmer for pharmacophore modeling enabled structural analysis. Molecular docking studies performed with AutoDock Vina demonstrated strong binding affinities of -6.2, -6.5, and -6.1 kcal/mol for CETP, AMPK, and TNF respectively, these results suggesting that effective modulation of lipid metabolism and inflammatory cascades. Toxicity prediction using ProTox-II indicated a favorable safety profile with minimal toxicological risks. Collectively, these computational findings highlight allicin as a promising natural lead compound for the therapeutic management of

ISBN: 978-81-980623-8-3

atherosclerosis. However, further *in vitro* and *in vivo* studies are required to validate its efficacy and pharmacological potential.

**Keywords:** Allicin, Atherosclerosis, Molecular docking, CETP, AMPK.

Heterocyclic compounds with benzo fused nitrogen have been shown to exhibit anticancer action. Researchers have identified a number of heterocyclic derivatives containing nitrogen that have been shown to have anticancer properties in earlier studies. In order to develop more effective anticancer compound, 116 novel N-(substitutedphenyl)-2-(3-(4-hydroxy/methoxy-1-methyl/phenyl -2-oxo-1,2-dihydroquinolin-3-yl) -5-phenyl-4,5-dihydro-1H-pyrazol-1-yl) acetamide molecules were created. *In silico* tests, including molecular docking, ADME, and toxicity were conducted using Schrodinger (2024, 3.0), SwissADME, and ProTox-3.0, respectively, to verify their efficacy. All designed derivates on molecular docking with Epidermal Growth Factor Receptor tyrosine kinase domain with 4-anilinoquinazoline inhibitor erlotinib (PDB ID: 1m17) and AZD9291 complex with wild type EGFR (PDB ID: 4ZAU) were found to have promising docking score. Compared to regular bosutinib and doxorubicin, the majority of the developed compounds had superior docking findings. All compounds had a good ADME profile. Amongst all the designed derivatives, best 12 compounds were selected for further synthesis and were characterised using IR, 1H NMR, 13C NMR and mass spectroscopy.

**Keywords:** Anticancer, molecular docking, ADME, toxicity, characterisation.

## DIETARY BIOACTIVE ARACHIDONIC ACID TARGETS NF-KB: MOLECULAR DOCKING STUDY FOR NEURODEGENERATIVE DISEASE MODULATION

S Akash, P.Natarajan
Department of Pharmacology
Sankaralingam bhuvaneswari college of pharmacy, Sivakasi-626130

Arachidonic acid, a polyunsaturated fatty acid commonly found in fish, meat, and eggs, plays a crucial role in inflammatory signaling. Its dysregulation has been implicated in the activation of nuclear factor kappa B (NF-κB), a transcription factor strongly associated with neuroinflammation and the progression of neurodegenerative disorders. This study aimed to explore the molecular binding interactions of arachidonic acid with NF-κB using molecular docking and interaction mapping, thereby elucidating its potential role in modulating neuroinflammatory pathways. Structure-based molecular docking was employed to evaluate the binding affinity of arachidonic acid with NF-κB, and 2D interaction diagrams were generated to identify key amino acid residues contributing to the ligand–protein complex stability. Arachidonic acid exhibited a strong binding affinity towards NF-κB with a docking score of –7.56 kcal/mol, indicating stable interactions. The 2D interaction analysis revealed that amino acid residues such as GLY-64, VAL-62, PHE-82, LEU-100, LEU-104, LEU-112, LEU-118, and VAL-116 were involved in hydrophobic and hydrogen-bond interactions, thereby stabilizing the complex. These interactions highlight the critical role of hydrophobic residues in the binding mechanism and potential inhibitory modulation of NF-κB signaling. The findings suggest that arachidonic acid, a dietary bioactive compound, can effectively interact with NF-κB and may influence its regulatory role in neuroinflammatory processes. This supports its potential relevance in the prevention or management of neurodegenerative diseases. However, further *in vitro* and *in vivo* studies are necessary to validate these computational insights.

**Keywords:** Arachidonic acid, NF-κB, neurodegenerative diseases, molecular docking, amino acid interactions, neuroinflammation.

## OPTIMIZED METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF PARACETAMOL AND NEFOPAM HCL BY HPLC USING CENTRAL COMPOSITE DESIGN

Sudha T, Dinesh K S
Department of Pharmaceutical Chemistry and Analysis,
School of Pharmaceutical Sciences,
Vels Institute of Science, Technology and Advanced Studies, Chennai.
ksdinesh511@gmail.com

Optimization for the estimation of drug combinations by HPLC is essential and superior in terms of efficient, cost, accuracy and regulatory compliance comparing normal method development making it high quality pharmaceutical analysis. Optimization by Central Composite Design is highly significant due to its advanced and systematic approach of multiple variables evaluation and their interaction providing minimal number of experimental runs by giving an accurate mathematical models like Response surface method which predicts method performance under various conditions. The present study uses Paracetamol and Nefopam HCl in their combined tablet dosage forms for method development and validation using CCD as an Optimization tool by HPLC. Nefodol formulation containing 325 mg of Paracetamol and 30 mg of Nefopam HCl was used. For Optimization, Acetonitrile concentration as mobile phase, pH of the ammonium acetate buffer and flow rate were selected as factors with chosen responses from capacity factor, retention time and resolution between the peaks. The results obtained from CCD experiments were presented as perturbation and response surface plots to get visual representation of individual and multiple factors. Overall, the method gets a desirability value of 0.845 indicating best method performance. Retention time of Paracetamol and Nefopam HCl were 5.066 minutes and 7.211 minutes using Acetonitrile and 0.05M ammonium acetate buffer buffer in the ratio 45:55 %V/V and pH of 4.2 at a flow rate 1.3ml/min at a detection wavelength of 220 nm. Validation parameters according to ICH guidelines were done and found to be within limits. The method may be adopted for routine analysis of these drugs in pharmaceutical industry.

**Keywords:** Optimization, Central Composite design, HPLC, Validation, ICH guidelines

chakri.adusumalli@gmail.com

This study reports the synthesis of novel 1,5-dihydrobenzothiazepine derivatives using both conventional reflux condensation and microwave irradiation techniques. The synthesis involved the reaction of 1,3-diarylprop-2-enones with o-aminothiophenol, followed by purification through recrystallization and chromatography. Microwave-assisted synthesis resulted in rapid and efficient product formation within minutes at 180 watts. The pharmacological properties of the compounds were evaluated by assessing their antibacterial and antifungal activities using the minimum inhibitory concentration method and their *in vitro* cytotoxicity via the MTT assay. Several synthesized derivatives demonstrated notable antibacterial and antifungal effects, and most compounds showed the highest cytotoxic activity against prostate cancer cell lines (DU-145), albeit less potent than standard drugs. These findings suggest that the newly synthesized benzothiazepines are promising for further exploration as antimicrobial and anticancer agents with potential application in other microbes and cancer cell lines.

**Keywords:** Benzothiazepines, microwave assisted synthesis, antibacterial activity, antifungal activity, cytotoxicity

## SYNTHESIS AND PRELIMINARY CHARACTERIZATION OF HALLOYSITE-DERIVED MESOPOROUS SILICA NANOPARTICLES FOR DRUG DELIVERY APPLICATIONS

Kamaladevi Kshatriya, Fatima S Dasankoppa

ISBN: 978-81-980623-8-3

Department of Pharmaceutics, KLE College of Pharmacy, Hubballi, Karnataka, India 580031
kamaladevikshatriya02@gmail.com

Halloysite nanotube (HNT)-derived mesoporous silica nanoparticles (MSNs) were synthesized using a modified sol-gel process with cetyltrimethylammonium bromide (CTAB) as a soft template and tetraethyl orthosilicate (TEOS) as the silica precursor. The synthesis involved pre-calcination to remove impurities and final calcination to eliminate the surfactant and develop mesoporous structure. Fourier-transform infrared spectroscopy (FTIR) confirmed the formation of Si–O–Si bonds and reduction in Al–OH groups, indicating successful silica deposition. X-ray diffraction (XRD) revealed the disappearance of crystalline HNT peaks, confirming the transition to amorphous silica. Scanning electron microscopy (SEM) demonstrated a transformation from tubular HNT morphology to partially coated mesoporous surfaces, while transmission electron microscopy (TEM) visualized ordered mesopore arrangements along the nanotube structure. BET analysis recorded a specific surface area of 977 $m^2/kg$ with a pore diameter of 2–4 nm, indicating effective template removal and mesoporosity generation. Zeta potential shifted from –20.6 mV (HNT) to –30.9 mV (MSN), suggesting improved surface charge and dispersion stability. These findings confirm the successful conversion of HNT into MSNs with high surface area, controlled pore size, and enhanced stability, making them promising candidates for drug delivery and biomedical applications.

**Keywords:** Mesoporous silica nanoparticles, Halloysite nanotubes, Sol-gel synthesis, BET surface area, Zeta potential

## SYNTHESIS AND BIOLOGICAL EVALUATION 1, 5-BENZOTHIAZEPINES AS POTENTIAL ANTICONVULSANT AGENTS

Vutla Venkata Rao[1], Adusumalli Chakravarthy[2], Suryadevara Vidyadhara[3]
[1,2]Department of Pharmaceutical Chemistry, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur – 522019, Andhra Pradesh, India
[3]Department of Pharmaceutics, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur – 522019, Andhra Pradesh, India
venkataraovutla@gmail.com

1,5-Dihydrobenzothiazepines have gained considerable attention in drug research due to their clinical relevance in both cardiovascular and central nervous system disorders. The first clinically used molecule in this class was diltiazem, followed by clentiazem for cardiovascular applications, and thiazesim, clothiapine, and quetiapine for CNS-related conditions. This has led to the development of numerous synthetic approaches for these compounds. In the present study, chalcones derived from p-fluoroacetophenone and o-amino thiophenol were used to synthesize benzothiazepines. The reaction was carried out in methanol using piperidine as a base, followed by the addition of glacial acetic acid and overnight incubation at 25°C, leading to the formation of yellow benzothiazepine crystals, which were recrystallized in methanol. The synthesized compounds, labeled Bp-1 to Bp-15, were evaluated for their anticonvulsant activity using the Maximal Electroshock Seizure Test (MES) at a dose of 200 mg/kg body weight intraperitoneally. Several compounds demonstrated significant anticonvulsant activity, notably Bp-3 (4-chlorophenyl substitution), Bp-5 (2,4-difluorophenyl), Bp-14 (3,2-bromofurfuryl), and Bp-15 (4-dimethylaminophenyl), all of which showed complete protection with 0% mortality. These findings suggest that 1,5-dihydrobenzothiazepines, particularly those with specific substitutions at the second and fourth positions, hold promise as potential anticonvulsant agents.

**Keywords:** 1,5-dihydrobenzothiazepines, Maximal Electroshock Seizure Test, anticonvulsant activity

## DESIGN AND SYNTHESIS OF NEW THIAZOLO[3,2-A] PYRIMIDINE DERIVATIVES AS SSRIS FOR ANTIDEPRESSANTS

Nikhil M. Bisen, Alpana J. Asnani
Department of Pharmaceutical Chemistry,
Priyadarshini J. L. College of Pharmacy, Electronic Zone Building, MIDC, Hingna Road, Nagpur, Maharashtra, India - 440016
nikhilbisen2309@gmail.com

Depression is a chronic mental health disorder with a significant global burden. Selective serotonin reuptake inhibitors (SSRIs) are first-line therapies but have limitations such as delayed onset and side effects. The thiazolo[3,2-a] pyrimidine scaffold has shown promising biological activities, including affinity for the selective serotonin reuptake inhibitors (SSRIs). This work integrates AI-driven drug design with chemical synthesis to develop novel thiazolo[3,2-a] pyrimidine derivatives with potential antidepressant properties. Computational tools such as molecular docking, predictive ADME-Tox models, and AI-based lead optimization were employed to identify promising candidates. The optimized derivatives were synthesized, structurally characterized, and evaluated for antidepressant activity. Results indicate strong predicted binding affinities, good drug-likeness, and favorable pharmacokinetic profiles. This approach demonstrates the synergy between synthetic medicinal chemistry and artificial intelligence in novel antidepressant development. The synthesized derivatives showed significance antidepressant activity as compare to standard drug Fluoxetine.

**Keywords:** Antidepressant, Selective serotonin reuptake inhibitors (SSRIs), Fluoxetine, Thiazolo[3,2-a] pyrimidine Derivatives, CADD, etc.

**CH-141**

## QBD-DRIVEN ANALYTICAL METHOD DEVELOPMENT FOR HPTLC QUANTIFICATION OF SPIRONOLACTONE AND HYDROCHLOROTHIAZIDE IN PHARMACEUTICAL DOSAGE FORM

Tummala Pruithviraj, T.Sudha
Department of Pharmaceutical Chemistry and Analysis, Vels Institute of Science, Technology, and Advanced Studies,
Pallavaram, Chennai, Tamil Nadu, India.
tsudha.sps@vistas.ac.in

The present study examines simultaneous multiple response optimization using Derringer's desirability function for the development of an HPTLC method to detect sprinolactone and hydrochlorothiazide in pharmaceutical dosage form. Central composite design (CCD) was used to optimize the chromatographic conditions for HPTLC. The independent variables used for the optimization were the acetone content in the mobile phase, the wavelength, and the distance travelled. HPTLC separation was performed on aluminium plates pre-coated with silica gel 60 F254 as the stationary phase using toluene: methyl acetate: acetone (5:3:2% v/v/v) as the mobile phase. Quantification was achieved based on a densitometric analysis of spironolactone and hydrochlorothiazide over the concentration range of 50–175 µg/ml for both analytes, at 229 nm. The method yielded compact and well-resolved bands at Rf of $0.71 \pm 0.03$ and $0.41 \pm 0.02$ for spironolactone and hydrochlorothiazide, respectively. The linear regression analysis for the calibration plots produced $r2 = 0.9994$ and $r2 = 0.9991$ for spironolactone and hydrochlorothiazide, respectively. The precision, accuracy, robustness, specificity, limit of detection, and limit of quantitation of the method were validated according to the ICH guidelines. The factors evaluated in the robustness test were determined to have an insignificant effect on the selected responses. The results indicate that the method is suitable for the routine quality control testing of marketed tablet formulations.

**Keywords:** Spironolactone, Hydrochlorothiazide, Central composite design, Validation.

## QBD-DRIVEN CENTRAL COMPOSITE DESIGN IN DUAL ANALYTICAL METHOD DEVELOPMENT: SIMULTANEOUS ESTIMATION OF OLANZAPINE AND SAMIDORPHAN BY HPLC AND HPTLC

T.Sudha
Department of Pharmaceutical Chemistry and Analysis, Vels Institute of Science, Technology, and Advanced Studies,
Pallavaram, Chennai, Tamil Nadu, India.
tsudha@sps.vistas.ac.in

The current study represents the development and validation of HPLC and HPTLC methods for the simultaneous estimation of Olanzapine and Samidorphan in their combined formulation by using the design of experiments (DoE). In the RP-HPLC method, three independent factors, like Organic solvent composition, flow rate, and wavelength, were

ISBN: 978-81-980623-8-3

employed. HPTLC method factors like developing distance, Chamber saturation time, and methanol content in the mobile phase. Central composite design (CCD) was applied and also to study the response surface methodology. Capacity factor, Retention time, and Resolution were simultaneously optimized by using the Desirability function for the HPLC method and the Rf value for both drugs as responses in the HPTLC method. The proposed RP-HPLC method, the optimized and predicted data consisted of mobile phase acetonitrile: phosphate buffer (pH 6.8 with 1ml orthophosphoric acid) in the ratio of 45: 55%v/v respectively, at a flow rate of 0.8 ml/min and wavelength of 261 nm. By applying these optimum conditions with the Solar C18 column baseline partition of both drugs had good resolution and run time of 4.623 min for olanzapine and 7.767 min for Samidrophan. In HPTLC, separations were performed on silica gel 60 F254 using acetonitrile: glacial acetic acid: methanol (5: 4.5: 0.5%v/v/v) as mobile phase. The Rf value was found to be 0.48 for Olanzapine and 0.87 Samidrophan were scanned at 236 nm. Both methods optimized conditions were validated according to International Council for Harmonization guidelines (ICH). The proposed methods can be routinely employed in quality control for the analysis of Olanzapine and Samidorphan in the pharmaceutical dosage forms.

**Keywords**: Design of experiment, Central composite design, Olanzapine, Samidorphan

The application of Job's method which is the method of continuous variation to metal-ligand complexes is explored in the context of a ligand that has n equivalent and independent binding sites. In this study, we selected cephalosporin antibiotics from all generations, specifically Cefotaxime (CFX), Cefpodoxime (CPD), Cefuroxime (CFO), Cefdinir (CDR), Cefepime (CFP), and Cefadroxil (CFD). Three transition metals—zinc, nickel, and copper—were chosen along with one alkaline earth metal, calcium, to compare their effectiveness in binding. Job's method is a continuous variation technique that employs solutions with varying mole fractions. The selected wavelength (lambda max) is chosen so that it does not correspond to either the metal or the ligand solutions, but rather to the complex formed by the interaction between the metal and the ligand. Absorbance measurements are taken at this specified lambda max, and a curve of mole fraction/volume against absorbance is plotted to determine the value of n. By comparing the n values, we can estimate the amount of metal bound to the ligand. It is important to keep the total concentrations of metal and ligand relatively high compared to the dissociation constant in order to obtain a reliable estimate of the stoichiometry of the complex.

## STRUCTURE-BASED VIRTUAL SCREENING AND MOLECULAR DYNAMICS ANALYSIS OF CLINICALLY-APPROVED NEUROPROTECTIVE COMPOUNDS TARGETING MULTIPLE ALZHEIMER'S DISEASE PATHWAYS

Selva Bharathi S, Prabhakar V
[1, 2] Department of Pharmacology, Sri Shanmugha College of Pharmacy (Affiliated to the Tamil Nadu Dr. M.G.R. Medical University), Salem, Tamil Nadu, India - 637304.
selvabharathinotes.pharmacy@gmail.com

Alzheimer's disease involves multiple pathological mechanisms, with acetylcholinesterase (AChE), glycogen synthase kinase-3β (GSK-3β), and beta-site amyloid precursor protein cleaving enzyme 1 (BACE-1) representing critical therapeutic targets. This study investigates computational repurposing of clinically-approved neuroprotective compounds as multi-target inhibitors. Eight neuroactive agents—Agomelatine, Apomorphine, Cariprazine, Mirdametinib, Pomalidomide, Risdiplam, Tianeptine, and Vortioxetine—underwent structure-based virtual screening. Molecular docking using AutoDock Vina evaluated binding affinities within AChE, GSK-3β, and BACE-1 active sites. Risdiplam was selected for 100-nanosecond molecular dynamics simulations on AChE and GSK-3β targets based on superior docking performance. Docking analysis revealed favorable binding affinities across all three targets. AChE interactions involved catalytic triad residues, GSK-3β binding occurred at the ATP-binding pocket, and BACE-1 showed active site interactions. MD simulations confirmed Risdiplam's exceptional stability for AChE and GSK-3β complexes, maintaining low RMSD values and stable intermolecular contacts throughout trajectories. This investigation demonstrates successful repurposing potential of neuroactive drugs as multi-target AD inhibitors. Risdiplam exhibited favorable binding across all targets with confirmed structural stability for AChE and GSK-3β, positioning it as a promising candidate for experimental validation in comprehensive Alzheimer's therapeutic strategies.

**Keywords:** Acetylcholinesterase inhibition, GSK-3β targeting, BACE-1 inhibition, Risdiplam, Neuroprotective compounds

## *IN-SILICO* CHARACTERIZATION, ADMET PREDICTION, AND MOLECULAR DOCKING STUDIES OF CALIFORNIA ALMONDS AGAINST THE ALZHEIMER'S DISEASE

Sarang Digambar Gadegone, Komal Dangre
School Of Pharmacy, G.H. Raisoni University Amravati, Maharashtra.
saranggadegone1984@gmai.com

Alzheimer's disease is a progressive neurologic disorder that causes the brain to shrink (atrophy) and brain cells to die. Alzheimer's disease is the most common cause of dementia - a continuous decline in thinking, behavioral and social skills that affect a person's ability to function independently. The bitter almond is used in Alzheimer's disease for the treatments. The major chemical constituents of California almonds were study for molecular docking by using the software. Protein Data Bank (PDB) file of cholinesterase inhibitor with the code 5oug and its co-crystallized ligand rivastigmine (docking score -6.4), donepezil (docking score -8.9) were used for this purpose. The binding affinity and interactions with amino acids of phytochemicals were evaluated. Protein homology modelling of target protein was carried out, and protein structure validation and energy minimization were performed. Phytochemicals mentioned in literature having Alzheimer's disease properties were studied for absorption, distribution, metabolism, excretion, and toxicity (ADMET) properties and that passed ADMET filters were further carried for comparative *in silico* docking analysis along with the standard drug. Preliminary docking analysis was carried out using AutoDock Vina, and the results obtained were validated using Auto Dock 4.2.6 and Swiss Dock.

**Keywords:** Alzheimer's Disease, Dementia, ADMET prediction and Docking Studies.

## HPTLC FINGERPRINTING AND QUANTIFICATION OF SCOPOLETIN AS A MARKER COMPOUND IN CONVOLVULUS PLURICAULIS

Tanvi Bole, Yashwant Nakhate
School Of Pharmacy, Gh Raisoni University, Amravati.
tanvibole78@gmail.com

Analytical techniques such as chromatography, spectroscopy, titration, and gravimetric analysis are widely used in scientific research to identify and quantify chemical compounds. Chromatographic methods, in particular, play a crucial role in the analysis of medicinal plants due to their ability to separate and characterize bioactive constituents. The present study aimed to develop a simple, accurate, and precise high-performance thin layer chromatography (HPTLC) method for the estimation of Scopoletin in the hydroalcoholic extract of Convolvulus pluricaulis. HPTLC fingerprinting was carried out using aluminum plates pre-coated with silica gel 60F254. The extract and standard scopoletin were developed in a mobile phase of toluene:ether (1:1). Following development, densitometric scanning was performed at 254 nm using a Camag TLC Scanner III. Scopoletin was distinctly detected at an Rf value of 0.41 under the optimized conditions. In addition to scopoletin, three other fluorescent spots showing bluish fluorescence characteristic of coumarins were observed at Rf values of 0.49, 0.54, and 0.58, indicating the presence of additional coumarin derivatives in the extract. The developed HPTLC method provides a reliable and reproducible approach

ISBN: 978-81-980623-8-3

for the simultaneous detection of scopoletin in C. pluricaulis. The presence of multiple coumarins highlights the phytochemical richness of the plant, while scopoletin serves as a key marker compound for standardization and quality control.

**Keywords:** Convolvulus Pluricaulis, Scopoletin, Coumarins and Chromatographic Methods.

adithyaadithya58263@gmail.com

Benzodiazepines (BDZs) are common in the treatment of anxiety disorders, sleep disorders, and epilepsy by acting on the benzodiazepine receptor (BzR) of GABAA receptors. The use of these drugs in therapy is usually restricted by the side effects including sedation and dependency. During this research, 6,9-disubstituted purine derivatives have been studied as a possible alternative through computational techniques such as Quantitative Structural Activity Relationship (QSAR), molecular docking, and molecular dynamics (MD) simulations. We developed field-based QSAR models for a dataset of purine derivatives. These models allowed us to predict the inhibitory activity against BzR. The high-predicted activity compounds were docked to the GABAA receptors protein (PDB ID: 8BGI). Of these, compound A50 was more tightly bound (Glide score = -6.0) to the binding site than flumazenil (reference ligand). Moreover, MD simulations of the A50-receptor complex at 100 ns showed that the complex was stable with reasonable RMSD values (1–3 Å), which makes it a promising lead molecule. These results indicate that the purine derivatives, especially A50 are potential agents in developing benzodiazepine receptor inhibitors, and they should be synthesized further and tested in experiments to determine their effect on receptor inhibition to develop a possible therapy.

**Keywords:** Purine derivatives, QSAR, Docking, Molecular dynamics, Benzodiazepine receptor

**A NOVEL APPROACH TO PARTICLE POLLUTION CONTROL: ELECTROSTATIC PRECIPITATION WITH SPRAYING CORONA DISCHARGES**

Vijay Bhausaheb Jadhav, Sachin B Aglawe, Suraj D Bendre
Department of Pharmaceutical Chemistry, Rashtrasant Janardhan Swami College of Pharmacy, Kokamthan, Kopargaon, Maharashtra, India – 423601.
vijayjadhav1111@yahoo.in

Airborne particulate matter (PM), especially fine and ultrafine particles, is one of the most harmful pollutants affecting air quality and human health. Traditional electrostatic precipitators (ESPs) are widely employed to remove particulates from industrial flue gases, yet their efficiency declines significantly when handling nanosized particles or when particle re-entrainment occurs. To overcome these limitations, this study proposes a novel electrostatic precipitation approach using spraying corona discharges (ETP-SCD). In this system, corona discharge is employed to ionize the gas and impart charges to suspended particles. Simultaneously, liquid sprays are introduced, which promote particle agglomeration and growth, making collection more effective. The discharge electrodes are grounded while the collecting electrodes are connected to a high voltage, ensuring efficient particle migration and deposition. Compared with conventional ESPs, ETP-SCD offers distinct advantages, including enhanced capture of PM2.5 and nanosized particles, suppression of re-entrainment due to wet deposition, reduced operating voltage, and broad applicability across industries such as power generation, cement, metallurgy, and chemicals. The results suggest that ETP-SCD combines the strengths of electrostatic charging and spray-assisted precipitation, providing a more sustainable and effective technique for charged particle pollution control under modern environmental standards.

**Keywords:** Electrostatic precipitation, spraying corona discharge, particle removal, air pollution control.

**PREPARATION OF NEEM EXTRACT CARBON QUANTUM DOTS FOR PHARMACEUTICAL APPLICATION**

Rekha Hondadakatti
Set's College of Pharmacy, Dharwad
rekha2003h@gmail.com

Carbon quantum dots (CQDs) were synthesized from neem (Azadirachta indica) leaves and their excitation-dependent photoluminescence was tuned by hydrothermal temperature. Fresh leaves collected from the Kappatagudda region (Karnataka, India) were washed, homogenized in double-distilled water, clarified by sequential filtration (muslin, Whatman paper, 0.22 µm), and hydrothermally treated in a Teflon-lined autoclave at 150 or 180 °C for 5 h. Formation of fluorescent nanodots was first verified under UV illumination and subsequently characterized using a Shimadzu RF-6000 spectrofluorometer across multiple excitation wavelengths. CQDs prepared at 150 °C exhibited bright blue emission with maxima near 468 nm (λ_ex 280 and 360 nm) and \~460 nm (λ_ex 320 nm), with intensity increasing with excitation and peaking at 360 nm. In contrast, CQDs obtained at 180 °C showed red-shifted emission (\~488, \~482, and \~507 nm for λ_ex 280, 320, and 360 nm, respectively) and markedly reduced intensity. These trends indicate temperature-driven changes in core size and surface states: moderate carbonization (150 °C) favors effective passivation and radiative recombination, whereas harsher treatment (180 °C) introduces non-radiative pathways. Overall, neem-derived CQDs synthesized at 150 °C deliver stronger, more stable luminescence for blue-emission applications, while 180 °C products may suit longer-wavelength windows and diagnostics

**STUDY ON THE EFFECT OF VARIOUS HYDROTROPIC AGENTS ON THE WATER SOLUBILITY OF RIFABUTIN AND DEVELOPMENT OF A GREEN SPECTROPHOTOMETRIC METHOD**

Deepa Parayil, Sreejith K R, Anjali M, Blessna Varghese
College of Pharmaceutical Sciences, Government Medical College, Kannur, Pariyaram – 670503
dpnair144@gmail.com

Rifabutin, a potent antimycobacterial agent, presents challenges in aqueous solubility, limiting its effective spectrophotometric analysis without organic solvents. This study explores hydrotropic solubilization as a green and efficient alternative for enhancing its solubility. Seven hydrotropic agents—citric acid, sodium benzoate, urea, ammonium acetate, sodium tartrate, potassium acetate, and sodium citrate were screened for their solubilizing potential. Among them, 2M citric acid exhibited the highest solubility enhancement (~67-fold) and was selected for method development. A green UV-visible spectrophotometric method was successfully developed and validated at 279 nm, with a linearity range of 2–10 µg/ml and correlation coefficient $R^2$ = 0.9983. The method was applied to Rifabutin capsule formulation and yielded accurate results consistent with label claim. This study demonstrates the potential of hydrotropic solubilization as a safe, eco-friendly, and cost-effective approach for enhancing solubility and enabling green analytical methods for poorly water-soluble drugs.

**Keywords:** Rifabutin, Hydrotropy, Solubility Enhancement, Green Analytical Method, Citric Acid, UV-Visible Spectrophotometry

**ISOLATION, IDENTIFICATION AND CHARACTERIZATION OF 3,4,5 TRIMETHOXY CINNAMIC ACID FROM ETHANOLIC LEAF EXTRACT OF AVICENNA MARINA BY LC-MS AND EVALUATION OF ANTIEPILEPTIC ACTIVITY**

G. Jaya Syamala
NRI College of Pharmacy, Pothavarappadu Village, Agiripali Mandal, Eluru District-521211, Andhra Pradesh.
akshayajayasyamala@gmail.com

The Current study reveals the anti-epileptic activity of Avicenna marina, a mangrove plant, ethanolic leaf extract of Avicenna marina was obtained by Soxhlet extraction and performed phytochemical screening followed by Chromatographic separation using silica gel column chromatography was performed for Isolation of 3,4,5-trimethoxycinnamic acid. Structural elucidation through liquid

ISBN: 978-81-980623-8-3

chromatography mass spectrometry revealed a Rt of 6.8 minutes and a molecular ion peak at m/z 225.1, with fragmentation peaks at m/z 193 and 165. TMCA's antiepileptic activity was evaluated in Swiss albino mice using MES and PTZ-induced seizure models. TMCA was administered intraperitoneally at doses of 25, 50, and 100 mg/kg, with valproate of 200 mg/kg as the reference standard. In the MES model, TMCA at 100 mg/kg significantly reduced tonic hind limb extension duration of 8.7 ± 1.1 sec compared to control at 22.3 ± 1.8 sec. In the PTZ model, TMCA delayed seizure onset at 210.4 ± 15.6 sec compared to control at 115.2 ± 12.3 sec and reduced mortality rate was found to be 16.7% and control was 66.7%. This study reveals TMCA exert antiepileptic effects through GABAergic or sodium channel modulation, its potential as a novel epilepsy therapy.

**Keywords:** Trimethoxycinnamicacid (TMCA), Maximal Electroshock Seizure (MES), Pentylenetetrazole (PTZ), Liquid Chromatography- Mass Spectroscopy (LC-MS).

A simple, rapid, reliable, precise, accurate, sensitive and selective analytical method for the estimation of lobeglitazone. In human plasma and using as an internal standard (IS). Lobeglitazone is a novel thiazolidinedione (TZDs) based peroxisome proliferator-activated receptor (PPAR) agonist, used for the management of type-2 diabetes. The chromatographic separation was achieved on a Rubitas C18 Column (250 mm 4.6mm, 5 µm particle size) and the mobile phase was a combination of Acetonitrile: Methanol (60:40 v/v). The flow rate was set at 1.0 mL/min, and detection of the effluents occurred at 248 nm. Results: The retention time for Lobeglitazone was determined to be 5.945±0.164 min. The drug exhibited linearity within the concentration range of 0.1-5 µg/mL, the correlation coefficient was established to be 0.9924. The LQC, MQC, HQC were found to be 0.5 µg/ml, 2µg/ml, 4µg/ml. The accuracy of the method was considered satisfactory and the mean recovery percentage is found to be in the acceptable range of 93.87-97.07%. The HPLC method was successfully developed, validated as per ICH guidelines. The proposed method was simple, precise, sensitive, rapid, robust for the estimation of Lobeglitazone Sulphate.

**Keywords:** Lobeglitazone, Method development, Validation, RP-HPLC.

**COMPREHENSIVE ANALYTICAL PROFILING OF BIO FUEL DERIVED FROM MADHUCA LONGIFOLIA RESIDUE PYROLYSIS**

Manish Kumar Thimmaraju
Balaji Institute of Pharmaceutical Sciences, Narsampet Warangal Telangana India
manishcancer@gmail.com

This study investigates the properties of biofuel derived from the pyrolysis of Madhuca longifolia residues, chosen for their high volatile matter content. Slow pyrolysis was carried out in a fixed-bed reactor at temperatures ranging from 350 to 600 °C, and the resulting pyrolysis oil, char, and gas were characterized using various analytical techniques. The influence of temperature on product yield was first evaluated, with the highest oil yield of 44.2 wt% obtained at 475 °C. Corresponding yields for char and gas were 22.1 wt% and 33.7 wt%, respectively. Thermogravimetric analysis (TGA) and Fourier-transform infrared spectroscopy (FT-IR) confirmed the suitability of the feedstock as a potential energy source. Comprehensive characterization of the pyrolysis products was performed using FT-IR, gas chromatography-mass spectrometry (GC-MS), and gas chromatography (GC). The pyrolysis oil was found to be a viscous liquid with a lower heating value compared to conventional diesel. FT-IR and GC-MS analyses revealed a high concentration of oxygenated compounds, including acids and phenolic derivatives. The char exhibited both aromatic and aliphatic hydrocarbons, along with elevated carbon content, indicating its potential use as a solid fuel. GC analysis of the pyrolysis gas confirmed the presence of combustible compounds, supporting its application as a gaseous fuel.

lotlikar.reema@gmail.com

The susceptibilities of complexes formed by complexation of metal salts with cephalosporin antibiotics were evaluated against various both Gram positive and gram-negative organisms. The selected cephalosporin antibiotics represent all four generations based on their spectrum of activity: Cefotaxime (CFX), Cefpodoxime (CPD), Cefuroxime (CFO), Cefdinir (CDR), Cefepime (CFP), and Cefadroxil (CFD). For this study, three transition metals—zinc, nickel, and copper—were chosen, along with one alkaline earth metal, calcium, to compare their effectiveness. The organisms tested included E. coli, S. aureus, B. subtilis, and P. aeruginosa. The Minimum Inhibitory Concentration (MIC) was determined for each complexed antibiotic, allowing for the calculation of the MIC 99 values, which indicate the minimum concentration required to inhibit the growth of 99% of the bacteria. These values were then compared to the non-complexed antibiotics. Mueller-Hinton broth and agar were used as culture media, while saline was utilized for dilutions. The bacterial strains were incubated for 24 hours prior to testing. The study found that nickel-complexed antibiotics demonstrated more promising activity compared to their non-complexed counterparts. Additionally, some zinc complexes exhibited notable effectiveness. Comparative studies across the different metal complexes were conducted and found to be significant, as evaluated through SEM and one-way ANOVA analyses.

**Keywords:** Complexation, Cephalosporin antibiotics, MIC 99, Antimicrobial activity.

**CH-155**

**DESIGN, SYNTHESIS AND BIOLOGICAL EVALUATION OF SOME IMIDAZO[1,2-a] PYRIDINE DERIVATIVES AS ANTI-TUBERCULAR AGENTS**

Patel Harnisha
Parul Institute of Pharmacy, Faculty of Pharmacy, Parul University, Vadodara-391 760, India
harnishaben.patel16128@paruluniversity.ac.in

Tuberculosis (TB) is a serious infectious disease caused by Mycobacterium tuberculosis (Mtb) that affects millions of people worldwide. The emergence of drug-resistant strains of Mtb poses a major challenge for the development of effective anti-TB drugs. Imidazo[1,2-a] pyridine derivatives are a class of heterocyclic compounds that have shown promising anti-TB activity. Analogs of imidazo[1,2-a] pyridine fused ring system were designed using molecular docking on InhA, a vital enzyme involved in the cell wall synthesis of M.tb. Compounds (5a-5o) showing promising docking scores were synthesized. All the synthesized compounds were evaluated for their *in-vitro* anti-tubercular activity against H37Rv strain by Alamar Blue assay method. Most of the synthesized compounds displayed potent anti-tubercular activities. The most potent compound was further evaluated against am MDR-TB strain. To assess the stability of the protein-ligand complex of two most potent compounds, molecular dynamics simulations were conducted for duration of 100 ns. All these results indicate that the synthesized compounds could prove to be potential leads for further development of new potent anti-tubercular agents.

**SCALING UP OF PHOTO BIOREACTOR DESIGN, OPTIMIZING THE PRODUCTION PARAMETERS FOR HIGH YIELD OF OMEGA 3 FATTY ACIDS FROM MARINE MICROALGAE**

Bhojaraju P, Satyavathi K
Veda College Of Pharmacy Battalur-518510; Andhra Pradesh
raju74in@gmail.com

ISBN: 978-81-980623-8-3

This is aimed at scaling up of photo bioreactor , optimizing the production parameters for high yield of omega 3 fatty acids from marine micro algae , Omega – 3 (ω-3) fatty acids (EPA and DHA) are polyunsaturated fatty acids and are essential components that provide significant health benefits to the human population, particularly in reducing cardiac diseases such as thrombosis, arrhythmia, stroke, high blood pressure[2,3] breast and lung cancer, alzheimer's disease etc. Most of the global health organizations (WHO, NIH USA UK, GERMANY) are recommending the regular intake of (ω-3) fatty acids. These fatty acids regular consumption as a part of diet may reduce the risk of cardiovascular diseases specially atherosclerosis by reducing the triglycerides. Many people across the world are taking (ω-3) fatty acids regularly along with other nutritional supplements. So, there is a great demand for the production of (ω-3) fatty acids to meet the daily requirements of the people globally. So many food sources like fish, flax seeds, chia seeds, algal oil etc are there for these healthy fats. At present many countries like USA, European countries established the (ω-3) fatty acids production from marine microalgae. In India it is yet to be established. In this context we are aiming for scaling up high quality good yield production of (ω-3) fatty acids from marine microalgae in a pilot scale Photo bioreactor.

## QSAR ANALYSIS OF ANTIVIRAL COMPOUNDS FOR COVID-19 DRUG REPURPOSING

Saeem Zahoor Shadulla
MCES's PAI Allana College of Pharmacy
shadullasaeem@gmail.com

Quantitative Structure–Activity Relationship (QSAR) modelling offers a strategic and time-efficient approach for identifying antiviral candidates suitable for drug repurposing against COVID-19. This study aimed to develop predictive QSAR models to evaluate structural features influencing the antiviral activity of diverse compounds previously approved or investigated for other therapeutic indications. A curated dataset of molecules with reported activity against SARS-CoV-2 or related viral targets was compiled and subjected to descriptor calculation, including physicochemical, topological, electronic, and hydrophobic parameters. Multiple linear regression, partial least squares, and machine learning-based algorithms were employed to construct models capable of correlating molecular characteristics with antiviral potency. Model performance was assessed through internal and external validation using statistical indicators such as $R^2$, $Q^2$, RMSE, and predictive residuals to ensure robustness, reliability, and minimal overfitting. Significant descriptors identified in the best performing models highlighted the importance of molecular flexibility, hydrogen-bonding capacity, lipophilicity, and electron distribution in modulating antiviral effects. Virtual screening of larger repurposing libraries using validated QSAR models enabled rapid selection of promising candidates with predicted high activity and favourable drug-like profiles. Several molecules demonstrated strong theoretical potential for SARS-CoV-2 inhibition, warranting further evaluation through docking studies, molecular dynamics simulations, and *in-vitro* assays. The study underscores the value of QSAR-guided screening as an efficient computational tool for accelerating COVID-19 drug repurposing efforts. By providing mechanistic insights into structural determinants of antiviral activity, these models support rational prioritization of compounds for experimental testing and contribute to the ongoing search for effective therapeutic options.

## METHOD DEVELOPMENT AND VALIDATION FOR THE SIMULTANEOUS ESTIMATION OF PIPERINE AND UMBELLIFERON IN A POLYHERBAL AYURVEDIC FORMULATION USING RP-HPLC

S G Vasantharaju[1], A Arjun Prabhu[2]
[1]Department of Pharmaceutical Quality Assurance, Rani Chennemma College of Pharmacy, Belagavi, Karnataka, India – 590010
[2]Department of Pharmaceutical Quality Assurance, Manipal College of Pharmaceutical Sciences, MAHE, Manipal, Karnataka, India – 576104
sgvasanth65@gmail.com

A simple, sensitive, precise, and accurate RP-HPLC method was developed and validated for the simultaneous estimation of Piperine and Umbelliferone in the polyherbal ayurvedic formulation hingwashtaka churna. Chromatographic separation was achieved using a Kromasil 100 C18 column (250 × 4.6 mm, 5 µm) with an isocratic mobile phase of methanol and 10 mM ammonium acetate buffer (pH 4.7) in the ratio of 70:30 v/v. The flow rate was 0.9 mL/min, with UV detection at 324 nm and a run time of 20 minutes. Umbelliferone and Piperine were eluted at retention times of 4.375 and 13.085 minutes, respectively. Validation was performed as per ICH Q2(R1) guidelines, confirming specificity, linearity (2–10 µg/mL), accuracy (98.34–101.57%), precision (%RSD < 2%), LOD (0.1193 µg/mL for Umbelliferone and 0.1117 µg/mL for Piperine), and LOQ (0.3616 µg/mL and 0.3385 µg/mL respectively). Two extraction techniques were evaluated, with ultrasonication-assisted liquid-liquid extraction yielding higher efficiency: 515.22 µg/g for Umbelliferone and 2778.42 µg/g for Piperine. The developed method proved effective for the quantitative analysis and standardization of Piperine and Umbelliferone in hingwashtaka churna.

**Keywords:** RP-HPLC, Piperine, Umbelliferone, Hingwashtaka Churna, Simultaneous Estimation

## *IN SILICO*-BASED IDENTIFICATION OF LEADS FROM THE LEAF EXTRACTS OF NERIUM OLEANDER TARGETING PLASMODIUM PROTEASES AS THERAPEUTIC DRUG TARGETS FOR DEVELOPMENT OF ANTIMALARIAL AGENTS

Kapil Kumar Goel, Bhupinder Kumar, Gaurav Joshi, Shalini Juglan
[1]Department of Pharmaceutical Sciences,
Gurukul Kangri Deemed to be University Haridwar
kapilgoel@gkv.ac.in

Resistance to conventional antimalarial drugs, particularly in Plasmodium falciparum, necessitates the search for alternative therapies, including plant-based remedies. Nerium oleander (Apocynaceae), a traditionally used medicinal plant, has shown various biological activities, but its potential as an antimalarial remains underexplored. This study investigates the phytoconstituents of N. oleander leaves and their potential to inhibit P. falciparum via molecular modelling targeting the threonine protease (PfHs1V or ClpQ). Phytochemical screening revealed the presence of alkaloids, carbohydrates, flavonoids, catechins, glycosides, and steroids. Twelve major plant-derived molecules were selected for molecular docking studies, alongside two known PfHs1V inhibitors (Bortezomib and Gitotoxin) as positive controls. All compounds were prepared using LigPrep and docked into the most active binding site of PfHs1V, identified via the Sitemap module. Docking was performed using the GLIDE-XP algorithm, and binding affinities were assessed based on G-scores. Among test compounds, quercetin showed the highest docking score (-6.610 kcal/mol), equivalent to that of the positive control Bortezomib, indicating strong binding affinity. Digitoxigenin and sitosterol also exhibited favorable scores of -6.514 and -6.392 kcal/mol, respectively. Interaction analysis revealed key amino acids (Thr25, Ala47, Val26) at the active site formed hydrogen bonds, π-cation, and π-π interactions, particularly in the quercetin complex. These findings highlight quercetin's potential as a lead compound against P. falciparum, warranting further *in vitro* and *in vivo* validation to support its role in antimalarial therapy.

**Keywords:** Plasmodium falciparum, quercetin, Molecular docking, Nerium oleander

1,3,4-oxadiazoles, one of the heterocyclic compounds and chalcones, a group natural compounds possesses diverse therapeutic properties

ISBN: 978-81-980623-8-3

including anti-inflammatory activity. Conjugation of chalcones with other pharmacologically interesting molecules enhances its therapeutic property. With this view, the present study was focused on design, synthesis and *in vitro* anti-inflammatory evaluation of novel chalcone linked 1,3,4-oxadiazole derivatives. In this study, ACD Lab Chemsketch 12.0 was used for the three-dimensional drawing of the proposed compounds. Molinspiration cheminformatics software was used to analyze whether the proposed derivatives obey the Lipinski's rule of five or not. The selected compounds were synthesized through a series of four steps. Purity of the synthesized compounds was ascertained by TLC and melting point determination by open capillary tube method. The synthesized compound were characterized by IR, 1HNMR, 13CNMR and Mass spectral methods. Anti-inflammatory activity was evaluated *in vitro* by TNFα and IL-6 inhibition. The results indicated that 15 derivatives out of 50 designed were obeying the Lipinski's rule of five. Among the 15 derivatives, two compounds viz, (E)-1-(4-hydroxyphenyl)-3-[3-[4-[5-(3-hydroxyphenyl)-1,3,4-oxadiazol-2-yl]phenoxy]phenyl]prop-2-en-1-one and (E)-1-(4-aminophenyl)-3-[4-[4-[5-(3-aminophenyl)-1,3,4-oxadiazol-2-yl]phenoxy]phenyl]prop-2-en-1-one, named as, OXC 29 and OXC 30 respectively were randomly selected for the synthesis. After ascertaining the purity and characterization by spectral study, the synthesized compounds were evaluated for the anti-inflammatory activity *in vitro*, the results strongly supported the anti-inflammatory activity of the tested compounds. These findings are helpful for future research and may provide a new specific lead in the anti-inflammatory category.

## DESIGN, COMPUTATIONAL STUDY, SYNTHESIS AND ANTI-DIABETIC EVALUATION OF NOVEL GLITAZONE DERIVATIVES

Usha Nitin Jain
Rastrasant Janardhan Swami College of Pharmacy Nagpur Highway, Kokamthan, Tal Kopargaon
unjain11@gmail.com

Diabetes mellitus remains a critical global health challenge, with type 2 diabetes mellitus (T2DM) accounting for approximately 95% of all cases worldwide. Thiazolidinediones (TZDs), also known as glitazones, are a well-established class of insulin-sensitizing agents used in the management of T2DM. In the present study, a series of N-substituted glitazone derivatives were rationally designed and subjected to *in silico* ADME profiling and toxicity prediction using online computational tools. Molecular docking studies were performed to evaluate their binding affinity toward the peroxisome proliferator-activated receptor gamma (PPAR-γ) target. Ten promising derivatives were synthesized, recrystallized, and purified. Their chemical structures were confirmed by IR, 1H NMR, 13C NMR, and mass spectrometric analyses. *In vitro* antidiabetic activity was assessed using a glucose uptake assay, which revealed that the N-substituted derivatives significantly enhanced glucose uptake. Notably, compound PB-TZD-1 demonstrated the highest activity, increasing glucose uptake by 36.00%, outperforming both pioglitazone and insulin, suggesting a superior insulin-sensitizing effect potentially via robust PPAR-γ activation or enhancement of the insulin signaling pathway. Compounds PB-TZD-3 (34.30%) and PB-TZD-6 (33.53%) also exhibited greater activity than the standard drug pioglitazone, indicating promising antidiabetic potential. Cytotoxicity evaluation using the MTT assay confirmed that all derivatives exhibited $IC_{50}$ values above 275 µM, indicating low cytotoxicity. *In vivo* antidiabetic evaluation in STZ-induced diabetic rats further supported these findings, with PB-TZD-3 producing the most significant reduction in fasting blood glucose, decreasing from 269.0 ± 3.62 mg/dL to 124.5 ± 2.63 mg/dL after 28 days of treatment. Overall, these results suggest that the synthesized N-substituted glitazone derivatives, particularly PB-TZD-1 and PB-TZD-3, are promising candidates for the development of safer and more effective antidiabetic agents.

**Keywords:** Type 2 diabetes mellitus, thiazolidinediones, glitazone derivatives, PPAR-γ, antidiabetic.

## DESIGN, MOLECULAR DOCKING, SYNTHESIS, TOXICITY EVALUATION, AND HYPOGLYCEMIC ACTIVITY OF NOVEL N-SUBSTITUTED GLITAZONE DERIVATIVES

Nitin Pannalal Jain
Rastrasant Janardhan Swami College of Pharmacy Nagpur Highway, Kokamthan, Tal Kopargaon
nitinpjain06@gmail.com

Diabetes mellitus continues to pose a significant global health burden, especially in low- and middle-income countries, where the prevalence of type 2 diabetes mellitus (T2DM) is steadily increasing. Thiazolidinediones (TZDs), commonly known as glitazones, are established insulin-sensitizing agents used in T2DM management. In this study, a new series of N-substituted glitazone derivatives was designed to develop safer and more effective TZD analogues. The compounds were first screened using *in silico* ADME profiling and toxicity predictions via online computational tools. Molecular docking studies were performed to predict their binding affinity and interaction with the peroxisome proliferator-activated receptor gamma (PPAR-γ), a key target in glucose metabolism. Eight derivatives were successfully synthesized, recrystallized, and purified. Their chemical structures were confirmed through IR, 1H NMR, 13C NMR, and mass spectrometric analysis. The *in vitro* antidiabetic potential was assessed using a glucose uptake assay, while cytotoxicity was evaluated by MTT assay. Six of the synthesized derivatives exhibited a higher percentage of glucose uptake than the standard drug pioglitazone. Among these, PB-TZD-20 showed the most promising activity, enhancing glucose uptake by 36.00%, surpassing both pioglitazone and insulin. This suggests a stronger insulin-sensitizing effect, possibly due to enhanced PPAR-γ activation or modulation of the insulin signaling pathway. Additionally, all compounds demonstrated $IC_{50}$ values above 250 µM, indicating low cytotoxicity *in vitro*. *In vivo* antidiabetic evaluation of PB-TZD-20 in STZ-induced diabetic rats revealed a substantial reduction in fasting blood glucose levels, decreasing from 276.0 ± 4.97 mg/dL to 114.67 ± 1.50 mg/dL over the treatment period. This reduction was more pronounced than that observed with pioglitazone. These findings highlight PB-TZD-20 as a promising lead compound with significant potential for further development as a safer and more effective therapeutic option for T2DM.

**Keywords:** Type 2 diabetes mellitus, thiazolidinedione derivatives, glitazone analogues, PPAR-γ, molecular docking, glucose uptake assay.

## WATER PURIFICATION AND PUBLIC HEALTH: EVALUATING TECHNOLOGIES, ECOLOGICAL SOURCES, AND SUSTAINABILITY CHALLENGES IN A GLOBAL AND REGIONAL CONTEXT

Vijayakumar S, Deepak CM, Rogeshwaran
Department of Pharmacy Practice, SVVCOP,
Nallampalli, Dharmapuri 636701.
vijaykumarsasikala@gmail.com

In order to assess the nutritional value of different water purification technologies, including reverse osmosis (RO), ultraviolet (UV) treatment, activated carbon filtration, and novel methods like solar desalination, this review looks at their wider health implications. Unintended consequences, like the removal of vital minerals and the production of brine waste, are given special attention. Along with evaluating surface water (rivers, lakes, and ponds), groundwater (aquifers), rainwater harvesting systems, and desalinated seawater, the study also highlights the availability, ecological roles, as well as associated challenges of these global water sources. With case studies of effective implementations and government programmes advancing sustainability, the review delves deeper into the function of rainwater harvesting in water-scarce nations like BRICS. Another important tactic in the fight against freshwater scarcity, particularly in arid and coastal areas, is desalination. Despite technologies like RO and thermal distillation offer practical answers, their high energy requirements and prospective long-term environmental effects are causes for concern. The objective is to present a comprehensive perspective on how public health outcomes, source sustainability, and water purification technologies interact with one another. A comprehensive search for literature using databases like PubMed, Scopus, Dovepress, MDPI and Google Scholar, with a particular focus on research conducted within the last 15 years, served as the foundation for this narrative review. To alleviate water scarcity and protect ecosystem integrity, future research should concentrate on improving energy efficiency, optimising purification systems to retain vital minerals, and developing sustainable practices like solar desalination and rainwater harvesting.

**MOLECULAR DOCKING STUDY OF SYNTHESIZED SUBSTITUTED TRIAZOLE DERIVATIVES AS AN ANTI-INFLAMMATORY AGENTS**

Kalyani Shelar, Sampada Jangam, Sagar Wankhede
School of Pharmaceutical Sciences, JSPM University, Wagholi, Pune, Maharashtra, India – 412207.
kalyanishelar23.sdsr@jspmuni.ac.in

Inflammation is a complex defense response triggered by pathogens, irritants, or damaged cells. It may be acute or chronic. Over 50% of all deaths coming from chronic inflammatory disorders, these conditions are widely acknowledged as the world's largest cause of mortality. Nowadays many FDA approved treatments are available but problems such as drug resistance, selectivity and high cost of treatment remain promising, hence it is necessary to develop the new medications with fewer side effect. In present study series of 1, 2, 4-triazoles-1, 3, 4-oxadiazoles incorporating piperine moiety (4-(5-(4-(benzo[d][1,3]dioxol-5-yl)butyl)-1,3,4-oxadiazol-2-yl)-5-phenyl-4H-1,2,4-triazole-3-thiol) were synthesized and structurally characterized using infrared (FTIR) spectroscopy, proton nuclear magnetic resonance (1HNMR) and mass spectrometry. In addition, in-silico studies were conducted including pharmacokinetic profiling which indicated that the compound exhibited remarkable bioavailability and drug likeness properties. Molecular docking studies revealed that all synthesized derivatives demonstrated stronger binding affinities as the standard anti-inflammatory drug, which exhibited binding energies of -8.9 to -10.89 kcal/mol. The binding energy of standard anti-inflammatory drug was found to be -10.83 kcal/mol. The interaction studies were performed using PDB ID 1CX2 {Cyclooxygenase-2 (Prostaglandin synthase-2), SC-558}, showing effective binding of compound with target enzyme. Among the tested derivatives compounds 1c, 2c, 3c, 4c, 5c, 6a and 7c exhibited significant binding energies for anti-inflammatory activity. In particular compounds 1c (p-NO2), 2c (p-NH2) and 7c (p-OCH3) derivatives demonstrated highest binding affinities with docking scores are -10.89, -10.06 and -9.97 kcal/mol indicating as strong potential as anti-inflammatory agents.

**Keywords:** Inflammation, 1, 2, 4-triazoles-1, 3, 4-oxadiazoles-piperine, molecular docking, anti-inflammatory activity.

Research scholar, Vels Institute of Science and Technology and Advanced Studies (VISTAS), Pallavaram, Chennai, Tamil Nadu, India -600117
emraan2002@gmail.com

Breast cancer is a leading health concern all over the world and standard procedures of treatment are either exhausted due to drug resistance and adverse effects. The Therapeutic effects of three flavonoids- Apigenin, Curcumin and Hesperidin will be studied in this paper through in- silico molecular docking, dynamic simulations and ADMET. Molecular docking indicated that these three flavonoids exhibit strong binding affinity towards potential breast cancer related proteins with Apigenin having a better potential. Simulations of molecular dynamics was conducted and the results confirmed that Apigenin stayed consistent and Curcumin and Hesperidin retains a much looser connection. The effectiveness of gastrointestinal absorption, toxicity and bioavailability of these flavonoids were checked using ADMET analysis that revealed that Apigenin exhibits good gastrointestinal absorption, least toxicity and good bioavailability. Curcumin and Hesperidin showed a prospect but had limitations with regard to the blood-brain barrier penetration and a bioavailability profile. Such results indicate the interest of Apigenin as the best flavonoid in treating breast cancer, but more studies should be conducted to maximize its usage in the clinical setting.

**Keywords:** Apigenin, Breast cancer, Molecular docking, Molecular dynamics & ADMET analysis

**DEVELOPMENT AND VALIDATION OF STABILITY INDICATING RP-HPLC METHOD FOR DETERMINATION OF NIRAPARIB IN BULK DRUG AND ITS PHARMACEUTICAL DOSAGE FORM**

Pravin Sanjay Sake
Department of Pharmaceutical Chemistry,
Savitribai Phule Pune University, Pune,
Maharashtra, India- 411048
pravinsake7853@gmail.com

Niraparib was FDA approved in the year 2020 for employed preliminary to mitigate ovarian, fallopian tube, or peritoneal cancer. Objective of current research study was to develop and validate simple, rapid, precise, accurate and robust RP-HPLC method for quantitative determination of niraparib in bulk drug and formulation. Chromatographic separation was achieved Agilent Zorbax Bonus-RP column (4.6 mm× 250 mm, 5µm particle size). Mobile phase consisted of 0.1% trifluoroacetic acid (TFA) in water and acetonitrile in a 75:25 v/v ratio, delivered in isocratic mode at flow rate of 1.0 mL/min. Detection wavelength was 240 nm and injection volume 20 µL. Niraparib peak eluted at 5.18 minute with good peak symmetry. Method validation was done as per ICH guideline (Q2R1). Method revealed linearity in concentration range of 40–60 µg/mL with r2 0.999. LOD was 1.42 µg/mL and LOQ 4.30 µg/mL. %RSD less than 2% for intra- and inter-day precision were within appropriate limits, mean recovery 99.95%. Forced degradation study was performed on niraparib drug such as acidic, alkaline, oxidation, thermal and photolytic, which showed that no degradant peak interferes with niraparib peak. Novel method having certain advantages simple mobile phase preparation, shorter run time compare to reported method and transfer to LC-MS instrument due to buffer in volatile nature. Developed RP-HPLC method was simple, accurate, precise, sensitive, robust and specific. Thus, it adopts for regular quality control analysis of niraparib in bulk drug and pharmaceuticals formulation.

**DESIGN AND DEVELOPMENT OF N-HETEROCYCLIC ACACETIN HYBRIDS AS POTENTIAL ANTIDEPRESSANT AGENTS: BY USING EXPERIMENTAL AND COMPUTATIONAL APPROACHES**

Shatabdi B. Roy, Kalyani R. Thombre, Krishna R. Gupta, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee,
Nagpur, Maharashtra-441002
Shatabdiroy2002@gmail.com

Depression is a widespread mental health issue that frequently has adverse drug effects and varies in responsiveness to treatment. A novel set of 7- [(substituted nitrogen-containing heterocyclic molecule) alkoxy] hybrids was designed and evaluated for possible antidepressant efficacy in mouse models using acacetin, a precursor of bioactive chemicals. In the presence of potassium carbonate and dimethylformamide, acacetin interacted with 1,4-dibromobutane to produce 4'-methoxy-5-hydroxy flavones (F1-F7), which were then modified with various N'-heterocycles. Spectral and elemental investigations were used (UV, MS, NMR, IR) to confirm the structure. Insilico studies were performed to determine binding affinities against 5HT2AR via molecular docking followed by ADMET analysis. Antidepressant potential was evaluated computationally using PASS analysis and experimentally using the Tail Suspension Test (TST) and Modified Forced Swim Test (MFST) to examine in-vivo efficacy. Docking scores, pharmacokinetic parameters, PASS analysis, and toxicological profiles were all favourable for all synthesized compounds. The highest docking score was -9.76 Kcal/mol. Interestingly, at a dosage of 10 mg/kg, most of the hybrids (F1-F3 and F5) showed noticeably more antidepressant action than acacetin. Hybrids F1–F4 dramatically decreased immobility time and frequency in the TST and MFST, indicating strong antidepressant-like effects that are probably related to serotonergic pathways and reminiscent of fluoxetine.

**RP-HPLC TECHNIQUE DEVELOPMENT AND VALIDATION FOR QUANTIFICATION OF IRBESARTAN AND CHLORTHALIDONE FROM THE FORMULATIONS**

ISBN: 978-81-980623-8-3

Chavan S. Samrudhi, Trupti M. Shelar, Waghmare C. Pranjali
Dept of Postgraduate in Pharmacy, SVPM College of Pharmacy,
Malegaon (BKII) Baramati Dist Pune 413115 India

Chromatographic methods are characterized due to their efficient ability for the separation of complex mixtures. Also, efforts are being made to improve preciseness, robustness in the current chromatographic techniques. RP-HPLC technique was developed for simultaneous estimation of water insoluble drugs Irbesartan (IST) and Chlorthalidone (CTD) from dosage form. Chromatographic system RP-HPLC equipped with RP - C18 column (× i.d. 5-µm particle size) and UV detector was employed for analytical technique. Optimized mobile phase [Acetonitrile: Methanol: water pH 4.7 (pH adjusted with acetic acid)] was pumped at a flow rate of 0.8 ml/min in the ratio of 50:30:22 % v/v and the eluents were monitored at 245 nm. The method was successfully applied for quantitative estimation of both drugs from their combined dosage form. The method was validated as per ICH guidelines and US FDA guidelines. The linearity of both drugs was ascertained over the conc range 2 to 40µg/ml for IST and 1 to 6µg/ml for CTD. The retention time of IST and CTD was found 4.724 and 3.418 mins respectively. The method was validated for accuracy and precision, LOD and LOQ. The assay was found 101.07% w/w for CTD and 101.12% w/w for IST within the limits given in the official book. SD was found 1.0922 for CTD and 0.5404 for IST in accuracy study and RSD was obtained within prescribed limits in precision study. Resolution was proper and chromatogram with well resolved peaks is sign of methods efficiency. The developed method is suitable for routine quality control tests for this solid dosage form. The method is rapid as both drugs were eluted within 5 mins and no interference of excipients was observed during estimation.

**Keywords:** Irbesartan, Chlorthalidone, validation, ICH guidelines, RP-HPLC

## DEVELOPMENT AND VALIDATION OF AN RP-HPLC METHOD FOR ESTIMATING PROCESS-RELATED IMPURITIES IN ANTIDIABETIC DRUGS

Sachin K.Hodgar, Sumit R.Deore
School of Pharmaceutical Sciences, Sandip University,
Nashik, Maharashtra, India
skh.vniprc@gmail.com

There has been ever increasing interest in impurities present in Active Pharmaceutical Ingredient's (API's). Nowadays, not only purity profile but also impurity profile has become mandatory according to the various regulatory authorities. The study aimed to develop and validate a reverse-phase high-performance liquid chromatography (RP-HPLC) method for the simultaneous estimation of process-related impurities in Dapagliflozin, Vildagliptin, and Sitagliptin. The method was optimized using various mobile phases and validated according to ICH guidelines for parameters including linearity, accuracy, precision, robustness, LOD, and LOQ. The optimized method employed an Agilent Poroshell C18 column (150 mm × 4.6 mm, 5 µm), with a mobile phase of acetonitrile and 0.05% orthophosphoric acid in water (30:70, v/v), at a flow rate of 1.0 mL/min, and detection at 210 nm. The method exhibited good linearity ($r^2 > 0.998$), accuracy (recovery within 98–102%), and precision (RSD < 2%). The method is suitable for routine quality control of impurities in antidiabetic formulations. Regulatory bodies across the globe have established comprehensive guidelines to ensure that impurity profiling is rigorously conducted during the development and manufacturing of pharmaceuticals. These guidelines are designed to protect public health by setting acceptable limits for impurities and mandating robust analytical methods for their detection and quantification. Thus, impurity profiling is a cornerstone of pharmaceutical development, ensuring that drug products are safe, effective, and of high quality. Regulatory guidelines such as FDA (Food and Drug Administration, USA), EMA (European Medicines Agency), Pharmacopoeias etc. The presence of impurities can accelerate the degradation of drug products, thereby reducing their shelf life and stability. Stability studies are conducted to understand how impurities develop over time and under various storage conditions, which is essential for establishing appropriate storage guidelines and expiration dates.

**Keywords:** FDA, EMA, API, shelf life

## NEW IMPROVED RP-HPLC VALIDATED METHOD FOR SIMULTANEOUS ESTIMATION OF THEOPHYLLINE AND ETOFYLLINE FROM SOLID DOSAGE FORM

Sakshi A. Navale, Prajakta D. Gaikwad, Monika S. Kare
Dept of Postgraduate in Pharmacy, SVPM'S College of Pharmacy,
Malegaon (BKII) Baramati Dist Pune--413115 Maharashtra, India
pharmacyresearchsvpmcop@gmail.com

Liquid chromatography is extensively used in separation and detection of components from complex matrix. A simple and improved economical RP-HPLC method for combined drug estimation Theophylline (TPE) and Etofylline (EFE) have been developed. Chromatographic method was developed for estimation of both drugs, with system RP-HPLC, using RP - C18 column equipped with UV detector. The mobile phase [Methanol: water pH 8.4 (pH adjusted with KOH AR grade)] was pumped at a flow rate of 0.8 ml/min in the ratio of 46:54 % v/v and the eluents were monitored at 273 nm. The method was successfully studied for quantitative estimation of both drugs from their combined dosage form. The method was studied as per ICH guidelines and US FDA guidelines. The linearity of both drugs was ascertained in the conc range 2 to 20µg/ml for TPE and 4 to 40µg/ml for EFE. The retention time of TPE and EFE was found to be 3.152 and 5.478 mins respectively. The method was validated for accuracy, precision and LOD and LOQ etc. The assay was found 102.87% w/w for TPE and 98.67% w/w for EFE in the range given stated in the official book. SD was found 0.7984 for EFE and 1.3954 for TPE and RSD data in precision study was within given criteria. Resolution was proper and chromatogram with well resolved peaks was sign of methods efficiency. The developed method is suitable for routine quality control tests for the solid dosage form. The method is economical as both drugs were eluted within 6 mins and no interference of excipients was observed during estimation.

## SYNTHESIS, ANTICANCER ACTIVITY, MOLECULAR DOCKING STUDIES OF N-[(4-METHYLPHENYL) SULFONYL]-N'-SUBSTITUTED UREA

Sayukta V Pahurkar, Vithal M. Kulkarni, Sandeep S. Pathare
Department of Pharmaceutical Chemistry, Poona College of Pharmacy,
Bharati Vidyapeeth (Deemed to be University),
Pune - 411038, Maharashtra, India.
sandeep.pathare@bharatividyapeeth.edu

Cancer remains a significant global health challenge due to its complex etiology and limited therapeutic specificity. Sulphonylureas, traditionally known for antidiabetic applications, have recently gained attention for their potential anticancer activities. Synthesis of some N-[(4-methylphenyl) sulfonyl]-N'-substituted urea derivatives were synthesized by general methods. These were purified and characterised spectroscopy. The cytotoxic potential was evaluated *in vitro* against the MCF-7 breast cancer cell line via MTT assay. Compound SS-4 showed the most promising $IC_{50}$ value of 0.49 µM. Molecular docking was carried out using AutoDock Vina targeting VEGFR2 (PDB ID: 3WZE), and binding interactions were compared with a known standard drug, Sorafenib. QSAR analysis was performed between pIC50 and physicochemical descriptors (logP, HBA, HBD, MR). The results revealed a negative contribution of lipophilicity for inhibitory activity. This study provides valuable insights into the development of sulphonylurea-based potential anticancer agents.

## INTEGRATING NETWORK PHARMACOLOGY WITH MOLECULAR DOCKING AND *IN VITRO* MTT ASSAY TO RATIONALIZE THE USE OF CLEOME VISCOSA FOR THE TREATMENT OF PROSTATE CANCER

Gedela. Madhuri, M. Naga Bharathi
Department of Pharmacology, Vignan Institute of Pharmaceutical Technology, Vishakhapatnam, Andhra Pradesh.
bharathimarni@gmail.com

Prostate cancer remains a leading cause of cancer-related mortality in men, with current treatments often fraught with severe side effects and drug resistance, necessitating the discovery of novel therapeutic agents. Cleome viscosa, a plant with documented anticancer activity against

ISBN: 978-81-980623-8-3

liver and breast cancer cell lines, was investigated for its potential against prostate cancer in this study.This study aimed to comprehensively explore and rationalize the anticancer potential of Cleome viscosa against prostate cancer by integrating network pharmacology, molecular docking simulations, and *in vitro* MTT assay. Fresh Cleome viscosa plants were extracted with methanol after collection, drying, and pulverization. Standard qualitative tests confirmed the presence of various phytochemicals. Network pharmacology analysis was then performed by identifying bioactive compounds from public databases, assessing their drug-likeness (ADMET), and predicting their molecular targets. Prostate cancer-related genes were curated from databases, and overlapping targets between compound predictions and disease genes were identified using the Venny tool, yielding 15 common targets including AR, MAPK8, EGFR, and PIK3CA. Compound-target and protein-protein interaction networks were constructed followed by pathway and functional enrichment analyses to delineate affected signaling pathways. Key targets were then used for molecular docking, with protein structures sourced from the Protein Data Bank. Docking simulations using PyRx evaluated binding affinities and interactions. For experimental validation, human prostate cancer PC-3 cells were treated with various doses (25-200 µg/ml) of the methanolic extract for 24 hours, and cytotoxicity was assessed via the MTT assay. The study successfully demonstrated the anticancer potential of Cleome viscosa phytochemicals. Molecular docking revealed strong binding interactions; notably, Bazedoxifene exhibited an identical high binding affinity of -8.2 kcal/mol with both Quercetin and Naringenin, indicating favorable and stable interactions. The *in vitro* MTT assay on PC-3 cells confirmed a dose-dependent reduction in cell viability, with an $IC_{50}$ of 166.22 ± 0.41 µg/ml after 24 hours. These integrated findings suggest that Cleome viscosa contains compounds with promising therapeutic effects against prostate cancer, acting through multiple molecular targets.

**Keywords:** Prostate cancer, Cleome viscosa, Network pharmacology, Molecular docking, MTT assay, Phytochemicals

## METHOD DEVELOPMENT AND VALIDATION OF A GAS CHROMATOGRAPHY TECHNIQUE FOR RESIDUAL SOLVENTS IN BORTEZOMIB

Lurdhu Mary.k, Naresh Podila,
Vignan's Foundation for Science, Technology, and Research,
Vadlamudi, Guntur, Andhra Pradesh-522213.
lurdhumary.k@gmail.com

Residual solvents in pharmaceutical products pose potential health risks, making their accurate quantification essential for ensuring drug safety and regulatory compliance. Bortezomib, a potent anticancer drug, requires stringent quality control to minimize residual solvents levels as excessive residues can affect drug efficacy and patient safety. A validated gas chromatography (GC) method with a flame ionization detector (FID) can provide a reliable approach for detecting and quantifying residual solvents.Separation was achieved using a DB-624 capillary column (30 m x 0.53 mm id x 30 µm film thickness) with helium as the carrier gas. The total run time was 25 min. The developed method underwent comprehensive validation for system suitability, specificity, linearity, range, LOD, LOQ, precision, stability of test solution, ruggedness, and robustness, making it suitable for precise quantification.The method shows good linearity in concentration ranges from LOQ to 150%. The proposed method is a reliable and validated approach for residual solvent analysis in bortezomib. Its accuracy and precision make it well-suited for quality control and regulatory compliance in pharmaceutical manufacturing.

**Keywords**: Bortezomib, residual solvents, carrier gas, direct injection method, capillary column.

## METHOD DEVELOPMENT AND VALIDATION OF SELECTIVE ANTIHYPERTENSIVE DRUGS IN THEIR COMBAINED TABLET DOSAGE FORM BY USING REVERSE PHASE HIGH PERFORMANCE LIQUID CHROMATOGRAPHY

Bodavula Samba Siva Rao
Principal & Professor, Khammam College of Pharmacy, Khammam.
siva69pharma@gmail.com

The present work describes a validated reverse phase high performance liquid chromatographic method for simultaneous estimation of Irbesartan chlorthalidone and cilnidipine in tablet dosage form. The quantification was carried out using C18 column (250 x 4.6mm, 5µm) and mobile phase comprised of Buffer, Acetonitrile and TEA in a proportion of 80:20:0.1 %v/v/v. The flow rate was 1.0 ml/min and the eluent was monitored at 222 nm. The selected chromatographic conditions were found to effectively separate Irbesartan Chlorthalidone and cilnidipine were 3.807 min, 4.667 min, and 6.887 min respectively. Linearity was found to be in the range of 30-90 µg/ml, 1.25-3.75 µg/ml and 1-3 µg/ml for Irbesartan Chlorthalidone and cilnidipine respectively. The percentage recoveries of all the drugs were found to be 99.27-99.81%, 99.57-99.99% and 99.22-99.44% for Irbesartan, chlorthalidone, and cilnidipine. The proposed method was found to be fast, accurate, precise, and reproducible and can be used for simultaneous estimation of these drugs in a tablet.

**Keywords:** Irbesartan, chlorthalidone and cilnidipine, Reversed-phase HPLC.

## DESIGN, SYNTHESIS, AND ANTICANCER EVALUATION OF NEW SCHIFF BASES CONTAINING A 1,2,4-TRIAZOLE CORE VIA A ONE-POT APPROACH

Byran Gowramma, Balasubramanian Hardha
Department of Pharmaceutical Chemistry, JSS College of Pharmacy,
JSS Academy of Higher Education & Research, Ooty,
Nilgiris, Tamil Nadu, India
gowrammab@jssuni.edu.in

A series of ten novel Schiff bases incorporating a 1,2,4-triazole core were designed, synthesized, and evaluated for their anticancer potential. The synthesis was carried out via a green and convenient one-pot method using phenyl hydrazine, ethyl acetoacetate, and formic acid, with lemon juice employed as a natural catalyst to generate the triazole intermediate. This intermediate was subsequently condensed with various substituted aromatic aldehydes to yield the target Schiff bases (A1–A10). The structures of all synthesized compounds were confirmed by IR, $^{1}H$ NMR, $^{13}C$ NMR, and mass spectrometry. *In silico* molecular docking studies were performed against the PARP-1 enzyme (PDB ID: 4ZZZ), a key target in anticancer therapy. Compounds A2, A3, and A5 exhibited strong binding affinities with Glide scores comparable to the reference drug Olaparib. ADME predictions further supported their drug-likeness and suitability as lead candidates. The *in vitro* anticancer activity of all compounds was assessed against human breast cancer cell lines MCF-7 and MDA-MB-231 using the MTT assay. Notably, compounds A3 and A5 demonstrated significant cytotoxicity, with $IC_{50}$ values in the low micromolar range, closely aligning with Olaparib. The remaining compounds showed moderate activity, indicating a structure-activity relationship (SAR) influenced by the nature of the aldehyde substituents. Overall, the findings highlight compounds A3 and A5 as promising PARP-1 inhibitors with potential for further development in anticancer drug discovery.

**Keywords:** Schiff bases, 1,2,4-Triazole, PARP-1 inhibitors, green synthesis, Anticancer activity, Molecular docking

Compounds A2, A3, and A5 exhibited strong binding affinities with Glide scores comparable to the reference drug Olaparib. ADME predictions further supported their drug-likeness and suitability as lead candidates. The *in vitro* anticancer activity of all compounds was assessed against human breast cancer cell lines MCF-7 and MDA-MB-231 using the MTT assay. Notably, compounds A3 and A5 demonstrated significant cytotoxicity, with $IC_{50}$ values in the low micromolar range, closely aligning with Olaparib. The remaining compounds showed moderate activity, indicating a structure-activity relationship (SAR) influenced by the nature of the aldehyde substituents. Overall, the findings highlight compounds A3 and A5 as promising PARP-1 inhibitors with potential for further development in anticancer drug discovery.

## CENTRAL COMPOSITE DESIGN ASSISTED HPLC METHOD DEVELOPMENT FOR HIGH-THROUGHPUT ANALYSIS OF TELMISARTAN, CHLORTHALIDONE AND METOPROLOL SUCCINATE

Rajasekaran C, Sudha T
Department of Pharmaceutical Chemistry and Analysis, School of Pharmaceutical Sciences, Vels Institute of Science,Technology and Advanced Studies, Pallavaram, Chennai, Tamil Nadu, India. -600117
rajasekar301199@gmail.com

Optimization for the estimation of drug combinations by HPLC is essential and superior in terms of efficient, cost, accuracy and regulatory compliance comparing normal method development making it high quality pharmaceutical analysis. Optimization by Central Composite Design is highly significant due to its advanced and systematic approach of multiple variables evaluation and their interaction providing minimal number of experimental runs by giving an accurate mathematical models like Response surface method which predicts method performance under various conditions. The present study uses Telmisartan, Chlorthalidone and Metoprolol Succinate. In their combined tablet dosage forms for method development and validation using CCD as an Optimization tool by HPLC. For Optimization, acetonitrile concentration as mobile phase, pH of the phosphate buffer and flow rate were selected as factors with chosen responses from capacity factor, retention time and resolution between the peaks. The results obtained from CCD experiments were presented as perturbation and response surface plots to get visual representation of individual and multiple factors. Overall, the method gets a desirability value of 0.770 indicating best method performance. Retention time of Telmisartan, Chlorthalidone and Metoprolol Succinate. were 5.239, 7.692- and 10.623-minutes using acetonitrile and 0.05M phosphate buffer in the ratio 30:70 %V/V and pH of 6.2 at a flow rate 1.0 ml/min at a detection wavelength of 215 nm. Validation parameters according to ICH guidelines were done and found to be within limits. The method may be adopted for routine analysis of these drugs in pharmaceutical industry.

**Keywords:** Optimization, Central Composite design, HPLC, Validation, ICH guidelines

## NOVEL ZINGERONE-DERIVED CHALCONES AS POTENTIAL NEUROPROTECTIVE LEADS: SYNTHESIS, *IN SILICO* DOCKING, AND *IN VITRO* EVALUATION

Vasanthi Sunkari, Kiran Manda
Department of Pharmaceutical Chemistry, Shri Vishnu College of Pharmacy, Bhimavaram, West Godavari District,
Andhra Pradesh-534202
vasanthisunkari39@gmail.com

Chalcones are open-chain flavonoids with antioxidant and neuroprotective potential. Zingerone, a phenolic alkanone from Zingiber officinale, has demonstrated beneficial neuroprotective effects. This study reports the synthesis of novel Zingerone-derived chalcones, their structural characterisation, *in silico* docking, and evaluation of neuroprotective activity. A series of six Zingerone-derived chalcones were synthesised via Claisen–Schmidt condensation using substituted benzaldehydes. Structures were confirmed by FT-IR, 1H/13C NMR, and mass spectrometry. *In silico* docking was performed against acetylcholinesterase (AChE), monoamine oxidase-B (MAO-B), and GSK-3β using AutoDock Vina. ADMET profiles were predicted *in silico*. Neuroprotective effects were evaluated in SH-SY5Y neuronal cells exposed to $H_2O_2$-induced oxidative stress, using MTT, ROS, caspase-3, and mitochondrial potential assays. The synthesised chalcones exhibited good yields (62–83%). Docking scores ranged from −7.8 to −10.2 kcal/mol for AChE and −7.1 to −9.4 kcal/mol for MAO-B, with the methoxy-substituted derivative (C4) showing the best binding (−10.2 kcal/mol for AChE). ADMET analysis predicted BBB penetration, logP values between 2.5–3.8, and no hepatotoxicity or mutagenicity risk. In SH-SY5Y cells, $H_2O_2$ reduced viability to 48 ± 3.2%, whereas pretreatment with chalcones (10 µM) restored viability to 78–91% ($p < 0.01$). ROS generation decreased by 65%, caspase-3 activity was reduced by 45%, and mitochondrial membrane potential was preserved at 82% of control levels compared to 51% in untreated stressed cells. Zingerone-derived chalcones display favourable drug-likeness, strong binding affinity to neurodegeneration-related targets, and significant neuroprotective effects *in vitro*. These findings suggest their potential as leads for developing novel therapeutics against neurodegenerative disorders.

## SYNTHESIS, CHARACTERIZATION, AND BIOLOGICAL EVALUATION OF 2-PHENYL-1,3-OXAZOL-5-ONE DERIVATIVES AS POTENTIAL BREAST CANCER THERAPEUTICS: A COMBINED APPROACH OF MICROWAVE SYNTHESIS, MOLECULAR DOCKING, AND CYTOTOXIC STUDY

Sriabinaya S, Pradeepa Prasad
Department of Pharmaceutical Chemistry, The Oxford College of Pharmacy, Hongasandra, Bangalore-68, Karnataka, India.
srinathg364@gmail.com

Oxazolone derivatives have gained significant attention due to their wide spectrum of biological activities, particularly anticancer potential. Breast cancer continues to be a leading cause of mortality among women, necessitating the development of novel therapeutic agents. In this study, 36 derivatives of 2-Phenyl-1,3-Oxazol-5-One were designed as potential PARP-1 inhibitors. Molecular docking against PARP-1 (PDB ID: 4UND) revealed that several compounds exhibited favourable binding affinities, with strong hydrogen bonding and hydrophobic interactions comparable to standard drugs such as niraparib, veliparib, and Olaparib. Three top-ranking derivatives (OV1, OV2, and OI30) were synthesized using an efficient microwave-assisted method involving hippuric acid and substituted benzaldehydes. Structural confirmation was achieved through FT-IR, $^1$H-NMR, and mass spectrometry. Biological evaluation by MTT assay demonstrated dose-dependent cytotoxicity, with certain derivatives showing moderate to potent activity against breast cancer cells. In addition, *in silico* ADME profiling indicated favourable drug-likeness and pharmacokinetic potential. The present work establishes 2-Phenyl-1,3-Oxazol-5-One derivatives as promising scaffolds for anticancer drug discovery targeting PARP-1. The combination of rational design, docking validation, eco-friendly microwave-assisted synthesis, spectral characterization, and preliminary biological evaluation highlights their potential as lead candidates. Further optimization and pharmacological studies are warranted to advance these oxazolone derivatives toward breast cancer therapy.

**Keywords:** 2-Phenyl-1,3-Oxazol-5-One, Oxazolone derivatives, PARP-1 inhibition, Microwave-assisted synthesis, Anticancer agents

## ANTIMICROBIAL POTENTIAL OF NOVEL 3,5-DISUBSTITUTED 1,3,4-OXADIAZOLE-2-THIONE DERIVATIVES: AN IN-SILICO AND *IN-VITRO* APPROACH

Sasmita Dash[1], Biswakanth Kar[2]
[1]Bengal School of Technology, Sugandha, Hooghly, West Bengal – 712102
[2]School of Pharmaceutical Sciences, Siksha O Anusandhan Deemed to be University, Bhubaneswar, India-751030
dsasmita.in@gmail.com

Infectious diseases remain a significant health concern, accounting for approximately 41% of the global disease burden. One of the main causes of this problem is bacterial resistance to antibiotics. The current antibiotic therapies are often accompanied by a range of toxic effects. Antimicrobial drugs may produce adverse effects like an allergic reaction and hypersensitivity upon consumption. Additionally, a major concern is

ISBN: 978-81-980623-8-3

that some antimicrobial drugs have triggered multiple drug resistance in hosts, thus, attention is now being shifted towards biologically active components of many synthetic origins. A series of novel 3,5-disubstituted 1,3,4-oxadiazole-2-thione derivatives (1e, 2e, 3e, 4e, and 5e) synthesized from different substituted aromatic acids. The identification of functional groups and structure determination were made on the basis of IR, 1H NMR, and Elemental analysis, respectively. Further, the newly synthesized 1,3,4-oxadiazole derivatives were studied for the antimicrobial activity against various gram-positive and gram-negative bacteria. Among all the tested compounds, 1(e) and 5(e) showed minimum inhibitory concentration (MIC) at 100 µg/ml compared with 4(e) & 3(e) at 200 µg/ml against specific organisms. The ortho and para substitution of the aromatic ring in the oxadiazole derivative with nitro, hydroxy, chloro, and alkyl substitution may hold the responsibility to enhance the cytotoxicity against the tested microorganisms, which extends the scope of research to develop potent molecules for the treatment of microbial infections. Molecular docking studies were performed to explore the binding interactions of synthesized 1,3,4-oxadiazole compounds with receptor proteins to justify their antimicrobial potential, which has been compared with the standard drug methicillin.

## RP-HPLC METHOD DEVELOPMENT AND VALIDATION FOR QUANTITATIVE ESTIMATION OF ABAMETAPIR IN BULK DRUG FORM

Himashruthi, Vijayakrishna C. Aradhya
Department of Pharmaceutical Analysis, National College of Pharmacy,
Shivamogga - 577204, Karnataka, India
himashruthismg@gmail.com

A novel, simple, and reproducible reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed and validated for the quantification of Abametapir in bulk drug. Chromatographic separation was achieved using a C18 column with a mobile phase of methanol:water (90:10 v/v), at a flow rate of 1.0 mL/min, and detection at 254 nm. A distinct retention time for Abametapir was observed at 7.41 min, with sharp peak symmetry. The developed method exhibited excellent linearity over the concentration range of 200–1000 µg/mL ($r^2$ = 0.9984). Validation was performed in accordance with ICH Q2(R1) guidelines. The method demonstrated high accuracy, with percentage recovery ranging from 99.17% to 100.02% across 50%, 100%, and 150% levels. Precision studies showed %RSD values below 1% for both intra-day and inter-day analyses, confirming method reliability. The limit of detection (LOD) and limit of quantification (LOQ) were found to be 8.93 µg/mL and 27.06 µg/mL, respectively. System suitability parameters, including tailing factor (1.17) and theoretical plates (3434.2), were within acceptable limits.This validated RP-HPLC method provides a reliable, cost-effective tool for routine quality control of Abametapir, ensuring analytical consistency and regulatory compliance.

**Keywords:** Abametapir, RP-HPLC, ICH Q2(R1), Photodiode Array Detector, Empower Software.

## DEVELOPMENT AND VALIDATION OF AN HPLC METHOD FOR THE QUANTIFICATION OF STIGMASTEROL AND NEUROPROTECTIVE POTENTIAL OF ALPINIA CALCARATA AGAINST CISPLATIN-INDUCED NEUROPATHY IN A RAT MODEL

Apurwa Rahul Salunkhe, Hariprasad M G
Department of Pharmaceutical Quality Assurance,
Krupanidhi College of Pharmacy,
Bengaluru, India - 560035.
Department of Pharmacology, KLE College of Pharmacy,
Bengaluru, India -560010
apurwa.dhavale@gmail.com

The current study aims to develop and validate a high-performance liquid chromatography (HPLC) method for the quantification of stigmasterol and the neuroprotective Potential of ethanolic extract of Alpinia calcarata (EEAC) rhizome against Cisplatin-Induced neuropathy in a rat model. Cisplatin (CDDP) is a platinum-based anticancer drug widely used as a cytotoxic chemotherapeutic agent. In the present study, the neuroprotective effect of EEAC was investigated in cisplatin-induced (2 mg/kg i.p. once weekly for five weeks) peripheral neuropathy in rats. After 5 weeks of EEAC treatment, the degree of neuroprotection was determined by measuring body weight, behavioural and histopathological properties. Acetonitrile: Orthophosphoric acid (90:10v/v) was found to have good symmetry and the lowest Rt (3.64) min and a sharp peak, and a wavelength of 220 nm. The linearity range, regression coefficient and LOD and LOQ of the stigmasterol solution were obtained. Accuracy and precision were determined for stigmasterol and RSD values, respectively. The % RSD was < 2. The peak retention time was found to be 3.6 min, and the number of theoretical plates in all standard injections for stigmasterol was ≥ 2000. The tailing factor was recorded as 0.99. The developed method was applied for the quantification of stigmasterol in EEAC. It was found that stigmasterol shows retention at 3.58, and the area under the peak was found to be 4088.86. The amount of stigmasterol detected in the extract was 12.61 µg. EEAC showed improvement in b.w. Cisplatin-induced behavioural changes were seen to be reverted back to normal to a significant extent. Histopathological analysis revealed reduced nerve damage along with improved preservation of myelin and axonal structures in the treatment groups.

## FORMULATION AND EVALUATION OF A SEMI-SYNTHETIC CREAM FOR THE TREATMENT OF SHINGLES (HERPES ZOSTER)

Khedkar Amol N., Veer Sujata U., Atole Samiksha N., Bhosale Sayali S.
Saikrupa Institute of Pharmacy, Ghargaon, Tal-Shrigonda,
Dist-Ahilyanagar, Maharashtra State, India 413728.
khedkaramol2@gmail.com

The Varicella-zoster virus (VZV), also known as human herpes virus 3, is a neurotropic alpha herpes virus responsible for causing both chickenpox (varicella) and shingles (herpes zoster). This study focuses on herpes zoster, which commonly occurs as a reactivation of VZV, particularly in older adults. Herpes zoster is more prevalent in the elderly and in individuals with low immune systems due to factors such as stress, infections like HIV, COVID-19, or immunosuppressive conditions. Shingles is characterized by painful rashes and blisters. Though antiviral drugs are standard treatment, there is growing interest in herbal therapies for symptom relief and faster healing. This research involves the development and assessment of a new semi-synthetic cream formulated with herbal ingredients known for their antiviral, anti-inflammatory, and analgesic properties specifically, extracts of walnut, tulsi, fenugreek, dracena trifasciata, black beans and rose water. A randomized controlled trial was conducted with patients diagnosed with shingles. The herbal cream was applied topically to affected areas, and outcomes were measured in terms of pain reduction, lesion healing, and overall symptom improvement over a set period. Initial findings suggest that the cream is effective, showing significant pain relief and faster recovery compared to the control group. The formulation was well tolerated with no reported side effects. In summary, this herbal-based cream demonstrates promise as a complementary or alternative treatment for shingles, supporting both symptom relief and healing. Further research is encouraged to confirm these results and investigate the cream's mechanisms of action.

## DESIGN, SYNTHESIS OF 9-ANILINOACRIDINE DERIVATIVES AND EVALUATION OF ANTI-BREAST CANCER ACTIVITY

Kalirajan Rajagopal, Aparna Baliwada
Department of Pharmaceutical Chemistry, JSS College of Pharmacy,
JSS Academy of Higher Education & Research, Ooty – 643001,
Tamil Nadu, India.
rkalirajan@jssuni.edu.in

The prevalence of breast cancer is increased globally; there is need of promising drugs without side effects. So, we can design drugs against various breast cancer targets like ER, HER-2, CDK 4, PARP etc. 9-anilinoacridines play an important role as antitumor DNA-intercalating agents, due to their antiproliferative properties. Several anticancer agents with 9-anilinoacridines such as amascrine and nitracrine have

ISBN: 978-81-980623-8-3

been developed. In the present study, for identification of potential ligands of 9-anilino acridines as selective ERα inhibitors (2IOG.pdb) targeting breast cancer by using Schrodinger suit-2024-2, Maestro 14 version. Docking was performed by Glide module, in-silco ADMET screening by qikprop module, free binding energy was calculated by Prime-MMGBSA module and MD simulation by Desmond Module. The selective compounds are synthesized, Characterized and evaluated for *in-vitro* anti-breast cancer activity against MCF-7 cells. The 9-anilinoacridine derivatives 4a-j have good binding affinity with Glide score in the range of --8.11 to -12.64 Kcal/mol when compared with the standard Nitracrine (-5.61) and tamoxifen (-7.81). The ADMET screening of the designed molecules are within the recommended values. MM-GBSA binding results of most potent inhibitor displayed stable and favorable. A 100ns MD simulation study also confirms the stability of docking complex. The compounds with good Glide scores are synthesized, characterized and evaluation of Anti-breast Cancer activity against MCF-7 Cell lines also performed Two of the synthesized compounds 4f & 4j had shown good IC50 values 123.3µM and 164µM. ER binding assay and gene expression by RT-PCR method had also proven that these compounds are good antagonist to estrogen receptor. The results reveal that, this study provides evidence for consideration of valuable ligands in 9-anilinoacridine derivatives as potential ERα inhibitor and the compounds, 4f & 4j have significant anti-breast cancer activity and are useful as drugs after further refinement.

### MOLECULAR DOCKING-BASED INSIGHTS INTO THE INHIBITORY POTENTIAL OF VITAMIN E AGAINST MAPK8 (JNK1) IN DISEASE PATHWAYS

A.S.Deva Dharsan, P.Natarajan
Department of Pharmacology, Sankaralingam Bhuvaneswari College of Pharmacy, Sivakasi-626130.
devadharsan78@gmail.com

Vitamin E is a naturally occurring fat-soluble antioxidant that plays a crucial role in maintaining cellular integrity by reducing oxidative stress and preventing free radical–induced damage. Beyond its nutritional value, Vitamin E has been reported to possess therapeutic potential in various pathological conditions, including cancer, rheumatoid arthritis, and inflammatory disorders. The mitogen-activated protein kinase 8 (MAPK8), also known as c-Jun N-terminal kinase 1 (JNK1), is a key regulator of stress-induced signaling pathways that contribute to apoptosis, inflammation, and tumor progression. In this study, we aimed to investigate the inhibitory potential of Vitamin E against MAPK8 using molecular docking approaches. The three-dimensional crystal structure of MAPK8 was retrieved from the Protein Data Bank (PDB) and validated using UniProt, while the ligand structure of Vitamin E was obtained from the PubChem database. Molecular docking simulations were performed using Biovia Discovery Studio to predict the binding orientation, interaction energy, and key amino acid residues involved in the Vitamin E–MAPK8 complex. The docking analysis revealed a favorable binding energy of −7.89 kcal/mol, suggesting strong interaction and stability of the ligand–protein complex. Vitamin E was found to form hydrophobic contacts and hydrogen bond interactions with critical residues in the MAPK8 active site, potentially interfering with its kinase activity. These results highlight the ability of Vitamin E to modulate MAPK8 signaling through direct binding, providing computational evidence for its therapeutic relevance in MAPK8-associated diseases. Further *in vitro* and *in vivo* validation is warranted to establish Vitamin E as a potential natural inhibitor of MAPK8.

**Keywords**: Vitamin E, MAPK8 (JNK1), Molecular docking, Cancer, Computational drug discovery

### NETWORK MODELING, DFT AND COMPUTATIONAL INSIGHTS OF QUINOXALINE MEDIATED PYRAZOLINES AS ANTI-BREAST CANCER AGENTS

Praveen Sekar[1,2], Senthilkumar Palaniappan[1], Senthil Kumar Raju[2]
[1]Faculty of Pharmacy, Karpagam Academy of Higher Education, Eachanari, Coimbatore, Tamil Nadu, India – 641021.
[2]Department of Pharmaceutical Chemistry, Swamy Vivekanandha College of Pharmacy, Tiruchengode, Namakkal, Tamil Nadu, India – 637205.
mrpraveensekar@gmail.com

Heterocyclic compounds play a vital role in the treatment of various ailments. Network pharmacology is an emerging technique for investigating the molecular effects of compounds. In this current research, novel quinoxaline-mediated pyrazoline derivatives were designed and evaluated for their potential using the network pharmacology approach. The mechanistic pathway and the prominent targets were identified using network pharmacology and enrichment analyses. These analyses merely showed that the designed compounds would be highly active against breast cancer by targeting the Estrogen signaling pathway. The gene survival analysis exhibited that the targets (ESR1 and ERBB2) were significant. The physicochemical, pharmacokinetic and toxicity parameters of the designed compounds were evaluated and the findings of these studies showed the druggable nature of the compounds. The drug score in the range of 0.1-0.7 was observed, calculated using the OSIRIS Property Explorer. The molecular docking using Autodock 4.2 against the selected targets was performed, which was compared with the co-crystallized ligands and standards. Among them, derivative 7Q was found to be highly active with binding energies of -9.8 Kcal/Mol and -10.6 Kcal/Mol against ESR1 and ERBB2, respectively. The binding interactions of this compound are also higher compared to other derivatives and superimposable with the co-crystallized ligand, which will be suitable for molecular dynamics simulations. Further, the compounds 7N, 7O, 7AO and 7AP were also found to be active, according to various computational studies. The graph theoretical studies at the DFT level and molecular modelling of the lead-like molecules confirmed the stability and potency of the compounds. Thus, these derivatives can be effectively used in the management of breast cancer. However, biological studies are warranted.

### *INSILICO* SCREENING OF BIOACTIVE COMPOUNDS DERIVED FROM BACOPA MONNIERI AGAINST ARTHRITIS

Renuka Jadhav[1], Akshada Koparde[2]
[1] Department of Regulatory Affairs, Krishna Institute of Pharmacy, Krishna Vishwa Vidyapeeth (Deemed to Be University), Karad, Maharashtra, India- 415539
[2] Department of Pharmaceutical Chemistry, Krishna Institute of Pharmacy, Krishna Vishwa Vidyapeeth (Deemed to be University), Karad, Maharashtra, India 415439
renukajadhav2002@gmail.com

Bacopa monniera (synonyms Herpestis monniera, Bacopa monnieri), commonly known as water hyssop or “Brahmi,” is a prominent herb in the Ayurvedic medicine recognized for its neuroprotective, antioxidant, and cognition-enhancing properties. The present study utilized an in-silico approach to assess the pharmacological potential of its major phytoconstituents, namely bacopaside II, bacopaside I, and kaempferol. Molecular docking analyses were conducted by using PyRx software, with ligand structures obtained from PubChem and receptor coordinates retrieved from the Protein Data Bank (PDB). Receptor interactions were evaluated with supporting the structural insights from PDB-SUM and BioDiscovery tools. Three neurologically relevant protein targets—3LXK, 4JKV, and 5XRA—were selected due to their association with the signaling pathways and neurodegenerative disorders. Docking simulations enabled the prediction of optimal binding orientations, interaction energies, and pharmacokinetic properties for each evaluated compound. Among the tested ligands, bacopaside II demonstrated the highest binding affinity across all receptors, indicating a more favorable interaction profile compared with bacopaside I and kaempferol. These results highlight the superior therapeutic potential of bacopaside II and reinforce its relevance for central nervous system modulation. Overall, the study underscores the value of in-silico methodologies as cost-effective, time-efficient strategies for prioritizing bioactive molecules prior to *in-vitro* and *in-vivo* validation.

### DESIGN AND DEVELOPMENT OF NATTOKINASE-LOADED NANOCARRIERS FOR SENOSTATIC THERAPY

Neha Nistane, Jayshree Taksande, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee,

ISBN: 978-81-980623-8-3

Nagpur, Maharashtra-441002
nehanistane8@gmail.com

Aging is characterized by progressive cellular and physiological decline, mainly caused by the buildup of senescent cells with a pro-inflammatory senescence-associated secretory phenotype. Senotherapeutics, including senolytics and senostatics, have emerged as promising approaches to reduce age-related dysfunction. Nattokinase, a fibrinolytic serine protease derived from Bacillus subtilis natto, has shown senostatic and antioxidant activity by modulating senescence markers and inflammatory cascades. However, its therapeutic use is limited by enzymatic breakdown, instability, and poor absorption in the gastrointestinal tract. In this study, Nattokinase was encapsulated into liposomes using the thin film hydration method after confirming drug–excipient compatibility through FTIR analysis. Optimization via Box–Behnken Design produced an optimal batch (F7) with a mean particle size of 189 ± 1.92 nm, which increased to 287 ± 0.32 nm after Eudragit–chitosan coating. The zeta potential improved from 22.3 ± 1.0 mV (uncoated) to 32.6 ± 1.3 mV (coated), indicating enhanced colloidal stability. Entrapment efficiency also rose from 77.02 ± 0.30% to 81.82 ± 0.40% following coating. *In vitro* release studies showed sustained Nattokinase release, with the coated liposomes providing slow and controlled drug release. The DPPH assay confirmed notable dose-dependent antioxidant activity. Further *in vivo* tests revealed that Nattokinase nanocarriers reduced senescence-associated β-galactosidase activity in the liver, spleen, and hippocampus, while decreasing oxidative stress markers in the liver, plasma, and brain. These results suggest that Eudragit–chitosan coating liposomal Nattokinase nanocarriers are a stable, bioavailable, and effective platform for senostatic therapy, emphasizing their potential as next-generation treatments for aging related conditions.

## EVALUATION AND OPTIMIZATION OF EXTRACTION EFFICIENCY AND HPTLC ANALYSIS OF ANDROGRAPHOLIDE IN ANDROGRAPHIS PANICULATA

K. S. Salve, R. S. Bhandakkar, Amruta Kashid
PES Modern Colleg of Pharmacy (For Ladies) Moshi, Pune,
Maharashtra, India, 412105
patilketki9@gmail.com

Andrographolide, the principal bioactive constituent of Andrographis paniculata, demonstrates diverse pharmacological properties, including anti-inflammatory, antiviral and hepatoprotective activities. The present study reports development and optimization of High-Performance Thin-Layer Chromatography (HPTLC) method for detection and quantification of andrographolide in plant extracts. Comparative analyses were performed using standard and newly optimized mobile phase systems (Chloroform: Methanol: Toluene, C:M: T, 5:2:3) to assess their efficiency in resolving andrographolide. A total of 25 g of powdered raw drug was divided into two sets for extraction. The first set underwent solvent extraction with ethanol, methanol, acetone, and ethyl acetate (250 mL each) without solubility enhancers. The second set was extracted in the same solvent supplemented with compatible solubility enhancers: methanol with PEG 400, ethanol with PVP K30, ethyl acetate with Span 80 and acetone with sodium lauryl sulphate. Extracts were quantitatively analyzed via HPTLC to determine andrographolide yield. Results indicate that solubility enhancers significantly enhance extraction efficiency and yield. The optimized mobile phase yielded improved resolution, sharper peaks, and superior Rf value with reproducibility. This method provides a reliable, accurate and reproducible approach for the standardization and quality control of herbal formulations containing andrographolide.

amritkumar052@gmail.com

Linagliptin, a dipeptidyl peptidase-4 (DPP-4) inhibitor, is widely prescribed for the treatment of type 2 diabetes mellitus. Accurate and sensitive quantification of linagliptin in human plasma is essential for pharmacokinetic and bioequivalence studies, yet many previously reported assays suffer from limited sensitivity and reproducibility. This study aimed to develop and validate a highly sensitive and robust liquid chromatography–electrospray ionization–tandem mass spectrometry (LC–ESI–MS/MS) method for the determination of linagliptin in human plasma, in accordance with USFDA and EMA guidelines. The method employed liquid–liquid extraction using clopidogrel carboxylic acid as the internal standard. Chromatographic separation was achieved with a mobile phase of 0.1% formic acid in water (A) and acetonitrile (B) under gradient conditions. The mass spectrometer operated in positive ion mode with multiple reaction monitoring (MRM) for selective quantification. The calibration curve was constructed over the range of 0.16–20 ng/mL. Validation parameters including specificity, sensitivity, accuracy, precision, recovery, stability, and matrix effects were systematically evaluated. The method demonstrated excellent linearity ($r^2 > 0.999$) with an LLOQ of 0.16 ng/mL. Intra- and inter-day accuracy and precision were within regulatory acceptance limits. Recovery exceeded 85% for linagliptin and 90% for the internal standard, with negligible matrix effects. Stability studies confirmed the analyte's integrity under short-term, long-term, freeze–thaw, and autosampler conditions. The validated LC–ESI–MS/MS method is highly sensitive, selective, and reproducible, making it suitable for application in clinical pharmacokinetic and bioequivalence studies of linagliptin.

**Keywords:** Linagliptin; LC–ESI–MS/MS; Bioanalytical Method; Pharmacokinetics; Validation.

## DEVELOPMENT AND VALIDATION OF RP-HPLC METHOD FOR SIMULTANEOUS ESTIMATION OF DAPAGLIFLOZIN, VILDAGLIPTIN AND METFORMIN HYDROCHLORIDE IN COMBINE DOSAGE FORM ALONG WITH GREENNESS ASSESSMENT

Suraj Singh, Mansi Rohit, Ishvarchandra Parmar
Department of Pharmaceutical Quality Assurance, SSR College of Pharmacy, Sayli, Silvassa-396230,
UT of Dadra and Nagar Haveli and Daman and Diu, India.
ss184742@gmail.com

The simultaneous quantification of dapagliflozin, vildagliptin, and metformin hydrochloride in fixed-dose combinations is critical for ensuring pharmaceutical quality and therapeutic efficacy. Reverse-phase high-performance liquid chromatography (RP-HPLC) remains the preferred analytical technique for such multi-component formulations due to its precision and reproducibility. To develop and validate a selective, accurate, and precise RP-HPLC method for the concurrent determination of dapagliflozin, vildagliptin, and metformin hydrochloride in combined dosage forms in accordance with ICH Q2(R2) guidelines. Chromatographic separation was achieved on a Finepak SIL C18T-5 column (250 mm × 4.6 mm) using a gradient elution of 0.1% orthophosphoric acid and acetonitrile, with detection at 215 nm. Validation parameters assessed included specificity, linearity, accuracy, precision, and robustness.
The method demonstrated linearity for metformin (40–140 µg/mL), vildagliptin (8–28 µg/mL), and dapagliflozin (0.8–2.8 µg/mL) with correlation coefficients ($r^2$) ≥ 0.99. Recovery values ranged from 98% to 102%, and intra- and inter-day %RSD values were <2%. The validated RP-HPLC method exhibits high specificity, accuracy, and reproducibility, rendering it suitable for routine quality control analysis of dapagliflozin, vildagliptin, and metformin hydrochloride in fixed-dose combinations.

**Keywords:** RP-HPLC, dapagliflozin, vildagliptin, metformin hydrochloride

## FABRICATION AND CHARACTERIZATION OF NANOSPONGES LOADED WITH AN ANTINEOPLASTIC AGENT

Rose Mary Thankachan, Praveen Raj.R, Titha Jose

ISBN: 978-81-980623-8-3

Department of Pharmaceutics, St. Joseph's College of Pharmacy, Cherthala, Kerala, India-688524.
rosykariyil239@gmail.com

The present work is to fabricate and characterize nanosponges loaded with an antineoplastic agent. The nanosponge was formulated by incorporating the drug into the particles. Doxorubicin Hydrochloride has a wide anticancer activity. The activity of Doxorubicin Hydrochloride can be improved and its toxicity can be diminished by enhancing the relative specific accumulation in the tumor regions. The potential of the drug to be incorporated into the dosage form was analyzed by preformulation studies such as FTIR study, solubility studies and organoleptic properties. The formulation was carried out using Emulsion solvent diffusion method. In this method an organic phase consisting of the drug and polymer in dichloromethane is added to the aqueous phase consisting of PVA in water. The mixture was stirred using a magnetic stirrer at 1000rpm. The formulation was evaluated by Percentage yield, Entrapment efficiency, SEM, Zeta potential, Particle size distribution, Differential Scanning Calorimetry, *In-vitro* dissolution study. The SEM images showed that the particles are spherical and nano-sized. The best formulation was selected based on the results of Entrapment efficiency, *In-vitro* dissolution study etc. Nanosponges are commonly developed as a topical dosage form but this study can be used as a model to develop controlled or targeted drug delivery systems that are cheap, effective and easily affordable to the patients. This study resulted in porous nature of nanosponges which provides a channel for the release of the drug and the method is quick and reproducible.

**Keywords:** Doxorubicin Hydrochloride, FTIR study, organoleptic properties, Emulsion solvent diffusion, SEM.

## DESIGN OF EXPERIMENTS-BASED RP-HPLC METHOD DEVELOPMENT AND VALIDATION FOR EZETIMIBE DETERMINATION

N.Jaya Sri, A.Sai Datri
Department of Pharmaceutical Analysis, V.V. Institute of Pharmaceutical Sciences, Gudlavalleru, Andhra Pradesh, India-521 356
jayasrinagireddy45@gmail.com

The present research aims to develop and validate a simple and accurate RP-HPLC method for the determination of Ezetimibe by using the Design of Experiments Approach. This approach was useful for multivariate optimization of the method. The critical method parameters (CMPs) were optimized using the Box-Behnken design. Minitab software was equipped for the study. Chromatographic separation was done on Phenomenex C18 column with specifications 150 mm × 4.6 mm × 5 µm at 30°C. The predicted and optimized data from the software consisted of mobile phase 0.02 N Ortho phosphoric acid (OPA) and Acetonitrile (53:47% v/v), pumped at a flow rate of 0.96 ml/min brought the desirability function of 1. The UV detector was adjusted at 232.6 nm. The developed method was shows linearity with a correlation coefficient of 0.999. The optimized chromatographic method was validated as per the guidelines of ICH Q2 (R1). The stability of drug was forcibly studied under different stress conditions. Keywords: Ezetimibe; Design of Experiments Approach; Box-Behnk.

**Keywords:** Ezetimibe; Design of Experiments Approach; Box-Behnken design; ICH Q2 (R1).

## UPLC METHOD DEVELOPMENT FOR SELECTED ANTIPSYCHOTIC DRUG.

Shrikant S. Kadam [1], Manish S Kondawar 2
[1] SVPM College of Pharmacy Malegaon Bk. Tal Baramati Dist Pune Maharashtra
[2] Appasaheb Birnale College of Pharmacy Sangli Dist Sangli Pune Maharashtra.
shrikant.kadamsvpm@gmail.com

Liquid chromatography of selected Antipsychotic drug was carried out on a Waters Acquit UPLC with a photodiode array detector (DAD/PDA). The output signal was monitored and processed using empower software. The chromatographic column used Acquity UPLC BEH C-18 100-mm, 2.1-mm, and 1.7-µm particle sizes. Separation was achieved using a gradient method. Mobile phase A contained a mixture of 20 mM NaH2PO4, H2O and 2.0 mL of triethylamine (TEA) buffer (pH of 6.8), acetonitrile, and methanol in a ratio of 50:20:30 (v/v/v), respectively. Mobile phase B contained a mixture of water and acetonitrile in a ratio of 10:90 (v/v), respectively. The flow rate of the mobile phase was 0.3 mL/min. The UPLC gradient program (T/%B) was set as 0.01/0, 5.0/20, 6.5/90, 8.0/100,9.0/0 and 10.0/0. The column temperature was maintained at 27 ◦C, and the detection was monitored at a wavelength of 250 nm. The injection volume was 1.0 µL. Method was developed successfully and validated for parameters like Precision, Accuracy, Limit of detection (LOD) and limit of quantification (LOQ), Robustness, Solution stability and mobile phase stability.

## PHARMACOLOGICAL EVALUATION OF NEUROPROTECTIVE AND HEPATOPROTECTIVE EFFECTS OF ALBIZIA AMARA IN WISTAR RATS

Ramineni Sai Reshma, Doppalapudi Sandeep, Suryadevara Vidyadhara
Department of Physiology and Pharmacology, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India – 522019.
saireshma95@gmail.com

Albizia amara, a deciduous member of the Leguminosae family native to India, is a medicinally significant plant whose pharmacological properties remain inadequately explored. The present study was aimed to investigate the novel neuroprotective and hepatoprotective activities of Albizia amara leaves in Wistar rats. Leaves were subjected to Soxhlet extraction with a hydroalcoholic solvent, and the active fraction was isolated using ethyl acetate. Preliminary phytochemical screening of the leaf extract revealed the presence of flavonoids, alkaloids, tannins, saponins, and terpenoids, which may be responsible for the observed pharmacological activities. Healthy adult male Wistar rats (150–200 g) were randomly allocated to control (n = 6) and experimental (n=24) groups. Neurotoxicity was induced by scopolamine (1 mg/kg, i.p.), whereas hepatotoxicity was produced by acetaminophen overdose (single high dose, p.o.). The Albizia amara leaf fraction was administered orally at 200 and 400 mg/kg for 8 consecutive days. Neuroprotective activity was evaluated via behavioral and cognitive performance tests using donepezil (5 mg/kg, p.o.) as the standard. Hepatoprotection was assessed by serum transaminases and oxidative stress markers compared against N-acetylcysteine as the reference treatment. Albizia amara markedly attenuated scopolamine-induced memory deficits and improved biochemical indices in the acetaminophen model, suggesting potent neuroprotective and hepatoprotective properties. These findings provide evidence towards Albizia amara therapeutic promising nature for neurological and hepatic disorders and warrant further mechanistic studies.

**Keywords:** Albizia amara, neuroprtotection, hepatotoxicity, scopolamine and wistar rats.

## NOVEL UPLC METHOD FOR CONCURRENT ESTIMATION AND PHARMACOKINETIC ANALYSIS OF FAVIPIRAVIR AND MOLNUPIRAVIR IN RAT PLASMA

Edward Raju Gope, Srikanth Pottendla
[1] Samuel George Institute of Pharmaceutical Sciences, Acharya Nagarjuna University, Markapur, Andhra Pradesh, India, 523316.
edward.phd.2022@gmail.com

To establish a rapid and sensitive UPLC method to estimate Molnupiravir and Favipiravir in rat plasma using Nirmatrelvir as internal reference. The separation was performed on Waters Acquity UPLC BEH C18 (100mm x 2.1mm, 1.7µm) by isocratic elution. A buffer with 1 mL of formic acid in 1 litre of water made up the mobile phase. The mobile phase was a 70:30 mix of buffer and acetonitrile, and the flow rate was 0.3 mL/min at ambient temperature. The analysis was completed in 3 minutes for Favipiravir and Molnupiravir, with a linear concentration range of 100ng/mL to 4000ng/mL (r2 = 0.9999 ± 0.018 and r2 = 0.9998± 0.006, respectively). Favipiravir and Molnupiravir's extraction recoveries, matrix effect, precision, and recovery research findings were determined to be within an acceptable range. The method was successfully applied to pharmacokinetic studies, extracting the drugs from rat plasma using liquid-liquid extraction.

**Keywords:** Favipiravir, Molnupiravir, UPLC, Validation, ICH guidelines.

shindemurli593@gmail.com

Cancer therapy continues to demand novel therapeutic agents with enhanced efficacy and reduced toxicity profiles. Pyrimidine derivatives have emerged as privileged scaffolds in anticancer drug development due to their structural similarity to nucleic acid bases and ability to interfere with critical cellular processes. This study focuses on the synthesis, comprehensive characterization, and anticancer evaluation of novel pyrimidine ring-containing derivatives of nicotinic acid. The target compounds were synthesized through cyclization reactions of 2-aminonicotinic acid derivatives. Structural confirmation was achieved using FT-IR spectroscopy, $^{1}H$ NMR, $^{13}C$ NMR, and mass spectrometry, revealing characteristic absorption bands and chemical shifts confirming successful synthesis. Anticancer and antibacterial evaluation was performed using the *in vitro* cell viability count method and Allium assay. Almost all synthesized compounds displayed dose-dependent anticancer activity compared to the standard drug Methotrexate. The percent cell inhibition was found to be the following decreasing order P2, P3, P5, P6>P4>P1. Altogether, pyrimidine derivatives of 2-aminonicotinic acid open a new area for the development of novel anticancer and antibacterial agent, however further experiments are needed to confirm the same.

**Keywords:** Pyrimidine derivative, Nicotinic acid, Anticancer activity, Antibacterial activity, FT-IR, Mass spectroscopy, Cell viability assay, Drug discovery.

**GREEN HPLC METHOD FOR SENSITIVE BIOANALYSIS OF IBRUTINIB IN SPIKED RAT PLASMA: DEVELOPMENT, VALIDATION, AND APPLICATION TO PHARMACOKINETIC STUDIES**

Akshay, Pragathi Devanand Bangera, Mahalaxmi Rathnanand
Department of Pharmaceutics, Manipal College of Pharmaceutical Sciences, MAHE, Manipal 576104
akshay.mcopsmpl2024@learner.manipal.edu

Ibrutinib (IBR) is a covalent inhibitor of Bruton's tyrosine kinase (BTK), which is used in management of B-cell malignancies. Accurate IBR quantification in plasma is important for pharmacokinetic assessment and therapeutic drug monitoring (TDM). In this study, a sensitive, robust and sustainable bioanalytical method of HPLC was developed and validated for IBR. The method utilises a simple protein precipitation technique for sample preparation, avoiding more hazardous or solvent-intensive procedures. Chromatographic separation was carried out in a Kromacil C18 (250 × 4.6 mm id,5µm,100 Å) using an isocratic mode. The mobile phase comprises of acetonitrile and phosphate buffer (pH adjusted to 6.70 with triethylamine) mixed in a 1:1 ratio (v/v), and delivered at 1.0 mL/min flow rate. Detection was performed at 260 nm on a Shimadzu LC-2010CHT equipped with a dual-wavelength UV detector coupled to a photodiode array (SPD-M20A). The technique demonstrated excellent linearity over 25–15,000 ng/mL range ($r^2$ = 0.9997). Intra and inter-day precision and accuracy complied with ICH M10 bioanalytical validation guidelines, with %RSD values below 2% and recoveries ranging from 97±0.2 to 101±0.3%. Stability under all relevant conditions was confirmed. Environmental sustainability was evaluated using AGREE and GAPI tools, an approach not previously applied to IBR bioanalysis, highlighting its novelty and sustainable design for routine use. Thus, a validated bioanalytical HPLC method for IBR quantification in plasma was successfully developed, and is suitable for routine pharmacokinetic and therapeutic drug monitoring applications.

**Keywords:** Ibrutinib, Bioanalytical Method, HPLC, Rat plasma.

Sahilinaik012sai@gmail.com

The present research work deals with the *in silico* docking, synthesis and characterization of quinolin-2(1H)-one derivatives. Based on the recent review of literature novel nitrogen heterocyclic compounds were designed and in-silico molecular docking studies were performed to establish the validity and scope of current research work using schrodinger(2024, 3.0). Docking of the designed compounds with EGFR-Tyrosine kinase enzyme (PDB: 1M17) exhibited well conserved hydrogen bonds with one or more amino acid residues in the active pocket. From all the designed compounds first 12 best docked compounds were synthesized and were characterized by IR, 1H-NMR, 13C-NMR, and mass spectral data. In-silico-ADMET studies were carried out using SwissADME and it revealed that all the synthesized compounds had optimal physicochemical parameters. All the synthesized compounds were tested for their toxicity profile using ProTox 3.0 which showed good toxicity profile

**Keywords:** Docking, Swiss-ADME, ProTox2.0

**CH-200**

**QBD BASED RP-HPLC METHOD DEVELOPMENT AND VALIDATION FOR DETERMINATION OF ABACAVIR SULPHATE**

Vrushal S. Sonkusare, Shivani R. Umre
Krishna R Gupta, Milind J. Umekar
Department of Pharmaceutical Chemistry, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur, Maharashtra-441002
vrushalsonkusare@gmail.com

Abacavir sulphate (ABS) was developed and validated in its formulation using a reversed-phase high-performance liquid chromatography (RP-HPLC) technique based on quality-by-design (QbD). A medication called ABS is an antiretroviral medication used to treat HIV infections. A QbD methodology was used to optimize key method parameters as part of the method development process. Using a mobile phase consisting of methanol: phosphate buffer (pH-6) 70:30 v/v and a detection wavelength of 287 nm, chromatographic separations were accomplished on an Agilent ZORBAX SB-C18 (4.6 x 250 mm) column run isocratically. The injection volume was 20 µl, and the flow rate was 1 ml/min. To find the best conditions for the separation and quantification of ABS, a design of experiments (Box-Behnken Design) technique was used to investigate how these parameters affected the chromatographic response. The method that was explained was linear. (r2 = 0.99). The values for precision, robustness, and ruggedness were similarly within the expected ranges (less than 1% for system precision and less than 2% for other metrics). By improving comprehension of the method's performance and facilitating its optimization, the QbD technique used in this study guarantees the consistently high quality of the medicine under analysis.

**Keywords**: Quality by Design (QbD); RP-HPLC; Abacavir sulphate; Method development; Box-Behnken Design; Validation; Chromatographic optimization

vaijayantikshirsagar4@gmail.com

The behavior of nicotine in solid-state drug degradation is the main focus of the current investigation. Choosing an RP-HPLC method for drug estimation and method validation is part of the study design. Using an isocratic pump (LC 10ADVP) and a UV detector, the Ultimate HPLC 3000 series chromatography was used to analyze nicotine for stress degradation in nicotine polacrilex pouches, a solid dose form. The analysis was conducted using a Hypersil BDS Phenyl C18 column (4.6 mm × 250 mm × 5 µm) and water. 0.25M sodium acetate The mobile phase is sodium dodecyl sulfate: Acetonitrile in the following ratio: 68.5: 20: 7.5: 4 v/ v/ v. The medication has a strong peak at the 254 nm wavelength, where the analysis was conducted at a flow rate of 1.5

ISBN: 978-81-980623-8-3

mL/min. The analysis was conducted using the isocratic pump mode with an injection volume of 20 µl. As a diluent, mobile phase is employed. The suggested method was shown to be linear over the concentration range of 4 to 14 µg/mL. In a dark control, stress degradation was performed at temperatures of 40°C and 60°C for hydrolytic degradation and 25°C and 60°C for oxidative degradation. For photolytic degradation, use UV and white light; for thermal degradation, use 60ºC at 75% and 90% relative humidity. The outcome showed that nicotine was stable under photolytic and heat conditions but unstable under hydrolytic and oxidative circumstances. Since it was demonstrated to be robust, specific, and selective, the suggested approach was successfully applied for its test, drug degradation (stress degradation).

**Keywords:** Nicotine; RP-HPLC; Stress degradation; Solid dosage form; Method validation; Stability studies; Chromatographic analysis

## DESIGN, SYNTHESIS AND BIOLOGICAL EVALUATION OF ABCB1 INHIBITORS

Rupali M. Barhate[1], Minal Ghante[1], Rajesh B. Patil[2]
[1]Department of Pharmaceutical Chemistry, Smt Kashibai Navale College of Pharmacy, Kondhwa , Pune-411048, India
[2]STES's, Sinhgad College of Pharmacy, Vadgaon, Pune- 411041, India
rupali.barhate2020@gmail.com

The recurrence of cancer and patient mortality are often associated with chemotherapy-induced drug resistance. The ATP-binding cassette subfamily B member 1 (ABCB1) transporter is overexpressed in tumors, contributing to this resistance. However, most ABCB1 inhibitors have been ineffective in clinical trials. In this study, we propose a novel approach to developing ABCB1 inhibitors. The ZINC database, which contains millions of small molecules, was screened, and 641 compounds with structural and shape similarity to Zosuquidar were identified using Lipinski's rule and shape similarity criteria. These compounds were selected for multiple ligand simultaneous docking, which provided the means of simultaneously dock two zinc compounds at the drug binging site and at the adjacent access tunnel. A molecular docking study provided insights into the interactions between the compounds and the target protein (7A6F). The docking process yielded several compounds with higher binding energies. Ultimately, 82 hits with higher binding energies than Zosuquidar were selected. Subsequently, using the Langevian Rotametically Induced Perturbation (LRIP) method (a non-equilibrium MD approach aimed at identifying slow conformational changes in a binding site) the conformations of ABCB1 varying in the binding site residues were generated and used in ensemble docking of 82 hits on 23 rotamers of ABCB1. The re-ranking of docked hits identified top 20 hits having lower and better binding free energies than the Zosuquidar. Based on docking scores, 82 compounds with superior binding energies were shortlisted. From these, 18 top hits were selected for molecular dynamics (MD) simulations to assess the stability and behavior of ligand-protein interactions over time. The synthesis of the most promising hit molecule and its characterization is currently in Progress.

**Keywords:** Multidrug resistance, ABCB1/P-glycoprotein, Zosuquidar analogues, database virtual screening, molecular docking, LRIP, molecular dynamics.

## GREEN SYNTHESIS OF SILVER NANOPARTICLES USING HIBISCUS ROSA SINENSIS AND SENNA AURICULA

N. S. Kabilan[1], Rajkumari[2]
Department of Biotechnology, PPG College of Pharmacy, Coimbatore-641035, Tamil Nadu.
nskabi2203@gmail.com

The present work reports a simple, safe, non-toxic, cost-effective, and eco-friendly method for the synthesis of silver nanoparticles using plants like *Hibiscus rosa sinensis* and *Senna auriculata*. The extracts of each plant were prepared, and the formation of silver nanoparticles (AgNPs) was identified by color changes due to surface plasmon resonance. The Characterization was done using UV-Vis spectroscopy, Transmission Electron Microscopy (TEM), Dynamic Light Scattering (DLS), and Fourier Transform Infrared Spectroscopy (FTIR). The antimicrobial activity was tested against Gram-positive bacteria (*Staphylococcus aureus*) and Gram-negative bacteria (*Escherichia coli* and *Klebsiella pneumoniae*). The results suggest that biologically synthesized AgNPs are promising candidates for the development of new antimicrobial drugs.

**Keywords**: Green synthesis, Silver Nanoparticles, FTIR, Antimicrobial activity.

## GREEN SYNTHESIS OF NIOBIUM OXIDE NANOPARTICLES: A SUSTAINABLE STRATEGY TO COMBAT MULTI -DRUG RESISTANT PATHOGENS

Tejesswin G A, Rajakumari S
Department of Biotechnology, PPG College of Pharmacy, Coimbatore-641035, Tamil Nadu, India.
tejesswin@gmail.com

Bauhinia purpurea (Fabaceae) has been traditionally used for treating fever, digestive disorders, and wounds due to its anti-inflammatory and antimicrobial properties attributed to flavonoids, alkaloids, glycosides, and phenolic acids. In this study, nanoparticles were synthesized by combining flower extract with niobium pentachloride to produce niobium oxide nanoparticles via a green synthesis approach. The nanoparticles were subjected to physicochemical characterization using UV–Visible spectroscopy, FTIR spectroscopy, SEM, EDX, and DLS to confirm their formation and stability. The objective of this work was to develop a niobium oxide nanoparticle-coated biofilm wound dressing, especially aimed at diabetic patients who are highly susceptible to microbial infections due to delayed wound healing. The synthesized nanoparticles were evaluated for antimicrobial activity against multi-drug resistant (MDR) bacterial strains using well diffusion assay, minimum inhibitory concentration (MIC), minimum bactericidal concentration (MBC), and time-kill assay. These studies confirmed significant antimicrobial efficacy, highlighting the potential of niobium oxide nanoparticles as a novel wound-healing material. The findings suggest that green-synthesized niobium oxide nanoparticles may serve as an innovative and sustainable surgical aid in wound management, particularly in diabetic care where infection control and regeneration are critical.

**Keywords**: Bauhinia purpurea, Niobium oxide, Green synthesis, Antimicrobial, Multi drug-resistant bacteria, Wound healing

## SYNTHESIS, INSILICO EXPERIMENTS AND BIOLOGICAL EVALUATION OF DITHIOCARBAMATE DERIVATIVES AS CHEMOTHERAPEUTIC AGENTS

Deshpande Shruti[1,2], S. Muni Sireesha[1],
T. Saritha Jyotsana[1], Anuradha bai[1]
[1]Department of Pharmaceutical Chemistry, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka, Hyderabad.500007, Telangana,India.
[2]Department of Pharmaceutical Chemistry, RMES collage of Pharmacy, Kalaburagi, Karnataka 585102
grishruti@gmail.com

Dithiocarbamates are considered as an important motif owing to its extensive biological applications in medicinal chemistry. Recent advance study shows that they have anticancer, Antifungal, antibacterial, anti-Alzheimer, antitubercular, anti-glaucoma, anti-cholinergic, anti-inflammatory activities which elaborated with notable examples. The synthesis of this framework can easily be achieved via a one-pot reaction of primary/secondary amines, CS2, and alkyl or aralkyl halides. Present research work focuses on synthesis, Insilco drug design and evaluation of new dithiocarbamate derivatives as antimicrobial agents. All designed compounds were synthesized and characterized by using different spectroscopic techniques. Subsequently, subjected to Molsoft, Molinspiration, Swissadme, PkCSM to predict their molecular properties which are important for drug candidate. Simultaneously docking studies were performed using Autodock Vina software to evaluate biological activity. The results exhibited that, compounds stratified to Lipinski's,rule, this proves them as safe administrable drugs and establishes their pharmacological activity. Results also indicating that synthesized compounds are more selective for antibacterial activity rather than antifungal activity. The binding energies of the antifungal target (3IDS) indicating, none of the compounds are active when compare to the standard Fluconazole except 4e. The docking results

ISBN: 978-81-980623-8-3

suggest that the hydrophobic interactions are important for antimicrobial activity rather than hydrogen bond interactions.

**STRUCTURE AND LIGAND BASED DESIGN, SYNTHESIS AND BIOLOGICAL EVALUATION OF DUAL INHIBITORS OF SELECT KINASE TARGETS**

Suvarna N. Vakare, Rajesh B. Patil
Department of Pharmaceutical Chemistry, STES's Sinhgad College of Pharmacy, Vadgaon Bk. Pune- 411041, India
vakare.suvarna@gmail.com

Cyclin-dependent kinase 4/6 (CDK4/6) inhibitors and FMS-like tyrosine kinase-3 (FLT3) have been proven to play a significant role in tumour therapy. The present study aimed to generate 2D QSAR model to predict the CDK4/6 and FLT3 activity. A dataset of molecules with affinity for both the CDK4/6 and FLT3 was taken from the literature. The genetic algorithm based multiple linear regression (GA- MLR) approach was used to generate highly predictive models using Padel descriptors available in QSARINs program. The 2D-QSAR models were developed and validated using internal and external validation criteria R2: 0.8152 and Q2loo: 0.7136 for CDK4 inhibitory activity and R2: 0.8388 and Q2loo: 0.7175 for FLT3 inhibitory activity, with good external predictivity. The most active compound 23K (Potent dual acting FLT3 and CDK4 inhibitors) was taken further for the shape and multi-feature based (Lipinski's rule, TPSA, and LogP) virtual screening of Zinc database. The CDK4 and FLT3 inhibitory activity was predicted for filtered zinc compounds by using developed 2D QSAR models. Hit selection against FLT3 and CDK4 was finally achieved. Further, the comparative binding affinity assessment, against CDK4 and FLT3 targets, for the dataset compounds and selected hits from the ZINC database, was obtained from the molecular docking studies. Binding energies and protein–ligand interactions were analysed. Top six hit compounds each for CDK4 and FLT3, identified through molecular docking, were selected for molecular dynamics (MD) simulations, where 100 ns MD simulations employing Gromacs 2020.4 was performed. The results of the QSAR studies, molecular docking insights and binding affinity evaluations and stability of respective CDK4, FLT3 complexes will be presented. The synthesis of identified hit molecules belonging to 1,2,5 trisubstituted 1,3,4-triazoles is currently in progress and will be appropriately showcased.

**Keywords:** CDK4/6-FLT3 dual inhibitors, 2D QSAR, virtually screening, molecular docking, molecular docking

In the pharmaceutical field, the quality by design (QbD) approach is crucial for developing and improvement of analytical techniques. This method evaluates the influence of crucial parameters on important quality attributes and aids in the identification and optimization of these parameters during method development. The purpose of this work was to validate and develop a rapid, accurate, and precise RP-HPLC by QbD approach for the determination of posaconazole in bulk as well as pharmaceutical dosage form. A VWD detector-equipped Agilent 1220-Infinity II was the instrument utilized for separation with a mobile phase of methanol-phosphate buffer pH 3.6 (80:20 v/v), flow rate of 1.085 mL/min, and detection wavelength of 262nm. Critical variables selected for method optimization were methanol percentage and flow rate, determined using central composite design (CCD). Posaconazole's retention time was 4.7 minutes, with precise, accurate, and linear signals ($R^2$ = 0.999). The method is simple, fast, cost-effective, and ideal for routine quality control. The ICH guidelines were followed in the development of the method and the execution of all validation parameters, yielding results that satisfied the acceptance criteria. After validation, the suggested approach was shown to be precise, reliable, robust, repeatable, and suitable for quantitative analysis. Its ease of use, low cost, and short processing time make it a useful tool for estimating the dosage forms of posaconazole. The process described above can be used with ease to the analysis of medicinal products.

**Keywords:** Posaconazole (PSZ), RP-HPLC, Method Validation, ICH guidelines, and QbD.

**MOLECULAR DOCKING AND ADME ANALYSIS OF ISOFLAVONE-BASED DERIVATIVES TARGETING NUCLEAR FACTOR-KB IN THE CONTEXT OF CANCER**

Gagana D [1], Nidhi Malviya [1], Pallavi B M [2], Oyitabu Ifunanya Mercy [1]
[1]Nargund College of Pharmacy, Bengaluru
[2]Government College of Pharmacy, Bengaluru

The NF-κB pathway plays a pivotal role in regulating cell proliferation, angiogenesis, and resistance to apoptosis, and its aberrant activation has been implicated in cancers such as lymphoma, breast and colorectal malignancies. Thus, targeting this transcription factor represents an attractive therapeutic strategy. In this study, *in silico* molecular docking was employed to evaluate isoflavone structural derivatives as potential NF-κB inhibitors. Initially, the derivatives were designed in ChemDraw using isoflavone as the parent nucleus and their structures were further optimized through energy minimization in Avogadro. The minimized structures were then converted into SDF format for subsequent molecular docking studies. Docking simulations were performed with AutoDock Vina 4.0 against NF-κB to assess binding efficiency. To evaluate their drug-likeness, physicochemical and pharmacokinetic properties of the derivatives were predicted using the SWISS ADME server. Parameters such as lipophilicity, solubility, and absorption profiles were analyzed to assess suitability for oral administration. The results demonstrated that the designed ligands exhibited favorable affinities toward the target protein, with docking scores ranging between -6.04 to -7.04 kcal/mol. Detailed analysis indicated stable interactions within the binding pocket, suggesting that structural modifications of isoflavone enhance its inhibitory potential. The favorable ADME characteristics, together with the docking outcomes, support the potential of these compounds as scaffolds for the development of novel therapeutic agents. In conclusion, this computational investigation highlights isoflavone derivatives as promising candidates for NF-κB inhibition, offering a basis for preclinical validation in inflammatory and cancer-related disorders.

divyasuares@gmail.com

Burn wounds are complex injuries requiring advanced healing strategies due to their susceptibility to infection. Conventional therapies often fall short in managing these wounds effectively. There is a growing need for wound dressing materials that combine strong antimicrobial action, biocompatibility, and enhanced tissue regeneration. Graphene oxide (GO), known for its antimicrobial and regenerative properties, and natural biopolymers like zein and gelatin, offer promising alternatives for wound care. In the current research, GO nanoparticles were synthesized using a modified Hummer's method and optimized via a Box-Behnken Design considering variables such as amount of oxidizing agent, reaction time, and temperature. Optimized GO dispersion of zeta potential -17.2 and particle size of 626.8 nm was then incorporated into electrospun nanofibrous scaffolds composed of zein and gelatin using electrospinning technique. The pre-processed solution was evaluated for its clarity and viscosity. The nanofiber scaffolds from optimized batch was assessed for *in-vitro* tests such as thickness, folding endurance, SEM, swelling index, adhesion and hydration studies. Electrospun nanofiber scaffolds demonstrated desired film-forming property and flexibility. Burn wound induction was carried out using Mason Walker burn model in Swiss albino mice to assess the wound healing efficiency. In-vivo studies showed enhanced wound contraction by day 10, and histopathological analysis indicated improved tissue regeneration in GO-loaded scaffolds compared to control group. GO-loaded zein/gelatin

ISBN: 978-81-980623-8-3

nanofibrous scaffolds promoted wound healing, making them a viable alternative to conventional wound care solutions.

**INTEGRATED ANALYTICAL QUALITY BY DESIGN APPROACH FOR THE DEVELOPMENT&VALIDATIONOFLIQUIDCHROMATOGRAPHYMETHOD FOR SIMULATANEOUS ESTIMATION OF SULFADOXANE AND PYRIMETHAMINE**

B. Sravanthi
KGR Institute of Technology and Management
sravanthi.bodike@gmail.com

This Research work presents a comprehensive evaluation of the chromatographic resolution of Sulfadoxine & Pyrimethamine using a validated method. Aquadratic model was identified as the most suitable for analyzing retention times, yielding significant results ($p < 0.0001$). System suitability parameters demonstrated compliance with regulatory standards, indicating adequate resolution, theoretical plates, and tailing factors for both compounds. The method's validation included assay, linearity, precision, intermediate precision, accuracy, LOD, & LOQ. The assay results for Sulfadoxane and Pyrimethamine were 99.79% and 99.52%, respectively. Linearity was confirmed with correlation coefficients of 0.9996 for Sulfadoxane and 0.9993 for pyrimethamine. The method exhibited excellent precision (%RSD < 1), accuracy (mean recovery within 98-102%), and robustness under varying conditions. LODs were determined to be 0.5 µg per ml for Sulfadoxane and 0.2 µg per ml for Pyrimethamine, with LOQs of 1.9 µg per ml and 0.8 µg per ml, respectively. Overall, the developed Procedure is reliable and effective for the concurrent analysis of Sulfadoxane and Pyrimethamine in formulations.

Type 2 Diabetes Mellitus (T2DM) is a growing global health concern requiring safer, more effective therapies. Laurus nobilis (bay leaf), known for its medicinal properties, offers a rich source of bioactive compounds with potential antidiabetic effects. This study explored the antidiabetic potential of Laurus nobilis phytoconstituents through molecular docking. pharmacophore modeling, ADMET prediction, and molecular dynamics (MD) simulations. Among the screened compounds, apigenin, quercetin, and kaempferol exhibited strong binding affinities towards key diabetic enzymes, alpha amylase, and DPP-IV, with apigenin achieving a docking score of-10.2 kcal/mol. MD simulations confirmed the stability of these complexes. while ADMET predictions indicated favorable pharmacokinetic properties and low toxicity risks Additionally, silver nanoparticles (AgNPs) were synthesized using Laurus nobilis leaf extract via a green synthesis method. Characterization by UV-Vis, FTIR, DLS, zeta potential, and SEM confirmed their formation and stability. This integrated computational and nanotherapeutic study highlights Laurus nobilis as a promising candidate for plant-based antidiabetic therapeutics and warrants further preclinical investigation.

**A NOVEL LC-TQ-MS/MS METHOD FOR QUANTIFYING MEFENAMIC ACID-NDSRI (N-NITROSO DRUG SUBSTANCE-RELATED IMPURITY) IN MEFENAMIC ACID TABLET AND PEDIATRIC SUSPENSION DOSAGE FORMS: A COMPARATIVE STUDY WITH A COST-EFFECTIVE WHITE, GREEN, AND BLUE UPLC METHOD**

Gampa Vijaya kumar[1], Akiful Haque[2], B. Sravanthi[3]
[1,3] Department of Pharmacy, KGR Institute of Technology and Management, Rampally, Hyderabad
[2]School Of Pharmacy, Anurag University, Venkatapur, Hyderabad
vijaytanu71@gmail.com

The current research presents novel LC-TQ-MS/MS and cost-effective UPLC methods intended for the accurate quantification of mefenamic acid-N-nitroso drug substance-related impurity-NDSRI (N-MFA) in mefenamic acid (MFA) tablet and pediatric suspension dosage forms. The acceptable intake of N-MFA is derived from the TD50 (Median Toxic Dose-50%) value of N-nitroso diphenylamine. The analytical separation was achieved for the UPLC method using an XBridge BEH Shield RP18 Column (175 × 3.1 mm, 3.6 µm), employing 0.15% formic acid and acetonitrile as mobile phases in a gradient mode. A flow rate of 0.7 mL min−1 was set for the pump, and the detection wavelength was 235 nm. LC-TQ-MS-MS analysis was accomplished utilizing a Xevo TQ-XS mass spectrometer with electrospray ionization in the positive mode. N-MFA quantification was carried out using multiple reaction monitoring (MRM) as the mass transition: m/z 275.13 → 246.14. The proposed methods were successfully validated following ICH guidelines and are capable of quantifying at 0.015 ng mL−1 at an MFA concentration of 1 mg mL−1 for the LC-MS/MS method and at 0.036 µg mL−1 at an MFA concentration of 10 mg mL−1 for UPLC. The validated methods exhibited excellent linearity over the concentration ranges of 0.01 to 125 ppm for LC-MS/MS and 0.036 µg mL−1 to 1.350 µg mL−1 (3.6 to 125 ppm) for UPLC, with a Pearson correlation coefficient of 0.999. The method's trueness, in terms of accuracy recoveries, ranged from 90.43% to 101.34% for LC-MS/MS and 92.12% to 101.21% for UPLC. The applicability of these methods was successfully verified through the analysis of commercial samples of MFA formulations. Additionally, the sustainability and eco-friendliness of the method were assessed using whiteness and greenness metrics, including RGB12 (Red-Green-Blue) tools, GAPI (Green Analytical Procedure Index), analytical eco-scale, AGREE (Analytical GREEnness), AGREEprep (Analytical GREEnesspreparation), and BAGI (Blue Applicability Grade Index). Both methods can be used to determine N-MFA content in mefenamic acid formulation dosage based on the availability of instruments LC-TQ-MS/MS and UPLC in R&D (Research and Development) and quality control laboratories.

**Keywords:** mefenamic acid, LC-TQ-MS/MS, UPLC methods, MFA formulations

namdevdhas89@gmail.com

Breast cancer (BC) continues to be a leading contributor to cancer-related mortality in women, emphasizing the critical demand for novel and targeted therapeutic solutions to address limitations such as low tumor specificity, multidrug resistance, and systemic toxicity. Everolimus, an mTOR pathway inhibitor prescribed for hormone receptor–positive/HER2-negative subtype of advanced breast cancer, offers potent anticancer activity but is limited by poor aqueous solubility, suboptimal bioavailability, and off-target toxicity. In this work,

ISBN: 978-81-980623-8-3

mesoporous silica nanoparticles (MSNs) were engineered as a nanocarrier platform to enhance the solubility, stability, and targeted delivery of everolimus. Quantitative assessment of drug content was established using validated UV–visible spectrophotometry and HPLC methods, demonstrating excellent linearity and reproducibility. MSNs were synthesized by systematically varying process parameters, including cetyltrimethylammonium bromide (CTAB), triethyl orthosilicate (TEOS), toluene, and sodium salicylate concentrations. The optimized nanoparticles demonstrated an average hydrodynamic diameter of ~200 nm, a PDI of 0.268, and a zeta potential of –34.4 mV. SEM imaging revealed uniform spherical morphology, while BET surface area analysis confirmed a Type IV isotherm, characteristic of mesoporous structures. The optimized MSN formulation demonstrates potential as a delivery vehicle to improve everolimus solubility, reduce systemic toxicity, and enhance therapeutic efficacy in targeted breast cancer treatment.

**Keywords**: Breast cancer; Mesoporous silica nanoparticles; Everolimus; Targeted drug delivery.

dralrao@gmail.com

A novel bioanalytical reverse-phase high-performance liquid chromatography method was developed and validated for the simultaneous quantification of Benazepril hydrochloride (BENZ) and Hydrochlorothiazide (HCTZ) in rat plasma. Chromatographic conditions were optimized through systematic trials focusing on column selection, mobile phase composition, and wavelength adjustment to achieve sharp peak resolution and consistent retention times. The finalized method employed a Waters X-Bridge Phenyl column with a mobile phase consisting of acetonitrile and 0.1% triethylamine buffer, adjusted to pH 2.5 with orthophosphoric acid, in a 40:60 v/v ratio, delivered at a flow rate of 1.0 mL/min. Analysis was accomplished within 12 minutes using a 10 µL injection volume, with detection carried out at 224 nm, and metoprolol was used as the internal standard. The method was validated in accordance with regulatory bioanalytical method validation guidelines, assessing parameters such as selectivity, carryover, sensitivity, linearity, accuracy, precision, recovery, matrix effect, dilution integrity, and stability under varied conditions. The developed method demonstrated excellent reproducibility, robustness, and sensitivity, confirming its suitability for pharmacokinetic, bioavailability, and toxicological investigations of BENZ and HCTZ in preclinical models.

**Keywords:** Benazepril hydrochloride, Hydrochlorothiazide, Rat plasma, RP-HPLC, Bioanalytical method validation, Pharmacokinetics.

## DESIGN, SYNTHESIS, CHARACTERIZATION, BIOLOGICAL EVALUATION AND MOLECULAR DOCKING STUDIES OF SOME NOVEL SUBSTITUTED COUMARIN DERIVATIVES

Yogeshri Jibhkate, Shraddha Pawar Atul Hemke
Department of Pharmaceutical Chemistry, S.K.B. College of Pharmacy Gada, Kamptee, Nagpur-441002.
yogeshrijibhkate11@gmail.com

A number of coumarin exhibit interesting pharmacological activities, to increase the biological potency structural optimization campaign focusing on the C-4 and C-7. A series of novel coumarin-based derivatives were designed by molecular hybridization approach. The molecular docking revealed the possible mode of interaction of the compound with protein 1x7r (crystal structure of estrogen alpha complexed with genistein). Our finding suggests that the compounds which designed according to SAR. Some of them were novel coumarin-based estrogen receptor antagonist that provides promising activities and best scaffold for the development of new potential anti-breast cancer targeting ER- alpha. The compounds which showed less binding energy and docking score were decided for synthesis. ER alpha co-crystal ligand docking score was -10.302, S12A had a docking score of -8.735 and Molecular mechanics with generalized born and area solvation (MMGBSA) ΔG Bind score was -51.01 kcal/ mol. RMSD value of ligand 0.0540, significant in evalution of the correctness of docking geometry. From the interaction of the compound with protein it concludes that to establish the electrostatic interaction polar group like methoxy, hydroxy or phenolic group is required. Also conclude that the key interaction between ligand and ER apha receptor includes hydrogen bonding, π-π aromatic stacking. (Pdb id: 1x7r) having amino acid which constitutes catalytic active site are (His 524), (Glu 353), (phe 404) and (Arg 395) also docking study revealed binding affinity with that.

**Keywords:** coumarin, Molecular docking, docking score, binding energy, Estrogen receptor.

## DESIGN, SYNTHESIS, CHARACTERIZATION AND BIOLOGICAL EVALUATION OF NOVEL PYRAZOLE-4 CARBALDEHYDE DERIVATIVES

Merin K Varghese, Sneha Antony and Vinod B
Department of Pharmaceutical Chemistry, St.Joseph's College of Pharmacy, Cherthala, Kerala, India 688524
merinvarghese2000@gmail.com

The present study was aimed at synthesizing some novel pyrazole-4-carbaldehyde derivative using Vilsmeier-Haack reaction, a most effective method for producing heterocyclic aldehydes to enhance their biological activities. Drug discovery is a complex, costly, and inefficient process that requires identifying new therapeutic agents based on computational, experimental, and clinical models. A five-membered ring with two adjacent nitrogen atoms makes up the class of nitrogen-containing heterocycles known as Pyrazoles (C3H4N2). Naturally occurring Pyrazole compounds such as Pyrazomycin and Celecoxib exhibit Anti-tumor properties. Pyrazoles are commonly synthesized via cyclization of hydrazine, with hydrazones acting as important intermediates. Pyrazoles derivatives, particularly those with a conjugated carbonyl group, have shown diverse pharmacological activities, including Anti-inflammatory, Anti-viral, Anti-tumor, and Anti-microbial effects. Synthesized compounds were characterized using standard spectroscopic techniques like FT-IR, NMR and Mass spectrometry. This Anti-cancer activity was evaluated against Dalton negative Lymphoma Ascites (DLA) cells by a Trypan Blue Exclusion method and was reported as the percentage of cell death.The Anti-microbial activity was screened against Gram-positive and Gram- bacteria (E.coli, S.aureus) and fungi (C.albicans, A.niger) at 40 and 80µg/ml concentrations by the Agar well diffusion method. The study concluded that the synthesized Pyrazole-4-carbaldehyde derivatives possess significant Anti-cancer activity. Specifically, the derivative SA3 exhibited superior Anti-cancer effects compared to others. Additionally, compound SA1 showed moderate to good Anti-microbial activity. These results indicate that these Pyrazole-4-carbaldehyde derivatives are a good lead for novel Anti-cancer drug development.

**Keywords:** Vilsmeier-Haack reaction; Pyrazole; Carbaldehyde; Anti-cancer activity.

## DEVELOPMENT AND VALIDATION OF ANALYTICAL METHODS FOR THE ESTIMATION OF DESIDUSTAT IN BULK DRUG AND PHARMACEUTICAL FORMULATION

Suhas Padmane[1], Sakshi Jadhav[1], Savant Upare[2]
[1]Department Of Regulatory Affairs, Krishna Institute Of Pharmacy, Krishna Vishwa Vidyapeeth (Deemed To Be University), Karad, MS, India -415539
[2]Gurunanak College of Pharmacy, Mauza- Nari, Near Dixit Nagar, Kamptee Road, Nagpur, Maharashtra, India- 440 026
sakshijadhav3092001@gmail.com

A stability-indicating reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed and validated for the quantification of Desidustat in bulk drug and pharmaceutical formulations. This method provides a robust analytical approach for routine quality control in compliance with ICH guidelines. Forced degradation studies were performed under acidic, alkaline, oxidative, thermal, and photolytic conditions to evaluate the stability profile of Desidustat. Significant degradation was observed only under acidic conditions, while the drug remained stable under alkaline, oxidative,

ISBN: 978-81-980623-8-3

thermal, and photolytic stress. Effective chromatographic separation was achieved using a Kromasil 100-5C8 column with a mobile phase of methanol and 0.1% formic acid (72:28 v/v) and detection at 235 nm. The method demonstrated excellent linearity within the 5–25 µg/mL range, exhibiting a correlation coefficient of 0.998. It also showed high levels of precision, accuracy, specificity, robustness, and ruggedness. The limits of detection and quantitation were found to be 1.345 µg/mL and 4.078 µg/mL, respectively. Assay of tablet formulations indicated an average Desidustat content of approximately 98.7%, with percentage relative standard deviation (%RSD) well within acceptable limits, confirming the method's reliability for quality assurance. Overall, this validated RP-HPLC method is suitable for the routine estimation of Desidustat and effective for monitoring its stability in pharmaceutical products.

**Keywords:** Desidustat, HPLC, stability-indicating, validation, assay.

**ANALYTICAL METHOD DEVELOPMENT AND VALIDATION OF STABILITY STUDIES FOR COMBINED DOSAGE-FORM OF REMOGLIFLOZIN ETABONATE AND TENELIGLIPTIN HCL BY RP-HPLC METHOD**

Suman M
Department of Pharmaceutical Analysis, Aditya Bangalore Institute of Pharmacy Education and Research, Rajiv Gandhi University of Health Sciences, Bengaluru, Karnataka 560064
bsumangowda30@gmail.com

A new simple, rapid, economical reverse phase high performance liquid chromatographic method was developed for the determination of Remogliflozin Etabonate and Teneligliptin HCl in bulk and dosage-form. The separation was carried out by using column as YMC C18 ( 250mmx4.6mmx5µm), mobile phase Acetonitrile: Methanol: Water (60: 30: 10) v/v, at a flow rate of 1.0ml/min, diluent as Methanol used. The detection was made by UV-Vis. Spectrophotometer at 245nm. The retention times were 4.636 for Remogliflozin Etabonate and 1.791 for Teneligliptin HCl. Calibration curve was linear over the concentration range of 10 to 50 µg/ml for Remogliflozin Etabonate and 1 to 5 µg/ml for Teneligliptin HCl, accuray mean recoveries obtained for Remogliflozin Etabonate and Teneligliptin HCl were 99.9-100.15% and 99.75-100.19% respectively, limit of detection and limit of quantification were found to be 0.003428 & 0.01038µg/ml and 0.007559171 & 0.02290µg/ml respectively. The propose method was validated as per the ICH guidelines parameters like Linearity, precision, accuracy, robustness, LOD and LOQ. The method was accurate, precise, specific and rapid found to be suitable for the quantitative analysis of the drug in the combined dosage form.

**Keywords:** Remogliflozin Etabonate, Teneligliptin HCl, degradation studies, ICH-guidelines.

A novel and selective reverse-phase ultra-performance liquid chromatography (RP- UPLC) method was developed and optimized for the simultaneous estimation of Bempadoic Acid and Ezetimibe. Chromatographic separation was achieved using an SB C18 column (100 × 1.8mm, 2 µm particle size). The mobile phase consisted of 0.01% orthophosphoric acid and acetonitrile in a 60:40 (v/v) ratio, delivered at a flow rate of 0.3 mL/min. Detection was carried out at an optimized wavelength of 226 nm. Bempadoic Acid and Ezetimibe exhibited retention times of 1.865 min and 1.234 min, respectively, with a total runtime of 5 minutes. The method demonstrated excellent linearity with correlation coefficients (r2) of 1.000 over the concentration ranges of 22.5–135 µg/mL for Bempadoic Acid and 1.25–7.5 µg/mL for Ezetimibe. The lower limits of quantification (LLOQ) and detection (LLOD) were determined to be 2.34 µg/mL and 0.77 µg/mL for Bempadoic Acid, and 0.28 µg/mL and 0.09 µg/mL for Ezetimibe, respectively. The proposed RP-UPLC method was successfully validated and applied for the analysis of Bempadoic Acid and Ezetimibe in both bulk drugs and pharmaceutical formulations, demonstrating high precision and accuracy.

**Keywords**: Bempadoic Acid; Ezetimibe; RP-UPLC; Bulk Drug; Formulation; Method Validation.

**CH-221**

**A NOVEL STABILITY-INDICATING RP-HPLC ANALYTICAL METHOD FOR SIMULTANEOUS ESTIMATION OF PREGABALIN AND ETORICOXIB IN PHARMACEUTICALS.**

Y.Sailaja, A.Sai Datri
Department of Pharmaceutical Analysis, V. V. Institute of Pharmaceutical Sciences, Gudlavalleru, Andhra Pradesh, India-521356
yallasailaja53@gmail.com

New, fast, accurate, sensitive and reproducible reverse phase high performance liquid chromatography (RP-HPLC) method has been established for the quantitative analysis of Pregabalin and Etoricoxib in pharmaceutical dosage form. Chromatographic separation of Pregabalin and Etoricoxib was done on Waters Alliancee2695 using X-Terra RP-18(150 mm X4.6mm, 3.5µm) column and the mobile phase consisting of acetonitrile and 0.1% triethylamine in the proportion of 50:50% v/v. The flow rate was 1.0 mL/min; detection was done by absorption at 214nm using a photodiode array detector at room temperature. Number of theorectical plates and tailing factor of Pregabalin and Etoricoxib were NLT 2000 and should not more than 2 respectively. % Relative standard deviation of peak areas of all measurements was below 2.0. Proposed method was validated as per ICH guidelines. The method was found to be easy, cost-effective, accurate and robust method for quantitative analysis of Pregabalin and Etoricoxib investigation of its stability.

**Keywords:** Pregabalin, Etoricoxib, HPLC, Validation.

## EXPLORING CHROMONE ANALOGUES: A NOVEL THERAPEUTIC STRATEGY FOR POSTPRANDIAL HYPERGLYCEMIA IN DIABETES

Rahul Kumar[1], Beena Gidwani[1], Alok SinghThakur[2]
[1]Columbia Institute of Pharmacy, Raipur (C.G.)
[2]Sri Sankarachaya Professional University, Bhilai (C.G.)
kumarrahul3085@gmail.com

Diabetes is a metabolic illness characterized by persistently elevated blood sugar levels, leading to various problems such as cardiovascular disease, renal failure, neuropathy, and lipid metabolism issues. Controlling blood glucose levels in diabetes individuals is crucial, and several bioactive compounds have been reported to improve various patho-physiological states. The two major enzymes responsible for breaking down complex sugar molecules into glucose and fructose are α-amylase and α-glucosidase. These enzymes catalyze postprandial elevations in blood glucose levels, leading to the formation of advanced glycation end products like AGEs and RAGEs. To treat diabetes mellitus, α-glucosidase & α-amylase inhibitors from natural and synthetic sources are trending for their ability to inhibit these enzymes, leading to reduced hydrolytic cleavage of non-reducing ends of dietary oligosaccharides and decreased release of α-glucose, which retards carbohydrate digestion and glucose absorption in the small intestine. This method is significant in managing postprandial hyperglycemia, a current therapeutic strategy for stabilizing blood glucose levels in diabetic patients, particularly those with type 2 diabetes.This study aims to design and synthesize new chromone analogues as potential anti-glycation agents. The design process involves rational modification of flavones with various substitutions for evaluation of anti-glycation activity. The purity and identity of the synthesized compounds will be determined using various spectroscopic techniques, and the antioxidant activity of the proposed molecules will be determined by radical scavenger assay. The most promising molecules will be explored for *in-vivo* and *in-vitro* enzymatic assays to determine their pharmacological aspects.

**Keywords:** Hyperglycemia, Postprandial, flavones, Anti-glycation, Radical scavenger assay, α-glucosidase.

drmskhandai@gmail.com

Lovastatin, a potent antihyperlipidemic agent, plays a pivotal role in reducing cardiovascular risk. This study presents the development and validation of a novel ultra-performance liquid chromatography (UPLC) method for quantifying Lovastatin concentrations in rat plasma, with subsequent application to pharmacokinetic profiling following both oral and intravenous administration. The analyte was isolated using solid-phase extraction (SPE), ensuring high purity and minimal matrix interference. Chromatographic separation was achieved on a BEH C18 UPLC column (2.1 mm × 100 mm, 1.8 µm), employing a gradient elution of acetonitrile and water containing 0.1% formic acid, at a flow rate of 0.4 mL/min. The drug was administered orally at 2 mg/kg and intravenously at 0.05 mg/kg. Blood samples were collected at predetermined intervals, processed, and analyzed using Empower software. The method demonstrated excellent intra-day (91%–103%) and inter-day accuracy (85%–107%), with precision (RSD%) consistently below 15%. The matrix effect ranged from 95% to 108%, and extraction recovery exceeded 70%, affirming the method's robustness. A strong linear response was observed across the concentration range of 10–500 ng/mL, with a lower limit of quantification (LLOQ) at 10 ng/mL. All validation parameters including precision, accuracy, recovery, matrix effect, and stability complied with regulatory guidelines, confirming the method's reliability for pharmacokinetic investigations in preclinical models.

ss.mutalik@gmail.com

A novel and reproducible high-performance liquid chromatography (HPLC) method was developed and validated for the quantification of Quercetin (QCT) in accordance with ICH guidelines, using a Quality by Design (QbD)-based Design of Experiments (DoE) approach. A Phenomenex HyperClone BDS C18 column (250 × 4.6 mm, 5 µm, 130 Å) was employed with a mobile phase consisting of acidified water (0.1% v/v triethylamine, pH adjusted to 3.0 with ortho-phosphoric acid) and acetonitrile (55:45 v/v). Force degradation studies confirmed QCT's stability under most stress conditions, with significant degradation observed only in oxidative and alkaline media. Method performance was optimised via a Box–Behnken design, where key parameters such as pH, flow rate, injection volume, and acetonitrile concentration were modelled for response optimisation. The method displayed excellent linearity over a concentration range of 0.05–50 µg/mL ($R^2 = 0.9996$), with limits of detection and quantification determined as 40.27 ng/mL and 122.03 ng/mL, respectively. Precision and robustness were statistically validated ($p < 0.0001$), confirming reliability under deliberate variations. The developed method was successfully applied for the quantification of QCT in monodispersed Metal Organic Frameworks (MOFs). The entrapment efficiency was found to be 80.52%. The method was further evaluated for its greenness profile, supporting its use in routine analytical applications. In conclusion, the validated methodology proved to be simple, rapid, accurate, and environmentally considerate for quantifying QCT in both bulk and nanoparticulate formulations.

## QSAR-GUIDED DESIGN AND VIRTUAL EVALUATION OF DUAL IL-6 AND TNF-A INHIBITORS VIA DOCKING, ELECTROSTATIC COMPLEMENTARITY, MM/GBSA, MOLECULAR DYNAMICS, WATERSWAP, AND ADMET STUDIES

Saurabh Gupta[1], Yogita Bansal[1]
[1]Drug Design and Synthesis Lab, Department of Pharmaceutical Sciences and Drug Research, Punjabi University, Patiala 147002, India
saurabhgupta2022@outlook.in

Simultaneous inhibition of key cytokines, IL-6 and TNF-α is a promising strategy for treatment of inflammatory and autoimmune disorders. Monoclonal antibodies like tocilizumab (IL-6) and adalimumab/golimumab (TNF-α) act as effective inhibitor but no oral small-molecule dual inhibitor has reached clinics yet. This is attributed to challenges in achieving optimum potency, selectivity, pharmacokinetics, toxicity, and clinical efficacy. Levels of cytokine reduction is often used to measure its inhibition but mechanism of

ISBN: 978-81-980623-8-3

inhibition is unexplained. It remains unclear whether the effect is due to direct cytokine binding or its production modulation. In this study, small molecule dual inhibitors are designed via QSAR studies and the mechanisms involved are also tried to be explained. Canonical SMILES-based 2D-QSAR models utilising Monte Carlo optimisation were developed from cytokine level-based IC50 dataset, irrespective of upstream targets. Among all models, Split-3 of IL-M4 for IL-6 and Split-1 of TNF-M4 for TNF-α exhibited the highest statistical performance. Structural fragments responsible for increase and decrease of inhibitory potency were identified and were used to design dual inhibitors. Compounds designed utilising this dataset were virtually screened for direct inhibition of both cytokines using *in silico* workflows, focusing on their binding affinity, stability, and drug-like properties. Compound DITS00048 emerged as the most promising candidate and provides important structural insights into dual cytokine inhibition. A robust QSAR model is delivered for prospective pIC50 prediction and are made publicly available for further research and virtual screening applications.

## DEVELOPMENT AND VALIDATION OF RP-HPLC METHOD FOR SIMULTANEOUS ESTIMATION OF TRICHOLINE CITRATE AND SILYMARIN IN PHARMACEUTICAL DOSAGE FORM

Jaiswal Priya, Yashasvi Kankhar, Ishvarchandra Parmar, Sonal Desai
Department of Pharmaceutical Chemistry,
SSR College of Pharmacy, Sayli, Silvassa-396230,
UT of Dadra and Nagar Haveli and Daman and Diu, India.
pj807746@gmail.com

Tricholine citrate and Silymarin are widely used in combination therapies for hepatic protection due to their complementary pharmacological actions. Ensuring accurate and simultaneous quantification of both compounds in pharmaceutical formulations is critical for quality control. While RP-HPLC is the preferred analytical approach for such applications, there is a lack of validated, robust, and eco-conscious methods for this drug combination. To develop and validate a novel RP-HPLC method for the simultaneous estimation of Tri choline citrate and Silymarin in pharmaceutical formulations, and to assess its environmental sustainability using established greenness evaluation tools. Chromatographic separation was achieved using a Sunniest ECO C18 column (150 × 4.6 mm, 5 µm) with a mobile phase comprising sodium dihydrogen phosphate buffer and acetonitrile (55:45 v/v), pH 4.0 adjusted with ortho-phosphoric acid. Validation was conducted following ICH guidelines, assessing linearity, accuracy, precision, specificity, and robustness. Environmental impact was evaluated using AGREE, GAPI, and BAGI tool. The method demonstrated excellent linearity ($r^2 > 0.999$), high accuracy (98–102% recovery), and precision (low intra-day and inter-day RSD values). No interference from excipients or degradation products was observed. Robustness testing confirmed stability under slight method variations. Greenness assessment showed the method to be environmentally friendly and sustainable. The developed RP-HPLC method is rapid, accurate, precise, robust, and green, making it highly suitable for routine quality control of Tricholine citrate and Silymarin in pharmaceutical dosage forms.

**Keywords:** RP-HPLC, Tricholine citrate, Silymarin, AGREE, GAPI,

## COMPUTER-AIDED DRUG DESIGN OF 1, 2, 4-TRIAZINE DERIVATIVES AS PROMISING CANDIDATES AGAINST ALZHEIMER'S DISEASE

Ranadeep Borgohain
Girijananda Chowdhury University, Guwahati, Assam, India
ranadeepborgohain1996@gmail.com

Alzheimer's disease (AD) is a leading cause of dementia worldwide, characterized by progressive memory loss, cognitive decline, and a growing global health burden. Current therapies offer only temporary relief, which highlights the urgent need for novel and more effective treatments. In this work, we focus on the 1, 2, 4-triazine scaffold, a chemical structure known for its diverse biological activities, and explore its potential in the design of new anti-Alzheimer agents. To accelerate discovery, we employed artificial intelligence (AI) and advanced computer-aided drug design tools to create and evaluate a library of Triazine-based molecules. Using molecular docking and virtual screening, these compounds were tested in-silico against major Alzheimer's targets, including key enzymes responsible for breaking down neurotransmitters and proteins involved in plaque formation. Computer simulations further assessed the stability of drug–target interactions, while drug-likeness and safety properties were predicted using ADMET models. Several designed compounds displayed strong binding potential, favourable pharmacokinetic profiles, and the ability to cross the blood–brain barrier, suggesting their promise as lead molecules for future development. By integrating AI with medicinal chemistry, this study demonstrates how digital innovation can reduce time, cost, and experimental burden in early-stage drug discovery. The findings not only underscore the therapeutic relevance of 1, 2, 4-triazine derivatives but also illustrate the transformative role of technology in addressing complex health challenges. In alignment with the conference theme, "AI & Technology in Pharma: Educate, Innovate, Empower," this research highlights the value of combining computation and creativity to guide the next generation of Alzheimer's therapies.

**Keywords:** Alzheimer's disease, drug design, 1, 2, 4-triazine, artificial intelligence, computer-aided discovery

## MOLECULAR DOCKING AND PREDICTING ADME PROPERTIES OF CHALCONE DERIVATIVES CONTAINING HETEROCYCLES AS AROMATASE INHIBITORS FOR TREATMENT OF BREAST CANCER

Sandeep Behera, Ishvarchandra Parmar, Samir Patel, Umang Shah,
Department of Pharmaceutical Chemistry,
SSR College of Pharmacy, Sayli, Silvassa-396230,
UT of Dadra and Nagar Haveli and Daman and Diu, India.
spsandeep258@gmail.com

Breast cancer remains one of the leading causes of cancer-related mortality in women, with the aromatase enzyme playing a key role in estrogen biosynthesis and tumor progression. Inhibiting aromatase represents an effective therapeutic strategy. In this study, a series of 96 chalcone derivatives containing heterocyclic moieties such as benzotriazole, triazole, quinoxaline, and indole were designed and evaluated as potential aromatase inhibitors using computational approaches. The three-dimensional structure of the human aromatase enzyme (PDB ID: 3S7S) was employed as the target, and molecular docking was performed using Maestro 12 (Schrödinger software). Docking results revealed that approximately 40 chalcone derivatives exhibited strong binding affinities, with docking scores ranging from –7.011 to –8.746, which are comparable or superior to the reference drug Exemestane (–7.407). Detailed interaction analysis demonstrated that most active derivatives formed stable hydrogen bonds, halogen bonds, π-π stacking, and salt bridge interactions with the active site residues of aromatase. Further, drug-likeness and pharmacokinetic evaluations were conducted using the QikProp module, based on Lipinski's rule of five and ADME (Absorption, Distribution, Metabolism, and Excretion) criteria. The results indicated that the majority of derivatives possessed favourable oral bioavailability and drug-like properties, comparable to the standard drug. Overall, the study concludes chalcone derivatives bearing heterocyclic substitutions as promising candidates for the development of novel aromatase inhibitors with potential application in breast cancer therapy.

## ANALYTICAL METHOD DEVELOPMENT, VALIDATION & FORCE DEGRADATION WITH STABILITY INDICATING RP-HPLC STUDIES FOR ESTIMATION OF MOLNUPIRAVIR IN BULK AND ITS DOSAGE FORM

Sudhanshu Sakharkar, Snehal Ithape, Sandeep Gadhwe
Department of Pharmaceutical Quality Assurance, Sinhgad College of Pharmacy, Vadgaon Bk., Pune, MS, India- 411041.
sudhanshusakharkar333@gmail.com

Molnupiravir is an antiviral agent that inhibits RNA-dependent RNA polymerase and disrupts viral RNA replication. It has gained prominence as an oral treatment option for COVID-19. The present study reports the development and validation of a simple, precise, and stability-indicating reversed-phase high-performance liquid chromatographic (RP-HPLC) method for the quantitative estimation of Molnupiravir in bulk and pharmaceutical dosage forms. Chromatographic separation was achieved using a Thermo BDS C18 column (4.6 × 250 mm, 5 µm) with a

ISBN: 978-81-980623-8-3

mobile phase comprising ammonium acetate buffer and acetonitrile (40:60 v/v) at a flow rate of 1.0 mL/min. Detection was carried out at 240 nm, and the retention time of Molnupiravir was 2.8 minutes. The method was validated as per ICH Q2 (R1) guidelines for linearity, accuracy, precision, robustness, and sensitivity. Linearity was demonstrated over the concentration range of 20–100 µg/mL, with a correlation coefficient ($r^2$) of 0.9986. The limit of detection (LOD) and limit of quantitation (LOQ) were 0.511 µg/mL and 1.54 µg/mL, respectively. Accuracy studies showed recovery values between 100–104%, while precision results confirmed %RSD values below 2. Robustness studies indicated that minor variations in chromatographic conditions did not significantly affect results. Forced degradation studies revealed that Molnupiravir remained stable under acidic, thermal, and photolytic conditions but underwent significant degradation under basic and oxidative stress. Overall, the validated RP-HPLC method is simple, robust, and reliable, making it suitable for routine quality control and stability analysis of Molnupiravir in/ bulk drug and dosage form.

**Keywords**: Molnupiravir, RP- HPLC, ICH Q2 (R1) guidelines, Validation Analysis and Forced Degradation Condition.

## DEVELOPMENT AND VALIDATION OF A STABILITY-INDICATING RP-HPLC METHOD FOR THE QUANTITATIVE ESTIMATION OF PROPAFENONE HYDROCHLORIDE IN PHARMACEUTICAL TABLET DOSAGE FORMS

Anuja Galande[1], Suhas Padmane[2], Jyotiram Sawale[3]
[1]Department Of Regulatory Affairs, Krishna Institute of Pharmacy, Krishna Vishwa Vidyapeeth (Deemed to be University) Karad, MS, India -415539
[2]Gurunanak College of Pharmacy, Mauza- Nari, Near Dixit Nagar, Kamptee Road, Nagpur, Maharashtra, India- 440 026
galandeanuja10@gmail.com

This research outlines the creation and validation of a dependable reversed-phase high-performance liquid chromatography (RP-HPLC) technique for measuring Propafenone Hydrochloride in tablet formulations. Propafenone Hydrochloride, an anti-arrhythmic drug used to treat both supraventricular and ventricular arrhythmias, was examined using an Eclipse XDB-C18 column with a mobile phase composed of methanol and a 10 mM ammonium acetate buffer in a 70:30%v/v ratio. Detection occurred at 246 nm with a flow rate of 1.0 mL/min, and the column temperature was kept at 40ºC. The method demonstrated excellent system suitability parameters, such as symmetrical peak shapes, stable retention times, and high theoretical plate counts. It was validated according to ICH Q2(R1) guidelines, showing strong linearity within a concentration range of 5-25 µg/mL (correlation coefficient of 0.999), high precision with a %RSD below 1%, and satisfactory accuracy confirmed through recovery studies. The limits of detection and quantitation were found to be 0.972 µg/mL and 2.94 µg/mL, respectively. The stability of the standard and sample solutions was maintained for at least 24 hours. Assay results consistently matched the labeled claim amount, confirming the method's appropriateness for routine quality control of Propafenone Hydrochloride in pharmaceutical products.

**Keywords:** Propafenone Hydrochloride, RP-HPLC, Validation, Tablet Assay, Stability-indicating.

## STABILITY INDICATING UPLC METHOD FOR THE ESTIMATION OF ELEXACAFTOR, IVACAFTOR AND TEZACAFTOR IN BULK AND PHARMACEUTICAL DOSAGE FORMS.

Poornima Ghanta, Nagaraju Pappula, Durgarao pasupuleti
Department of pharmaceutical analysis, Hindu college of pharmacy, Guntur, Andhrapradesh, India-522002
poornimaanalysis@gmail.com

A simple, accurate, precise method was developed for the simultaneous estimation of the Elexacaftor, Ivacaftor and Tezacaftor in solid dosage form. Chromatogram was run through HSS C18 100x2.1mm, 1.7. Mobile phase containing 0.01N KH2PO4 and Methanol in the ratio of 70:30 v/v was pumped through column at a flow rate of 0.3ml/min. Temperature was maintained at 30°C. Optimized wavelength for Elexacaftor, Ivacaftor and Tezacaftor was 222.0 nm. Retention time of Elexacaftor, Ivacaftor and Tezacaftor were found to be 1.060 min, 1.352 min and 1.706 min. %RSD of system precision for Elexacaftor, Ivacaftor and Tezacaftor were and found to be 0.5, 0.8 and 0.6 respectively. %RSD of method precision for Elexacaftor, Ivacaftor and Tezacaftor were and found to be 0.5, 0.3 and 0.5 respectively. % Recovery was obtained as 99.46%, 99.59% and 99.89% for Elexacaftor, Ivacaftor and Tezacaftor respectively. LOD values were obtained from regression equations of Elexacaftor, Ivacaftor and Tezacaftor. were 0.21ppm, 0.10ppm, 0.10pm and LOQ values were obtained from regression equations of Elexacaftor, Ivacaftor and Tezacaftor were 0.62ppm, 0.31ppm ,0.30ppm respectively. Regression equation of Elexacaftor was y = 13392.x + 3536.9 Ivacaftore was y = 10067x + 1603.8 and of Tezacaftor was y = 14171x + 1880.8.

**Keywords:** UPLC, Elexacaftor, Ivacaftor and Tezacaftor

## MOLECULAR DOCKING OF BENZYL AMINO-2H-CHROMEN-2-ONE AS STEROIDAL SULFATASE INHIBITORS IN TREATMENT OF BREAST CANCER

Jugnu Jahan, Jubie S
Department of Pharmaceutical Chemistry, JSS College of Pharmacy, JSS Academy of Higher Education and Research, Ooty, Tamil Nadu, India-643001
jugnujahan72@gmail.com

The incidence of Breast cancer is predicted to increase by about 47% visualizing, a doubling number by the year 2040. Approximately 28.4 million people are at risk of occurrence, and women above 50 years are at higher risk in the near future. It is observed that genetic mutations are the causative factors, and about 72 different types show high predominancy, including BRCA1, BRCA2, TP53, PTEN, PALB2, etc. Hormonal contributions from aromatase (AR) and steroidal sulfatase (STS) accounts for 75% of the responsibility for causing breast cancer. They act as additional sources of excessive estrogen through the conversion of Estrogen(E1) to Estradiol(E2), triggering mutation. Of the two different types of hormones, STS shows about 87% higher expression in malignant tissues, and Irosustat was the first molecule of STS inhibitor to reach Phase-II clinical trials. The basic nucleus is chromen-3yl-sulfamate, and several modifications were done on the ring system synthesized and estimated for *in-vitro* placental STS inhibition against MCF-7 cells. Based on the above hypothesis, 25 compounds of benzyl-amino-2h-chromen-2-one were designed and subjected to molecular docking studies to identify the best binding modes of interaction. Five compounds, 3a, 2a, 2c, 3d and 3e exhibited better binding energies in comparison to standard Irosustat. The stability of the docked complex was further validated using molecular dynamic simulations.

**Keywords:** Irosustat, steroidal sulfatase inhibitor, benzyl-amino-2h-chromene-2-one, molecular docking, molecular dynamics.

## DEVELOPMENT AND VALIDATION OF A SIMPLE RP-HPLC METHOD FOR QUANTITATIVE ESTIMATION OF CURCUMIN IN PHARMACEUTICAL DOSAGE FORMS

Vaishnavi M. Gawande, Divya D. Kurjekar, Sushil S. Burle, Milind J. Umekar, Krishna R. Gupta, Monali R. Dakhole
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra-441002
gawandev220@gmail.com

A bioactive component of Curcuma longa, curcumin, has a variety of pharmacological characteristics, including anti-inflammatory, antioxidant, antibacterial, and anticancer effects. For pharmaceutical formulations to guarantee therapeutic efficacy and quality control, curcumin must be precisely quantified. Developing and validating a straightforward, accurate, and exact Reverse Phase High-Performance Liquid Chromatography (RP-HPLC) method for curcumin quantification in dosage forms was the goal of the current work. At a flow rate of 0.8 mL/min, a mobile phase consisting of acetonitrile and 0.1% formic acid (70:30, v/v) was used to achieve chromatographic separation on a Phenomenex Luma C8 column (150 × 4.6 mm, 5 µm), with detection at 425 nm. 3.52 minutes was the retention time for curcumin. According to ICH Q2(R2) requirements, the method was validated by assessing its specificity, linearity, accuracy, precision, robustness, ruggedness, limit of detection (LOD), and limit of quantification (LOQ). In the 10–50 µg/mL range, the technique demonstrated excellent linearity (R2 = 0.9997).

ISBN: 978-81-980623-8-3

Recoveries from accuracy trials ranged from 98.92% to 101.37%, but precision investigations showed %RSD values for intra- and inter-day analyses below 2%. 0.258 µg/mL and 0.783 µg/mL were found to be the LOD and LOQ, respectively. There was no evidence of formulation excipient interference, demonstrating the specificity of the procedure. Curcumin in marketed pill and cream formulations was effectively quantified using the established method. The established RP-HPLC method is very appropriate for routine quality control analysis of pharmaceutical goods based on curcumin since it is straightforward, dependable, and economical.

**Keywords:** Curcumin; RP-HPLC; Method validation; Pharmaceutical formulations; Quality control

## COMPUTATIONAL-TO-EXPERIMENTAL EVALUATION OF ZINC OXIDE NANOPARTICLE-LOADED FULVESTRANT FOR HER2-POSITIVE BREAST CANCER THERAPY

[1]Melphiya D, [1]Jubie Selvaraj
[1]Department of Pharmaceutical Chemistry, JSS College of Pharmacy, JSS Academy of Higher Education and Research,
Ooty-643001, Tamil Nadu, India
melphiyadicksi@gmail.com

About 15% to 20% of breast tumors have higher levels of a protein know HER2.These cancers are called HER2-positive breast cancers. In this study, we adopt a pioneering integrative approach, synthesis and *in-vitro* method screening to unveil a novel therapeutic avenue for HER2-positive breast cancer. Through comprehensive data mining and network analyses, we identified a potential target as a key player in HER2-positive breast cancer, we devised a novel strategy to target ErbB2 using Fulvestrant comprising with zinc oxide nanoparticles, guided by *in silico* predictions. Our aim was to synthesize and characterize the Fulvestrant-zinc oxide nanoparticles, evaluate its efficacy *in vitro* and ascertain its potential as a therapeutic agent for HER2-positive breast cancer. Pharmacogenomics and gene enrichment process involved in HER2 positive breast cancer to select the potential target by following computational drug design strategy. Docking investigations of the proposed compounds were carried out for the selected targets, MMGBSA and Molecular Dynamics were undertaken to assess the stability. Subsequently Fulvestrant-zinc oxide nanoparticles was synthesized and characterized using techniques. *In-vitro* assessments involved MTT viability assays and AO/EtBr staining method. Molecular docking simulations revealed strong binding affinity between Fulvestrant and ErbB2 compared to other drugs, supported by favourable MMGBSA binding energy scores following through Molecular dynamics simulations confirmed the complex stability. *In-vitro* experiments demonstrated its non-toxic nature and showed dose-dependent cytotoxicity in HER2+ cells and AO/EtBr staining confirmed apoptosis induction. This study highlights the Fulvestrant – zinc oxide nanoparticles as a promising therapeutic intervention for HER2-positive breast cancer. By undergoing computational approaches, Network analysis and pharmacogenomics.

**Keywords:** HER2-positive breast cancer, ErbB2, Molecular docking, zinc oxide nanoparticles

## BREAST CANCER THERAPY USING STIMULI RESPONSIVE HYDROXYUREA STREARIC ACID CONJUGATE; SYNTHESIS, FORMULATION AND *IN-VITRO* EVALUATION

Saranya Dharmaraj, Esakkimuthukumar M, Jubie S
Department of Pharmaceutical Chemistry,
JSS College of Pharmacy, Ooty, India
Saranyadharma27@gmail.com

Hydroxyurea (HU) is a clinically established antitumor drug that functions primarily as an inhibitor of DNA synthesis, with additional inhibitory effects on RNA and protein synthesis. Despite its therapeutic potential, HU's hydrophilic nature limits its ability to permeate lipid membranes and reduces its clinical specificity. Lipid–drug conjugation strategies, particularly those utilizing fatty acids, can improve drug lipophilicity, stability, and cellular uptake. In this study, a novel hydroxyurea–stearic acid conjugate (HU-SA) was synthesized via a pH-sensitive hydrazone bond, designed to exploit the acidic tumor microenvironment for targeted drug release. The novelty of the conjugate was confirmed through SciFinder analysis. The HU-SA conjugate was synthesized in a two-step process and comprehensively characterized, confirming the successful formation of the hydrazone bond. A pH-dependent release assay demonstrated selective drug liberation under acidic conditions, mimicking the tumor microenvironment. *In vitro* cytotoxicity studies using MCF-7 breast cancer cells revealed that HU-SA exhibited enhanced anticancer activity, with an $IC_{50}$ value of 68.63 µg/mL, compared to free HU, which displayed an $IC_{50}$ of 92.07 µg/mL. These findings indicate that conjugation significantly improves HU's efficacy and pH-responsiveness, offering a potential strategy for tumor-targeted chemotherapy.Future studies will extend to *in vivo* evaluation and the development of nanostructured lipid carrier (NLC) formulations. By partially substituting solid lipid with oil, NLCs provide a less ordered lipid matrix, enhancing drug loading capacity, reducing premature drug leakage, and improving storage stability. Collectively, the results highlight HU-SA as a promising candidate for advanced breast cancer therapy.

## CARBON QUANTUM DOTS (CQDS): TYPES, SYNTHESIS, AND MULTIFUNCTIONAL APPLICATIONS

Divya P. Janbandhu, Diksha S. Undirwade, Sushil S. Burle, Radheshyam T. Lohiya, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee,
Nagpur, Maharashtra-441002
divyajanbandhu25@gmail.com

A novel family of zero-dimensional carbon-based nanomaterials with special optical, electrical, and surface characteristics is known as carbon quantum dots or CQDs. Multidisciplinary research is paying more attention to CQDs because of their tiny size (less than 10 nm), good photostability, tunable photoluminescence, biocompatibility, and ease of manufacturing. The three main categories of CQDs, graphene quantum dots (GQDs), carbon nanodots (CNDs), and polymer carbon dots (PCDs) differ in terms of their structural traits, luminescence mechanisms, and potential for functionalization. Numerous uses in bioimaging, drug delivery, photodynamic treatment (PDT), biosensing, optoelectronics, catalysis, and environmental remediation are made possible by their varied physicochemical characteristics. Notably, CQDs are interesting prospects for pharmacological and biological applications due to their low toxicity, high water dispersibility, and simplicity of surface modification. The types, synthesis methods, and multipurpose uses of CQDs are highlighted in this poster, along with their potential as sustainable, affordable, and adaptable nanomaterials with future uses in advanced material research, diagnostics, and therapy.

**Keywords:** Carbon Quantum Dots (CQDs), Photoluminescence, Biomedical Applications, Photodynamic Therapy (PDT), Sustainable Nanomaterials

## QUANTIFICATION OF RESMETIROM IN THE RAT PLASMA BY THE SIMPLE AND PRECISE BIO ANALYTICAL METHOD USING HIGH PERFORMANCE LIQUID CHROMATOGRAPHY

Gowri Gollu, Jagadeesh Panda, Gandi Dileep Kumar
Raghu College of Pharmacy, Dakammarri,
Visakhapatnam-531162, Andhra Pradesh, India
gowri33rx@gmail.com

A simple and precise bioanalytical, high performance liquid chromatography method was developed and validated for the quantification of resmetirom in the rat plasma using sobetirome as internal standard. Resmetirom was extracted from rat plasma by using liquid liquid extraction. The chromatographic analysis was carried out on symmetry C18 column (150 ×4.6 mm, 3.5µ) using formic acid and acetonitrile at 25:75, v/v as the mobile phase with a flow rate of 1 mL/min at 266 nm. Resmetirom and sobetirome eluted at 2.39 min. and 1.87 min. respectively. The developed method showed good linearity over 38.9 -1556 ng/mL concentration range with a regression coefficient of 0.999. The accuracy of the developed method was found in the range of 96-99%. Limit of detection and limit of quantification were determined to be 19.48 ng/mL and 64.28 ng/mL respectively. Analyte showed recovery in the range of 96-99 % and the developed method

ISBN: 978-81-980623-8-3

applied for pharmacokinetic study of marketed dosage form. obtained results proves the potentiality of the developed method and as no substantial method is available for the quantification of resmetirom in biological fluids, this proposed method can be regularly applied to establish the pharmacokinetic parameters to other resmetirom containing marketed dosage forms.

**Keywords:** Bioanalytical method, Resmetirom, Sobetirome, high performance liquid chromatography, Pharmacokinetic studies.

**CH-240**

## SYNTHESIS, CHARACTERIZATION AND PHARMACOLOGICAL EVALUATION OF A NOVEL 3,5- THIAZOLIDINE-2,4-DIONE DERIVATIVE

Christy K. Jose
Department of Pharmaceutical Chemistry, Pushpagiri College of Pharmacy, Tiruvalla, Kerala, India-689107.
christykjose1@gmail.com

In the current research, a novel 3,5-thiazolidine-2,4-dione derivative was synthesized and evaluated for various pharmacological actions by *in vitro* methods. The objective behind the research was to develop a novel derivative of thiazolidinedione and to screen for its pharmacological actions. The synthesized compound was screened for *in-vitro* anti-inflammatory activity by evaluating the percentage inhibition of protein denaturation using bovine serum albumin. Indomethacin was used as the standard. Maximum inhibition of 80.94% was observed for the synthesized compound at 500 µg/ml. At the same concentration the standard, Indomethacin showed maximum inhibition of 89.17%. *In vitro* anti-inflammatory activity using RAW 264.7 cell line was performed for COX and LOX inhibition assays. The synthesized compound exhibited cyclooxygenase (COX) and lipoxygenase (LOX) inhibitory activity i.e. the sample has anti-inflammatory property. The maximum efficacy was elicited by the concentration 100 µg/mL. DPPH radical scavenging assay and Ferric Reducing Antioxidant Power (FRAP) assay were used to perform *in vitro* antioxidant activity. It was observed from the results that, by both the methods the synthesized compounds exhibited poor antioxidant activity. By DPPH method the IC50 value was found to be more than 1000 µg/mL which for standard ascorbic acid used was 28.19 µg/mL. The antioxidant activity by FRAP assay was also not comparable with the standard. Minimum inhibitory concentration for antibacterial activity was determined by Resazurin-based 96-well plate microdilution method and was found to be very less compared to the standard, ciprofloxacin used. Minimum inhibitory concentration for the synthesized compound was found to be 250 µg/mL while for standard it was 31.25 µg/mL. Agar well diffusion method was used for screening antibacterial and antifungal assay. It was found that the synthesized compound has no antimicrobial activity because there is no/zero mm zone of inhibition against the particular microbial strain used in this study. The results indicated that the compound did not exhibit significant activity in the tested models. However, the study contributes to understanding the structure–activity relationship within this class of compounds and provides a basis for future structural modifications to enhance biological activity.

**Keywords:** thiazolidinedione, *in vitro*, anti-inflammatory, antioxidant, antimicrobial

## GREEN PHARMACOLOGY – ECOFRIENDLY INNOVATIONS IN DRUG DESIGN

Soundarya Ramachandrapu
Department of Pharmacology,
Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
soundaryaramachandrapu@gmail.com

Green pharmacology represents a transformative step in the field of drug discovery and development, focusing on the integration of eco-friendly practices with pharmaceutical innovation. Conventional drug design often involves chemical processes that consume large amounts of energy, utilize toxic solvents, and generate significant waste, thereby contributing to environmental pollution and sustainability challenges. In contrast, green pharmacology emphasizes the principles of green chemistry and sustainable technologies to reduce ecological footprints while maintaining therapeutic efficacy. Strategies such as the use of biocatalysts, renewable raw materials, green solvents, and computational drug design play a pivotal role in minimizing hazardous by-products and energy consumption. Furthermore, advancements in nanotechnology, molecular modelling, and biotechnology provide innovative platforms for developing drugs that are both environmentally benign and clinically effective. This approach not only supports environmental conservation but also enhances cost-effectiveness, scalability, and regulatory compliance. Importantly, green pharmacology promotes a paradigm shift from traditional linear development models toward circular, resource-efficient systems in pharmaceutical sciences. By integrating environmental responsibility into the early stages of drug design, it fosters a holistic model that addresses global health needs without compromising ecological balance. As healthcare systems worldwide increasingly recognize the need for sustainable practices, green pharmacology stands out as a promising and essential framework for future drug innovation.

**Keywords:** Green pharmacology, eco-friendly drug design, green chemistry, renewable resources, environmental sustainability.

## DEVELOPMENT AND VALIDATION OF BIOANALYTICAL METHOD FOR THE DETERMINATION OF SELEGILINE IN RAT PLASMA AND ITS APPLICATION TO PHARMACOKINETICS

Priyanka Gawarkar-Patil, Vividha Dhapte-Pawar
Department of Pharmaceutics, Poona College of Pharmacy, Bharati Vidyapeeth (Deemed to be University),
Pune, Maharashtra 411038, India.
pgawarkar123@gmail.com

Selegiline hydrochloride (SH), a selective and irreversible monoamine oxidase (MAO-A) inhibitor, is commonly prescribed for early-stage Parkinson's disease, depression, and senile dementia. Owing to its very low therapeutic plasma concentration (2 µg/L), a sensitive and rapid analytical method is required for reliable quantification. In this study, a high-performance liquid chromatography method with ultraviolet detection (HPLC-UV) was developed and validated for the estimation of SH in rat plasma. Chromatographic separation was achieved using a mobile phase of phosphate buffer saline (pH 7.0 ± 0.2, adjusted with 85% orthophosphoric acid) and acetonitrile in a 60:40 v/v ratio, with detection at 205 nm. Method validation performed according to ICH M10 guidelines, confirmed excellent linearity (5–1500 ng/mL, $R^2$ = 0.9989), high recovery with acetonitrile (94.23%), satisfactory accuracy, precision, robustness, and stability under freeze–thaw conditions. The retention time of SH was 6.7 minutes, enabling quick analysis. Application of the validated method to a pharmacokinetic study in Sprague-Dawley rats (oral dose: 1 mg/kg) demonstrated its suitability for in-vivo investigations. Overall, the developed method provides a reliable, efficient and reproducible approach for quantifying SH in rat plasma and can be effectively applied in preclinical pharmacokinetic studies.

**Keywords:** Selegiline hydrochloride, HPLC, Bioanalytical method validation, Rat plasma, Pharmacokinetics.

## HIGHLY SENSITIVE AND SPECIFIC LC-MS/MS METHOD FOR CABOZANTINIB QUANTITATION: COMPARATIVE PHARMACOKINETIC STUDIES BETWEEN ORAL AND IV ROUTE

J. Swathi [1,2], Dr.K.Sathish Kumar[1], P. Vivek Sagar[2]
[1]Department of Pharmaceutical Sciences, VFSTR, Vadlamudi,Guntur.
[2]Dept.of Pharmaceutical Analysis, Sarojini Naidu Vanita Pharmacy Mahavidyalaya, Tarnaka, Hyderabad, Telangana.
snvpmv22swathi@gmail.com

A highly sensitive and specific Liquid Chromatography-Tandem Mass Spectrometry (LC-MS/MS) method was developed and validated for the quantification of Cabozantinib, aimed at supporting pharmacokinetic studies comparing oral and intravenous administration routes in rats. Male Sprague-Dawley rats were divided into control, oral (5 mg/kg), and intravenous (5 mg/kg) groups, with blood and tissue samples collected at multiple time points post-dosing. The LC-MS/MS method demonstrated robust linearity across 5–1000 ng/mL, with precision, accuracy, and stability meeting standard validation guidelines. Pharmacokinetic analysis following oral administration revealed a maximum plasma concentration (Cmax) of approximately 800 ng/mL at a time to peak concentration (Tmax) of 6 hours, along with a clearance (CL/F) of 0.0621 L/kg/h and a central compartment volume (V1/F) of

ISBN: 978-81-980623-8-3

0.438 L/kg, indicating efficient drug absorption and disposition. The study facilitates reliable quantitation of cabozantinib for comparative pharmacokinetic assessment, with institutional animal ethics approval obtained.

**Keywords**: Cabozantinib, LC-MS/MS, Pharmacokinetics, Oral administration, Intravenous administration, Sprague-Dawley rats, Bioanalysis, Method validation, Drug quantification

## LIQUID CHROMATOGRAPHIC METHOD DEVELOPMENT AND VALIDATION FOR SIMULTANEOUS ESTIMATION OF METFORMIN, PIOGLITAZONE, GLIMEPIRIDE IN BULK AND DOSAGE FORMS

K Manogna, R Karthikeyan, C. Sreedhar, T Srinivasa Rao
Research Scholar, Department of Pharmaceutical Analysis, Sri Balaji Vidyapeeth, Pillayarkuppam, Puducherry, India - 607403
manognamanoj@gmail.com

A simple reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed and validated for simultaneous determination of Metformin hydrochloride (MET), Pioglitazone (PIO), and Glimepiride (GLIM) in their pharmaceutical dosage form. The validated technique proved to be suitable for routine QA applications. The chromatographic separation was achieved using Agilent C18 column (250 mm × 4.6) 5 µm as a stationary phase with mobile phase composition of Methanol and Tris buffer (pH 8) in ratio of 65:35 v/v. The mobile phase was then sonicated for 10 min and then filtered through 0.45 µm membrane. The flow rate was 1 ml/min isocratic, column temperature 40°C, and ultraviolet detection at λ 227 nm. The retention times for MET, PIO, and GLIM were found to be 1.227 min, 3.843 min, and 7.353 min, respectively. The RP-HPLC technique was validated using the International Council for Harmonisation (ICH) guidelines. Recovery, precision, accuracy, selectivity, and robustness of the method were evaluated according to the ICH guidelines. This method is simple, rapid, convenient, and a perfect choice for the determination of metformin, pioglitazone, and glimepiride from bulk and pharmaceutical formulations.

**Keywords:** Accuracy, Glimepiride, Metformin, Pioglitazone, Precision

## BOX–BEHNKEN DESIGN-ASSISTED OPTIMIZATION OF A REVERSE-PHASE HPLC METHOD FOR THE SIMULTANEOUS ESTIMATION OF FINASTERIDE AND BIMATOPROST LOADED MOFS

Rahul Pokale, Srinivas Mutalik
Department of Pharmaceutics, Manipal College of Pharmaceutical Sciences, Manipal Academy of Higher Education, Manipal, 576104, Karnataka, India
rahulpokale0@gmail.com

The objective of this research was to develop, optimize, and validate a sensitive and specific reverse-phase high-performance liquid chromatography (RP-HPLC) method for the simultaneous quantification of Finasteride (FIN) and Bimatoprost (BIM) encapsulated in Metal–organic frameworks (MOFs). Design of Experiment approach was employed to optimize critical chromatographic parameters. Independent variables included acetonitrile ratio, column oven temperature, and flow rate, while dependent variables were resolution, peak area, number of theoretical plates, and tailing factor for both drugs. The optimized conditions were: 43% acetonitrile, column oven temperature of 25 °C, flow rate of 0.8 mL/min, and detection wavelength of 210 nm. The method was validated as per ICH Q2(R1) guidelines. The optimized method demonstrated excellent linearity ($R^2 > 0.99$) for both FIN and BIM within the range of 20–10,000 ng/mL. The LOD and LOQ were 10 ng/mL and 30.3 ng/mL for FIN, and 31.32 ng/mL and 94.9 ng/mL for BIM, respectively. The method showed high sensitivity, accuracy, precision, specificity, and robustness. Forced degradation studies confirmed the stability-indicating nature of the method, with clear and well-resolved FIN and BIM peaks unaffected by matrix interferences. Greenness assessment using GAPI and AGREE tools confirmed the eco-friendly nature of the method. Application of the validated method to formulation studies revealed entrapment efficiencies of 61 ± 1.5% for FIN and 83 ± 2% for BIM. The developed RP-HPLC method is robust, accurate, sensitive, eco-friendly, and stability-indicating. It offers a reliable analytical platform for simultaneous quantification of FIN and BIM in MOF-based formulations, supporting their further pharmaceutical development.

## SILVER AND COPPER COUMARIN -METAL COMPLEXES: STRATEGIC SYNTHESIS, SPECTRAL CHARACTERIZATION, *IN SILICO* DOCKING INSIGHTS, AND POTENT ANTIMICROBIAL EVALUATION STUDIES

Shweta Gupta[1] Shiv Dev Singh
[1]Department of Pharmacy, M.J.P Rohilkhand University, Bareilly -243006
shivdev.singh@mjpru.ac.in

In this study, a series of novel coumarin-based silver (Ag+) and copper (Cu++) metal complexes were synthesized via coordination of selected transition metals with functionalized coumarin ligands. The synthesized complexes were characterized using various physicochemical and spectral techniques including UV-Visible, IR, , LC-MS and elemental analysis to confirm their structural integrity and coordination behavior. The geometry and bonding nature of the complexes were further evaluated using in-silico molecular docking studies, which revealed the strong interactions of metal complxes with bacterial target proteins, suggesting potential mechanisms of action. The *in vitro* antibacterial activity of coumarin metal complexes were evaluated against Staphylococcus aureus and Escherichia coli using the agar well diffusion method. The silver complex exhibited antibacterial activity within the range of inhibition zones of 22.4 mm and 20.1 mm, respectively, followed by the copper complex within the range of 19.6 mm and 17.8 mm. This indicates that silver metal complexes are more potent than copper complexes. Both complexes displayed greater efficacy than the free ligand, may be due to improved lipophilicity and membrane permeability. This multifaceted study highlights the promise of coumarin-metal coordination complexes as potent antibacterial agents and provides a basis for further pharmacological development.

**Keywords:** Coumarin metal complexes, Molecular docking, Antibacterial. Agar well diffusion method

## RATIONAL SELECTION OF PHYTOCHEMICALS FOR H PYLORI UREASE INHIBITION IN THE TREATMENT OF GASTRIC ULCER: A MOLECULAR DOCKING AND ADMET PREDICTION APPROACH

Chetana Dhoble, Shruti R. Gotmare,
J.N. Narendra Sharath Chandra, Priyanka N. Warambhe
School of Pharmacy, G.H. Raisoni University, Amravati, Maharashtra, India - 444701.
chetanadhoble1@gmail.com

Gastric ulcers continue to be a major global health concern, with Helicobacter pylori identified as a primary causative agent. This bacterium infects more than half of the world's population and is strongly associated with chronic gastritis, peptic ulcers, and gastric cancer. In India, particularly in under- resourced areas like rural Maharashtra, the prevalence of H. pylori-related disorders is notably high due to inadequate sanitation and healthcare access. Although standard triple therapy (antibiotics with proton pump inhibitors) is commonly used, rising antibiotic resistance and treatment failure have created an urgent need for new therapeutic alternatives. This research work explored the inhibition of H. pylori urease, a key enzyme that aids bacterial survival and mucosal damage. Based on documented traditional use, extracts from over 100 medicinal plants were screened, and 10 were selected for their low IC50 values. Active phytochemicals from these were docked to the urease active site using MOE software. Cholic acid, homoorientin, and cyanidin showed strong binding affinity and promising ADMET properties. Subsequent *in vitro* spectrophotometric assays confirmed their potency, with cholic acid showing the lowest IC50 (0.164 µM). This multi-phase study highlights the potential of plant-derived compounds as safe and effective anti-H. pylori agents, especially against resistant strains.

## SYNTHESIS, DOCKING, CHARACTERIZATION AND BIOLOGICAL EVALUATION OF NOVEL 1,2,4-TRIAZINE DERIVATIVES

ISBN: 978-81-980623-8-3

Sneha Suresh, Jayakrishnan K G, Vinod B
Department of Pharmaceutical Chemistry, St. Joseph's College Of Pharmacy, Cherthala, Kerala, India - 688524
snehasuresh26072001@gmail.com

The present research investigates the synthesis and evaluation of new 1,2,4-triazine derivatives from thiosemicarbazide. The aim is to explore their anticancer, antibacterial, and anti-inflammatory activities. The compounds were established in structure by FTIR, NMR, and mass spectroscopy. Measured anticancer activity *in vitro* against Dalton Lymphoma Ascites (DLA) cells and by the Trypan Blue Exclusion method. Reported results as a percentage of cell killing. Antimicrobial activity was measured against Pseudomonas aeruginosa (Gram-negative) by the agar well diffusion method at concentrations of 40 µg/mL and 80 µg/mL. Found anti-inflammatory activity by the HRBC membrane stabilization method with diclofenac sodium as standard drug. Eight novel derivatives of 1,2,4-triazine were synthesized by conventional methods using benzil and thiosemicarbazide with various aldehydes (JK1- JK8). Among the tested compounds, JK1 was found to possess the most anticancer and anti-inflammatory activities, with greater inhibition of cell death and membrane stabilization compared to the other derivatives. Compound JK8 had a stronger antibacterial activity, producing larger inhibition zones against P. aeruginosa compared to the others. These findings indicate that the synthesized 1,2,4-triazine derivatives are of potential multi-target biological activity. Compounds JK1 and JK8, in our opinion, have the potential to be ideal candidates for further structural optimization and preclinical evaluation in the design of anticancer, anti-inflammatory, and antibacterial drugs.

**Keywords:** Thiosemicarbazide, 1,2,4-Triazine, Anticancer activity, Antibacterial activity, Anti-inflammatory activity

## CH-249

## DEVELOPMENT AND VALIDATION OF A ROBUST HPTLC ASSAY METHOD TO ASSESS THE STABILITY OF MOLNUPIRAVIR UNDER VARIOUS STRESS CONDITIONS

Surekha Shegar[1], Minal Ghante[2]
[1] PhD Scholar, Department of Chemistry, Sinhgad Technical Education Society's Smt. Kashibai Navale College of Pharmacy Kondhva, Pune, Maharashtra, India.
[2] Principal and Professor, Department of Chemistry, Sinhgad Technical Education Society's Smt. Kashibai Navale College of Pharmacy Kondhva, Pune, Maharashtra, India.
surekhashegar.pescopharmacy@gmail.com

This research focuses on designing and validating a precise, sensitive, a stability-indicating HPTLC test technique for quantification of molnupiravir medicament formulation. Validation process adhered to the ICH guidelines. Developed High-Performance Thin-Layer Chromatography technique employed Silica Gel G60F254 as stationary phase for effective separation and analysis. The optimized mobile phase consisted of ethanol, ethyl acetate, and formic acid in a 3:6.5:0.5(v/v/v) ratio. Molnupiravir exhibited an Rf value of 0.76 ± 0.01, with a maximum absorbance at 282 nm for detailed analysis. The method exhibited strong linearity with an $R^2$ value of 0.9937 over range of concentration 100-300 ng/spot and was thoroughly authenticated for parameters including accuracy, precision, specificity, robustness and linearity. Research was carried out in many circumstances, such as acidic, alkaline, neutral, oxidative, thermal, and photolytic environments. with % of degradation calculated. Significant Degradation was noted. under oxidative and thermal condition. No degradation occurred observed under acidic conditions. The method proved to be selective and reproducible for molnupiravir in both bulk and capsule formulations. The developed method effectively separated drug degradants from the non-degraded drug, confirming its status as a stability-indicating assay method.

## DEVELOPMENT AND VALIDATION OF A SENSITIVE, ECONOMICAL BIOANALYTICAL LC-MS/MS METHOD FOR THE SIMULTANEOUS ESTIMATION OF AN ANTIHYPERTENSIVE COMBINATION

Celina Nazaretha, Raman Bathejab
[a] Department of Pharmaceutical Chemistry, P.E.S.'s Rajaram and Tarabai Bandekar College of Pharmacy, Farmagudi – 403 401, Goa, India
[b] VerGo Pharma Research Pvt. Ltd. (Division – VerGo Clinicals), Corlim - 403 110, Goa, India
celinanaz@yahoo.com

A robust and sensitive bioanalytical LC-MS/MS method has been developed and validated for the simultaneous quantification of valsartan and amlodipine in human plasma, utilizing deuterated internal standards. Sample pretreatment was performed using Strata-X cartridges to ensure effective analyte recovery. Chromatographic separation was achieved on a Thermo Hypurity C8 column (100 X 4.6 mm, 5µ), under isocratic elution conditions. The mobile phase comprised acetonitrile and acidified 10 mM ammonium formate buffer (80:20; V/V). A constant flow rate of 1.0 mL min-1 was maintained, and the column temperature was regulated at 40℃ ± 2℃. Retention time recorded for valsartan and valsartan D9 was 1.40 ±0.50 minutes and for amlodipine and amlodipine D4 it was 1.52 ±0.50 minutes. The method was validated in accordance with EMA guidelines. This method exhibited linearity over a concentration range of 51.63 ng mL-1 to 16003.99 ng mL-1 for valsartan and 0.101 ng mL-1 to 20.035 ng mL-1 for amlodipine. This approach is economical and streamlined, making it ideal for high-throughput plasma analysis.

## DEVELOPMENT AND VALIDATION OF A SECOND DERIVATIVE METHOD FOR THE ESTIMATION OF OLMESARTAN MEDOXOMIL BY UV SPECTROSCOPY

Leena Sawaikar, Rucha Barve, Anand Bandodcar
Department of Pharmaceutical Chemistry, PES's Rajaram and Tarabai Bandekar College of Pharmacy-Farmagudi Ponda Goa- 403401
sawaikarleena@gmail.com

This study developed and validated a UV spectrophotometric second derivative method for quantifying Olmesartan medoxomil. Optimized for detection at 262 nm using distilled water, the method showed a linear response within a 5-50 µg/ml range and adhered to Beer-Lambert's law. Extensive statistical validation and recovery studies per ICH guidelines confirmed the method's simplicity, precision, accuracy, selectivity, and rapidity. It proved effective for analyzing Olmesartan medoxomil in both pure samples and tablet formulations.

**Keywords:** Olmesartan, second derivative UV method, ICH guidelines

## DRUG DESIGN AND DISCOVERY: A PARADIGM SHIFT IN MODERN MEDICINE

Saniya D. Dakhale, Mr. Sumit S. Kolte, Dr. Vinod Thakare
Nagpur College of Pharmacy, Nagpur, Maharashtra.
saniyadakhale@gmail.com

The field of drug design and discovery is undergoing a transformative shift, driven by artificial intelligence (AI), deep learning, and computational techniques. Traditional drug development is hindered by high costs, lengthy timelines, and low success rates. However, AI-powered predictive modelling, molecular docking, and virtual screening are accelerating drug discovery by optimizing target identification and candidate selection. This study examines the role of AI and omics technologies-including genomics, proteomics, and metabolomics in modern drug discovery. AI-driven platforms like AlphaFold predict protein structures, facilitating drug target identification. High-throughput screening enhances the selection of therapeutic compounds, significantly reducing development time and costs. A key breakthrough is the AI-designed drug for idiopathic pulmonary fibrosis by *In silico* Medicine, which advanced to clinical trials in just 18 months. Additionally, biotherapeutics-such as monoclonal antibodies, RNA-based therapies, and CRISPR-based gene editing- are redefining treatment approaches for complex diseases. These innovations improve drug efficacy, enable personalized medicine, and address challenges like drug resistance. As AI-driven drug discovery evolves, it promises to reshape global healthcare, enhance clinical trial success rates, and deliver more effective, individualized treatments. This study highlights AI's pivotal role in pharmaceutical research, marking a new era of efficiency, innovation, and patient-centred solutions.

## ECO-FRIENDLY HPLC METHOD DEVELOPMENT FOR ROUTINE QUALITY CONTROL AND IMPURITY PROFILING OF NIRMATRELVIR–RITONAVIR TABLETS

Senthil Kumar Krishnan, Deshika Karunanithi
Department of Pharmaceutical Analysis, Kamalakshi Pandurangan College of Pharmacy, Tiruvannamalai, India
senthikumarsomesh2005@gmail.com

The rapid global deployment of Nirmatrelvir–Ritonavir (Paxlovid®) for the treatment of COVID-19 has created a significant demand for robust, reliable, and sustainable analytical methods to ensure product quality and safety. Conventional high-performance liquid chromatography (HPLC) techniques widely employed in pharmaceutical analysis rely heavily on acetonitrile and methanol, which are toxic, costly, and environmentally unsustainable. To address these limitations, the present study reports the development and validation of an eco-friendly reverse-phase HPLC method for the simultaneous estimation and impurity profiling of Nirmatrelvir and Ritonavir in fixed-dose combination tablets. The method utilizes ethanol, a green solvent, in combination with an acetate buffer as the mobile phase, thereby minimizing environmental hazards while maintaining high analytical performance. Chromatographic separation was achieved on a C18 column (150 × 4.6 mm, 5 µm) under optimized isocratic conditions, producing sharp, symmetrical peaks with baseline resolution. Forced degradation studies under acid, alkali, oxidative, photolytic, and thermal conditions confirmed the method's stability-indicating nature and ability to resolve impurities effectively. Validation in accordance with ICH Q2(R2) guidelines demonstrated linearity ($R^2 \geq 0.999$), accuracy (98–102%), precision (%RSD < 2), robustness, and sensitivity, with detection limits in the low µg/mL range. The short run time (<7 minutes) further enhances method efficiency, reducing solvent consumption and analysis cost. This eco-friendly HPLC method thus represents a sustainable, accurate, and reproducible alternative for routine quality control, stability testing, and impurity profiling of Nirmatrelvir–Ritonavir formulations, aligning with the principles of green analytical chemistry and pharmaceutical sustainability.

## COMPUTATIONAL SCREENING OF NOVEL TETRAMETHYLPYRAZINE-CHALCONE BASED DERIVATIVES OF RIVASTIGMINE TARGETING ACETYLCHOLINESTERASE

Amit Upadhyay[1], Shashi Kant Singh[1], Vibhu Jha[2]
[1]Faculty of Pharmaceutical Sciences, Mahayogi Gorakhnath University Gorakhpur, Arogya Dham, Gorakhpur, India.
[2]Institute of Cancer Therapeutics, School of Pharmacy and Medical Sciences, Faculty of Life Sciences, University of Bradford, Bradford, U.K.
amit.upadhyay189@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder and a leading cause of dementia. While current symptomatic treatments, such as rivastigmine, can temporarily improve cognitive function, they do not alter the disease's progression and are associated with significant adverse effects, including gastrointestinal issues and bradycardia. The complex and multifaceted pathophysiology of AD highlights the need for a new therapeutic approach, such as a multi-target directed ligand (MTDL) strategy. This project proposes the design, synthesis, and evaluation of novel hybrid molecules that combine three key components: rivastigmine, chalcone, and tetramethylpyrazine (TMP). We designed hybrid molecules to create a synergistic therapeutic effect by combining rivastigmine's potent cholinesterase inhibition with the anti-inflammatory, antioxidant, and anti-amyloid properties of chalcone. The inclusion of TMP, an alkaloid with excellent blood-brain barrier penetration and neuroprotective effects, is anticipated to significantly enhance the overall therapeutic profile. While, the synthesis and characterization of designed derivatives are in progress, in this work we present the results of computational screening of the designed derivatives. The research screened a library of designed molecules through molecular docking simulations to predict their binding affinities and interactions with the desired protein (acetylcholinesterase). The designed molecules were then compared to rivastigmine to assess their potential as superior or alternative therapeutic candidates. Detailed analysis of the molecular interactions revealed that these compounds formed a greater number of hydrogen bonds and hydrophobic interactions with critical amino acid residues in the protein's active site. This, combined with favorable physicochemical properties and ADMET predictions, suggests that designed molecules possess superior inhibitory potential and desirable drug-like properties, warranting further *in vitro* and *in vivo* validation.

**Keywords:** Alzheimer's, rivastigmine, docking, ADMET.

## INTERPRETABLE QSAR MODELS: BALANCING ACCURACY AND TRANSPARENCY IN DRUG DISCOVERY

Shrushti D. Ghodmare, Sumit S. Kolte, Vinod Thakare
Nagpur College of Pharmacy, Nagpur, Maharashtra.
shrushtighodmare2004@gmail.com

Quantitative structure–activity relationship (QSAR) models are pivotal in drug discovery, offering predictions of biological activity based on molecular properties. However, the traditional trade-off between model accuracy and interpretability remains a critical challenge. Highly accurate models, such as those employing deep learning or ensemble methods, often lack transparency, limiting their utility in understanding underlying chemical and biological interactions. Conversely, interpretable models like linear regression or decision trees may sacrifice predictive power, constraining their broader application. This review explores strategies to balance accuracy and interpretability in QSAR modelling, emphasizing their importance in accelerating drug discovery. Advances in interpretable machine learning, including attention mechanisms, feature importance metrics, and hybrid modelling, are discussed as potential solutions to enhance the utility of QSAR models. The role of domain knowledge, feature engineering, and transparent validation methods in improving model trustworthiness is highlighted. Furthermore, case studies demonstrate the integration of interpretable QSAR models in real-world drug discovery pipelines, emphasizing their role in hypothesis generation and lead optimization. concludes by proposing a framework to guide the development of interpretable yet accurate QSAR models, aiming to bridge the gap between computational predictions and actionable insights for chemists and pharmacologists. Balancing these dual objectives is critical for advancing rational drug design and decision-making.

## UV SPECTROPHOTOMETRIC METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF RIVAROXABAN AND ASPIRIN IN MULTI COMPONENT SYSYTEM.

Ankita G. Gulhane, Kalyani V. Rahate, Dipti B. Ruikar.
P. R. Pote Patil College of Pharmacy, Amravati, Maharashtra 444603.
ankitagulhane2610@gmail.com

Rivaroxaban is a factor Xa inhibitor is commonly prescribed for the treatment of deep vein thrombosis and pulmonary embolism and Aspirin is widely recognized as an antithrombotic agent extensively utilized in the management and prevention of cerebrovascular and cardiovascular ailments, such as stroke. The development of analytical method is required for accurate analysis of both the drugs. Two simple, precise & economical UV spectrophotometric method have been developed for the simultaneous estimation of Rivaroxaban & Aspirin in their synthetic mixture. Method 1 is Ratio spectra derivative method & Method 2 is Difference spectrophotometric method which is based on measurement of absorption at 245nm & 304nm i.e. maximum of Rivaroxaban & Aspirin, respectively. Linearity was observed in the concentration range of 5-30mcg/ml for Rivaroxaban an\7d 50-300mcg/ml for Aspirin using methanol as a solvent. The accuracy of the methods was assessed by recovery studies and was found to be within range of 98-102%for both the drugs. Precision of the method was estimated by repeatability and intermediate precision studies. The % RSD value were found to be less than 2, proving method were precise. The developed methods were statistically compared using ANOVA, f-

ISBN: 978-81-980623-8-3

test, t-test. The result were validated as per ICH (Q2) R2 guideline and were found to be satisfactory.

**Keywords:** Rivaroxaban, Asprin, Ratio spectra derivative method, Difference spectrophotometric method, Simultaneous estimation.

**ANALYTICAL METHOD DEVELOPMENT AND VALIDATION FOR THE DETERMINATION OF SELECTIVE PHARMACEUTICAL DOSAGE FORMS**

Shanmugapriya Rengaswamy[1], S. Alexandar[1]
[1]Department of pharmaceutical analysis
Vinayaka missions college of pharmacy,
Vinayaka missons Research Foundation salem-636008
rvpriyarajesh84@gmail.com

Parkinson's disease (PD) is the second most common neurodegenerative disorder of the central nervous system, affecting 7–10 million people worldwide according to WHO (2014). It arises from the degeneration of dopamine-producing neurons in the substantia nigra and manifests with motor and non-motor complications including tremor, rigidity, bradykinesia, dementia, and depression. Ropinirole hydrochloride (HCl), a dopamine agonist, is widely prescribed for PD but suffers from limited oral bioavailability (~50%) and a short half-life of 5–6 hours due to extensive first-pass metabolism. To overcome these drawbacks, nanostructured lipid carriers (NLCs) of Ropinirole HCl for intranasal administration are proposed to enhance bioavailability, bypass hepatic metabolism, and achieve direct brain delivery, thereby reducing dosing frequency and improving patient compliance. Parallelly, for the treatment of pulmonary arterial hypertension, Bosentan monohydrate—an endothelin receptor antagonist—requires stringent quality control for residual solvents. A sensitive and reliable headspace gas chromatography (HS-GC) method with flame ionization detection (FID) was developed and validated for the simultaneous determination of methanol, ethanol, 2-propanol, acetone, acetonitrile, and toluene in Bosentan monohydrate, in compliance with ICH Q3C, Q2A, and Q2B guidelines. The method exhibited excellent specificity, linearity, sensitivity, accuracy, precision, robustness, and recovery, with residual solvent levels in tested batches well below ICH limits. These combined studies highlight innovative drug delivery approaches for PD management and robust analytical methods for quality control in pulmonary arterial hypertension therapy.

**Keywords:** Parkinson's disease, Ropinirole HCl, nanostructured lipid carriers (NLCs), intranasal delivery, bioavailability, blood–brain barrier, Bosentan monohydrate, headspace gas chromatography (HS-GC), flame ionization detector (FID), residual solvents, ICH guidelines, method validation, quality control.

**CH-258**

**RP- HPLC METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF LUMATEPERONE IN BULK FORM**

Gilala Pooja, P. Vaishali, K. Neelima
Department of Pharmaceutical Analysis
Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana
gilalapooja@gmail.com

A validated, stability-indicating RP-HPLC method for quantifying Lumateperone tosylate in bulk and capsule dosage forms was developed and optimized. The chromatographic separation employed a Phenomenex C18 column (250 mm × 4.6 mm, 5 µm) with an isocratic mobile phase of methanol and 0.1% ortho-phosphoric acid in water (45:55 v/v), at a flow rate of 1.0 ml/min and detection at 227 nm. Linearity was observed between 2–10 µg/ml with an $R^2$ value of 0.9999. The method was rigorously validated for accuracy, precision, robustness, LOD (0.771 ppm), and LOQ (2.336 ppm) as per ICH Q2(R1) guidelines. Forced degradation studies exposed samples to acid/base hydrolysis, oxidation, thermal, and photolytic conditions; degradation products were well-resolved from the parent drug peak, with 10–20% drug degradation observed under stress. The assay demonstrated excellent specificity, enabling accurate estimation of Lumateperone tosylate in the presence of degradation products. Results confirm that the method is simple, rapid, selective, cost-efficient, and suitable for routine analysis of Lumateperone tosylate in pharmaceutical quality control.

**Keywords:** Lumateperone, RP- HPLC, Validation

**CH-259**

**DEVELOPMENT OF VALIDATED STABILITY INDICATING METHODS OF TOLBUTAMIDE BY HPLC AND UV-VIS SPECTROPHOTOMETER.**

Manisha Verma[1], Bina Gidwani[1], Shiv Shankar Shukla[1], Ravindra Kumar Pandey[1]
Columbia Institute of Pharmacy, Raipur (C.G.)
mv1638710@gmail.com

The present study aimed to develop and validate a stability-indicating high-performance liquid chromatography (HPLC) method for the determination of tolbutamide and the identification of its major degradation products. Acetonitrile and 0.14% potassium dihydrogen orthophosphate buffer (pH 3.0) were gradient eluted in a 35:65 ratio at a flow rate of 1 mL/min to optimise a reverse-phase HPLC method. The method produced good resolution between the drug and its degradants, and tolbutamide showed a sharp peak with a retention time of 4.182 minutes. The linearity in the range of 10–60 µg/mL was confirmed by method validation in accordance with ICH guidelines, with correlation coefficients of 0.9988 (HPLC) and 0.9968 (UV-VIS spectrophotometry). RSD values for both approaches were less than 2%, demonstrating the precision. The spectrophotometric method's mean recoveries ranged from 100.5% to 100.6%, while HPLC's ranged from 99.11% to 99.33%, according to accuracy studies. For HPLC, the limits of quantification (LOQ) and detection (LOD) were 16.76 µg/mL and 5.53 µg/mL, respectively. Studies on forced degradation were carried out in conditions of acidic, basic, oxidative, thermal, and photolytic stress. Tolbutamide degraded the most under oxidative conditions out of all of these. The parent compound and its degradants were successfully separated by the developed method, suggesting that it is a suitable assay for indicating stability. For routine quality control and stability testing of tolbutamide in bulk medications and pharmaceutical formulations, the validated HPLC and UV-VIS spectrophotometric techniques are reliable, accurate, and precise.

**Keywords:** HPLC, PDA detector, tolbutamide, stability indicating method, validation, degradation.

**DEVELOPMENT AND VALIDATION OF RP-HPLC METHOD FOR THE ESTIMATION OF PONESIMOD IN BULK AND TABLET DOSAGE FORM**

Rani B. Navale, Pankaj H. Chaudhary, Dipti B. Ruikar
P.R. Pote Patil College of Pharmacy, Amravati, Maharashtra 444603
raninavale80@gmail.com

The pharmaceutical industry demands precise and robust analytical methods to ensure drug quality, safety, and efficacy. This poster presents the development and validation of a reliable Reverse Phase High-Performance Liquid Chromatography (RP-HPLC) method for estimating Ponesimod, a selective sphingosine-1-phosphate receptor modulator, in bulk and tablet dosage forms. Method development focused on optimizing chromatographic parameters such as mobile phase composition and flow rate to achieve high resolution and minimal tailing. The final method demonstrated excellent linearity across the 10–30 µg/mL concentration range, with a correlation coefficient ($r^2$) > 0.999. System suitability tests confirmed acceptable retention time, theoretical plates, and tailing factor. Accuracy was validated through recovery studies, with results ranging from 98% to 102%, while precision studies showed %RSD values below 2%, affirming method reproducibility. The method's sensitivity was established with LOD and LOQ values of 1.09 µg/mL and 3.29 µg/mL, respectively. Robustness was proven by varying analytical conditions, and forced degradation studies confirmed its stability-indicating capability under acid, base, oxidative, thermal, and photolytic stress. Overall, the validated method complies with ICH guidelines and is suitable for routine analysis of Ponesimod in pharmaceutical formulations.

**STABILITY INDICATING ASSAY METHOD FOR ESTIMATION OF DOMPERIDONE AND PANTOPRAZOLE IN THEIR COMBINED DOSAGE FORMULATION**

Manoj S. Charde, Rita D. Chakole
Government College of Pharmacy,
Chhatrapati Sambhajinagar - 431005, Maharashtra
manojudps@rediffmail.com

ISBN: 978-81-980623-8-3

In this study the method was developed for determination of Domeperidone (DOM) & Pantoprazole (PTZ) in combined dosage form. A RP-HPLC method was developed using Younglin (S.K.) system with PremesilC18 (4.6 x 250mm, 5µm) column and UV detector in a gradient mode with mobile phase comprising of Methanol: Water (60:40v/v) pH-2.5 adjusted with 0.05% OPA (HPLC grade). 0.7ml/min flow rate and monitoring of effluent were done at 285.0 nm for DOM and PTZ estimation in combined dosage form. 10min for (DOM) & (PTZ) retention times were found. The dynamic range of linearity 1-5 µg/mL for PTZ and 30- 150 µg/mL for DPD were exhibited for the assay. The linear calibration curves were found over the entire range linearity (r2 = 0.9992 for DPD and r2 = 0.9992 for PTZ) and 99.82 % for DPD and 99.91 % for PTZ mean % recovery was found with % RSD was NMT 2 for both estimations which fully agrees by system suitability in good agreement with labeled claimed of formulation. The % RSD for Intra & Inter-Day Precision was NMT than 2 for both drugs. The developed method was accurate, precise, rugged and linear as per ICH guidelines.

**Keywords:** DOM, PTZ, RP-HPLC.

**AQBD-BASED OPTIMIZATION AND SIMULTANEOUS RP-HPLC METHOD DEVELOPMENT AND VALIDATION OF MONOMETHYL FUMARATE AND FAMPRIDINE IN BULK AND NANOSTRUCTURED LIPID CARRIERS**

Atith Muppayyanamath[1], Vinayak Mastiholimath[1]
[1]Department of Pharmaceutical Quality Assurance, KLE College of Pharmacy, KLE Academy of Higher Education and Research, Nehru Nagar, 590010, Belagavi, Karnataka, India.
atithum22@gmail.com

Analytical Quality by Design (AQbD) is essential for developing precise, robust pharmaceutical analytical methods ensuring drug safety and efficacy. Monomethyl fumarate (MMF) and fampridine (FAM) are important drugs with oral formulations limited by side effects, highlighting the need for a reliable simultaneous HPLC method to enable accurate estimation, quality control, and monitoring of MMF and FAM in bulk and nanostructured lipid carrier (NLC) systems using AQbD principles. Optimization employed Box-Behnken Design (BBD) to study effects of organic phase concentration ($X_1$), flow rate ($X_2$), and column temperature ($X_3$) on retention time ($Y_1$), tailing factor ($Y_2$), and theoretical plates ($Y_3$). Seventeen runs were performed, with run 13 optimized at a mobile phase of water with 0.5% ortho phosphoric acid in water and methanol (85:15 v/v), flow rate 1.0 mL/min, column temperature 35°C, and Phenomenex Luna column (5 µm, 150 × 4.6 mm). MMF and FAM retention times were 9.482 and 3.492 min; tailing factors 1.25 (MMF) and 1.76 (FAM); theoretical plates 8871.31 and 4060.28. Excellent linearity was observed ($R^2$=0.9989 MMF, 0.9992 FAM) from 2 to 12 µg/mL. LOD and LOQ: 0.34 and 1.03 µg/mL (MMF), 0.30 and 0.91 µg/mL (FAM). Recovery ranged 99.87–118.13% (MMF), 97.1–102.4% (FAM). Forced degradation showed significant oxidative stress degradation (45.07% MMF, 48.55% FAM). The developed simultaneous HPLC method is simple, precise, cost-effective, and suitable for quality control and research of MMF and FAM formulations.

**Keywords:** Analytical Quality by Design (AQbD), Simultaneous HPLC method, Monomethyl fumarate, Fampridine, Nanostructured lipid carriers

***IN SILICO* ASSESSMENT AND SONOCHEMICAL SYNTHESIS OF 2-ALKYNYL 3-CHLOROPYRAZINES AS PROSPECTIVE LIGANDS FOR SARS-COV-2**

Gopi Reddy Alugubelli
Sana College of Pharmacy, kodad, Suryapet (Dist), Telangana.
grpharmachem@gmail.com

The recent global pandemic caused by COVID-19 has triggered an intense effort worldwide towards the development of an effective cure for this disease. In our effort we have explored the 2-alkynyl substituted 3-chloropyrazine framework as a potential template for the design of molecules for this purpose. Our strategy was supported by the *in silico* studies of representative compounds to assess their binding affinities via docking into the N-terminal RNA-binding domain (NTD) of N-protein of SARS-CoV-2. Thus, we created a small library of molecules based on the aforementioned template via an environmentally safer method that involved the rapid synthesis of 2-alkynyl 3-chloropyrazine derivatives under Cu-catalysis assisted by ultrasound. The reactions proceeded via the coupling of 2,3-dichloropyrazine with commercially available terminal alkynes in the presence of CuI, PPh 3 and K 2 CO 3 in PEG-400. Further molecular modeling studies helped in establishing a virtual SAR (Structure Activity Relationship) within the series and identification of three potential hits. The desirable ADME was also predicted for these three molecules suggesting their prospective medicinal value.

Mangiferin (MGF), known for its antioxidant and anticancer properties, is widely used in pharmaceutical formulations. Analytical Quality by Design (AQbD) is a systematic, science-driven approach that develops robust and reliable analytical methods, ensuring consistent precision and reproducibility essential for drug safety and efficacy. This study aimed to develop and validate a robust HPLC method for quantifying MGF in bulk and MGF-loaded stealth liposomes using AQbD principles. The method optimization was performed using Box-Behnken Design (BBD) with organic phase concentration ($X_1$), flow rate ($X_2$), and column temperature ($X_3$) as independent variables; retention time ($Y_1$), tailing factor ($Y_2$), and theoretical plates ($Y_3$) were dependent variables. Seventeen experimental runs identified run 6 as optimal, using a mobile phase of 0.1% ortho phosphoric acid in water and methanol (60:40 v/v), flow rate 1.0 mL/min, column temperature 35°C, and Phenomenex Luna column (5 µm, 150 × 4.6 mm). MGF retention time was 3.095 min, with a tailing factor of 1.70 and 2109.05 theoretical plates. The method showed excellent linearity ($R^2$=0.9983) over 10–60 µg/mL. Limit of detection (LOD) and quantification (LOQ) were 2.52 and 7.64 µg/mL, respectively. Recovery ranged between 69.23% and 94.38%. Forced degradation studies indicated notable degradation under alkaline (9.5%) and photolytic (8.2%) stress. The developed RP-HPLC method provides accurate, economical and green chemistry approach for quantifying Mangiferin, making it a valuable tool for pharmaceutical research and quality assurance in complex formulations and drug development.

**THIN LAYER CHROMATOGRAPHY PROFILING AND IDENTIFICATION OF MARKER COMPOUNDS IN MEDICINAL PLANT EXTRACTS FOR PHARMACOGENETIC STANDARDIZATION**

Siva Kumar P, Pichuka Padmalatha, J.V. Suresh,
Pharmacognosy Division, Jagan's Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh, India.
shineshiva227@gmail.com

Thin Layer Chromatography (TLC) is a simple, rapid, and cost-effective analytical method widely employed for the qualitative analysis and profiling of plant extracts in pharmacognosy. This technique allows for the separation and identification of marker compounds based on their differing affinities towards the stationary and mobile phases. TLC profiling is essential for standardizing herbal medicines by identifying bioactive constituents, impurities, and adulterants. The process involves applying a small sample of plant extract onto a silica gel-coated plate, developing it in an appropriate solvent system, and visualizing the separated compounds under UV light or through chemical derivatization. TLC is favored in phytochemical analysis for its ease of use, minimal sample preparation, and capacity to analyze multiple samples simultaneously. Identifying marker compounds through TLC

ISBN: 978-81-980623-8-3

profiling supports quality control, authentication, and validation of crude drugs and herbal formulations, ensuring their efficacy and safety.

## PHYSICOCHEMICAL PROFILING, DRUG-LIKENESS, ADMET PREDICTION, AND COMPUTATIONAL BINDING MODE ANALYSIS OF A PYRAZOLO-PYRIMIDINE LEAD DERIVATIVE

Saurabh Shirude[1], Rohit Singh[1], Nilesh Bajad[1]
[1]Department of Pharmaceutical Sciences, School of Health Sciences & Technology, Dr. Vishwanath Karad MIT-World Peace University, Pune, Maharashtra 411038.
shirudesaurabh5871@gmail.com

The growing global burden of cancer highlights the direct need for the discovery of novel therapeutic agents for the effective management of the disease. In addition to the therapeutic activity, the physicochemical properties of any drug molecule critically influence its bioavailability, distribution, metabolism, and excretion, and hence its therapeutic efficacy. Therefore, further complete physicochemical profiling of novel synthesized lead molecules are necessary in order to move for further pre-clinical studies. This study mainly investigates the physicochemical profiling, drug likeness, ADMET prediction along with computational binding mode analysis of novel synthesized Pyrazolo-pyrimidine derivative. The physicochemical profiling including, solubility, log P and log D of lead molecule showed the favorable physicochemical properties of lead molecule along with drug likeness. Moreover, *in silico* prediction of the ADMET indicated the favorable absorption, distribution, metabolism, excretion and lack of toxicity. The molecular docking and molecular dynamics studies was also carried out to understand the binding modes of this lead compound. The molecular docking interaction analysis showed high binding affinity of the lead compound against selected target. Furthermore, molecular dynamics simulation studies revealed the high protein–ligand stability of the lead compound with target.

**Keywords**: Physicochemical properties, ADMET, Molecular docking, Pyrazolo-pyrimidine.

## INVESTIGATION AND COMPARATIVE STUDY OF PHENOLPHTHALEIN AND IPOMOEA BATATAS AS A NATURAL INDICATOR FOR ACID-BASE TITRATION"

Krutika Kishor Khandre, Archana Gorakshnath Alhat, Bhavana Kumavat.
Department of Pharmacy, [Dbatu], [pune, maharashtra, india]
krutikakhandre32026@gmail.com

The application of the leaf extracts in acid-base titrimetry shows how analytically significant they are. It was discovered that the leaves of the Ipomoea batata's plant performed well in strong acid-strong base titrations. In SA-SB titration, a distinct and noticeable color shift from pink to green was seen, while in WA-SB, it results in a colorless to yellow end point. The pigment was suited for use as acid-base indicators due to the sharp contrast in their colors in acid and base. Ipomoea batata's plant leaf extracts have excellent performance and sharp color changes at the end points of the titration were observed, which could replace the standard indicators being used in conventional laboratories, i.e. phenolphthalein, with natural indicators. The extraction process is very straightforward, inexpensive, and environmentally friendly. The pigment extracts' good analytical capability through their use in acid-base titrimetry, where they performed best in strong acid-strong base titration with a distinct and distinct color shift. The pigment was suited for use as acid-base indicators due to the sharp contrast in their colors in acid and base. Extracts from the leaves of the Ipomoea batata's plant can be used as appropriate indicators in acid-base titrimetry experiments involving a strong acid and a strong base. These plant elements are easily accessible, and the extraction process is straightforward. They operate excellently and produce exact, accurate results, which makes them a perfect substitute for the currently used synthetic indicators. As a result, the use of natural indicators in acid-base titration is more advantageous due to their affordability, simplicity, ease of preparation, easy availability, pollution-free nature, inert nature, and accurate results.

**Keywords:** affordability, simplicity, ease of preparation, easy availability, pollution-free nature, inert nature, and accurate results with biodegradability and non-toxicity for aquatic life.

## INCREASE OF RIBOFLAVIN PRODUCTION FROM BACILLUS SUBTILIS BY FLUX BALANCE ANALYSIS

I.Shyam, V.Kevin, G.Dharani, B.Babu Rao
Nethaji Institute of Pharmaceutical sciences, Subbaiahpally, Somidi, Kazipet, Telangana, India – 506003
Department of Biotechnology, National Institute of Technology Warangal, Warangal, Telangana, India – 506003
samhornet2004@gmail.com

Riboflavin (vitamin B2) is an essential cofactor in cellular metabolism, widely applied in pharmaceuticals, food fortification, and nutraceuticals. Bacillus subtilis, a non- pathogenic GRAS microorganism, has emerged as a robust platform for riboflavin production owing to its genetic tractability and industrial relevance. The genome-scale model iYO844 provides a valuable tool for simulating flux distributions and identifying metabolic rewiring strategies to enhance yields. Flux Balance Analysis (FBA) will be applied to the B. subtilis genome-scale model to identify key metabolic bottlenecks and flux shifts across central carbon metabolism, with emphasis on the pentose phosphate pathway, purine biosynthesis, and flavin biosynthetic routes. Based on these insights, targeted interventions will include amplification of riboflavin biosynthetic genes (ribA–ribH), attenuation of competing NAD(P)H-consuming reactions, and rerouting of glycolytic flux toward GTP and ribulose-5-phosphate to strengthen precursor supply. Parallel nutrient optimization will evaluate glucose, glycerol, and agricultural by- products as substrates to ensure precursor robustness and cost-effectiveness. At the bioprocess level, controlled aeration, pH stabilization, and fed-batch feeding will be implemented to maintain redox balance, minimize inhibition, and prolong production phases. Integrating *in silico* predictions with metabolic engineering, nutrient optimization, and bioprocess control offers a systems-level framework for scalable riboflavin overproduction. Coupled with adaptive laboratory evolution, this approach positions B. subtilis as a next- generation microbial factory for cost-effective, sustainable, and high-titre riboflavin biosynthesis.

**Keywords:** Riboflavin production, Flux balancing, Bacillus subtilis, therapeutic application

## EXPLORING THE POTENTIAL OF ECHIOIDININ FROM ANDROGRAPHIS ECHIOIDES AS A NOVEL THERAPEUTIC AGENT FOR PARKINSON'S DISEASE THROUGH *IN SILICO* MOLECULAR DOCKING

Deepika G and Syed Abuthahir Badusha A
Vellalar college of pharmacy, TN Dr MGR University, Thindal, Erode, India - 638012.
deepikakkv2001123@gmail.com

Parkinson's disease (PD) poses a significant health challenge, negatively impacting quality of life. Current treatments focus on neuroprotection and symptom relief. This study examined Andrographis echioidies main metabolites in *in-silico* molecular docking ability against Parkinson's disease proteins, as well as their physiochemical properties (Lipinski rule of five), drug-likeness and parameters including absorption, distribution, metabolism, elimination and toxicity (ADMET) profiles of Andrographis echioidies. This investigation goes deeper into the possible anti-Parkinson's effects of Andrographis echioides, emphasising its engagement with critical enzymes linked to the condition: catechol-O-methyltransferase (COMT), adenosine A2A receptor (A2A), and monoamine oxidase-B (MAO-B). Investigations were conducted on various phytoconstituents derived from A. echioides in relation to specific targets associated with Parkinson's disease (PD). The findings indicated that echioidinin exhibited enhanced binding affinities when compared to standard medications. For instance, echioidinin demonstrated binding affinities of -7.9 kcal/mol with 3EML, -7.5 kcal/mol with 1H1D, -9.2 kcal/mol with 2C65, and -9.2 kcal/mol with 2V61. In contrast, the corresponding binding affinities for dopamine were -5.9 kcal/mol for 3EML, -5.2 kcal/mol for 1H1D, -6.4 kcal/mol for 2C65, and -6.2 kcal/mol for 2V61. Echioidinin shows superior binding affinities compared to other FDA-approved treatments for Parkinson's disease, such as selegiline and rasagiline. These results suggest that

ISBN: 978-81-980623-8-3

echioidinin has a significant affinity for targets related to PD, thereby highlighting its potential as a novel therapeutic approach for the condition. Further in vitro and *in vivo* studies are required to validate these findings and to evaluate the safety and efficacy of echioidinin in the treatment of PD.

**Keywords:** Echioidinin, Andrographis echioidies, molecular docking, ADMET, anti-parkinsonism.

Peptidomimetics are synthetic, peptide-like molecules designed to mimic the structure and function of natural peptides or proteins, but with enhanced stability, bioavailability, and potency to overcome the limitations of traditional peptides in drug development and therapeutics. They are engineered to interact with biological targets, such as protein-protein interfaces, to modulate biological processes in treating chronic diseases like cancer, infection, and neurological disorders. Peptidomimetic approaches have been utilized to design small molecules that selectively target cancer cells, an approach known as targeted chemotherapy, by inducing programmed cell death by a process called apoptosis. Peptidomimetic approaches have been utilized to design small molecules that selectively target cancer cells, an approach known as targeted chemotherapy, by inducing programmed cell death by a process called apoptosis.

**Keywords**: Peptidomimetics, biological targets, chronic diseases, targeted chemotherapy.

**DESIGN AND DEVELOPMENT OF PYRIMIDINE 5-CARBONITRILE ANALOGUES AS ANTICANCER AGENT**

Sunita S. Patil, Sandeep R. Kane
Rajarambapu college of Pharmacy, Urun-Islampur
sunitapatil88@gmail.com

Tyrosine kinases play crucial roles in a variety of biological processes, including growth, differentiation, metabolism, and apoptosis in response to both internal and external stimuli. They are significant mediators of the signalling cascade. Tyrosine kinases have been linked in recent research to the pathogenesis of cancer. Even though their activity is strictly controlled in healthy cells, mutations, overexpression, and autocrine paracrine stimulation can cause them to have transforming functions, which can result in cancer. Selective tyrosine kinase inhibitors have the ability to prevent constitutive oncogenic activation in cancer cells, making them an attractive strategy for novel genome-based treatments. The many methods of tyrosine kinase inhibition, including small molecule inhibitors, monoclonal antibodies, heat shock proteins, immunoconjugates, antisense, and peptide medications, as well as the mechanisms of oncogenic activation. Since angiogenesis plays a significant role in the development and spread of cancer, tyrosine kinase inhibitors can be used as an effective anti-angiogenesis target and as a novel cancer treatment approach.

**Keywords:** Tyrosine Kinase, Inhibitor, Drug Discovery, Oncogenic activation, Malignant.

**GREEN SYNTHESIS, CHARACTERIZATION, AND EVALUATION OF ANTIDIABETIC POTENTIAL OF DOPED MGO-ZNO NANOPARTICLES BY DOE APPROACH**

Himanshu Khatdeo[1], Saloni Ghodmare[1], Vishnu Choudhari[1]
[1]Department of Pharmaceutical Sciences, School of Health Sciences and Technology, Dr. Vishwanath Karad, MIT World Peace University, Kothrud-411038, Pune, India.
himanshu.khatdeo@mitwpu.edu.in

The rising incidence of diabetes and limitations of conventional therapies have created a demand for safe, sustainable, and effective alternatives. The present study focuses on the green synthesis of chromium-doped magnesium oxide–zinc oxide (MgO-ZnO) nanoparticles using hydroalcoholic leaf extracts of Aegle marmelos and Mangifera indica, both known for their rich phytochemical composition and traditional antidiabetic use. A Box-Behnken Design was applied to optimize critical synthesis parameters, including dopant concentration, extract volume, and sonication time, with responses evaluated for particle size, antioxidant potential, and α-glucosidase inhibition activity. The synthesized nanoparticles were characterized using FTIR, XRD, particle size analysis, FESEM-EDX, and ICP-OES, confirming nanoscale morphology, functional groups, and elemental composition. The optimized nanoparticles exhibited strong α-glucosidase inhibition (up to 68%), a mean particle size of 95.79 nm, and potent antioxidant activity (DPPH and FRAP assays). Additionally, the brine shrimp lethality assay and MTT assay on HepG2 cell lines revealed moderate anticancer activity with low toxicity, while antibacterial studies demonstrated growth inhibition at 100 µg/ml. These findings suggest that green-synthesized chromium-doped MgO-ZnO nanoparticles hold significant potential as a nanomedicine-based approach for diabetes management, with additional prospects in anticancer and antibacterial therapy. Further *in vivo* studies and formulation development are recommended to advance their therapeutic application.

**Keywords:** Green synthesis, MgO-ZnO nanoparticles, DoE, Antidiabetic.

**CH-273**

***IN-SILICO* STUDY ON CONJUGATION OF VARIOUS THIAZOLIDINEDIONE AND AMINES DERIVATIVES WITH PROPER SPACER MOLECULE AS POTENT ANTIDIABETIC MOIETY**

Rajdeep Bhuyan, Deboprotim Dasgupta
Department of Pharmaceutical Chemistry,
NETES Institute of Pharmaceutical Science,
NEMCARE Group of Institutions, Mirza, Kamrup, Assam- 781125
rajdeepbhuyan626@gmail.com

Diabetes mellitus is a chronic metabolic disorder characterized by impaired glucose regulation and associated complications that significantly affect quality of life. Despite the availability of numerous therapeutic agents, limitations such as reduced efficacy, adverse effects, and drug resistance necessitate the design of novel antidiabetic molecules. Thiazolidinediones (TZDs), a class of heterocyclic compounds, have been extensively studied as potent antidiabetic activity, contributing to improved insulin sensitivity and glycemic control. Similarly, amine derivatives are known to enhance bioactivity through hydrogen bonding and electrostatic interactions with biological targets. In this study, novel hybrid scaffolds were designed by conjugating various TZD cores with different amine derivatives via suitable spacer molecules to optimize molecular flexibility and binding efficiency. The designed conjugates were subjected to in-silico evaluation, including molecular docking and other key antidiabetic targets, as well as ADMET profiling to assess pharmacokinetic behaviour and safety. Docking analysis revealed that several conjugates exhibited enhanced binding affinity, favourable orientation, and strong hydrogen-bonding interactions within the active site compared to standard TZD analogous. ADMET predictions further indicated acceptable drug-likeness, oral bioavailability, and low toxicity risks. The results suggest that TZD-amine conjugates with appropriate spacers hold significant potential as next-generation antidiabetic agents. Further optimization and experimental validation are warranted to develop these scaffolds into effective therapeutic candidates for diabetes management.

**Keywords:** Anti-diabetic, thiazolidinedione, *In-silico* studies, molecular docking.

**COMPUTATIONAL IDENTIFICATION OF A SINGLE LIGAND TARGETING CONSERVED BINDING SITES IN ONCOGENIC KRAS MUTANTS: A PAN-CANCER *IN SILICO* STUDY**

Prashanth E
Gardencity University,
Bilal Nagara Nelamangala Town Banglore Rural Karnataka562123
prashantheprashanth584@gmail.com

KRAS (Kirsten rat sarcoma viral oncogene homolog) is an important oncogene often mutated in several human cancers, including pancreatic, colorectal, and lung cancers. Mutations like G12R, G12V, G12D, and G12A lead to constant activation of the KRAS protein, which helps cancer cells survive, grow, and resist treatment. Because of its smooth surface and strong attraction to natural ligands, KRAS has traditionally been seen

ISBN: 978-81-980623-8-3

as "undruggable." In this study, we used a pan-cancer approach to find one FDA-approved drug that can bind to conserved areas across different KRAS mutants. We screened 1400 FDA-approved compounds through molecular docking with AutoDock Vina, testing them against the modeled structures of KRAS G12R, G12V, G12D, G12A, and wild-type KRAS. Piperaquine stood out as the best candidate, showing strong binding affinities of –7.3 kcal/mol for G12R and G12D, and –7.0 kcal/mol for G12V and G12A. It had a significantly lower binding affinity of –6.2 kcal/mol for wild-type KRAS. This difference indicates that Piperaquine prefers to interact with the mutant forms over the wild type, suggesting its potential as a targeted inhibitor for pan-mutant KRAS. We conducted molecular dynamics (MD) simulations to evaluate the stability and behavior of the ligand–protein complexes, confirming that Piperaquine binds stably within the mutant KRAS pockets. These results show the potential of reusing drugs through computational screening to find broad-spectrum cancer treatments. They also provide a solid basis for future studies to validate these findings in lab and live settings, focusing on KRAS-driven cancers.

**CH-275**

## COMPARATIVE ANALYSIS OF HPLC VS UV-SPECTROSCOPY IN QUALITY CONTROL TESTING

Doppalapudi supriya
Department of pharmaceutical analysis
St.xavier institute of pharmacy, guntur, Andhra Pradesh, 522529.
supriyapharma369@gmail.com

Quality control testing plays a crucial role in ensuring the safety, efficacy, and reliability of pharmaceutical products. Among the most widely used analytical techniques, High-Performance Liquid Chromatography (HPLC) and UV-spectroscopy have gained significant importance due to their precision, accuracy, and applicability across a wide range of compounds. This study presents a comparative analysis of HPLC and UV-spectroscopy in pharmaceutical quality control testing. HPLC, with its superior separation ability, high sensitivity, and reproducibility, is particularly effective for multi-component analysis, impurity profiling, and stability studies. In contrast, UV-spectroscopy, being relatively simple, rapid, cost-effective, and non-destructive, is widely applied for routine drug assay, dissolution profiling, and quantitative estimation of compounds exhibiting chromophores. The comparative evaluation highlights that while HPLC provides detailed qualitative and quantitative information with high resolution, it is more time-consuming and requires higher operational costs and technical expertise. UV-spectroscopy, although limited by lower specificity and inability to effectively separate complex mixtures, remains advantageous for preliminary screening and high-throughput analysis. The findings emphasize that the selection between HPLC and UV-spectroscopy depends on the analytical requirements, complexity of the sample matrix, and regulatory expectations. A combined approach, utilizing the strengths of both techniques, can enhance the robustness of quality control testing in the pharmaceutical industry. This comparative analysis underlines the importance of method selection in achieving regulatory compliance, product consistency, and patient safety.

**Keywords:** HPLC, UV-spectroscopy, comparative analysis, pharmaceutical quality control, drug assay, impurity profiling, dissolution testing

## DESIGN AND *IN-SILICO* STUDY OF NOVEL RESORCINOL-THIAZOLYL HYBRIDS AS POTENT THERAPEUTICS FOR DIABETIC FOOT ULCER

Sanjit Kalita, Bitu Gogoi
Department of Pharmaceutical Chemistry,
NETES Institute of Pharmaceutical Science,
NEMCARE Group of Institutions, Mirza, Kamrup, Assam- 781125
sanjitkalita6000@gmail.com

Diabetic foot ulcer (DFU) is one of the most severe complications of diabetes mellitus, characterized by chronic, non-healing wounds that often lead to infection, amputation, and significant morbidity. Conventional treatment strategies face challenges due to poor vascularization, prolonged inflammation, and the rise of multidrug-resistant pathogens. Hence, there is an urgent need for novel therapeutic agents with enhanced antibacterial efficacy to improve wound healing outcomes. Resorcinol, a well-known phenolic compound, exhibits antioxidant and antimicrobial properties, while thiazole derivatives have been widely studied for their antibacterial, anti-inflammatory, and wound-healing potential. Hybridization of these two pharmacophores into resorcinol-thiazolyl scaffolds represents a promising molecular design strategy to generate new antibacterial agents with synergistic activity. In this research, a series of novel resorcinol-thiazolyl hybrids were designed and subjected to in-silico evaluation, including molecular docking and ADMET profiling, against key bacterial targets implicated in DFU infections. A library of resorcinol-thiazolyl hybrids theoretically designed through ChemDraw and their In-silico studies are performed. The study involves the assessment of molecular properties, toxicity, and the potential antibacterial activity of the resorcinol-thiazolyl hybrids through Molinspiration, SwissADME, ProTox-3.0; Molecular docking via vina PyRx and Discovery studio. Based on these studies it has been determine that certain resorcinol-thiazolyl hybrids has shown effective binding affinity and further these derivatives can be proceeded for synthesis. The result of the study indicates a potential effectiveness of the novel resorcinol-thiazolyl hybrids as an antibacterial agent to treat DFU.

**Keywords:** Anti-bacterial, diabetic foot ulcer, *In-silico* studies, resorcinol-thiazolyl hybrids.

## DEVELOPMENT AND VALIDATION OF RP- HPLC METHOD FOR DETERMINING NITROSOMINE IMPURITIES IN OTESECONAZOLE CAPSULES

Anupoju. V. R. Gayathri, B. Madhuharika
Department of pharmaceutical Analysis, vikas Institute of pharmaceutical sciences, near airport, Rajahmahendravaram, East Godavari district, Andrapradesh, India-533102.
anupojuvaraharatnagayatri@gmail.com

The determination of NDMA, NDEA, NMPA in osteseconazole was done by RP-HPLC method. The method was developed by using column DIKMA spursil C18, 250×4.6mm, 0.005mm, mobile phase consists of potassium di hydrogen orthophosphate through 0.22mm membrane filter paper-pH 3.5, and methanol in ratio of 80:20 with flow rate of 1ml/min. The wavelength scanned at 240nm seperation of osteseconazole was 9.910 min and the impurities NDMA, NDEA,and NMPA with retention time of 3.522, 5.513 and11.648 minutes respectively. The developed was validated and the parameters are discussed below. The linearity of NDMA, NDEA, and NMPA was found to be linear with a correlation coefficient of 0.99, 0.99 and 0.99, which shows that the method is capable of producing good sensitivity. The acceptance criteria of precision is RSD should be not more than 15 and the method shows precision 1.3, 3.4 and 2.1 for NDMA, NDEA and NMPA respectively which shows that the method is precised. The validation developed method shows that the limit, which shows that the method capable of showing good accuracy and reproducibility. The LOD for NDMA, NDEA and NMPA was 0.03. The LOQ for NDMA, NDEA and NMPA was found to be 1.51,0.51and 0.08. The robustness limit for mobile phase variation and flow rate variation are well within the limit, which shows that the method is having good system suitability and precision under given set of conditions.

## LCMS- A NEW COMPREHENSIVE URINE ANALYTICAL METHOD TO DETECT DRUG ACTIONS

M. Asmitha, V. Swathi.
Department of Pharmacology and Pharmacy Practice,
Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu,
Vijayawada, A.P., India-521108
asmithamarepalli@gmail.com

Drug addiction, is a condition that affects a person's brain and behavior and leads to an inability to control the use of a legal or illegal drug or medicine. The severity and intensity of drug addiction vary with different drugs. Diagnosis requires a thorough evaluation often involving assessment by a psychiatrist, a psychologist, or a licensed alcohol and drug counselor. Blood, urine and other lab tests are performed to identify the presence of drug. A new specific, accurate and concise method has been developed using liquid chromatography with mass spectroscopy that confirms and quantify the amount of drug taken using urine sample. A new method developed using ammonium fumarate with

ISBN: 978-81-980623-8-3

formic acid in methanol and water. This advanced method helps in identifying drugs and its metabolites quicker and easier compared with other techniques.

**Keywords**: Drug addiction, diagnosis, blood, urine, LC-MS, accurate, metabolites.

**ANALYTICAL QUALITY BY DESIGN APPROACH FOR DEVELOPING A ROBUST RP-HPLC METHOD TO QUANTIFY COMBINED COX-2 INHIBITOR AND SKELETAL MUSCLE RELAXANT AGENTS**

Manogna ch, Vijaya Lakshmi Marella
Department of Pharmaceutical Analysis, KVSR Siddhartha College of Pharmaceutical Sciences, Vijayawada-10
chilukurimanogna2050@gmail.com

A systematic analytical quality by design (AQbD) framework was applied to develop and validate a robust reversed-phase high-performance liquid chromatography (RP-HPLC) method for the simultaneous estimation of Etoricoxib and Thiocolchicoside in bulk and tablet dosage forms. The method followed QbD paradigm, starting with risk assessment by ishikawa analysis to identify potential critical method parameters such as mobile phase composition and pH and their impact on critical quality attributes which includes theoretical plates, tailing factor and resolution. A Design of Experiment approach using central composite design (CCD) was employed to statistically optimize the critical method parameters. From this , a method operable design region was established to ensure consistent method performance within the defined ranges. The optimised chromatographic conditions included an isocratic mobile phase consisting of 0.1 M ammonium formate buffer (pH 3.0) and acetonitrile in an 80:20% v/v ratio with separation achieved using a Symmetry C18 column (250 × 4.6 mm, 5 µm) at room temperature, with a flow rate of 1.0 mL/min. Detection was performed at an isosbestic point of 287 nm with a total run time of 6 minutes. The method exhibited excellent linearity (R2 >0.999) over the concentration ranges of 30–180 µg/mL for Etoricoxib and 2–12 µg/mL for Thiocolchicoside, with low limit of detection (LOD) 0.60 µg/mL/0.04 µg/mL and limit of quantitation (LOQ) 1.80 µg/mL/1.12 µg/mL for values confirming sensitivity. Validation as per ICH Q2(R1) confirmed accuracy, precision, robustness and system suitability. The defined control strategy ensures method reproducibility throughout its lifecycle, aligning with the principles of ICH Q8(R2), Q14 and Q12 for lifecycle management of analytical procedures. This study confirms that adopting the AQbD approach enables the development of a statistically optimised, regulatory complaint, and highly reliable method supporting routine Quality control and regulatory submissions.

**CINNAMOYL-HYDRALAZINE HYBRIDS: SYNTHESIS, MOLECULAR DOCKING, MOLECULAR DYNAMIC SIMULATIONS, *IN VITRO* CYTOTOXICITY AND ANTIOXIDANT ACTIVITY EVALUATION**

Rajitha Galla, Vidya Rani Murthi, Vanitha Madhuri Tadepalli and Gnaneswari Kongara
Institute of Pharmaceutical Technology, Sri Padmavati Mahila Visvavidyalayam, Tirupati- 517502, Andhra Pradesh, India.
grajitha@spmvv.ac.in

Treatment resistance in many cancers is a major concern, requiring development of new drugs to overcome the drug resistance. Hence, in present study, a novel (2E)-2-cyano-3-substituted phenyl-N'-(phthalazin-1-yl)prop-2-enehydrazide derivatives (4a-l) were synthesized and tested for cytotoxic and antioxidant activities. Title compounds were docked against EGFR kinase domain (PDB I'D:1M17) and Peroxiredoxin-5 (PDB I'D: 3MNG). *In vitro* cytotoxicity potential was explored on A549, PC-3 and MCF-7 cell lines by MTT assay. Further, synthesized derivatives were evaluated by *in vitro* EGFR inhibition assay using erlotinib as standard. Antioxidant activity was evaluated by DPPH assay. From molecular docking studies, it was found that compound 4i with 3,4-dihydroxy substitution exhibited comparable binding affinity towards both the selected targets EGFR and PrxV with XP Gscores -7.79025 Kcal/mol and -5.7368 Kcal/mol respectively to that of standard drugs erlotinib and ascorbic acid. Among the series, the most promising compound 4i elicited highest cytotoxic activity against A543 (IC50 = 12.5µM) and MCF-7 cell lines (IC50 = 18 µM). Compound 4i also exhibited significant EGFR inhibition with IC50 7.6 µM compared to erlotinib. Compound 4h with hydroxy group exhibited better DPPH radical scavenging activity (IC50 =8.6µM) which is comparable with that of standard ascorbic acid (IC50 =10.2µM).

**Keywords:** Cinnamamides, hydralazine, molecular docking, cytotoxic activity, EGFR inhibition

**DEVELOPMENT AND VALIDATION OF A RAPID AND COST-EFFECTIVE CONDUCTOMETRIC METHOD FOR THE ESTIMATION OF LABETALOL HYDROCHLORIDE IN MARKETED TABLET DOSAGE FORMS**

Meenaxi Maste, Shailendra Suryawanshi, Nikhil Gawas
Department of Pharmaceutical Chemistry, Faculty of Pharmacy, KLE Academy of Higher Education and Research, KLE College of Pharmacy, Belagavi-590010, Karnataka, India.
meenaximaste@klepharm.edu

Labetalol hydrochloride is an antihypertensive drug that requires precise and reliable analytical methods for quality control. A simple, rapid, and economical conductometric approach was developed and validated to quantify Labetalol hydrochloride in marketed tablet dosage forms. To develop and validate a sensitive, accurate, and cost-effective conductometric method for the estimation of Labetalol hydrochloride in pharmaceutical formulations, in accordance with ICH guidelines. Conductivity of standard Labetalol hydrochloride solutions was measured in the range of 20–100 µg/mL, and a calibration curve was constructed. The method was validated for specificity, linearity, sensitivity, precision, ruggedness, accuracy, and assay performance. Precision was assessed by intra-day and inter-day studies, and ruggedness studies. Recovery studies determined accuracy, and assay was performed on marketed tablet samples. The method was specific, with no interference from the blank solvent. A linear response was observed between 20 and 100 µg/mL, with a correlation coefficient ($R^2$) of 0.9991. The limit of detection and limit of quantification were 5.09 µg/mL and 15.42 µg/mL, respectively. Intra-day %RSD ranged from 0.35% to 1.63%, and inter-day %RSD ranged from 0.03% to 1.85%, confirming precision. Ruggedness testing showed %RSD values below 1.6%, indicating robustness. Recovery ranged from 97.88% to 107.83%. Assay of marketed tablets showed purity of 102.84%. The developed conductometric method is simple, rapid, precise, accurate, and economical for the estimation of Labetalol hydrochloride in tablet dosage forms. It offers a reliable alternative to more complex analytical methods for routine quality control.

**Keywords:** Labetalol hydrochloride; Conductometric method; Method validation; Precision; Accuracy; Pharmaceutical analysis; Tablet assay

**UNVEILING BENZODIAZEPINE CORES AS ANTI-TB LEADS: COMPUTATIONAL EXPLORATION OF BINDING MODES IN KEY ENZYMES**

G. Krupamai
Department of Pharmaceutical Chemistry
g.krupamai@gmail.com

The emergence of Mycobacterium tuberculosis strains that are resistant to many drugs has made tuberculosis (TB) an even more serious global health concern. Investigating novel chemical scaffolds is crucial to overcome resistance and aggrandize the effectiveness of treatment. Although benzodiazepines are well known for their effects on the central nervous system, their potential as antimycobacterial drugs is still poorly understood. In this study, we used a computer-aided drug design approach to examine novel 1,4-benzodiazepine derivatives as possible anti-TB leads. Protein structures of confirmed TB targets, including MmpL3 (mycolic acid transporter), DprE1 (decaprenylphosphoryl-β-D-ribose 2'-epimerase), and InhA (enoyl-ACP reductase), were constructed using conserved cofactors and obtained from the Protein Data Bank. AutoDock Vina was used to create, optimise, and dock a targeted ligand library of 1,4-benzodiazepines with a variety of aryl and heteroaryl substituents. To prioritize the candidates, binding free energies, hydrogen-bond occupancy, and hydrophobic complementarity were assessed. A number of analogues formed persistent contacts with catalytic residues and cofactors and showed docking scores higher than reference inhibitors. Derivatives with heteroaryl extensions (pyridyl,

ISBN: 978-81-980623-8-3

quinolinyl) and electron-donating substituents (3,4-dimethoxy) in particular showed a strong affinity for the InhA active site, whereas bulky amino-substituted analogues exhibited positive interactions within the hydrophobic pocket of MmpL3. Preliminary ADME predictions suggested acceptable solubility and drug-likeness, indicating potential for further optimization. These results demonstrate the benzodiazepine cores unrealised potential outside of neuropharmacology, providing a new chemical platform for the development of anti-tubercular drugs. To validate computational predictions and move the most promising analogues closer to experimental production, future research will combine molecular dynamics simulations with *in-vitro* evaluation.

**Keywords:** 1,4-benzodiazepine, Anti-TB leads, AutoDock Vina, ADME predictions, computer-aided drug design

**HPLC METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF EXEMESTANE FROM BULK**

Priyanka A. Mohite, Nalini Kurup
Principal K. M. Kundnani College of Pharmacy Cuffe Parade, Mumbai
priyanka.mohite1991@gmail.com

A simple, accurate, precise and rapid reversed-phase high performance liquid chromatographic (RP-HPLC) method has been developed and subsequently validated for the estimation of Exemestane pure. The proposed method is based on the estimation of drug by reversed-phase mode using BDS HYPERSIL C18 (4.6mmø×250mm) analytical column. The optimised mobile phase consisted of Acetonitrile: Methanol: 65:35 v/v. Flow rate was kept at 1 ml/min. The estimation was carried out at detection wavelength of 246 nm. Drug Exemestane was well resolved and retained at 3.66 minutes. The method was statistically validated as per ICH guideline for analytical method validation. The validated method was used for estimation of Exemestane from bulk.

**Keywords:** Exemestane, RP-HPLC, Validation.

**CH-284**

**RP- HPLC METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF BARICITANIB IN BULK FORM**

Nikitha, G. Pooja, S. Hemalatha
Department of Pharmaceutical Analysis, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya Secunderabad, Telangana
keshapaganikitha@gmail.com

A new, validated Reverse Phase High-Performance Liquid Chromatography (RP-HPLC) method has been developed for the quantitative analysis of baricitinib in pharmaceutical dosage forms. The method is simple, rapid, precise, and sensitive, offering reliable and reproducible results. Chromatographic separation was performed on a Waters Alliance E2695 system using a Symmetry Shield RP18 column (4.6 x 150 mm, 3.5 µm particle size). The mobile phase consisted of a 40:60 (v/v) mixture of acetonitrile and a phosphate buffer solution (2.5 g K$_2HPO_4$ + 3.2 g KH$_2PO_4$, adjusted to pH 3.0 with orthophosphoric acid). A constant flow rate of 1 mL/min was maintained. Detection of baricitinib was carried out using a photodiode array (PDA) detector at a wavelength of 257 nm at ambient temperature. The system suitability requirements for baricitinib were: theoretical plates not less than 2000 and tailing factor not more than 2. The method exhibited excellent precision, with the relative standard deviation (RSD) of peak areas for all measurements consistently below 2%. The method was validated in accordance with International Council for Harmonisation (ICH) guidelines and was found to be precise, accurate, robust, and economical. This makes it a suitable method for the routine quantitative analysis of baricitinib.

**Keywords:** Barcitinib, RP- HPLC, Validation

**DECODING STAT3 INHIBITION BY NATURAL PRODUCTS THROUGH COMPUTATIONAL MODELING IN CANCER RESEARCH**

Gargee M. Mahajan, Prashant S. Kharkar
Department of Pharmaceutical Sciences and Technology, Institute of Chemical Technology, Nathalal Parekh Marg
Matunga, Mumbai 400 019. India.
mahajangargee432@gmail.com

We have historically used natural products (NPs) as therapeutic agents due to their unique structural and medicinal properties. Despite their promise, NPs present several challenges, including limited availability, complex structures, and constraints in high-throughput screening. One promising application for NPs is in inhibiting STAT3, a crucial target in cancer therapy. STAT3 (Signal Transducer and Activator of Transcription 3) is a transcription factor that drives cancer development and progression by regulating genes involved in cell proliferation, survival, invasion, and immune evasion. Its protein-protein interaction surface is complex, large, and shallow, necessitating novel molecular scaffolds—such as those found in NPs—to effectively disrupt these interactions. We have compiled data on reported natural products with STAT3 inhibition properties, including experimentally validated examples like curcumin, resveratrol, quercetin, emodin, and luteolin. Data curation involved various sources and tools, including OCSR.ai software and SWISSADME. Furthermore, we conducted computational studies—including DFT studies, molecular docking, and MD simulations—to identify potent NP inhibitors by comparing them to napabucasin, a clinically proven STAT3 inhibitor.

**Keywords:** Natural products, STAT3, STAT3 Inhibitor, Computational, DFT studies, Molecular docking, MD simulation, cancer.

**NETWORK PHARMACOLOGY AND *IN SILICO* STUDIES OF PHYTOCHEMICALS FROM MELIA AZEDARACH AS ANTI-ALZHEIMER'S AGENTS**

Jegadheeswari Prakash, Senthil Kumar Raju, Praveen Sekar
Department of Pharmaceutical Chemistry,
Swamy Vivekanandha College of Pharmacy, Tiruchengode, Namakkal, Tamil Nadu, India – 637205.
jegaprakash7734@gmail.com

Alzheimer's disease causes 60-80% of dementia cases, making it the most common type of dementia. Melia Azedarach is a medicinal plant that contains hepatoprotective, anti-inflammatory, immunostimulant, antioxidant, antibacterial, sedative, anthelmintic, and anti-fertility properties. We used a network pharmacology technique to investigate the potential of phytochemicals derived from Melia Azedarach. The phytochemicals were gathered from several databases, including IMPPAT, the Coconut database, Phytohub version 1.4, the Medicinal Plants database, The Natural Products Atlas, Dr. Duke's Phytochemical and Ethnobotanical database, and the KNApSAcK Core system databases. SwissADME, ProTox 3.0, and CardioTOXCSM webservers were used to determine the phytochemical's physicochemical, pharmacokinetic, and toxicological characteristics. The drug score was predicted using OSIRIS Property Explorer, and the results confirmed that the compounds are druggable. Network modelling and enrichment analysis anticipated the phytochemicals' appropriate targets, indicating that they would be highly effective against Alzheimer's disease. The correlation analysis was conducted using the Gepia2 website. Molecular docking against the chosen targets was performed using Autodock tools, and the results were compared to the co-crystallized ligand and the standard. Nimbiol and T-Cadinol were found to be highly active against the tested targets, with high binding energies and interactions, according to *in silico* studies and drug scores. As a result, these chemicals can help fight Alzheimer's disease. However, more *in vitro* and *in vivo* study is needed.

**Keywords:** Alzheimer's disease, Melia Azedarach, *In silico* studies, Network Pharmacology, Molecular docking.

**ANALYTICAL METHOD DEVELOPMENT AND VALIDATION OF RP-HPLC METHOD FOR THE ESTIMATION OF VILDAGLIPTIN IN BULK AND TABLET DOSAGE FORM**

G. Salai Hanish, N. Vivekanandan
Department of Pharmaceutical Analysis,
Vellalar College of Pharmacy, Thindal, Erode- 638012
Salaihanish6@gmail.com

This dissertation aimed to develop and validate an economical and robust RP-HPLC method for the estimation of Vildagliptin in both bulk and tablet dosage forms. The goal was to establish an analytical technique for quality control that adheres to ICH guidelines. The optimized RP-HPLC method utilized an Intersil C18 column (4.6 x 250mm, 5 µm) operating at 40°C. The mobile phase consisted of Buffer (potassium dihydrogen orthophosphate, pH 3.0) and Acetonitrile in

ISBN: 978-81-980623-8-3

85:15 ratio. A flow rate of 1.5 mL/min was maintained, with detection at 205 nm using a UV detector. Comprehensive validation evaluated system suitability, specificity, linearity, range, precision, and filter integrity. Vildagliptin exhibited a consistent retention time of 3.381-3.382 minutes. System suitability parameters were within acceptable limits, demonstrating an RSD of 0.34% for standard area. Specificity studies confirmed no interference from blank or placebo. The method achieved excellent linearity ($R^2$ = 0.9999) over a 50%-150% concentration range. Precision (RSD 0.22%) and filter integrity (PVDF, Nylon, and PTFE filters suitable) were well within criteria. The developed method is concluded to be straightforward, rapid, accurate, precise, robust, specific, and selective for routine quantitative analysis of Vildagliptin in tablet dosage forms.

**Keywords:** RP-HPLC, Method development, Validation, Quality control, ICH guidelines.

## DETERMINATION OF PESTICIDE RESIDUES IN DIFFERENT VARIETIES OF TOMATOES USING QuEChERS METHOD BY GAS CHROMATOGRAPHY-MASS SPECTROMETRY

Derangula mounika, koppula jyothi
Kvsr Siddhartha college of pharmaceutical sciences,
Vijayawada, Andhra Pradesh – 520010
mounikaderangula999@gmail.com

Tomatoes are one of the most consumed vegetables worldwide and are a rich source of lycopene, offering nutritional and health benefits. With increasing global demand, various cultivars are grown in different regions, including locally adapted varieties. However, the use of pesticides in tomato cultivation has raised major concerns due to their potential adverse effects on human health and the environment. Ensuring food safety requires sensitive and reliable methods for detecting pesticide residues in tomato samples. For pesticide residue analysis, advanced pharmaceutical analytical techniques such as gas chromatography (GC), liquid chromatography (LC), and mass spectrometry (MS) are employed. These methods provide high sensitivity and selectivity, enabling the identification and quantification of multiple pesticide compounds even at trace levels. Sample preparation plays a vital role in residue analysis, involving steps like extraction, purification, and concentration. Among these, the QuEChERS method (Quick, Easy, Cheap, Effective, Rugged, and Safe) is widely preferred due to its efficiency, simplicity, and suitability for complex matrices like tomatoes. Studies reveal that pesticide residues in tomatoes can persist at levels that may cause acute and chronic toxicity, carcinogenicity, and endocrine disruption in humans, while also harming ecosystems by contaminating soil and water. Regulatory agencies worldwide have established maximum residue limits (MRLs) to ensure consumer safety and environmental protection. In conclusion, continuous advancements in analytical methods, combined with strict adherence to MRLs and regulatory monitoring, are essential to safeguard tomato quality and minimize health risks from pesticide residues.

**Keywords**: Gas Chromatography, Mass Spectrometry, Maximum Residue Limit, QuEChERS

## *IN-SILICO* PREDICTION, SYNTHESIS, ANTI-BACTERIAL AND ANTIOXIDANT EVALUATION OF NOVEL FERULIC ACID DERIVATIVES

Sharmina Begum, Paramita Das, Shabana Begum
Department of Pharmaceutical Chemistry, Krupanidhi College of Pharmacy, Bengaluru, Karnataka, India-560035
begum01sharmi@gmail.com

In an effort to discover novel antibacterial agents, we designed and synthesized ferulic acid derivatives predicted through computational studies to possess enhanced biological activity. A total of ten analogues were evaluated by molecular docking against E. coli gyrase B (PDB ID: 6F86), with ADMET and toxicity predictions supporting their drug-likeness and safety. Five compounds were synthesized and structurally characterized by IR, NMR, and mass spectrometry. Among them, compound FA05 emerged as the most promising derivative, displaying potent antibacterial activity with a minimum inhibitory concentration (MIC) of 1.2 µg/mL against Gram-negative strains and notable antioxidant potential with an IC50 of 25.76 ± 1.62 µg/mL. Molecular dynamics simulations and gene networking analyses further demonstrated the stability and mechanistic plausibility of its interactions. These findings suggested that ferulic acid analogues, particularly FA05, represent promising scaffolds for the development of dual-function antibacterial and antioxidant agents targeting resistant bacteria.

**Keywords:** Ferulic acid, Antimicrobial resistance, Antioxidant, Reactive oxygen species, ADMET.

## COMPARATIVE ANALYSIS OF TRACE ELEMENTS IN SKIN WHITEINING & MOISTURING CREAMS MARKETED IN INDIAN LOCAL MARKETS BY ICP-OES

Darisa gnana triveni, koppula jyothi
Kvsr Siddhartha college of pharmaceutical sciences,
Vijayawada, - 52001
darisagnanatriveni@gmail.com

The Indian cosmetic industry, including skincare and whitening products, is rapidly expanding due to rising beauty awareness, social media influence, and global trends. However, heavy metal contamination in cosmetics remains a critical safety concern, as prolonged exposure can lead to toxic effects. This study aimed to evaluate the presence of heavy metals in locally available cosmetic products. Ten samples were analyzed, comprising five moisturizing creams (M1–M5) and five whitening creams (W1–W5) collected from local Indian markets. All samples were digested following standard protocols, and the concentrations of arsenic, cadmium, chromium, nickel, lead, cobalt, copper, and selenium were quantified using Inductively Coupled Plasma–Optical Emission Spectroscopy (ICP-OES). The results revealed the presence of heavy metals in multiple samples. Cadmium and lead levels were within permissible limits; however, several products exceeded safety thresholds. Moisturizing cream M3 showed the highest contamination, with arsenic at 588.36 ppm and chromium at 14.54 ppm. Whitening cream W2 contained elevated selenium levels (194.48 ppm). In particular, nickel and chromium in sample M3 surpassed acceptable safety limits, posing potential risks of dermal absorption and chronic toxicity. The findings demonstrate that some cosmetic products sold in local markets may expose consumers to hazardous levels of heavy metals. Regular monitoring, stricter enforcement of regulatory standards, and consumer awareness are essential to ensure product safety and protect public health.

**Keywords**: Cosmetics, Heavy metals, ICP-OES

## ESTABLISHMENT AND VALIDATION OF AN LC-MS/MS METHOD FOR THE QUANTIFICATION OF SOFOSBUVIR, VOXILAPREVIR AND VELPATASVIR IN RAT PLASMA WITH APPLICATION TO PHARMACOKINETIC ASSESSMENT

Ramya Nagabathula[1,2], Kamepalli Sujana[1]
[1]University College of Pharmaceutical Sciences,
Acharya Nagarjuna University, Nagarjuna Nagar, Guntur
[2]Koringa College of Pharmacy, Korangi, Andhra Pradesh.
ramyanagabathula4@gmail.com

This study reports the establishment and validation of a sensitive and accurate LC–MS/MS method for the quantification of sofosbuvir, voxilaprevir, and velpatasvir in rat plasma, using elbasvir as the internal standard. Chromatographic separation was achieved on an Agilent Eclipse XDB column (250 × 4.6 mm, 5 µm) with a mobile phase consisting of acetonitrile and ammonium formate buffer (pH 3.0, adjusted with formic acid) in a 20:80 ratio. The calibration curves showed excellent linearity over the ranges of 20–800 ng/mL for sofosbuvir ($r^2$ = 0.99998), 5–200 ng/mL for voxilaprevir ($r^2$ = 0.99998), and 5–200 ng/mL for velpatasvir ($r^2$ = 0.99997). The analytes were stable under various storage conditions. Pharmacokinetic analysis revealed half-lives of 30 h for sofosbuvir, 30 h for voxilaprevir, and 20 h for velpatasvir, with respective Tmax values of 2, 4, and 4 hours. The method demonstrated excellent specificity, linearity, accuracy, and compliance with USFDA bioanalytical method validation guidelines. These findings establish the method as a robust and reliable tool for pharmacokinetic studies and potential clinical applications involving sofosbuvir, voxilaprevir, and velpatasvir.

**Keywords:** Sofosbuvir, Voxilaprevir, Velpatasvir, LC-MS/MS, USFDA

## A NOVEL UV VISIBLE SPECTROSCOPY METHOD FOR THE ESTIMATION OF BEDEQUILINE IN BULK-ANTITUBERCULAR DRUG.

P.D.Chaithanya Sudha, A J Preethi, Jayasree R,
Ashritha R, Aswin Joe Francis
Krupandhi College of Pharmacy
chaithumpharm@gmail.com

A simple and economical UV–Visible spectroscopic method was developed and validated for the estimation of Bedaquiline in bulk and pharmaceutical dosage forms. Bedaquiline is a novel diarylquinoline antibiotic approved for the treatment of multidrug-resistant tuberculosis (MDR-TB). It represents a significant advancement in TB therapy, being the first new anti-TB drug with a unique mechanism of action in over four decades. Bedaquiline targets the mycobacterial ATP synthase enzyme, essential for energy production in Mycobacterium tuberculosis, leading to bacterial death. Approved by the U.S. FDA in 2012, it is used in combination with other anti-TB agents to improve treatment outcomes in MDR-TB and extensively drug-resistant TB (XDR-TB) cases. Clinical trials have shown that bedaquiline significantly reduces the time to sputum culture conversion and enhances treatment efficacy. However, concerns remain regarding its potential side effects, including QT interval prolongation and hepatotoxicity. Despite these challenges, bedaquiline plays a critical role in global TB control strategies, especially in regions with high rates of drug resistance, offering new hope in the fight against resistant forms of TB. The method was validated as per ICH Q2(R1) guidelines for parameters such as linearity, accuracy, precision, limit of detection (LOD), limit of quantification (LOQ), and robustness. The recovery studies confirmed the accuracy of the method, while repeatability and intermediate precision studies demonstrated its reliability. The low values of LOD and LOQ indicated adequate sensitivity. The proposed method can be successfully employed for routine quality control and quantitative estimation of Bedaquiline in bulk and pharmaceutical formulations.

**CH-293**

## DOE-ENHANCED RP-HPLC METHOD FOR ROBUST AND ACCURATE FLUTAMIDE ANALYSIS

B. Poornima, N. Samyuktha, B Sri Krishna Sravya, B. Rani
Associate Professor & HOD, Department of Pharmaceutical Analysis,
Vijaya Institute of Pharmaceutical Sciences for Women (VIPW),
Vijayawada.
poornimavipw@gmail.com

Accurate and robust analytical methods are crucial for ensuring quality in drug development, especially for compounds like Flutamide, a non-steroidal antiandrogen used in prostate cancer therapy. This study reports an optimized Reverse Phase High Performance Liquid Chromatography (RP-HPLC) method for the quantification of Flutamide in both bulk and tablet forms, using a Quality by Design (QbD) approach with Design of Experiments (DoE). A Central Composite Design (CCD) was applied to systematically optimize two critical parameters, acetonitrile concentration in the mobile phase and flow rate, and their effects on important chromatographic responses such as retention time, theoretical plates, and tailing factor. The separation was performed on a Shimpack C18 column (250 × 4.6 mm, 5 µm), using an acetonitrile-water mixture (54:46 v/v) as the mobile phase in isocratic mode, with detection at 254 nm. The developed method showed excellent linearity ($r^2$ = 0.9999) within 10–100 µg/mL, high precision with %RSD below 2%, and strong accuracy with recovery rates between 98–102%. It was validated according to ICH Q2(R1) guidelines, confirming its specificity, robustness, and sensitivity, with a limit of detection (LOD) of 0.2443 µg/mL and limit of quantification (LOQ) of 0.7405 µg/mL. This work illustrates how integrating DoE into method development improves analytical performance and offers a scalable, predictive framework. It highlights the role of data-driven strategies in enhancing pharmaceutical analytics and supports the advancement of AI-assisted tools for smarter drug development and regulatory alignment.

## SYNTHESIS AND CHARACTERIZATION OF SCHIFF BASE DERIVATIVES WITH POTENTIAL ANTIMICROBIAL ACTIVITY

Bhishm kumar sahu[1], Priyanka Sinha[1], Pankaj Kashyap[2]
[1]Columbia Institute of Pharmacy, Vill. Tekari,
Near Vidhansabha - 493111, Raipur (C.G.)
[2]Royal College of Pharmacy, Raipur - 492099, (C.G.) India
bhishmsahu15@gmail.com

To synthesize Schiff base compounds, characterize those using spectroscopic techniques, and evaluate their antimicrobial and antifungal activities compared to standard drugs. Schiff bases were synthesized via condensation reactions between various amino groups and aromatic aldehydes. The resulting compounds were characterized using Fourier Transform Infrared Spectroscopy (FTIR), Proton Nuclear Magnetic Resonance (1H NMR), and Carbon-13 Nuclear Magnetic Resonance (13C NMR) spectroscopy to confirm the formation of imine bonds and the overall molecular structure. The antimicrobial activity was assessed against Escherichia coli and Staphylococcus aureus, while antifungal activity was tested against Aspergillus niger and Rhizopus oryzae. Standard antibiotic Ampicillin was used as a reference drug. Spectral analysis confirmed the successful synthesis of Schiff base compounds. Biological assays demonstrated that the Schiff bases exhibited enhanced antimicrobial and antifungal activity compared to Ampicillin, with particularly high activity against both bacterial and fungal strains tested. The synthesized Schiff base compounds showed significant antimicrobial and antifungal activity, surpassing that of standard drugs in some cases. This increased bioactivity is likely due to the interaction of the imine group with microbial cellular components, leading to effective inhibition of growth. These findings highlight the potential of Schiff bases as promising candidates for the development of new therapeutic agents.

**Keywords:** Schiff base, Imines, Condensation reaction, Synthesis, Spectral characterization, Antimicrobial activity, Antifungal activity.

## *IN SILICO* MOLECULAR DOCKING AND ADMET ANALYSIS OF NERIUM OLEANDER PHYTOCONSTITUENTS USING CHEMDRAW, OPEN BABEL, PYRX, AND BIOVIA

Ganesh YB, Shobha Singarapalle, Priyanka Yatham
Pharmaceutical Chemistry Division, Jagans Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh, India.
ybganesh26@gmail.com

Nerium oleander is a medicinally valuable but highly toxic plant that produces a wide array of bioactive secondary metabolites, including cardiac glycosides, flavonoids, and phenolic compounds. Although extracts from this plant have traditionally been used in folk medicine, their pharmacological benefits are often overshadowed by their cardiotoxic effects. To better understand the therapeutic potential and molecular interactions of these phytoconstituents, an in-silico study was conducted. Chemical structures of major compounds such as oleandrin, neriin, kaempferol, and chlorogenic acid were drawn and validated using ChemDraw, then converted into three-dimensional conformations and energy-minimized with Open Babel. Protein targets, including $Na^+/K^+$-ATPase and selected cancer-associated kinases, were retrieved from the Protein Data Bank and optimized for docking. PyRx with AutoDock Vina was used for molecular docking simulations, and the resulting ligand–protein interactions were visualized and analyzed using BIOVIA Discovery Studio Visualizer. The docking results showed strong interactions of cardiac glycosides with $Na^+/K$-ATPase, with oleandrin having the highest binding affinity (–11.2 kcal/mol), stabilized by hydrogen bonds with Asp121 and Thr797. Neriin had a binding score of –9.6 kcal/mol, while flavonoids like kaempferol and phenolic acids such as chlorogenic acid displayed moderate affinities (–6.0 to –8.0 kcal/mol) against kinase targets. ADME and toxicity analyses suggested promising pharmacokinetic properties for flavonoids but confirmed significant cardiotoxic risks for cardiac glycosides. Overall, this study underscores the value of integrating ChemDraw, Open Babel, PyRx, and BIOVIA Discovery Studio for predicting biological activity. The results offer a computational basis for further experimental validation and potential structural refinement of N. oleander metabolites to improve therapeutic effectiveness while reducing toxicity.

**METHOD DEVELOPMENT AND VALIDATION OF TOPIROXOSTAT FOR ITS APPLICATION TO TABLET DOSAGE FORM BY UPLC-MS**

Alibha Das[1], R Prasanthi[2]
Department of Pharmaceutical Quality Assurance, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, India – 500017
alibhadas11@gmail.com

Patients suffering from benign prostatic hyperplasia (BPH) are the main target patients for the medicine Topiroxostat. It works as a medicine by blocking the enzyme phosphodiesterase type 5. There has been increasing interest in the analytical approaches for quantifying it, despite the fact that its pharmacological profile is well-established. For Topiroxostat dosage formulations, very few analytical methods have been established for estimation. The pharmaceutical formulation of Topiroxostat was precisely quantified using a newly designed and validated LC-MS technology. With a significant m/z value of 249.20, successfully separated by chromatography with an optimized retention time of 6.754 minutes. The method's robustness, precision, accuracy, linearity, limit of detection (LOD), and linearity were among the validation parameters that were subjected to stringent evaluation. With a low limit of detection (LOD) of 0.815 ng/mL and a limit of quantification (LOQ) of 0.559 ng/mL, the technique demonstrated excellent linearity ($R^2$ = 0.9994) across the concentration range of 800-1500 ng/mL. Accuracy scores ranging from 99.35% to 100% were shown in recovery studies, indicating high quality. The method's dependability was validated by robustness testing under different experimental settings. All of the parameters were determined to be in compliance after the developed technique underwent validation in accordance with ICH Q2 (R1) requirements. The method's appropriateness for routine quality control analysis was proven by its successful application for Topiroxostat quantification in tablet dosage form.

**Keywords:** LC-MS, Topiroxostat, method validation, quantification, pharmaceutical analysis, quality control

The present study reports the microwave-assisted synthesis of novel benzoxazole-linked combretastatin analogues and their evaluation as potential anticancer agents targeting breast cancer cell lines. Microwave irradiation was employed to achieve rapid and efficient synthesis of the designed compounds, resulting in high yields and reduced reaction times. The synthesized analogues were structurally characterized using NMR, IR, and mass spectrometry, confirming the successful formation of the targeted molecules. The anticancer potential of these compounds was assessed against MCF-7 and MDA-MB-231 breast cancer cell lines using the MTT assay, and $IC_{50}$ values were determined. Selected compounds exhibited significant cytotoxicity, indicating promising anticancer activity. Further, molecular docking studies using AutoDock were performed to investigate the binding interactions of the synthesized analogues with tubulin, a key target of combretastatin. The docking results revealed strong binding affinities, with crucial hydrogen bonding and hydrophobic interactions supporting the observed *in vitro* cytotoxicity. Overall, this integrated experimental and computational approach highlights benzoxazole-linked combretastatin analogues as potential lead compounds for the development of novel therapeutic agents against breast cancer, offering insights into their mechanism of action and structure–activity relationships.

**SYNTHESIS, CHARACTERIZATION AND ANTI-MICROBIAL ACTIVITY OF SOME NOVEL BENZIMIDAZOLE DERIVATIVES.**

Poomagal. J, Jayakumar.A
Department of Pharmaceutical Chemistry, Pallavan Pharmacy College, Kanchipuram, Tamil Nadu, India-631502
annamalaijayakumar@gmail.com

In the present research O-Phenylene diamine used as a starting material and reacted with five different carboxylic acid derivatives. The product thus formed reacted with P- aminoacetophenone leading to the formation of five benzimidazole derivatives (BD-1 to BD-5). The structures of the synthesized compounds were confirmed by IR & Mass spectral analysis and they were evaluated for their antibacterial and antifungal activities. The antibacterial activities of synthesized compounds were screened against both gram positive S. aureus and gram-negative E. coli by agar cup-plate method using ciprofloxacin as standard drug. The antifungal activities of synthesized compounds were screened against Candida albicans by agar cup-plate method using ketaconazole as standard drug. Results revealed that BD-4 and BD-5 showed good antibacterial & antifungal activity.

**A STRUCTURE-BASED APPROACH FOR NOVEL INHA INHIBITORS AGAINST MYCOBACTERIUM TUBERCULOSIS**

Varadaraj Bhat. G
Department of Pharmaceutical Chemistry, Manipal College of Pharmaceutical Sciences (MCOPS), Manipal Academy of Higher Education (MAHE), Manipal, Udupi, Karnataka, India, 576104
Varad.g@manipal.edu

Tuberculosis (TB), caused by Mycobacterium tuberculosis, continues to pose a significant global health challenge, particularly with the rise of multidrug-resistant (MDR) and extensively drug-resistant (XDR) strains. Current first-line agents, such as isoniazid and ethionamide, act indirectly on InhA but are limited by resistance mechanisms, notably KatG and EthA mutations, necessitating the development of novel inhibitors. To address this, advanced computational strategies were employed by integrating geometric deep learning with fragment-based molecular expansion (FRAME) to design and optimize novel InhA inhibitors. The generated compounds were checked for their novelty, synthetic feasibility, predicted their ADMET(Qikprop) properties for their drug likeness, and then utilised molecular docking, dynamic simulations, and binding free energy calculations to study ligand-protein complex behaviour. This workflow enables the identification, optimization, and synthesis of feasible InhA inhibitors, providing a promising avenue for developing effective tuberculosis therapies.

Coronavirus disease 2019 (COVID-19), caused by the highly transmissible SARS-CoV-2 virus, emerged in late 2019 and rapidly evolved into a global public health crisis. In response, various therapeutic interventions have been developed, including a combination of Nirmatrelvir (Nir) and Ritonavir (Rit), known as Rit-boosted Nir, which received Emergency Use Authorization (EUA) from the U.S. Food and Drug Administration (FDA) for the treatment of mild to moderate COVID-19. This combination is recommended particularly for patients at high risk of progressing to severe disease, thereby reducing hospitalization and mortality rates. We used an Agilent C18 column (150 mm × 4.6 mm, 5 µm) to separate the compounds by chromatography. The mobile phase was 0.1% orthophosphoric acid (pH 4.8) and acetonitrile in a 60:40 ratio, with a flow rate of 0.9 mL/min. A PDA detector was used to find the signal at

ISBN: 978-81-980623-8-3

238 nm, and the column was kept at 29 °C. The average retention times for Nir and Rit were 2.3 minutes and 2.9 minutes, respectively. We used a central composite design (CCD) to find the best values for three important factors: the composition of the mobile phase, the flow velocity, and the temperature. The Design Expert 13.0 model properly showed how important method parameters and responses are related to each other. This made sure that the HPLC approach that was developed was reliable and strong enough to measure both Nir and Rit at the same time in both bulk and dose forms.

**Keywords**: Nirmatrelvir, Ritonavir, HPLC, QbD, Central composite design.

## SYNTHESIS, CHARACTERIZATION AND BIOLOGICAL EVALUATION OF SOME NOVEL HETEROCYCLIC COMPOUNDS FOR ANTICANCER ACTIVITY

Anil Pawar, Manisha Sonawane, Rahul Hajare
anilpharma123@gmail.com

Cancer remains a leading cause of global mortality, with current therapeutic strategies hindered by poor selectivity, severe side effects, acquired resistance, and suboptimal pharmacokinetics. Heterocyclic scaffolds, which form the backbone of more than 85% of FDA-approved drugs, offer versatile chemical architectures capable of targeting critical oncogenic pathways. This research aims to design, synthesize, and characterize a novel series of heterocyclic compounds and evaluate their anticancer potential. The study integrates *in silico* ADME, toxicity prediction, and molecular docking to identify promising candidates with high binding affinity toward Topoisomerase II, a validated cancer target. Synthesized compounds will be characterized using FTIR, NMR, mass spectrometry, and elemental analysis, followed by *in vitro* cytotoxicity screening against breast (MCF-7), cervical (HeLa), and lung (A549) cancer cell lines. Expected outcomes include the identification of potent lead molecules with IC50 values below 1 µM, favorable drug-likeness properties, and minimal toxicity to normal cells. Structure–activity relationship (SAR) insights will guide further optimization, while mechanistic studies will validate apoptosis induction pathways. This work is anticipated to yield promising next-generation heterocyclic anticancer agents with enhanced selectivity and reduced systemic toxicity, contributing to the development of safer and more effective therapeutics.

Alzheimer's disease (AD), one of the most prevalent neurodegenerative disorders, has seen therapeutic strategies largely focused on amyloid-β and tau, with limited clinical success. The conventional method of drug design is slow, costly, and associated with high failure rates, as many molecules effective *in vitro* fail during animal or clinical studies. This study employs artificial intelligence and machine learning (AI-ML) to accelerate drug development for AD by enhancing success rates, reducing costs, and shortening development timelines. A literature review provided structure–activity relationship (SAR) insights into existing TrkB agonists. Binding pocket dimensions and physicochemical properties were identified using BIOVIA and the P2Rank-ML-based tool for ligand-binding site prediction. Pharmacophore modeling was carried out using Molsoft for core structure selection, and SwissADME for favorable ADMET properties. Insilico and molecular dynamics will confirm the binding. Synthetic schemes for promising derivatives were generated through ChemAIRS, incorporating green chemistry principles and difficulty, and synthesizability. Binding site evaluation of the TrkB binding pocket presented 14.7 Å and aromatic. Pharmacophore modeling suggested a flavone-based core, which upon derivatization showed improved docking scores and retained essential amino acid interactions. ADMET predictions confirmed favorable BBB permeability. ChemAIRS proposed a green synthetic route via Claisen–Schmidt condensation and iodine-mediated cyclization to yield substituted flavones, meeting efficiency and sustainability criteria. The procedure involving substituted acetophenone, benzaldehyde, KOH, and ethanol was employed for chalcone synthesis, and cyclization under I2 was selected. The synthesized novel TrkB agonist has been characterised by IR, NMR, and MS, and showed good yield and reproducibility.

**Keywords:** Alzheimer's Disease, AI-ML in Drug Discovery, TrkB agonists.

In modern drug discovery, molecular docking analysis is routinely used to understand and predict the interaction between a drug molecule and a target protein from a microbe. Drugs identified in this way may inhibit the entry and replication of pathogens in host cells. Based on a literature survey, the current study explored some substituted hydrazine derivatives' anticancer and antitubercular potential. The synthesized compounds can be docked against Breast cancer (PDB ID: 7JXH) and Tuberculosis (PDB ID: 3UCI) target proteins by the molecular docking technique. Molecular docking was done using igemdockv2.1 software. The binding efficiency of ligands was scored based on their predicted pharmacological interactions and binding energy estimates. In docking analysis for anticancer and antitubercular potential, compound ABSb was found to have the highest binding affinity with the viral HER2 and MBTB protein, followed by compounds ABSc, ABSa, ABSe and ABSd. Also, amino acid residues comprise the viral and bacterial binding site and the nature of the hydrogen bonding involved in the ligand-receptor interaction. It revealed significant findings with tested compound ABSb binding at four and three amino acid residues with the binding energy of -117.7 kcal/mole with cancer and -71.98 kcal/mole with TB protein, respectively. The binding sites are near the amino acids required for virus and bacterial pathogenicity. This analysis may help create a new drug development to prevent or cure cancer and TB.

## FORCED DEGRADATION AND HPLC ANALYSIS OF ORLISTAT: STABILITY INSIGHTS AND ANALYTICAL PERSPECTIVES

Suresh Nimushakavi, Rajesh E Jesudasan, A Ramkumar
[1]Research Scholar, Assam Kaziranga University, Jorhat, Assam 785006
[2] Professor and Dean, School of Pharmacy,
The Assam Kaziranga University, Jorhat, Assam 785006
suresh.nimushakavi@gmail.com

Orlistat, a β-lactone-based gastrointestinal lipase inhibitor, is the only FDA-approved long-term anti-obesity drug. Its chemical structure, characterized by ester and β-lactone functionalities, makes it susceptible to degradation under various stress conditions, posing challenges for stability assessment and quality control. In this study, forced degradation of orlistat was performed under acidic, basic, oxidative, and thermal conditions following ICH guidelines. Degradants were analyzed using a validated reverse-phase high-performance liquid chromatography (RP-HPLC) method. The method demonstrated excellent linearity ($R^2$ = 0.999), precision (%RSD < 2%), and accuracy (recoveries 98–102%), effectively separating orlistat from its degradation products. Results revealed that basic and oxidative stress conditions led to the highest degradation, with approximately 18% and 12% loss of the parent compound, respectively, while acidic and thermal stress produced minimal degradation (<5%). The study also highlighted the formation of specific degradants under different stress conditions, providing insights into orlistat's chemical instability. These findings emphasize the critical role of stability-indicating analytical methods in ensuring drug quality, efficacy, and regulatory compliance. Additionally, the study underscores

ISBN: 978-81-980623-8-3

the importance of considering solubility, lipophilicity, and low UV absorbance when developing robust analytical protocols. By integrating forced degradation studies with advanced HPLC analysis, this work provides valuable guidance for formulation scientists, analysts, and regulatory authorities in the development and quality control of lipophilic drugs like orlistat.

**SIMULTANEOUS UV SPECTROSCOPIC ESTIMATION OF DAPAGLIFLOZIN, SITAGLIPTIN, AND METFORMIN IN TABLETS WITH GREENNESS ASSESSMENT USING GAPI AND RELATED TOOLS**

Qhazima Sareen, T. Tejaswini, S. Hemalatha
Sarojini naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana
qhazimasareen06@gmail.com

This study presents the development and validation of a green, simultaneous UV spectrophotometric method for the quantification of dapagliflozin, sitagliptin, and metformin in a combined tablet formulation. The successful simultaneous determination of DAP, SIT, and MET was made possible by the invention and validation of RP-HPLC and UV Spectrophotometric (Simultaneous Equation Method) techniques. It was discovered that the created techniques were resilient, sensitive, accurate, and exact. This suggests that DAP, SIT, and MET in the combination pharmaceutical formulation can be subjected to quality control analysis using the suggested UV and HPLC procedures. Overall, as the protocols for the UV Spectrophotometric and RP-HPLC methods show, green analytical chemistry can reduce the environmental effect of analytical techniques without sacrificing analytical performance. The developed RP-HPLC and UV methods were appropriate for routine analysis of pharmaceutical dosage forms and bulk forms of sitagliptin phosphate, dapagliflozin, and metformin HCL.

**Keywords:** Dapagliflozin, Sitagliptin, Metformin, Greenness Assessment

**CH-306**

**DESIGN AND DEVELOPMENT OF TRIPLE ANTIOXIDANT LOADED SELF-NANOEMULSIFYING DRUG DELIVERY SYSTEMS (SNEDDS) FOR IMPROVED ORAL BIOAVAILABILITY**

Manohar M[1], verginia stefhney pinto
Department of Pharmaceutics, Nitte (Deemed to be university), NGSM Institute of Pharmaceutical sciences (NGSMIPS),
Mangaluru-575018, Karnataka, India.
manu.mahadev16@gmail.com

Diabetes Mellitus (DM) is a global health challenge associated with oxidative stress and complications in vital organs. Bioactive flavonoids like Thymoquinone (TH), Quercetin (QU), and Hesperidin (HS) possess potent antidiabetic and antioxidant properties, but their therapeutic use is limited by poor solubility, instability, and low oral bioavailability. The present study focused on the development and evaluation of a triple antioxidant-loaded Self-Nanoemulsifying Drug Delivery System (SNEDDS) to enhance the solubility, stability, and oral bioavailability. The SNEDDS was formulated using Gelucire 44/14 (oil), Labrasol ALF (surfactant), and Transcutol-P (co-surfactant). A D-optimal design optimized oil and Smix ratios for droplet size, zeta potential, % transmittance, and emulsification time. The formulation was characterised and evaluated for globule size, polydispersibility Index, zeta potential, surface Morphology, stability testing, *in vitro* drug release, DPPH radical scavenging, MTT cytotoxicity assay, *in vitro* lipolysis, and *in vivo* pharmacokinetic studies in rats. The optimized SNEDDS showed a droplet size of 84.19 ± 1.355 nm, zeta potential −17.6 ± 0.67 mV, 95% transmittance, and 7 s emulsification time, with spherical globules on TEM. Stability studies confirmed high stability at elevated temperatures. At pH 6.8, drug release was 74.97% (TH), 91.99% (QU), and 76.63% (HS) compared to significantly lower release from pure drugs. The formulation exhibited synergistic antioxidant activity, no cytotoxicity to Caco-2 cells, enhanced solubility during simulated digestion, and significantly improved oral bioavailability *in vivo*. Thus, the optimized SNEDDS effectively improved the solubility, stability, antioxidant activity, and oral bioavailability of TH, QU, and HS, proving it a promising approach for delivery.

**Keywords:** Thymoquinone, Quercetin, Hesperidin, SNEDDS, Diabetes Mellitus.

**CH-307**

**VALIDATED UPLC-MS/MS METHOD FOR COMPREHENSIVE STABILITY EVALUATION OF RIBOCICLIB UNDER FORCED DEGRADATION FOR IMPURITY PROFILING**

Vijaya Lakshmi Marella, Pravallika M
KVSR Siddhartha College of Pharmaceutical Sciences,
Vijayawada-520010, Andhra Pradesh, India
marellavijayalakshmi1979@gmail.com

A cyclin-dependent kinase (CDK)4/6 inhibitor called ribociclib has become a leading targeted treatment for breast cancer. Its stability and analytical dependability are essential for medicinal safety as well as regulatory compliance. For thorough stability profiling of ribociclib, we present the creation and validation of a very sensitive Ultra-Performance Liquid Chromatography coupled with Tandem Mass Spectrometry (UPLC-MS/MS) approach. On a ThermoHypoPurity C18 column (50 × 4.6 mm, 5 µm), chromatographic separation was accomplished with a mobile phase consisting of 0.2% formic acid in water and acetonitrile (40:60, v/v) at a flow rate of 0.4 mL/min. The parent chemical eluted at 1.12 ± 0.02 minutes using positive electrospray ionization in multiple reaction monitoring mode. Different degradation pathways were identified by forced degradation studies conducted in acidic, alkaline, oxidative, thermal, and neutral environments. These included partial breakdown under the majority of stressors, total disintegration in alkaline media, and distinctive degradant peaks between 1.13 and 1.71 minutes. Two main degradants were found by mass spectrometric analysis (RD1 at m/z 299.10 and RD2 at m/z 281.20 ± 0.06), while a distinct fragment (m/z 179.15) was only seen under alkaline stress, suggesting substantial molecular disruption. Excellent accuracy, precision, linearity, and robustness were demonstrated by the approach, which was validated in compliance with ICH requirements. A quick, dependable, and legally valid UPLC-MS/MS platform for ribociclib stability-indicating analysis is presented in this work. Beyond normal quality control, the results reveal mechanistic insights into the drug's degradation behavior, with important ramifications for clinical safety assurance, formulation development, and international regulatory filings.

**A RAPID LC-MS/MS METHOD FOR QUANTITATIVE ESTIMATION OF VITAMINS IN FORTIFIED RICE SAMPLES**

Beauty Behera, Rimsha Saif
Delhi Pharmaceutical Sciences and Research University,
Pushp Vihar, New Delhi, India-110017
beauty.behera@dpsru.edu.in

Rice is one of the greatest staple food carriers for food fortification in developing countries. Any deviation in the fortification levels may result in either insufficient nutrient intake or toxic effects on the body. The fortification range of vitamin B9 and B12 is 75 µg/kg- 125 µg/kg and 0.75 µg/kg- 1.25 µg/kg, respectively as per the standards of Indian regulations. In the current study, a rapid LC-MS/MS method was developed for the analysis of vitamin B9 and B12 in marketed fortified rice samples. The LC-MS/MS method was operated in positive-ionization and in t-SRM mode. A heated electrospray ionisation source was used as the ion source. A gradient elution mode with an injection volume of 10 µl was used in this chromatographic technique using 20 Mm ammonium formate + 0.1% Formic acid in water and 100% methanol. The flow rate was set to 0.300 µl/min with a run time of 10 min of mobile phase. The method performance was evaluated for linearity, sensitivity, matrix effect, precision, recovery and robustness. This method showed good selectivity with a low-range detection in the fortified rice. The LOD for vitamin B9 was 0.5 ng/ml while for vitamin B12, it was 0.05 ng/ml. Linearity for vitamin B9 was in the range of 0.5-25 ng/ml while for vitamin B12, it was from 0.05-10 ng/ml. The LOQs for both the vitamins were 10 ng/ml. The recoveries for both vitamins were in the range 70%–120% with % RSD below 10%, specified as per the SANTE guidelines.

## SIMULTANEOUS ESTIMATION OF ATENOLOL AND CHLORTHALIDONE IN COMBINE TABLET DOSAGE FORM BY SIMULTANEOUS EQUATION METHOD USING UV-VIS SPECTROPHOTOMETRY

Mrunmayee Kulkarni
P. R. Pote Patil College of Pharmacy, Amravati
mrunmayee716@gmail.com

A simple, precise, reproducible, accurate, economical & rapid UV-VIS Spectrophotometric method have been developed and validated for the simultaneous estimation of ATN and CTN in tablet dosage form. This paper describes the simultaneous equation method as a quantification parameter. The simultaneous equation method (SEM) involves the measurement of absorbance of ATN and CTN at 227.0 nm and 251.0 nm respectively two and based on E 1% 1cm values at these wavelengths a two set of equations framed. The developed method obeys the beers law in the concentration range of 40-80µg/mL for ATN and 10-50 µg/mL for CTN. The recovery studies show %RSD for ATN 0.094 and for CTN 0.42 by SEM method. The results of analysis have been validated statistically for accuracy, precision, repeatability, specificity and ruggedness. The method was successfully applied to the determination of these drugs in pharmaceutical dosage form.

**Keywords:** ATN, CTN, UV- VIS, Spectrophotometry, Assay method, SEM.

## EXPLORING FOLATE PATHWAY INHIBITION FOR TUBERCULOSIS TREATMENT: SYNTHESIS AND EVALUATION OF SULFONAMIDE DERIVATIVES

Shaikh Alfiya Sikandar, Md. Rayees Ahmad, Shaikh Gazi,
Aslam Tamboli, Pathan Muzakkir
Dept. of Pharmaceutical Chemistry, RP College of Pharmacy
Dharashiv, MH, 413501
shaikhalfiya503@gmail.com

Tuberculosis (TB), predominantly caused by Mycobacterium tuberculosis (MTB), continues to be a formidable global health concern due to its high morbidity, mortality, and the growing incidence of multidrug-resistant (MDR) strains. Sulfonamides, as synthetic antimicrobial agents, have demonstrated the potential to inhibit folate biosynthesis pathways in MTB, offering a promising alternative to conventional first-line therapies like isoniazid and rifampicin, which mainly target cell wall biosynthesis and energy metabolism. The escalating resistance to these standard drugs highlights the urgent need for novel therapeutics with distinct mechanisms of action. In this study, a novel series of sulfonamide derivatives was synthesized through acid-catalysed condensation of substituted chalcone intermediates with sulfonamide in ethanol. These compounds were purified and structurally characterized using Fourier-transform infrared spectroscopy (FT-IR), nuclear magnetic resonance (NMR), and mass spectrometry. Biological screening against the MTB H37Rv strain revealed notable anti-mycobacterial activity, with several derivatives displaying potency on par with established anti-TB drugs. Mechanistically, the sulfonamide derivatives function by competitively inhibiting dihydropteroate synthase (DHPS) and dihydrofolate reductase (DHFR)—crucial enzymes in folate biosynthesis and DNA replication within MTB. Molecular docking studies further confirmed substantial binding affinities to both DHPS and DHFR, substantiating the hypothesized mechanism of action. These findings underscore the therapeutic promise of sulfonamide-based compounds as lead candidates in the fight against drug-resistant TB. Future research will focus on structural optimization to improve aqueous solubility and minimize cytotoxicity, as well as detailed pharmacokinetic and *in vivo* efficacy studies to advance clinical development.

**Keywords:** Tuberculosis, Sulfonamide derivative, drug resistance, folate biosynthesis, anti tubercular activity

## COMPLEXATION OF ANTIBIOTICS WITH SOME METAL IONS, THEIR CHARACTERIZATION AND EVALUATION OF ANTIBACTERIAL POTENTIAL

Rohit Sharma, Komal V. Yadav, Milind J. Umekar, Radheshyam T. Lohiya
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee,
Nagpur, Maharashtra-441002
rohit93254644@gmail.com

In this study, new complexes of cefixime with transition metals (Pd, Ag, Zn, Ni, Cu, and Cd) were successfully prepared and systematically characterized. The characterization involved melting point and solubility analysis, along with spectroscopic techniques including UV/Visible, IR, and NMR. All complexes showed UV absorption bands within the range of 202–295 nm. The IR spectra revealed characteristic signals such as N–H stretching (3500–3350 $cm^{-1}$), C=O stretching (1720–1700 $cm^{-1}$), C–N stretching (1320–1340 $cm^{-1}$), and C–C stretching (1670–1440 $cm^{-1}$), in addition to specific peaks that provided strong evidence for the proposed structures of the metal–cefixime complexes. The antimicrobial activities of these complexes were screened using the disc diffusion method against multiple bacterial strains, namely Staphylococcus aureus, Bacillus subtilis, Klebsiella pneumoniae, Pseudomonas aeruginosa, and Escherichia coli. The results indicated that the Pd, Zn, and Cd complexes demonstrated higher antibacterial activity compared to cefixime alone, while Ag, Ni, and Cu complexes exhibited moderate activity. All synthesized complexes were found to be soluble in polar organic solvents.

**Keywords**: Cefixime, transition metal complexes, spectroscopic characterization, antimicrobial activity.

## COMPUTATIONAL DESIGN AND STRUCTURE BASED OPTIMIZATION OF NOVEL ANTI ANGINAL AGENTS

Bhoomika, Mahesh Patil, Sidrameshwar, Bhavana Kharge
Sri Siddhalingeshwar College Of Pharmacy,
Bidar-585404 Karnataka (INDIA)
bhoomikabhoomi5757@gmail.com

The structure required for the generation of energy and physicochemical properties were obtained from known Anti anginal agents reported in ChEMBL database Multiple conformers, but not more than 300, were allowed to be generated rest of parameters was set to default values. Here we used igemdock and chemmaster for searching similar compounds. We have selected seven known anti-anginal agents which are generated and selected from the ChEMBLE database. The energy and physicochemical properties were obtained from the igemdock and chemmaster were used for the Lead Identification by subjecting the all structures of generated energy and physicochemical properties for virtual screening by using docking method against the PDB ID 1f3k. The energy compounds which has highest binding affinity was selected for the Lead optimization. All the structures were subjected for the molecular docking studies using Glide, in the active sites of the X-ray crystal structures and induced fit models anti-anginal agents. The inhibition activity of the optimized lead molecules against anti-anginal were studied. The extent of inhibition activity of the optimized lead molecules was estimated binding energy as energy score or physicochemical properties and no of interactions with anti-angina agents among the compounds 1-25 it was observed that the compounds, 1,2,3,8,9,10,11,13,18,19,20,21,22, and 25 have potent inhibitory activity against angina with highest energy. All drugs follow the Lipinskis rule of five.

## DESIGN, SYNTHESIS AND SCREENING OF NOVEL 2-PHENYL-1H-INDOLE DERIVATIVES AGAINST BREAST CANCER

Vaishali P. Nagulwar[1], Priti S. Chatter[1], Mohit R. Gaddam[2]
[1]Government College of Pharmacy, Chhatrapati Sambhajinagar,
Maharashtra, India-431005
vaishalinagulwar@yahoo.com

The study focussed on designing, synthesis and evaluation of novel 2-phenyl-1H-indole derivatives as potential anti-breast cancer agents. In-silico screening, identified 12 derivatives (D1-D12) with promising binding affinities against the p110 catalytic subunit of PIK3α enzyme (PDB ID: 5DXT) which were found to be in the range of -7.6 to -10.5, compared to standard 5-Flurouracil (-5.4). The derivatives also demonstrated favorable drug-like properties according to Lipinski's rule of five and improved toxicity profiles (Class 4 or 5) compared to 5FU (Class 3). Ten compounds were successfully synthesized and characterized. *In-vitro* antimitotic assays on Allium cepa bulbs revealed dose-dependent root growth inhibition, with D2, D4, D5, D6B and D10 showing maximal effects which confirmed their ability to slowdown the

ISBN: 978-81-980623-8-3

cell growth. Furthermore, cytotoxicity assays against MCF-7 cell lines highlighted D5 and D10 exhibiting % cell inhibition- 64.74 with IC50 - 64.37 µg/ml and 59.99 with IC50 - 84.07 µg/ml respectively against 5FU used as a standard showing % cell inhibition 85.54 with IC50 value 6 µg/ml at 100 µg/ml concentration. As per the results, it was observed that D5 and D10 although showed moderate % cell inhibition compared to standard but as per in-silico toxicity assessment, they belong to safer predicted toxicity class and have specific targeted affinity towards PKI3α receptor. Hence, the 2-phenyl-1H-indole derivatives can be predicted as selective and safer anti-breast cancer agents.

**Keywords:** Breast cancer, PIK3α enzyme, 5-Flurouracil, 2-phenyl-1H-indole derivative, MCF-7 cell lines

**CH-314**

## SYNTHESIS, CHARACTERIZATION, AND ASSESSMENT OF A PYRIMIDINE RING CONTAINING DERIVATIVE OF NICOTINIC ACID FOR ANTIBACTERIAL PROPERTIES

Abhay R. Thenge, Priyanka D. Meshram, Milind J. Umekar, Radheshyam T. Lohiya
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur, Maharashtra-441002
abhaythenge@gmail.com

Developing new antibacterial agents is still a top priority in the fight against drug resistance and infectious diseases. The structural resemblance of pyrimidine derivatives to nucleic acid bases and their capacity to interfere with essential cellular functions are well known. In this work, cyclisation reactions of 2-aminonicotinic acid derivatives were used to create a series of nicotinic acid derivatives with pyrimidine rings. The successful synthesis of the target compounds was confirmed by structural confirmation using mass spectrometry, FT-IR, $^{1}$H NMR, and $^{13}$C NMR. Streptomycin served as the positive control and DMSO as the vehicle in the cup-plate method, which was used to assess antibacterial activity against Escherichia coli and Staphylococcus aureus. The synthesized compounds demonstrated variable but quantifiable antibacterial potential, with zones of inhibition ranging from 10 to 27 mm. The most active compound was notably P-6, which produced inhibition zones that were similar to those of streptomycin, especially against S. aureus. Although P-1 and P-3 were relatively less active, compounds P-4 and P-5 also demonstrated notable inhibition. Antibacterial potency was ranked as follows: P-6 > P-4 > P-5 > P-2 > P-3 > P-1. These results show that 2-aminonicotinic acid pyrimidine derivatives could be promising candidates for the creation of new antibacterial agents, necessitating additional mechanistic and *in vivo* research.

**Keywords:** Pyrimidine derivative, Nicotinic acid, Antibacterial activity, Cup-plate method, Zone of inhibition, FT-IR, NMR, Drug discovery

## TELLURIUM IN BIOMEDICINE: A PROMISING FRONTIER IN CANCER THERAPY

Vishakha Ishwardas Chandane, Sushil S. Burle, Millind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur, Maharashtra – (441002)
vishakhachandane3@gmail.com

Once considered only a toxic trace element, tellurium is now drawing attention as a surprising ally in cancer therapy. Scientists have found that certain tellurium-based compounds can upset the redox (oxidation–reduction) balance that cancer cells rely on for survival. Two standouts—AS101 and SAS—work by oxidizing thiol groups in proteins. This blocks proteases, the enzymes tumors use to grow and spread, and also disables proteins that help cancer cells avoid death. Tellurium compounds are showing real promise against cancer. They lower IL-10, a protein that normally weakens the immune response, so the body can better attack tumors. This also drives cancer cells into programmed death and helps chemotherapy work more effectively. One compound, AS101, is already in early clinical trials. Scientists are even creating tellurium-based polymers that carry cisplatin and release it only when hit by targeted radiation—killing tumor cells while protecting healthy tissue.

**Keywords:** Tellurium compounds; AS101; SAS; Cancer therapy; IL–10 suppression; Targeted drug delivery

## DESIGN, SYNTHESIS AND CHARACTERIZATION OF CHRYSIN METAL COMPLEX NANOPARTICLES FOR ANTI-ALZHEIMER'S DISEASE ACTIVITY

Royal Massum Raja, Sumitha P, Paramita Das
Department of Pharmaceutical Chemistry, Krupanidhi College of Pharmacy, Chikka Bellandur, Bengaluru, Karnataka, 560035
royalmassum48@gmail.com

Alzheimer's disease is a progressive neurodegenerative disorder that affects the brain, leading to cognitive decline and memory loss primarily associated with acetylcholinesterase (AChE) activity and amyloid-beta accumulation. Chrysin, a natural flavonoid, exhibits neuroprotective effects but suffers from poor solubility and bioavailability. Complexation with zinc, a metal ion possessing neuroprotective properties, together with nanoencapsulation, offers a strategy to overcome these limitations and enhance therapeutic potential. Molecular docking of chrysin-zinc complexes against AChE (PDB: 1EVE, 2OHP, 1IYT) was performed using AutoDock 4.2.6 with ADME and toxicity predicted by SwissADME and ProTox II. The complexes were synthesized and characterised by FT-IR, 1H NMR and mass spectrometry, while chitosan-loaded nanoparticles were prepared via ionic gelation and evaluation for particle size, zeta potential, morphology (SEM), crystallinity, (XRD) entrapment efficiency, drug release, and solubility. Molecular docking studies revealed a strong interaction of the chrysin-zinc complex with AChE (-11.1 kcal·mol-1), supported by favourable ADME predictions and absence of toxicity alerts. Chitosan-loaded nanoparticles prepared via ionic gelation exhibited a nanoscale size of ~190.9 nm, high entrapment efficiency (95.36%), improved solubility, and controlled release (88.6% at 4 hours). Biological evaluation demonstrated that the nanoparticles showed significantly higher AChE inhibitory and anti-Alzheimer's activity compared with the free chrysin-zinc complex. These findings suggest that zinc complexation combined with chitosan nanoencapsulation offers a promising strategy to improve the pharmacological efficacy of chrysin, positioning it as a potential nanomedicine candidate for the management of Alzheimer's disease.

**Keywords:** Amyloid-beta (Aβ) aggregation; Chrysin; Zinc complex; Acetylcholinesterase; Chitosan nanoparticles

## SYNTHESIS, CHARACTERIZATION, *IN-SILICO* AND *IN-VIVO* PHARMACOLOGICAL SCREENING OF 2',4'-DIMETHYL-4-(DIMETHYLAMINO) CHALCONE AS TRPA1 ANTAGONIST CAOMBATING NEUROPATHIC PAIN

V. Swathi
Associate Professor, Department of Pharmacology, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, A.P., India-521108
swathi.pharmabud@gmail.com

Pain is defined as "an unpleasant sensory and emotional experiences associated with actual or potential tissue damage or described in terms of such damage". Neuropathic pain is "pain that comes from direct consequence of a lesion or disease which affect the somatosensory system". Chronic neuropathic pain is common and is majorly observed with co-morbidity conditions like cancer or diabetic neuropathy, arthritis or it could be related to treatments such as chemotherapy. TRP channels play an important role in mediating neuropathic pain. The present work focused on targeting TRPA1 receptors in combating neuropathic pain. *In silico* docking is performed using AUTODOC for 100ns to screen chalcone derivatives and the lead derivative is subjected for MD simulation using Gromax software. The2',4'-Dimethyl-4-(Dimethylamino)Chalcone is synthesized using green chemistry and characterized using M.S, H-NMR and C-NMR spectroscopic methods. Invivo pharmacological screening is performed using AITC and formalin induced pain models. Partial sciatic nerve ligation model is also performed and histopathological sections of sciatic nerve are also recorded to identify the blockade of TRPA1 receptors using standard TRPA1 antagonist from sigma Aldrich. The chalcone derivative showed good neuropathic pain property thus resulting in a potent drug with fewer side effects.

**Keywords:** Pain, somatosensory pathway, chalcone, sciatic nerve

**CH-318**

## SYNTHESIS AND ANTIMICROBIAL EVALUATION OF PYROGLUTAMIC ACID DERIVATIVES

Kancharla. Suneetha

ISBN: 978-81-980623-8-3

Department of Pharmaceutical Chemistry,
suneethavipw@gmail.com

Pyroglutamic acid and its derivatives serve as precursors in the synthesis of pharmacologically significant drugs. This work involved the synthesis and evaluation of several Pyroglutamic acid derivatives for their antimicrobial efficacy. The synthesized compounds were structurally validated using melting point analysis and infrared spectroscopy examination. Antimicrobial screening was conducted with the cup-plate method against bacterial strains (Staphylococcus aureus and Escherichia coli) and fungus strains (Candida albicans). None of the 15 compounds exhibited antibacterial action. Nevertheless, only a limited number of chemicals exhibited notable anti-fungal action. PGAD8 exhibited the most pronounced antifungal action, demonstrating a 20 mm zone of inhibition. This research underscores the potential of pyroglutamic acid derivatives exhibiting notable anti-fungal efficacy.

**Keywords:** Pyroglutamic acid, Carbonyl diimidazole, Amide derivatives, Anti-bacterial activity, Anti-fungal activity, Agar well diffusion method.

## UNRAVELING MULTI-TARGET THERAPEUTIC STRATEGIES FOR LEPTOSPIROSIS THROUGH NETWORK PHARMACOLOGY: A SYSTEMS-BASED APPROACH TO A NEGLECTED ZOONOTIC DISEASE

Min Shifa Umar, Ziyaul Haque, Pathan Tabreshkhan
School Of Pharmacy, Anjuman- I- Islam Kalsekar Technical Campus,
Navi Mumbai, Maharashtra, India 410206
shifamin24@gmail.com

Leptospirosis is a neglected zoonotic disease caused by pathogenic Leptospira species, with a significant burden in tropical regions, yet minimal investment in research and drug development. Current treatments are limited to a few broad-spectrum antibiotics, which may be ineffective in severe or chronic cases. Network pharmacology, a novel systems biology-based approach, offers a powerful platform to understand the complex host–pathogen–drug interactions involved in leptospirosis and to identify multi-target therapeutic candidates. By constructing comprehensive drug–target–pathway interaction networks, network pharmacology enables identification of critical molecular nodes in leptospiral infection and immune response. This approach is particularly promising for repurposing known drugs and for exploring bioactive compounds from medicinal plants. Several herbal candidates have shown potential anti-leptospiral activity, including Azadirachta indica (Neem), Phyllanthus niruri, Andrographis paniculata, and Eclipta alba. These plants exhibit antibacterial, anti-inflammatory, and immunomodulatory properties, which are crucial in managing leptospiral pathogenesis and complications such as renal or hepatic damage. Network-based analysis can help map the active phytoconstituents—such as andrographolide, phyllanthin, or wedelolactone—to their molecular targets and pathways, offering mechanistic insights into their therapeutic potential. Additionally, molecular docking and protein–protein interaction studies can be integrated to validate and prioritize candidates for further preclinical research. In conclusion, applying network pharmacology to leptospirosis not only enhances our understanding of disease mechanisms but also provides a scientific basis for developing multi-target herbal therapies, thus addressing the long-standing therapeutic void in this neglected disease.

**Keywords:** Network pharmacology, Phytoconstituents, leptospirosis, Zoonotic Disease

## DEVELOPMENT AND VALIDATION OF CHEMOMETRIC ASSISTED SPECTROPHOTOMETRIC METHODS FOR SIMULTANEOUS DETERMINATION OF ANTIGOUT DRUGS IN PHARMACEUTICAL DOSAGE FORM

[1]Shilpa Sahu, [1]Bina Gidwani, [1]Shiv Shankar Shukla
Columbia Institute of Pharmacy, Raipur (C.G.)
shilpasahu.pharma@gmail.com

Probenecid (PBD) and Colchicine (CLN) are combination of drugs used for the treatment and management of Gout. Two chemometric-assisted UV- Visible spectrophotometric approaches were developed for the simultaneous estimation of PBD and CLN in tablet dosage form, specifically the partial least squares (PLS) and classical least squares (CLS) methods. The proposed methods were successfully applied for simultaneous determination of PBD and CLN in their tablet formulation to achieve maximum sensitivity and lowest error. The applied methods were validated as per ICH guidelines and found to be linear in the concentration range of 5-30 µg/mL for PBD and 5-30 µg/mL for CLN. The developed methods were statistically compared with reported HPLC method where no significant difference was found relating to both accuracy and precision. Thus, the proposed methods can be effectively utilized for the routine quality control assessment of these drugs in commercial tablet dosage form.

**Keywords:** Chemometric, Probenecid (PBD), Colchicine (CLN), PLS and CLS

## SPECTROSCOPIC STUDY OF CROSSLINKING IN GELATINE CAPSULES AND ITS EFFECT ON CAPSULE CHARACTERISTICS WITH THE HELP OF CHEMOMETRIC TECHNIQUES

Sakshi Jain[1], Manjiri Gawali[2], Shounak Kulkarni[3], Abhijeet Sutar[1]
[1]School of Health Sciences and Technology, Dr. Vishwanath Karad MIT World Peace University, MIT Campus, Kothrud,
Pune - 411038, Maharashtra, India.
sakshi71001@gmail.com

The present study investigated the spectroscopic changes in the Hard gelatine capsules due to crosslinking and its effect on disintegration time of capsules, particularly examining the effect with non-destructive spectroscopic techniques with help of chemometric analysis. Capsules with added samples (Calcium Pantothenate, Cyanocobalamin, and a mix) and formaldehyde-induced capsules were tested and ATR IR and NIR spectra were recorded. Empty capsules disintegrated in 6.03 minutes. Moderately stressed capsules showed a longer disintegration time (10±6 mins) compared to unstressed capsules Formaldehyde-induced capsules required significantly more time to disintegrate, often exceeding an hour, indicating that crosslinking prolongs both disintegration and dissolution times. Calcium Pantothenate capsules disintegrated normally, while Cyanocobalamin capsules showed a trend change. A mix of Calcium Pantothenate and Cyanocobalamin showed a gradual increase in disintegration time. Principal Component Analysis (PCA) was employed as a classification method to identify minute changes in ATR IR spectra, comparing crosslinking with formaldehyde as a standard for Calcium Pantothenate and Cyanocobalamin samples.

**Keywords:** Hard gelatin capsules, Crosslinking, Disintegration time, ATR-IR spectroscopy, NIR spectroscopy, Chemometric analysis, Principal Component Analysis (PCA), Formaldehyde

## STRUCTURE-BASED DESIGN AND EVALUATION OF QUINOLIN-2-ONE SCAFFOLDS FOR BRAIN CANCER AND SEIZURE DISORDERS

Soniya Phadte, Soumya Vasu, Shivlingrao Mamle Desai
Department of Pharmaceutical Chemistry, P.E.S.'s Rajaram and Tarabai Bandekar College of Pharmacy, Farmagudi, Ponda, Goa, 403401, India
snya.nk@gmail.com

The present study focuses on the rational design, synthesis, characterization, and biological evaluation of novel 4-hydroxyquinolin-2-one nitrogen heterocycles as potential dual-acting anticancer and anticonvulsant agents. A library of thirty-six derivatives was designed and subjected to in-silico studies, and the best fifteen were synthesised based on their binding to the target and drug likeness properties. In-silico docking studies revealed favourable binding interactions of derivatives with farnesyltransferase (PDB ID: 1SA4) for glioblastoma (GBM) and GABA aminotransferase (PDB ID: 2COJ) for anticonvulsant activity. Notably, compound IVb5 and IVa14 demonstrated good dock scores (-7.513 and -6.452) compared to the reference drug Tipifarnib (-6.755) for GBM, while compound IVa14 exhibited higher binding affinity (-6.749) than Diazepam (-6.364) as an anticonvulsant. ADMET profiling showed all derivatives met Lipinski's rule of five and exhibited favourable pharmacokinetic properties, including oral bioavailability, BBB permeability, and low predicted toxicity. *In vitro* studies against U87-MG glioblastoma cells revealed that compounds IVb5, IVa5, and IVa14 exhibited good anticancer activity (GI50 = 6.91, 8.50, and 8.84 µg/mL), comparable to standard Doxorubicin. Further in PTZ-induced seizure models, compound IVa14 (100 mg/kg) provided complete protection (100% survival, clonic and tonic onset at 144.8 and 159.8 seconds),

ISBN: 978-81-980623-8-3

exhibiting anticonvulsant efficacy comparable to Diazepam. Overall, Compound IVa14 emerged as a potential lead candidate with dual therapeutic efficacy in GBM treatment and epilepsy management. Overall, the findings highlight the promising role of 4-hydroxyquinolin-2-one analogs as versatile leads and provide a strong basis for further optimization and development of multifunctional drug candidates for GBM and seizure disorders.

**Keywords:** Glioblastoma, epilepsy, quinoline-2-one, docking, ADMET.

**CH-323**

### *IN-SILICO* PREDICTION OF INDEPENDENT VARIABLE EFFECT OVER SLN-CHARACTERISTIC DEPENDENT VARIABLES

Jasmeen Kaur, Honey Goel
University Institute of Pharmaceutical Sciences and Research,
Faridkot, Punjab, India
jgseehra30@gmail.com

This study aims to systematically evaluate the effects of multiple independent variables on the characteristics of solid lipid nanoparticles (SLNs) prepared using the solvent evaporation technique. Seven formulation and process parameters were investigated: drug-to-lipid ratio, surfactant concentration, volume of organic phase, volume of aqueous phase, homogenization time, homogenization speed, and sonication time. These factors were analysed for their influence on key dependent parameters including entrapment efficiency (EE%), drug loading (DL%), polydispersity index (PDI), and particle size, which are critical determinants of SLN performance and stability. Statistical evaluation revealed that sonication time had the most significant impact on PDI, indicating its crucial role in controlling particle size distribution and homogeneity. In contrast, the drug-to-lipid ratio exhibited the least influence on PDI. Particle size was found to be highly dependent on the drug-to-lipid ratio, emphasizing the importance of lipid content in determining nanoparticle dimensions, while homogenization time showed minimal effect. Drug loading percentage was significantly affected by both the drug-to-lipid ratio and the volume of the aqueous phase, suggesting that these parameters govern the amount of drug encapsulated within the lipid matrix. Surfactant concentration had the least effect on drug loading. Entrapment efficiency was predominantly influenced by the volume of the aqueous phase, highlighting the role of the external phase in drug retention, whereas the volume of the organic phase had the least impact. Overall, the findings demonstrate that careful optimization of formulation variables, particularly sonication time, drug-to-lipid ratio, and aqueous phase volume, is essential to tailor SLN characteristics for enhanced drug delivery performance. This study provides valuable insights for the rational design and development of SLN-based drug delivery systems.

**Keywords:** dependent variables, independent variables, solid lipid nanoparticles

### ELUCIDATING THE PATH TO SKIN LIGHTENING: ANALYTICAL CHARACTERIZATION AND MOLECULAR DOCKING ANALYSIS OF A SYNTHETIC ANTI-PIGMENTATION AGENT

Khan Juweriya Fatima, Rajat Sayyed
Department of Pharmaceutics, MCES DR. PAIU Allana College of Pharmacy, Azam Campus, Camp Pune, Maharashtra India 411001.
juweriyakhan55@gmail.com

Hyperpigmentation disorders such as melasma, post-inflammatory pigmentation, and dark spots pose significant cosmetic and psychological challenges. Conventional depigmenting therapies are often limited by suboptimal efficacy or safety concerns, underscoring the need for novel synthetic agents with improved therapeutic potential. The present study aimed to perform a comprehensive analytical profiling of a synthetic anti-pigmenting molecule and to evaluate its *in silico* interactions with melanogenic targets. Analytical characterization was carried out using UV–Vis spectroscopy, FTIR, HPLC, and LC–MS, confirming structural identity, purity, and functional groups relevant to activity. Stability studies under variable pH and light conditions provided insights into formulation feasibility and shelf-life. These evaluations established the reproducibility and reliability of the compound as a promising candidate for further pharmacological assessment. Molecular docking studies were subsequently conducted against tyrosinase and tyrosinase-related protein 1 (TRP-1), the central enzymes of melanogenesis. The compound demonstrated favourable binding affinities, comparable to or surpassing kojic acid, through stable hydrogen bonding, hydrophobic interactions, and active-site coordination. The binding profiles suggested competitive inhibition mechanisms, rationalizing its potential to regulate melanin biosynthesis. The integration of analytical chemistry with computational docking provided both validation of molecular integrity and mechanistic insight into anti-pigmentation activity. These findings form a dual platform for translational research, bridging laboratory characterization with functional evaluation, and offer a foundation for subsequent preclinical and clinical exploration of synthetic depigmenting therapies.

**Keywords:** Synthetic drug, Anti-pigmentation, Analytical profiling, Molecular docking, Tyrosinase inhibition, Melanogenesis, Spectroscopy, HPLC

### INTEGRATING NETWORK PHARMACOLOGY AND NUTRITIONAL SCIENCE FOR FUNCTIONAL CHOCOLATE INNOVATION

Affan Parkar, Anas Memon, Akdus Khan, Abusufiyan Shaikh
Anjuman-I-Islam's Kalsekar Technical Campus,
School of Pharmacy, New Panvel, India-410206.
affanparkar2004@gmail.com

Consumer demand for health-oriented sweets has led to the creation of functional chocolates enriched with bioactive ingredients. In this study, we made a low-sugar chocolate by mixing dark and white chocolate bases, adding inulin, a prebiotic fiber, and Spirulina platensis, which is rich in protein and antioxidants. We partly replaced sugar with inulin and improved the recipes for texture and taste. Antioxidant tests showed that Spirulina-inulin chocolate had significantly higher antioxidant activity ($P < 0.01$) and phenolic content ($P < 0.05$) than the control. It also released more Spirulina nutrients and cocoa polyphenols. We used network pharmacology analysis to understand the mechanisms at work. Key cocoa flavanols (epicatechin, catechin, procyanidins), Spirulina metabolites (phycocyanin, β-carotene, phenolic acids), and inulin-derived metabolites were connected to multiple targets, including EGFR, AKT1, ESR1, and antioxidant enzymes (SOD, CAT). Pathway enrichment revealed links to PI3K/AKT, MAPK/ERK, NF-κB, Nrf2 antioxidant signaling, and gut microbiota control. These results indicate that the ingredients work together to help reduce oxidative stress, manage inflammation, and support metabolic health. Overall, Spirulina-inulin fortified chocolate stands out as a promising functional treat. By combining experimental bioassays with network pharmacology, this study offers both practical and scientific support for its potential as a health-promoting snack and a candidate for new nutraceutical products.

**Keywords:** Spirulina; Inulin; Cocoa polyphenols; Antioxidant activity; Network pharmacology

### EXPLORING THE ANTIDIABETIC EFFECTS OF BIOACTIVE COMPOUNDS FROM SELECTED HERBAL PLANTS, INCLUDING INSIGHTS FROM NETWORK PHARMACOLOGY AND MOLECULAR DOCKING

Sheetal Balu Kasbe, Aniket A. Garud, Devendra S. Shirode
Dr. D. Y. Patil College of Pharmacy, Akurdi, Pune – 411044, India
sheetalkasbe26@gmail.com

Type 2 Diabetes Mellitus (T2DM) is a chronic metabolic disorder characterized by insulin resistance, hyperglycemia, oxidative stress, and dysregulated glucose metabolism. Current therapies often provide limited efficacy and may cause adverse effects, highlighting the need for novel multi-target therapeutic strategies. This study aimed to investigate the antidiabetic potential and molecular mechanisms of bioactive metabolites from some selected medicinal plants using network pharmacology and molecular docking approaches. A network pharmacology-based analysis was conducted to identify key molecular targets and signaling pathways associated with bioactive metabolites from Piper nigrum, Cinnamomum verum, Trigonella foenum-graecum, Tinospora cordifolia, Azadirachta indica, and Curcuma longa. The analysis revealed their potential involvement in insulin signalling, glucose metabolism, oxidative stress, and inflammatory pathways. Molecular docking studies demonstrated strong binding affinities of these metabolites to key Type 2 Diabetes Mellitus-related targets, including AKT1, PPARG, DPP4, and AMPK, indicating their potential to modulate multiple pathological mechanisms involved in diabetes

ISBN: 978-81-980623-8-3

progression and complications. This study provides a mechanistic understanding of the antidiabetic potential of bioactive metabolites from selected herbal plants, supporting their role as multi-target therapeutic candidates. Future studies will focus on *in-vitro* and *in vivo* validation to confirm their efficacy and safety for the management of Type 2 Diabetes Mellitus.

**Keywords:** Type 2 Diabetes Mellitus, bioactive metabolites, antidiabetic activity, network pharmacology, molecular docking

## ADVANCED RP-HPLC APPROACH FOR RELATED SUBSTANCE AND VALIDATION IN TRIMIPRAMINE TABLETS

Umamaheswari Duraisamy, Kumar Mohan
Department of Pharmaceutical Analysis, Vinayaka mission's College of Pharmacy, VMRF(DU), Salem, Tamil Nadu, India- 636008
umamaheswariD@vmpha.edu.in

This study presents the development and validation of a reversed-phase high-performance liquid chromatography (RP-HPLC) method for determining related substances in Trimipramine tablets, an antidepressant medication. Chromatographic separation was achieved on a C18 column using a gradient system with mobile phase A (buffer, acetonitrile, 2-propanol, and methanol in 650:50:100:200 v/v) and mobile phase B (methanol and 1-butanol in 990:10 v/v). The buffer was prepared with diammonium hydrogen orthophosphate, adjusted to pH 7.3 ± 0.05. The method demonstrated excellent linearity ($R^2$ > 0.999) over the concentration ranges of 0.1–6 µg/ml for Trimipramine and 0.1–3 µg/ml for its impurities. The limits of detection and quantification were 0.04 µg/ml and 0.1 µg/ml, respectively. Precision studies showed %RSD values not more than 15.0%, confirming method reproducibility. The validated method was found to be selective, sensitive, accurate, and precise for detecting and quantifying related substances in Trimipramine tablets. This robust RP-HPLC method ensures batch-to-batch consistency and supports pharmaceutical quality control, ultimately contributing to patient safety.

**Keywords:** Trimipramine, Related substances, RP-HPLC, Method validation, Pharmaceutical analysis.

## REVERSE PHASE CHROMATOGRAPHIC METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF BENIDIPINE HCL AND METOPROLOL SUCCINATE FROM COMBINED DOSAGE FORM

Swapnil L. Tambare, Samruddhi T. Torane, G. K. Dyade
Dept of Postgraduate in Pharmacy, SVPM'S College of Pharmacy, Malegaon (BKII) Baramati Dist Pune 413115 Maharashtra, India
tambareswapnil23@gmail.com

Applicability of Liquid chromatography technique for separation and detection of drugs from complex matrix is well known and widely used. A new and improved economical technique has been developed for combined drug estimation Benidipine HCL (BDH) and Metoprolol succinate (MPS). Chromatographic system RP-HPLC, using RP - C18 column equipped with UV detector was utilised for estimation of both these drugs. The mobile phase [Methanol: water pH 4.7 (pH adjusted with acetic acid HPLC grade)] was pumped at a flow rate of 0.8 ml/min in the ratio of 70: 30 % v/v and the eluents were monitored at 239 nm. The technique was successfully applied for quantitative determination of both analytes from their combined dosage form. The method was validated as per ICH guidelines. To ascertain linearity of both these drugs conc level 2 to 10µg/ml for BDH and 2 to 12µg/ml for MPS was found suitable and within acceptable range. The retention time of BDH and MPS was found 5.457 and 2.318 mins respectively. The validation parameters accuracy, precision, LOD and LOQ, robustness were studied. The assay of formulation was found 99.37% w/w for BDH and 99.31% w/w for MPS in the range stated in the official book. The precision study RSD data were varied from 0.6359 to 0.9359 for BDH and 0.1422 to 0.2872 for MPS which was within given criteria. Efficiency of the column to resolve both analytes was good and parameters were in the specified limits. Both drugs were eluted within 6 mins and no interference of excipients was observed during estimation. The developed Technique can be applied for routine quality control tests for the combined dosage form. The techniques simple, preciseness, accurate and robust characters were made sound.

**Keywords:** Benidipine HCL, Metoprolol succinate, Chromatography, validation, ICH guidelines

## BIOANALYTICAL METHOD DEVELOPMENT AND VALIDATION FOR THE ESTIMATION OF CHLORTHALIDONE AND IRBESARTAN IN HUMAN PLASMA BY CHROMATOGRAPHIC TECHNIQUE

Gurappa K. Dyade, Puja C. Kawade, Rohan B. Lokhande
Dept of Postgraduate Studies in Pharmacy
SVPM'S College of Pharmacy, Malegaon (BKII),
Baramati Dist Pune 413115, Maharashtra, India

Bio analytical method was developed for estimation of Chlorthalidone and Irbesartan in human plasma by chromatographic technique. EMEA, US FDA and ICH M 10 regulatory guidelines elaborately discussed bio analytical guidelines intended to provide recommendations for the validation of bio analytical assays for chemical and biological drug quantification and their application in the analysis of study samples. Bio analytical method was developed for estimation of Chlorthalidone CTD and Irbesartan IST; on the RP-HPLC and for separation RP-C18 column equipped with UV detector was utilised. The mobile phase [Acetonitrile: Methanol: Water have pH 4.6 (pH adjusted with acetic acid)] was pumped at a flow rate of 0.8 ml/min in the ratio of 50:30:20 % v/v and the eluents were monitored at wavelength 245 nm. The method was applied for quantitative estimation of drugs from human plasma. Both drugs were shown linear response in conc ranges CTD (500-3000 ng/ml) and IST (500-7000 ng/ml) in plasma. Accuracy and precision study shown that % CV was varied in the range (2.4227-7.0438) for CTD and (3.541-6.942) for IST at all conc. levels and; the data of % nominal conc. were varied between (102.52-106.03) for CTD and (94.15-92.17) for IST at all conc. levels. Guideline elaborated that the results of pivotal nonclinical toxicokinetic (TK)/pharmacokinetic (PK) studies and of clinical trials, including comparative bioavailability / bioequivalence (BA/BE) studies, are used to make regulatory decisions regarding the safety and efficacy of drug products. The method can be applied for relative bioavailability and bioequivalence study of both drugs or/and dosage form.

**Keywords:** Bio analytical method, Regulatory guidelines, ICH, chlorthaidone, Irbesartan

## DEVELOPMENT AND VALIDATION OF ANALYTICAL METHOD FOR SIMULTANEOUS ESTIMATION OF ETODOLAC AND PARACETAMOL FROM BULK AND DOSAGE FORM.

Disha Vidhate, Bharatee Chaudhari
YSPM's Yashoda Technical Campus, Faculty of Pharmacy, Satara.
vidhatedisha84@gmail.com

A simple and reproducible high-performance liquid chromatography (HPLC) method was developed and validated for the simultaneous estimation of Etodolac and Paracetamol. Chromatographic separation was achieved on a Younglin (S.K.) isocratic system equipped with a UV-730 D detector and SP-930 D pump, operated through Autochro-3000 software. An Agilent C18 column (4.6 × 250 mm, 5 µm) maintained at ambient temperature ensured sharp and well-resolved peaks. The optimized mobile phase comprised methanol and 0.1 % orthophosphoric acid (pH 6, adjusted with triethylamine) in a 70:30 (v/v) ratio, delivered at a flow rate of 1.0 mL $min^{-1}$. Detection was performed at 256 nm with a 20 µL injection volume. These chromatographic conditions, established through systematic trial-and-error optimization. The retention time for Etodolac and Paracetamol was found to be 2.93 minute and 6.96 minute. The developed method was validated according to the International Conference on Harmonization (ICH) for the determination of Etodolac and Paracetamol in bulk and tablet dosage forms. The method was validated for specificity, linearity, precision, accuracy and solution stability. The method was linear in the drug concentration range of 20-200ppm with a correlation coefficient 0.99996. The method was also found to be robust as indicated by the % RSD values which are less than 2. The proposed method can be used successfully for determining Etodolac and Paracetamol from bulk and from dosage form.

**Keywords:** Etodolac, Paracetamol, HPLC, chromatographic analysis

**STRUCTURE-BASED DOCKING OF NATURAL XANTHOPHYLLS AGAINST RABIES VIRUS GLYCOPROTEIN (RABV-G) AT BASIC PH: POTENTIAL ANTIVIRAL CANDIDATES TARGETING PREFUSION CONFORMATION**

Uma Nath. U
Department of Pharmaceutical Chemistry and Analysis, Sreekrishna College of Pharmacy and Research Centre,
Parassala, Trivandrum, Kerala - 6955002.
drumapharm@gmail.com

In the current research rabies virus glycoprotein (RABV-G) plays a crucial role in viral attachment and membrane fusion, making it a valuable target for therapeutic intervention. The objective of the research was to study molecular docking to evaluate the antiviral potential of seven naturally occurring xanthophyll compounds: Carotenoid, Violaxanthin, Astaxanthin, Zeaxanthin, Lutein, Cryptoxanthin, and Cantaxanthin. At basic pH, RABV-G adopts a prefusion conformation characteristic of class III viral fusion proteins, exposing key interaction surfaces ideal for ligand binding. Using the RABV-G prefusion structure, we assessed binding affinity (GlideScore), hydrogen bonding, and interaction sites for each compound. Carotenoid exhibited the most favorable binding energy (−5.639 kcal/mol), forming stable hydrogen bonds with ARG152 (1.98 Å) and PRO353 (2.29 Å). Violaxanthin followed closely with a binding energy of −5.318 kcal/mol, interacting with GLU181 (1.65 Å), HIS020 (1.78 Å), and ARG152 (2.35 Å). Other ligands showed moderate binding energies ranging from −4.260 to −3.725 kcal/mol, with consistent interactions involving residues such as THR292, THR293, and GLU181. 2D and 3D interaction visualizations confirmed the specificity and stability of ligand-protein complexes, highlighting conserved binding pockets on RABV-G. The results indicate that xanthophyll compounds—especially Carotenoid and Violaxanthin—may act as inhibitors by stabilizing the prefusion conformation and blocking viral fusion. These findings support the potential of natural xanthophylls as lead candidates for antiviral drug development against rabies and possibly other viruses utilizing similar fusion mechanisms. Further *in vitro* and *in vivo* validation is recommended to confirm their efficacy.

**Keywords:** Rabies virus. Zeaxanthin, Violxanthin, Astaxanthin, Zeaxanthin, Lutein,

**DESIGN, SYNTHESIS, CHARACTERIZATION, *IN-SILICO* AND *IN-VITRO* EVALUATION OF NEW OFLOXACIN IMINE ANALOGS AS POTENTIAL ANTI-TUBERCULAR DRUGS**

Ramakrishna Chitakunta
Department of Pharmaceutical Chemistry, PESU Institute of Pharmacy,
PES University, Electronic City Campus,
Bengaluru-560100, Karnataka, India
rama0813@gmail.com

This research focuses on developing new drugs to combat tuberculosis, particularly strains resistant to multiple existing treatments. Ofloxacin is a broad-spectrum fluoroquinolone antibiotic widely used against various bacterial infections. Compounds containing imine groups are known to exhibit significant biological activities. The present study aims to explore the potential of ofloxacin-imine derivatives with enhanced activity and reduced toxicity. Ofloxacin-imine derivatives (1–7) were synthesized via Schiff base formation, involving the condensation of a ketone with an amine. The compounds were characterized by analytical methods (TLC, solubility), and spectroscopic techniques (FT-IR, HRMS, and $^1$H-NMR). In-silico studies were conducted using Molinspiration, ChemSpider, SwissADME, and ProTox-III. The antitubercular activity of the synthesized compounds was evaluated using the Microplate Alamar Blue Assay (MABA) with isoniazid as the standard drug. Test concentrations (0.8, 1.6, 3.12, 6.25, 12.5, 25, 50, and 100 µg/mL) were prepared in sterile deionized water. All synthesized compounds exhibited activity at 1.6 µg/mL. In-silico studies predicted favorable pharmacokinetic properties, including gastrointestinal absorption and bioavailability, along with low toxicity profiles. The study successfully synthesized and evaluated a series of new ofloxacin-imine derivatives that demonstrated significant anti-tubercular activity *in vitro* and promising pharmacological potential based on computational predictions. These findings highlight their potential as lead compounds for the development of novel anti-tubercular agents.

**Keywords:** Ofloxacin-imine synthesis, *In-silico* studies, Anti-tubercular activity, Molinspiration, ProTox-III, SwissADME.

**GREEN VALIDATED STABILITY-INDICATING REVERSE PHASE -HIGH PERFORMANCE LIQUID CHROMATOGRAPHY METHOD FOR IMEGLIMIN HYDROCHLORIDE: IDENTIFICATION OF PRINCIPAL DEGRADATION PRODUCTS USING LIQUID CHROMATOGRAPHY -MASS SPECTROPHOTOMETRY**

Harshraj Rathod
Department of Pharmaceutical quality assurance,
SSR College Of pharmacy, Silvassa,
Dadra and Nager haveli Diu and daman, 396230, India
rathodharshraj29@gmail.com

Imeglimin Hydrochloride, a first-in-class glimin antidiabetic agent, offers therapeutic benefits in type 2 diabetes with low hypoglycemia risk. The present work aimed to develop and validate a green, stability-indicating Reverse Phase High-Performance Liquid Chromatography (RP-HPLC) method for its quantification in bulk and pharmaceutical dosage forms, alongside degradation profiling by Liquid Chromatography–Mass Spectrometry (LC-MS). Chromatographic separation was achieved on an Intersil ODS C18 column using a mobile phase of 0.05% orthophosphoric acid in water, methanol, and acetonitrile (90:5:5 v/v/v) at 1.0 mL/min, with detection at 239 nm. Validation followed ICH Q2(R2) guidelines, assessing specificity, linearity, accuracy, precision, robustness, and sensitivity. Forced degradation studies were conducted under acidic, basic, oxidative, thermal, and photolytic conditions, and degradation products were identified via LC-MS. Greenness of the method was assessed using GAPI and BAGI tools. The method exhibited excellent linearity across 10–60 ppm ($R^2$ = 0.9997), with LOD and LOQ of 0.999 and 3.029 ppm. Accuracy ranged from 98–102%, and %RSD for intra- and inter-day precision was below 2%. The drug was highly susceptible to oxidative degradation (74.5%) and moderately sensitive to alkaline hydrolysis (20%), while stable under acidic, thermal, and photolytic stress. LC-MS confirmed the presence of principal degradation products. Greenness evaluation indicated minimal hazardous solvent use, with a BAGI score of 80 and favorable GAPI profile. The validated RP-HPLC method is precise, robust, and environmentally sustainable, making it suitable for quality control and stability testing of Imeglimin Hydrochloride in pharmaceutical industries.

**Keywords:** Imeglimin Hydrochloride, RP-HPLCStability-indicating method, Forced degradation, LC-MS.

The present study aimed to synthesize and evaluate the antioxidant activities of indole-based Mannich base derivatives (M1–M5). These analogues were prepared via a condensation reaction between indole, formaldehyde/furfuraldehyde, and substituted aliphatic or aromatic amines. The synthesized compounds were structurally characterized using FTIR, $^{1}H$ NMR, $^{13}C$ NMR, and mass spectrometry. Antioxidant potential was assessed through *in vitro* DPPH assays. Results demonstrated that the analogues possessed notable antioxidant activity, attributed to the presence of phenyl, piperidine, and morpholine rings in their structures. Among them, M2, M3, and M5 exhibited superior activity, suggesting their potential as promising candidates for the development of novel antioxidant agents.

**Keywords:** Novel Indole derivative, Antioxidant activity, DPPH Method.

**CH-336**

## DEVELOPMENT, VALIDATION AND GREENNESS ASSESSMENT OF A NEW RP-HPLC METHOD FOR SIMULTANEOUS ESTIMATION OF BEMPEDOIC ACID AND EZETIMIBE IN TABLET DOSAGE FORM

Md. Farheena Sulthana, K. Parimala
Department of Pharmaceutical Analysis, V. V. Institute of Pharmaceutical Sciences, Gudlavalleru- 521356, Krishna District, A. P.
farheenamd3@gmail.com

A cost-effective and dependable reversed-phase high-performance liquid chromatography (RP-HPLC) system was developed and proved to simultaneously measure the concentration of Bempedoic Acid (BEM) and Ezetimibe (EZE) in tablet form. A Phenomenex C18 column (150 × 4.6 mm, 5 µm) containing ammonium acetate/acetonitrile (50:50, v/v) mobile phase was used to run the analysis with the flow rate held at 0.9 mL/min and isocratic conditions. The column was heated at 30 o C, and it was detected at 220 nm. The optimized procedure gave clear and well-defined peaks to the retention time of 2.219 min of BEM and the retention time of 2.794 min of EZE which guaranteed a fast assay. Accurate analyses showed the values of the percent recalculated standard deviation (%RSD) of BEM of 0.8 and EZE of 1.2, and also accuracy was confirmed reported as 100.45 percent and 99.77 percent, respectively. Sensitivity Low detection and quantification limits (LOD: 0.14 µg/mL, LOQ: 0.42 µg/mL (BEM); LOD: 0.02 µg/mL, LOQ: 0.06 µg/mL (EZE)) were demonstrated. The calibration curves were greatly linear and regression equations were y = 32186x + 11484 in the case of BEM and y = 43904x + 1683 in the case of EZE. The validation of the method was performed according to the ICH standards and proved the robustness, accuracy, precision, and selectivity. The Analytical Eco-Scale and AGREE measures were used to determine the environmental profile of the method. The low usage of organic solvent, low run time and low waste generated resulted in a high Eco-Scale score, and the method can be described as an outstanding green one. AGREE assessment also attested that it would be suitable to use on a regular basis as a sustainable tool. In general, the created RP-HPLC method is sensitive, reproducible, and ecologically friendly, so it is a feasible alternative to the quality control of Bempedoic Acid and Ezetimibe as one of the combined formulations.

**Keywords**: Bempedoic Acid, Ezetimibe, RP-HPLC, Method validation, Eco-Scale, AGREE.

## HIDDEN HAZARDS IN COCONUT WATER: A STUDY ON PESTICIDE CONTAMINANT IN COCONUT (COCOS NUCIFERA L.) WATER

T.venkatesh Karthik, G.Tejaswi
Department of Pharmaceutical analysis, Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry,East Godavari District, Andhra Pradesh, India-533102.
Karthikpra59@gmail.com

Coconut water, often celebrated as nature's most refreshing and nutrient-rich drink, is consumed worldwide for its hydrating and therapeutic benefits. However, the growing use of chemical pesticides in coconut farming raises concerns about the safety of this natural beverage. This study investigates the hidden hazards of pesticide contamination in coconut water, highlighting its sources, detection methods, and health implications. Pesticides such as organophosphates, carbamates, and parathyroid are frequently applied to protect coconut palms from pests. Over time, these chemicals can penetrate through the husk and contaminate the liquid endosperm, leading to detectable residues in coconut water. Advanced analytical techniques including Gas Chromatography-Mass Spectrometry (GC-MS) and High-Performance Liquid Chromatography (HPLC) are employed to identify and quantify these residues with high precision. Findings suggest that while most samples remain within permissible safety limits, certain cases exceed international standards, posing risks of neurotoxicity, hormonal imbalance, and long-term health complications. The study emphasizes the urgent need for sustainable practices such as organic farming, integrated pest management (IPM), and routine monitoring of coconut-based products. In conclusion, ensuring the purity of coconut water is essential for safeguarding consumer health, promoting trust, and sustaining the value of this natural resource.

**Keywords:** Coconut Water (Cocos nucifera L), pesticide contamination, Organophosphates, Carbamates, High performance liquid chromatography

## APPLICATION OF RESPONSE SURFACE METHODOLOGY FOR THE DEVELOPMENT AND VALIDATION OF RP-HPLC ASSAY OF BEMPEDOIC ACID IN BULK AND DOSAGE FORMS

Md.Ayesha Begum, A. Sai dhatri
Department of Pharmaceutical Analysis,
V. V.Institute of pharmaceutical sciences,
Andhra Pradesh, India-521356
ayeshamohammad028@gmail.com

A specific and novel RP-HPLC method has been optimized for the quantitative analysis of bempedoic acid using response surface methodology. The methods include response surface methodology (RSM) helps in studying the empirical relationship between one or more measured responses and many independent variables in the form of a polynomial equation. Mapping of those responses related to the experimental domain helps in generating an optimized method. In this present study, the empirical relationship between measured responses like % organic phase, column temperature, and flow rate and independent variables like retention time and theoretical plates are drawn in the form of a polynomial equation and an optimized method was developed from that using Box-Behnken Design (BBD). The result analytes chromatogram was run through SB C18 100x1.8mm, 2µm. The optimized data from Design Expert software consists of 0.01% OPA: Acetonitrile (56.05:43.95%, v/v) as mobile phase pumped through column with 1.02ml/min flow rate at 30.09°C gave highest desirable function of 1. The retention times of the drug were found to be 2.231 min. The optimized method was validated as per instructions given in ICH Q2 (R1) guidelines. The conclusion Based on the results of the analysis of variance, the selected model for the responses like retention time and tailing factor were found to be significant with p=0.05. 2D contour plots were inured to visualize the effect of factors and their interactions on the response. Validation of design was done using actual plots vs. predicted values for responses. All the validation parameter results were within limit.

**Keywords:** RP-HPLC, Bempedoic Acid, Quantitative Analysis, Response Surface Methodology (RSM).

## MOLECULAR DOCKING ANALYSIS OF SANTALLIN (Red Sandalwood) WITH COX II

Swapnil Shivajirao Dounde, Kanchan G. Chauhan
Department of Pharmacognosy, MCES, Dr. P A Inamdar University, Allana College of Pharmacy, Pune, Maharashtra, India 411001.
swapnildounde@gmail.com

Pterocarpus santalinus Linn, generally referred to as red sandalwood, is esteemed for its therapeutic attributes, especially its anti-inflammatory capabilities. The principal bioactive component, santallin, has lately garnered interest as a potential selective inhibitor of cyclooxygenase-II (COXII), an enzyme essential in mediating inflammatory reactions. This work utilized molecular docking techniques to examine the binding interactions between santallin and COXII. The crystal structure of COXII was obtained from the Protein Data Bank and constructed by delineating

ISBN: 978-81-980623-8-3

the active site according to essential catalytic residues. The three-dimensional structure of Santallin was refined by computational approaches before conducting docking simulations with PyRx Python Prescription 0.8. The docking results indicated that santallin binds effectively inside the active region of COXII, demonstrating a binding energy of around – 8.2 kcal/mol. Comprehensive interaction study revealed that santallin establishes stable hydrogen bonds with key residues, including such as TYR B:136 and ASP B:157, while hydrophobic interactions additionally reinforce its positioning within the enzyme's binding pocket. Furthermore, the ligand was noted to penetrate a neighboring side pocket, a characteristic frequently linked to increased selectivity for COXII relative These findings suggest that santallin is a promising candidate for the development of selective COXII inhibitors.

**Keywords:** Pterocarpus santalinus Linn, anti-inflammatory, cyclooxygenase-II

**CH-340**

**_IN SILICO_ DESIGN, SYNTHESIS, CHARACTERIZATION AND PHARMACOLOGIC EVALUATION OF NOVEL PYRAZOLE DERIVATIVES**

Ganga L, Reeja Das, Vinod B
Department of Pharmaceutical chemistry, St.Joseph's College Of Pharmacy, Cherthala, Kerala, India -688524
gangaunnikrishnan13@gmail.com

In the present work, an efficient synthesis of 3,5-diphenyl-1H-pyrazoles was carried out from chalcones. The chalcone-epoxide, prepared from chalcones, was treated with phenyl hydrazine hydrate, resulting in cyclization and simultaneous dehydration to yield the desired pyrazole derivatives. This process corresponds to the Wharton reaction, in which hydrazine hydrate acts as a nucleophilic reagent without the addition of acetic acid, making the method simple and convenient.Based on the pharmacological potential of pyrazole derivatives, an attempt was made to synthesize a pyrazole-3-benzoic acid derivative. The newly synthesized compounds were thoroughly characterized using FT-IR, NMR, and Mass spectroscopic methods, confirming their structures.The derivatives that displayed the most promising docking scores were further evaluated for anticancer activity. The biological studies were performed using Dalton Lymphoma Ascits (DLA) cells through the Trypan Blue Exclusion method. The anticancer effect was expressed in terms of percentage cell death.The results demonstrated that the synthesized pyrazole derivatives exhibited significant anticancer activity. Thus, these compounds may serve as potential candidates for further development as anticancer agents.

**Keywords:** Pyrazole, Chalcone, Phenyl hydrazine hydrate, Wharton reaction

**DESIGN, _IN-SILICO_ STUDIES AND NETWORK PHARMACOLOGY APPROACHES OF BENZAMIDE AND PYRIDINE CONJUGATE DERIVATIVES FOR IMMUNOMODULATORY ACTIVITY**

Saurav Kr. Talukdar, Deboprotim Dasgupta
NETES Institute of Pharmaceutical Science, Mirza, Kamrup, Assam- 781125
talukdarsauravkumar@gmail.com

The modulation of immune system in recent years has drawn a considerable attention in drug discovery for managing autoimmune disorder, inflammatory condition and cancer. Benzamide and pyridine structure shows a wide range of biological activities which includes anti-inflammatory, anti-cancer, and immune system regulating properties. In this study, novel benzamide-pyridine conjugate derivatives are designed to improve immunomodulatory potential through structural blending and careful optimization. This study covers *in silico* process that included molecular docking, ADMET profiling, and pharmacophore modeling to evaluate how well these compounds bind to important immunological targets, such as cytokine receptors, NF-κB pathway proteins, and JAK/STAT signaling mediators. Docking studies showed positive interactions through hydrogen bonding, π-π stacking, and hydrophobic contacts, indicating a strong fit between the ligands and targets. The ADMET analysis suggested good oral bioavailability, drug-likeness, and low toxicity, which supports their potential as lead candidates. Further this study encompasses a network pharmacology approach to outline the multi target and pathway-level interactions of the conjugate derivatives. Combining computational drug design with system biology gave us a border view of the immunomodulatory effectiveness of these derivatives, showcasing their ability to act on multiple targets. Overall, this study shows that benzamide-pyridine conjugates are promising candidates for immunomodulatory drug discovery.

**Keywords:** Immunomodulatory activity, Benzamide-pyridine conjugate, In-silico studies, Network pharmacology.

**NETWORK PHARMACOLOGY AND MOLECULAR DOCKING-BASED INVESTIGATION OF NATURAL COMPOUNDS TARGETING MASLD: A MULTI-TARGET THERAPEUTIC STRATEGY**

Dhanashri Punde, Aparna Bhalerao, Apeksha Thite
Department of Pharmaceutical Sciences,
JSPM University Wagholi- Pune, Maharashtra, India-412207
dhanashripunde23.sdsr@jspmuni.ac.in

Metabolic dysfunction-associated steatotic liver disease (MASLD), formerly termed non-alcoholic fatty liver disease (NAFLD), is the most prevalent chronic liver condition, affecting 25–30% of the global adult population. Characterized by excessive hepatic fat deposition in the context of metabolic dysfunction, MASLD can progress to fibrosis, cirrhosis, and hepatocellular carcinoma, underscoring the urgent need for effective therapies. Tephrosia purpurea (Sharpunkha), traditionally used in Ayurveda for liver and digestive disorders, is reported to possess antioxidant, anti-inflammatory, and hepatoprotective activities. This study explores its therapeutic potential against MASLD using a network pharmacology-based approach. Phytoconstituent-related targets were retrieved from IMPPAT, Dr. Duke's Phytochemical Database, and KNApSAcK, yielding 118 unique genes. MASLD-associated genes (1474) were obtained from GeneCards, OMIM, and DisGeNET. Venn diagram analysis identified overlapping targets, which were further examined using protein–protein interaction (PPI) networks (STRING, Cytoscape). Gene Ontology and KEGG enrichment revealed significant involvement of pathways linked to lipid metabolism, inflammation, insulin resistance, and oxidative stress regulation. Our findings suggest that Tephrosia purpurea may exert hepatoprotective effects through multi-target and multi-pathway modulation of MASLD-related mechanisms. This integrative computational framework provides mechanistic insights into the potential role of T. purpurea in MASLD therapy and supports future validation through experimental and clinical studies.

**Keywords:** MASLD, Tephrosia purpurea, Network Pharmacology, Gene Targets, Pathway Analysis

## SPECTROPHOTOMETRIC METHODS FOR THE DETERMINATION OF PROPRANOLOL USING ALIZARIN RED-S AND ERYTHROSIN –B

Kousar Rabiya, Aminabee
Department of Pharmaceutical Analysis,
V.V. Institute of Pharmaceutical Sciences,
Andhra Pradhesh– 521356, India.
kousarrabiya444@gmail.com

A new spectrophotometric method has been developed for the determination of propranolol hydrochloride using Alizarin Red-S (ARS) and Erythrosin-B (ERB). The method involves the formation of red-colored ion-pair complexes between propranolol and the dyes at pH 5.12. These complexes are extractable into chloroform and exhibit maximum absorbance at 515 nm for ARS and 525 nm for ERB. Various experimental conditions such as pH, reagent concentration, and extraction time were optimized to achieve maximum absorbance and stability of the complexes. The method was applied successfully to both bulk drug samples and pharmaceutical formulations of propranolol. The results demonstrated good linearity, precision, accuracy, and reproducibility. Compared to other techniques, this method is simple, cost-effective, and does not require sophisticated instrumentation, making it suitable for routine analysis in quality control laboratories. The strong ion-pair complex formation under the selected pH ensures good sensitivity and specificity. The procedure provides a reliable alternative for propranolol determination and can be used for routine quality control in pharmaceutical industries. Overall, the proposed spectrophotometric methods offer practical and effective tools for the quantification of propranolol hydrochloride in various dosage forms.

**Keywords:** Alizarin Red-S, Erythrosin-B, propranolol hydrochloride, and spectrophotometry.

**CH-346**

## DESIGN, SYNTHESIS AND ANTITUBERCULAR ACTIVITY ASSESSMENT OF SOME 3-CHLOROYPYRAZINE-2-CARBOXAMIDE DERIVATIVES

Akhilesh Kumar Bilaiya, Gajanand Engla
Sri Aurobindo Institute of Pharmacy, Indore,
Madhya Pradesh, India-453555
akhileshbilaiya@gmail.com

Seven new compounds having 3-chloropyrazine-2-carboxamide nucleus were synthesized. The chemical structures of the newly synthesized 3-chloropyrazine-2 carboxamide derivatives were verified by analytical data. Additionally, the resazurin assay was used to assess the antitubercular activity of all the newly synthesized compounds against M. tuberculosis H37RV. The obtained results were compared with Rifampicin, Isoniazid and Pyrazinamide. The synthesized compounds demonstrated significant antitubercular activity against Mycobacterium tuberculosis (H37RV strain) with minimum inhibitory concentrations (MIC) ranging from 0.2 to 12.5 µg/mL, indicating their potential as effective anti-TB agents. Among the tested compounds, 3-chloropyrazine-2-carboxamide derivatives S8-17, S8-26 exhibited MIC 0.2 µg/mL better antitubercular activity that Rifampicin (MIC 0.4 µg/mL), Isoniazid (MIC 0.8 µg/mL) and Pyrazinamide (MIC 12.5 µg/mL). Compound S8-19, S8-25, S8-189, S8-13 and S8-28 found active at 0.8, 1.6, 3.125, 12.5 and 12.5 µg/mL respectively.

**Keywords:** Antitubercular action, M. tuberculosis H37RV, MABA, and pyrazine

**CH-347**

## DEVELOPMENT AND VALIDATION OF ANALYTICAL METHOD FOR SIMULTANEOUS ESTIMATION OF ELBASVIR AND GRAZOPREVIR BY RP-HPLC

P.Shivaranjani, Mantha Venkatesh, A.Yasodha
Department of Pharmaceutical Analysis.
Dhanvanthri college of Pharmaceutical Sciences,
Palamuru University, Mahabubnagar, Telangana, India-509001
bagalishivaranjani@gmail.com

A rapid and precise reverse phase high performance liquid chromatographic method has been developed for the validated of Elbasvir and Grazoprevir, in its pure form as well as in tablet dosage form. Chromatography was carried out on a Targetsil C18 (4.4 ×150mm, 5µm) column using a mixture of Acetone: 0.1% OPA (50:50v/v) as the mobile phase at a flow rate of 1.0ml/min, the detection was carried out at 240nm. The retention time of the Elbasvir and Grazoprevir was 2.079, 4.045 ±0.02min respectively. The method produces linear responses in the concentration range of 5-25µg/ml of Elbasvir and 93.75-448.75µg/ml of Grazoprevir. The method precision for the determination of assay was below 2.0%RSD. The method is useful in the quality control of bulk and pharmaceutical formulations.

**Keywords:** Elbasvir, Grazoprevir, RP-HPLC, validation.

A study on the design and testing of a graphene oxide–iron oxide (GO–IO) nanocomposite containing the anticancer medication rucaparib (GO–IO–R) is presented. Graphene oxide was prepared by using a modified Hummer's method. Each step was confirmed by UV and FTIR spectroscopy. These tests showed that the expected structure of GO, GO-IO, and the finished drug-loaded material was validated by these analyses. The nanocomposite had a stable dispersion and was 200–500 nm in diameter with low polydispersity. Additionally, differential scanning calorimetry (DSC) showed that the material's thermal integrity was preserved. Approximately 79.8% of rucaparib was successfully attached to the GO–IO framework, according to drug-loading experiments. The well-known sheet-like appearance of graphene oxide embellished with evenly spaced iron oxide nanoparticles was brought to light by scanning electron microscopy (SEM). The cell line study shows that the rucaparib-induced apoptosis of HeLa cells was estimated by flow cytometry.

**Keywords:** Graphene Oxide–Iron Oxide (GO–IO) Nanocomposite, Rucaparib, Hummers' Method, FTIR and UV-visible Spectroscopy, Scanning Electron Microscopy, Differential Scanning Calorimetry.

## EUGENOL-1,3,4-OXADIAZOLE DERIVATIVES AS MULTI-TARGET ANTICANCER CANDIDATES: *IN VITRO* AND *IN SILICO* EVALUATION

Munishama Gowda Y N, Chaluvaraju K C, S Ramachandra Setty
Department of Pharmaceutical Chemistry,
Government College of Pharmacy, Bengaluru, Karnataka, India
Munishama157@gmail.com

ISBN: 978-81-980623-8-3

Semisynthetic modification of natural products remains a powerful strategy in anticancer drug discovery. In this work, eugenol was synthetically modified to generate a new series of 1,3,4-oxadiazole derivatives (4a–4f). The structures were confirmed by FTIR, NMR, and mass spectrometry. Molecular docking studies targeting the PI3K/AKT/mTOR pathway revealed favorable binding interactions, indicating their potential as multi-target anticancer agents. The *in vitro* cytotoxicity of the derivatives was evaluated against breast cancer cell lines MDA-MB-231 and MCF-7. In MDA-MB-231 cells, all derivatives (IC50 = 150.8–285.2 µg/mL) exhibited stronger activity compared to eugenol (IC50 = 474.5 µg/mL), with compound 4d emerging as the most potent (IC50 = 150.8 µg/mL). In MCF-7 cells, compound 4b (IC50 = 14.08 µg/mL) demonstrated superior cytotoxicity relative to eugenol (IC50 = 26.56 µg/mL). Doxorubicin, used as the reference standard, showed IC50 values of 2.92 µg/mL and 1.08 µg/mL in MDA-MB-231 and MCF-7 cells, respectively. *In silico* ADMET predictions confirmed compliance with Lipinski's rule of five, high gastrointestinal absorption, and favorable bioavailability. Collectively, these findings suggest that eugenol-derived 1,3,4-oxadiazoles, particularly compounds 4d and 4b, possess enhanced anticancer activity and promising drug-like profiles, supporting their potential as semisynthetic leads for anticancer drug development.

**Keywords:** Eugenol derivatives, 1,3,4 oxadiazole, Breast cancer, Molecular docking, Anticancer activity.

## PHARMACOPHORE BASED VIRTUAL SCREENING AND MOLECULAR MODELING STUDIES TO IDENTIFY POTENTIAL PDE4B INHIBITORS FOR THE TREATMENT OF ALZHEIMER'S DISEASE

Jiya Desai, Kalpana Pandya, Devendra Kumar
School of Pharmacy & Technology Management,
SVKM's NMIMS University, Mukesh Patel Technology Park,
Shirpur, Maharashtra, India – 425405
jiyad2002@gmail.com

Phosphodiesterases (PDEs) are the enzymes that control the intracellular concentrations of cyclic adenosine monophosphate (cAMP) and cyclic guanosine monophosphate (cGMP). Among various isoforms of the PDEs, PDE4, PDE7, and PDE8 expression alteration in the brain is linked to Alzheimer's disease (AD). The current study aims to identify a selective PDE4B (4NW7) and PDE4D (3G4G) inhibitor by identifying the pharmacophoric elements, followed by drug design approaches. The pharmacophore model was validated using EF Value, GH score, and percentage yield to select the best-suited model. The optimized model was used to screen the Zinc-15 database, and this produced a collection of selective compounds. The compounds were filtered using a KNIME workflow, followed by various molecular property filters and the PAINS filter. The resulting compounds were further subjected to virtual screening to identify the hits. Additionally, precision-based docking was carried out in all three stages. Out of the candidates, the following four compounds, ZINC000096114200, ZINC000000598713, ZINC000096115334, and ZINC000096116289, showed strong binding affinity and featured molecular properties and low predicted toxicity. Further molecular dynamics (MD) simulations, post-MD simulation analysis, and binding free energy calculations of the hits established that ZINC000096114200 and ZINC000000598713 were determined as the most promising PDE4B and PDE4D inhibitor, which has the potential to enhance cAMP signalling and AD-related cognitive failures.

shrutikarande.25@gmail.com

The study describes a validated stability indicating reverse-phase HPLC method for the estimation of Bilastine in bulk and in tablet formulation. The proposed RP-HPLC method utilizes a Kromasil C18 column (150 × 4.6 mm, 5 µm), optimum mobile phase consisted of acetonitrile and ammonium acetate buffer (adjusted to pH 3.0) in the ratio of 40:60 v/v, effluent flow rate was kept at 1.0 mL/min and UV detection wavelength 275 nm. Bilastine was exposed to various hydrolytic, thermal, photolytic and oxidative stress conditions, and the stressed samples were analysed by proposed method. The drug showed degradation under alkali hydrolysis conditions. The degradation products were well resolved from the drug demonstrated that the method is specific stability indicating for assay of Bilastine in presence of degradation products. The developed method was validated as per ICH Q2R1 guidelines for linearity, accuracy, precision, robustness, ruggedness and specificity. The method was found to be linear in concentration range 2–50 µg/mL with $r^2$ = 0.9999, accurate with mean recovery of 99.39% and precise with maximum RSD of 0.90. LOD and LOQ were found to be 0.023 µg/mL and 0.068 µg/mL, respectively. System suitability parameters indicated the high column efficiency with sharp symmetrical peaks. The method is simple, rapid and specific for routine quality control of Bilastine in tablet formulation.

**Keywords:** Bilastine, RP-HPLC, stability-indicating assay method, ICH guidelines.

## NETWORK PHARMACOLOGY COMBINED WITH EXPERIMENTAL VERIFICATION TO EXPLORE THE POTENTIAL OF VILANGIN IN THE MANAGEMENT OF COLORECTAL CANCER

Brunda M A[1], Kamatchi Sundara Saravanan[1], Gouri Nair[2], Bindu M A[3]
[1]Department of Pharmacognosy, [2]Department of Pharmacology,
[3]Department of Pharmacy Practice, Faculty of Pharmacy, M S Ramaiah University of Applied Sciences, Bengaluru - 560054

Colorectal cancer (CRC) is among the most prevalent and lethal malignancies worldwide, and the effectiveness and safety of currently available treatment options are often limited. This study investigates the anticancer potential of vilangin, a dimeric benzoquinone derivative from Embelia ribes, by integrating network pharmacology, molecular docking, and *in vitro* assay. Databases such as SwissTargetPrediction, GeneCards, OMIM, and NCBI were explored to retrieve targets for vilangin and CRC. The intersection of these targets was analysed through a protein-protein interaction (PPI) network using STRING. The results were visualised in Cytoscape and further subjected to Gene Ontology (GO) and KEGG pathway analysis. Also, the genes with high node degree values were validated via an *in-silico* docking study using Schrodinger software. Finally, the cytotoxic potential of vilangin against the HCT116 CRC cell line was evaluated using the MTT assay. A total of 89 target proteins were found in common between CRC and vilangin. PPI analysis revealed IL6, STAT3, MMP9, and CASP3, among others, as key targets with high node degree values. GO and KEGG pathway enrichment analysis of the genes revealed the involvement of key cancer-related pathways, including apoptosis and IL-17 signalling. Molecular docking study demonstrated strong binding affinities of vilangin with STAT3 and MMP9, with interacting amino acid residues comparable to those of doxorubicin. The MTT assay of vilangin against HCT116 cells displayed a concentration-dependent cytotoxicity with $IC_{50}$ values of 80.15 µg/mL. Collectively, these findings provide support for the possibility of using vilangin as a multi-targeted anticancer treatment for CRC.

## DOCKING, SYNTHESIS AND ANTIMYCOBACTERIAL ACTIVITY OF NOVEL HYDRAZONE DERIVATIVES OF ACETYL SALICYLIC ACID.

Snehal Subhash Deshmane
Faculty of Pharmacy, Yashoda Technical campus, Satara 415015, India
snehaldeshmanestc@gmail.com

To synthesize and evaluate antimycobacterial activity of novel hydrazone derivatives of acetyl salicylic acid. Molecular docking of 5 compounds was performed by Autodock Vina software. Compounds were targeted on 2NSD and 2X22 involved in tuberculosis activity. Ester moiety was reacted with hydrazine hydrate to produce hydrazide, which on treatment with aromatic aldehydes or ketones yields hydrazones. The novel series of compounds were elucidated on the basis of spectral studies and screened for antimycobacterial activity. Compound no. 1 and 3 which show the sensitivity towards bacteria at 0.8 µg/ml and compound no. 2 and 5 exhibited at 1.6 µg/ml level. The antibacterial

ISBN: 978-81-980623-8-3

activity is strongly connected with the position of the substituent on aromatic aldehyde or ketones in relation to the hydrazide skeleton.

**Keywords:** acetyl salicylic acid, hydrazone, antimycobacterial activity.

**CH-354**

## MOLECULAR DOCKING AND *IN-VIVO* EVALUATION OF NOVEL DRUG IN PEPTIC ULCER

Sheetal Rajak[1,2], A.S. Shifana[1,2], Parag Jain[1,2], Girish Kumar Sahu[1,2], Chiranjeev Sahu[1,2] Ajazuddin[1,2]
Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh, INDIA-490023

sheetalrajak988@gmail.com

The present study was aimed at exploring the potential antiulcer activity of pramipexole, a dopamine D2/D3 receptor agonist, through a combined in-silico and in-vivo approach. The primary objectives were to assess the binding affinity of pramipexole to the histamine H2 receptor using molecular docking and to evaluate its gastroprotective efficacy in an ethanol-induced peptic ulcer rat model. Molecular docking studies were performed using AutoDock tools to examine the interaction of pramipexole with the histamine H2 receptor. For in-vivo studies, an ethanol-induced gastric ulcer model was developed in Wistar albino rats, divided into control, standard (famotidine 20 mg/kg), and test groups receiving pramipexole at 1 mg/kg and 2.5 mg/kg doses. Parameters including ulcer index, gastric volume, pH, and total acidity were recorded. The drug suspension formulation was prepared and evaluated prior to administration. Acute toxicity studies were also conducted to confirm safety. Stomach tissues were analyzed histologically to assess mucosal damage and healing. Docking results revealed a significant binding affinity of pramipexole to the H2 receptor with a docking score of −8.3041 kcal/mol, indicating a potential interaction. In-vivo findings showed a dose-dependent reduction in ulcer index and total acidity, along with an increase in gastric pH in pramipexole-treated groups compared to the ulcer control group. Histopathological examination supported the biochemical findings, with improved mucosal integrity and reduced hemorrhagic lesions observed in treated groups, especially at the higher dose. The study concludes that pramipexole exhibits promising antiulcer activity, likely mediated through histamine H2 receptor interaction and mucosal protective mechanisms. The results support further investigation into pramipexole as a potential therapeutic candidate for peptic ulcer disease.

**Keywords:** Dopamine D2/D3 receptor agonist, Histamine H2 receptor, Molecular docking, Ethanol-induced gastric ulcer, Mucosal integrity, Peptic ulcer disease

**CH-355**

## MOLECULAR DOCKING AND *IN VITRO* ANTITUBERCULAR EVALUATION OF PHYTOCONSTITUENTS FROM SELECTED ETHNOMEDICINAL PLANTS AGAINST MYCOBACTERIUM TUBERCULOSIS

Saranya Bhavanasi
Pharmacology Division, Jagan's Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh, India.
saranyashannu1920@gmail.com

Tuberculosis (TB) remains a major global health challenge, compounded by increasing drug resistance. This study explores the anti-tuberculosis potential of phytoconstituents from ethnomedicinal plants such as Gokhru (Tribulus terrestris), Vayyari Bhama (Pedalium murex), Chadurakalli (Cissus quadrangularis), Karakkaya (Terminalia chebula), Vailaku (Musa paradisiaca), Enugu Pallera (Ricinus communis), and Psidium guajava (Psidium guajava L.), which are important medicinal plants used in traditional medicine for their various therapeutic properties. The investigation employed a combined approach of *in silico* molecular docking and *in vitro* bioassays. Molecular docking targeted key Mycobacterium tuberculosis enzymes, including InhA, KasA, and DNA gyrase, to evaluate the binding affinities and interaction mechanisms of plant-derived compounds. Compounds demonstrating promising docking scores were further tested for their inhibitory activity against Mycobacterium tuberculosis strains through standardized *in vitro* assays to determine minimum inhibitory concentrations (MIC). The findings show that several phytochemicals strongly bind to essential TB enzymes and significantly inhibit bacterial growth *in vitro*, with effects comparable to current drugs. This dual approach affirms the potential of these plants as sources of new anti-TB agents and offers a framework for future isolation and drug development efforts to combat multidrug resistance in tuberculosis.

## *IN VITRO* ANTI-INFLAMMATORY ACTIVITY, DRUG LIKENESS, TARGET PREDICTION AND MOLECULAR DOCKING ANALYSIS OF BIOACTIVE COMPOUNDS FROM DURANTA ERECTA

D. Aruna Kumari[1], D.Vasudha, M. Lakshmi Narasimha[2]
[1]Department of Pharmacognosy and Phytochemistry, Vignan Institute of Pharmaceutical Technology, Visakhapatnam.
[2]Department of Pharmaceutical Chemistry, Vignan Institute of Pharmaceutical Technology, Visakhapatnam.
arunampharma@gmail.com

The current study investigates Durant aerecta phytochemical profile and biological activity using a combination of computational modeling and laboratory experiments. The findings revealed the existence of important bioactive elements as carbohydrates, glycosides, flavonoids, steroids, and phenolic compounds. Pharmacokinetic predictions using SWISSADMET found that all 10 selected drugs have desirable features, including compliance with Lipinski's Rule of Five and high gastrointestinal absorption. KEGG pathway mapping and Cytoscape network analysis revealed significant interactions between the chemicals and the proteins HSP90AA1, HIF1A, and HSP90AB1, based on degree centrality and binding affinity. Among them, the HIF1A gene, which is intimately associated to inflammatory reactions, emerged as a crucial target, with the 4BQG protein sequence from the PDB database used in docking investigations. Durantoside I (-9.7 kcal/mol), Durantoside II (-10.2 kcal/mol), and Scutellarein (-9.9 kcal/mol) all have a high binding affinity for the inflammatory target protein 4BQG, showing their potential as natural anti-inflammatory drugs. *In vitro* tests revealed that the methanol extract of Durantaerecta had significant anti-inflammatory properties when compared to the standard. This methanol fraction also had the highest levels of total glycosides (TGC) and total flavonoids (TFC), indicating a higher medicinal potential. Overall, these data suggest Durantaerecta's potential as a treatment for inflammation and associated disorders, particularly its methanolic extract. They also lay a solid framework for future *In vivo* and clinical studies to establish its usefulness in treating inflammatory illnesses.

## STABILITY-INDICATING RP-HPLC METHOD FOR THE QUANTIFICATION OF ROSUVASTATIN AND BEMPEDOIC ACID IN PHARMACEUTICAL DOSAGE FORMS: AN INTEGRATED AQBD AND GAC APPROACH

Aswathy SR, Hemnath Elango
Department of Pharmaceutical Analysis, KTN College Of Pharmacy, Puliyanamkunnu P O, Kerala-679505, India.
aswathysr22@gmail.com

Cardiovascular events remain a leading global health concern with elevated lipoprotein level recognized as a key contributor to their incidence. Rosuvastatin (ROSU) and Bempedoic acid (BEMP) are lipid-lowering drugs in combination form for the management of heterozygous familial hypercholesterolemia. A robust, stability-indicating, and eco-friendly RP-HPLC method was developed and validated for the simultaneous estimation of rosuvastatin and bempedoic acid in a pharmaceutical formulation. The Analytical Quality by Design (AQbD) strategy was applied with Central Composite Design (CCD) to optimize risk factors affect the chromatographic condition, such as acetonitrile ratio and pH. The optimized method used a Phenomenex Kinetex XB-C18 column (150 x 4.6 mm, 5µ), Acetonitrile: 20mM Ammonium formate buffer (35:65% v/v, pH 2.5) as the mobile phase, operating at a flow rate of 1.0 mL/min, and detection at 250 nm. The retention time of ROS and BEMP was found to be 9.85 min and 6.39 min. The method was validated as per ICH Q2(R1) guidelines for specificity, precision, accuracy, robustness, LOD, LOQ, and linearity. Forced degradation investigations were verified by acidic, basic, oxidative,

ISBN: 978-81-980623-8-3

thermal, and photolytic environments for determine the stability-indicating potential. Greenness was evaluated by ComplexGAPI and AGREE metrics, yielding an AGREE score of 0.70 and E-factor of 50. This study compliance with regulations and ecological sustainability renders it suitable for regular quality control assessment. This approach is anticipated to be highly beneficial moving forward because of the therapeutic exploration possibilities offered by ROSU-BEMP combination.

**Keywords:** Rosuvastatin, Bempedoic acid, AQbD, RP-HPLC, Green chemistry

## QUALITY BY DESIGN-ENABLED RP-HPLC METHOD FOR PIOGLITAZONE AND VILDAGLIPTIN AND FORCED DEGRADATION STUDIES: ROBUSTNESS THROUGH DESIGN SPACE EXPLORATION

Devi Swapna PV, G. Saravanan
Department of Pharmaceutical Analysis, KTN College of Pharmacy,
Chalavara, Puliyanamkunnu P O, Ottapalam,
Palakkad, Kerala 679505, India
deviswapnapv@gmail.com

A unique, environmentally friendly RP-HPLC technique has been established for the concurrent measurement of Pioglitazone and Vildagliptin, based on Analytical Quality by Design (AQbD) using Central Composite Design, including 13 experimental runs to optimize analytical parameters. It offers a systematic, risk-based approach in designing robust analytical methods that consistently meet their intended performance in implementing comprehensive validation and control strategies. The Agilent 1260 Infinity II HPLC system, with a quaternary pump and a Phenomenanex C18 column (150 x 4.6mm, 5µm), achieves robust separation with retention times of 2.21 min and 3.47 min for Vildagliptin and Pioglitazone respectively at a flow rate of 0.8 ml/min and UV detection at 220 nm. Validation using ICH guidelines demonstrated high precision, accuracy allowing for trustworthy quantification. The greenness of the proposed method were evaluated using AGREE, MoGAPI metrics, and White Analytical Principles via BAGI, with the method achieving an acceptable greenness and a BAGI score of 82.5, demonstrating high applicability and environmental safety. Forced degradation studies confirmed the method's stability-indicating power; both drugs could be accurately quantified in the presence of degradation products, with base-induced stress yielding the highest degradation. Thus, the established analytical technique allows for the unambiguous separation, quantification, and stability evaluation of Pioglitazone and Vildagliptin also meets contemporary sustainability norms. These findings show the increased sensitivity of the compounds to alkaline and oxidative stress, while acid, thermal, and photolytic conditions had no effect. The approach provides an environmentally friendly, reliable, and regulatory-compliant option for the estimation of these drugs in formulation.

## CUTTING-EDGE UHPLC-HRMS/MS METHOD FOR ULTRA-SENSITIVE DETECTION OF OCTREOTIDE IMPURITIES

Mounica Peela[1], Chiranjeevi Ponnam[2], G S V Girish kumar Gandi[3].
Vignan Institute of Pharmaceutical Technology (A), Duvvada,
Visakhapatnam, Andhra Pradesh, 530049, India.
srimoulica993@gmail.com

Octreotide, a synthetic somatostatin analogue, requires stringent impurity profiling to ensure safety and efficacy. A high-resolution UHPLC-HRMS/MS method was developed and validated for the qualitative and quantitative analysis of peptide-related impurities at or above 0.10 % of the drug substance. Chromatography was performed using a trifluoroacetic acid–acetonitrile–water system compatible with mass spectrometry. Qualitative analysis employed ESI+ scanning from m/z 100–1500, while quantitative analysis used ESI+ scanning from m/z 200–1500 at 70,000 resolutions with optimized gas and voltage parameters. Following U.S. FDA guidance, impurity profiles were compared across six reference-listed drug (RLD) batches of three strengths (sampled from 27 months prior to expiry through end-of-shelf-life) and nine ANDA exhibit batches of the proposed generic product (tested at release and again 4–9 months before expiry). Results demonstrated that the generic product's impurity profile closely matched the RLD, with no new peptide-related impurities ≥0.10 % detected. A combined peak at relative retention time (RRT) 1.31 contained [Des-Threoninol]-Octreotide and an unknown impurity of molecular weight 1076.4 Da; the latter was the major component, while [Des-Threoninol]-Octreotide remained below the 0.05 % disregard limit. Because these cannot be chromatographically resolved, they are jointly controlled at a 0.5 % limit. Additionally, six other unknown impurities ≥0.10 % were fully characterized by UHPLC-HRMS/MS or reference standards. This study confirms that the proposed generic octreotide product exhibits an impurity profile equivalent to the RLD and meets regulatory expectations for safety and quality.

**Keywords:** Octreotide, UHPLC-HRMS/MS, Reference listed drug, Impurities, and USFDA Guidelines.

## ADMET PREDICTIVE MODELLING IN DRUG DISCOVERY

M.Srikanth Reddy, B.Rama Rao[1], K.Daniel Raju[2]
Vignan Institute of Pharmaceutical Technology, Visakhapatnam,
Andhra Pradesh, India.
srikanthreddymule49@gmail.com

The pharmacokinetic and safety profile of a drug candidate is largely determined by its Absorption, Distribution, Metabolism, Excretion, and Toxicity (ADMET) characteristics. Evaluating these properties at an early stage has become indispensable in drug discovery, particularly during lead optimization, since even minor chemical modifications can significantly alter therapeutic efficacy and adverse effects. Conventional ADMET testing through *in vitro* assays, animal models, and clinical trials, though valuable, is often labor intensive, costly, and limited in scale. To address these shortcomings, computational strategies have gained prominence, employing rule based filters, quantitative structure activity relationship (QSAR) models, and molecular simulations to predict pharmacokinetic behavior. In recent years, numerous freely available platforms and databases such as pkCSM, SwissADME, ADMETlab, and Toxtreehave enabled rapid *in silico* screening and prioritization of candidate molecules. The integration of artificial intelligence and machine learning has further advanced this field, providing data driven models capable of large scale, accurate prediction and multiparametric optimization. This review summarizes both traditional and modern approaches, highlights open-access tools, and presents a step-by-step tutorial on AI based ADMET prediction. Collectively, these developments demonstrate how computational ADMET modeling can reduce attrition, refine lead optimization, and accelerate the progression of new drug candidates toward clinical use.

**Keywords:** Drug discovery, Lead optimization, Pharmacokinetics, Toxicity prediction.

## METHOD DEVELOPMENT AND VALIDATION OF RP-HPLC METHOD FOR SIMULTANEOUS ESTIMATION OF ATORVASTATIN CALCIUM AND OLMESARTAN MEDOXOMIL IN PHARMACEUTICAL DOSAGE FORM

D. Raj kumar, Anusha Gandi, Varaprasada Rao Kollabathula
Department of Pharmaceutical analysis, Vignan Institute of
Pharmaceutical Technology (Autonomous),
Besides VSEZ, Kapujaggraju peta, Duvvada,
Visakhapatnam, Andhra Pradesh 530049, India
gandianusha11@gmail.com

A new, simple, precise, accurate and reproducible RP-HPLC method developed and validated for Simultaneous estimation of Atorvastatin calcium and Olmesartan medoxomil in Oral solid dosage form. Separation of Atorvastatin calcium and Olmesartan medoxomil was successfully achieved on a Inertsil ODS C18 (250mm X 4.6mm X 5µ Make: Waters) in an isocratic mode utilizing Orthophosphoric acid buffer (pH 2.5): Acetonitrile (40:60 % v/v) at a flow rate of 1 mL/min and eluate was monitored at 225 nm, with a retention time of 2.461 and 3.765 minutes for Olmesartan medoxomil and Atorvastatin calcium. The method was validated and the response was found to be linear in the drug concentration range of 50 µg/mL to 150 µg/mL for Olmesartan medoxomil and 50 µ g/mL to 150 µg/mL for Atorvastatin calicium. The value of the correlation coefficient was found to be 0.999 and 0.999 for Olmesartan medoxomil and Atorvastatin calcium. The LOD and LOQ for Atorvastatin calcium were found to be 2.75 µg/mL, 9.17 µg/mL respectively. The LOD and LOQ for Olmesartan medoxomil were found to

ISBN: 978-81-980623-8-3

be 2.82 µg/mL, 9.41 µg/mL respectively. This method was found to be good percentage recovery for Atorvastatin calcium and olmesartan medoxomil were found to be 99.88 % and 100.05 % respectively indicates that the proposed method is highly accurate. The specificity of the method shows good correlation between retention times of standard with the sample so, the method specifically determines the analyte in the sample without interference from excipients of tablet dosage forms. The method was extensively validated according to ICH guidelines for Linearity, Range, Accuracy, Precision, Specificity and Robustness.

**Keywords:** Olmesartan medoxomil, Atorvastatin calcium, RP-HPLC.

sucharitababu2@gmail.com

The gut-liver axis is a crucial bidirectional pathway that links host metabolism, intestinal microbiota, and liver function. This axis's dysregulation is linked to inflammatory disorders, hepatotoxicity, and microbial infections. The plant Diospyros melanoxylon has been traditionally used for diuresis and the treatment of infectious diseases. Diarrhoea, diabetes, and liver disorder have been investigated in the current study through chemometric profiling, gas chromatography-mass spectroscopy analysis, *in vitro* antimicrobial studies, and *in silico* studies using the methanolic extract. Through GC-MS analysis, the presence of potential 13 regulations was examined using an integrated phytochemical, *in vitro*, and *in silico* method. *In vitro* antioxidant activity demonstrated significant radical scavenging activity (73%) at a 400µg concentration, while *in vitro* antimicrobial activity showed a considerable inhibitory effect against Escherichia coli (MIC 125 µg/mL) and Staphylococcus aureus (MIC 250 µgm/L). Strong binding affinities of α-amyrin with microbial DNA gyrase and hepatic HF-kB were predicted using molecular docking, found to be -8.6 kcal/mol and -7.4 kcal/mol, respectively, indicating dual antibacterial and hepatoprotective effects. It also showed that α-amyrin, as a lead compound with favourable oral bioavailability, high gastrointestinal absorption, blood-brain permeability, lack of mutagenicity, and no predicted hepatotoxicity, conforms to Lipinski's and Veber's rules through ADMET analysis. Together, these findings provide a detailed insight into the protective effect of D. melanoxylon, particularly α-amyrin as a lead compound to safeguard the gut-liver axis and reduce the hepatic damage and antibiotic-induced dysbiosis.

vasanthagrace10@gmail.com

Thrombocytopenia, characterized by a significant reduction in platelet count, presents a serious clinical challenge in conditions such as dengue fever, chemotherapy-induced cytopenia, and hematological malignancies. This preclinical study evaluated the platelet-augmenting and cytotoxic effects of aqueous extracts of Moringa oleifera (drumstick leaves), Psidium guajava (guava leaves), and Punica granatum (pomegranate seeds). Thrombocytopenia was chemically induced, and platelet counts along with hematological parameters were monitored to assess efficacy. Cytotoxicity assays, including studies on the MV411 cancer cell line, confirmed safety at therapeutic doses and revealed potential anticancer activity. Molecular docking demonstrated strong binding of quercetin (Moringa) and punicalagin (Pomegranate) to the thrombopoietin receptor, supporting their role as natural thrombopoietic agents. The findings validate the traditional use of these plants for platelet disorders and highlight their promise as safe, plant-based therapies with dual thrombopoietic and anticancer potential.

**Keywords:** Thrombocytopenia; Platelet enhancement; Moringa oleifera; Psidium guajava; Molecular docking.

aparna@jssuni.edu.in

A glycopeptide antibiotic, vancomycin, derived from Amycolatopsis orientalis and approved in 1958, treats aerobic Gram-positive infections, such as endocarditis, osteomyelitis, pneumonia, and meningitis, caused by methicillin-resistant Staphylococcus aureus (MRSA) and Staphylococcus epidermidis (S. epidermidis) bacteria. Vancomycin's narrow therapeutic range is crucial for therapeutic drug monitoring (TDM) to avoid therapeutic inefficacy, nephrotoxicity, and ototoxicity. Antibiotic resistance (ABR) is a global health threat necessitating vancomycin dose optimization. This study aims to develop a precise green bioanalytical HPLC method for vancomycin quantification, validate per ICH-M10 bioanalytical method validation guidelines, and analyze clinical samples to suggest dosing. An RP-HPLC method was developed for vancomycin and acetaminophen (IS) in human plasma using an I-series HPLC 2030 instrument and C18(150×4.6 mm; 5µm) column at 45°C. Mobile phase: ammonium acetate 10mM (pH 2.85 adjusted using glacial acetic acid) and methanol (84:16 v/v), flow rate: 0.8 mL/min, UV-detection: 240 nm. Plasma samples (100µL) spiked with 200µL vancomycin and IS, deproteinized with 20% methanol (300µL), and diluted to 2000µL with Milli-Q water. Samples were vortexed for two minutes, and 4-8 oC cold centrifuged at 5000 rpm for 10 min. Supernatant filtered through 2µm PTFE injection filters and 500µL injected into HPLC. The environmental impact and sustainability of the developed method were evaluated using multiple green analytical chemistry assessment tools like AGREE, ComplexGAPI, AGREEprep, RAPI and BAGI tools. Patients were administered a vancomycin IV-dose, and blood samples were collected 30 minutes before (trough) and 60 minutes after the dose (peak) and processed similarly to standard stock solutions. The retention times for vancomycin and IS were 3.7 and 4.9 min, respectively. The developed RP-HPLC method showed linearity in the 0.5-256µg/mL range with a regression coefficient (r2=0.9999), and a limit of detection and quantification of 2 and 6 µg/mL, respectively.

**DEVELOPMENT AND VALIDATION OF A STABILITY-INDICATING RP-HPLC METHOD FOR THE QUANTITATIVE DETERMINATION OF TIVOZANIB AND ITS IMPURITIES**

Manga Pavitra Reshma, U. Harini
Department of Pharmaceutical Analysis, Raghu College of Pharmacy, Dakamarri, Visakhapatnam, Andhra Pradesh, India.
reshmalucky17@gmail.com

A novel, rapid, accurate, sensitive, and reproducible reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed for the quantitative determination of Tivozanib and its related impurities in active pharmaceutical ingredient. The chromatographic separation was performed on a Waters Alliance e2695 system using a Luna C18 column (250 × 4.6 mm, 5 µm particle size). The mobile phase consisted of 0.1% trifluoroacetic acid and acetonitrile in a 70:30 v/v ratio, delivered at a flow rate of 1.0 mL/min. Detection was carried out at 286 nm using a photodiode array detector under ambient conditions. The retention times for Tivozanib, Impurity-1, Impurity-2, and the main compound were approximately 2.522, 3.967, and 8.738 minutes, respectively.

ISBN: 978-81-980623-8-3

Theoretical plate counts for Tivozanib and its impurities were 5236, 7721, and 17,695, with tailing factors of 1.05, 1.11, and 0.89. The percent relative standard deviations (%RSD) of peak areas were 0.47, 0.54, and 0.68, indicating good precision. The method was validated in accordance with ICH guidelines. This study aimed to develop and rigorously validate a simple, robust, and stability-indicating RP-HPLC method for the quantification of Tivozanib as an active pharmaceutical ingredient.

**Keywords:** Tivozanib, method development, impurities, RP-HPLC.

## SYNTHESIS, CHARACTERIZATION, *IN SILICO* MOLECULAR DOCKING AND BIOLOGICAL ACTIVITY OF NOVEL OXAZOLIDINE DERIVATIVES

Prerna Chaturvedi, Arun Kumar Gupta
Chameli Devi Institute of Pharmacy, Indore, Madhya Pradesh, India
prerna.chaturvedi@cdgi.edu.in

Oxazolidine derivatives represent a significant class of heterocyclic compounds with diverse pharmacological potential, including antimicrobial, anti-inflammatory, anticancer, and enzyme inhibitory activities. The present research was undertaken to design, synthesize, and characterize a series of novel oxazolidine derivatives through rational drug design approaches. The synthetic pathway involved condensation of selected aldehydes/ketones with amino alcohol precursors under controlled conditions to afford structurally diversified oxazolidine analogues. The synthesized compounds were characterized by spectroscopic techniques, including FT-IR, ^1H-NMR, ^13C-NMR, and mass spectrometry, to confirm their chemical structures and purity. *In silico* molecular docking studies were performed against relevant biological targets such as bacterial topoisomerases, COX-2 enzyme, and selected kinases to predict binding affinity, mode of interaction, and structure–activity relationship. Docking simulations revealed that several oxazolidine derivatives displayed favorable binding energies, hydrogen bonding, and hydrophobic interactions within the active sites of the targets, suggesting promising pharmacological relevance. The biological evaluation was carried out to assess antimicrobial, antioxidant, and cytotoxic potential using standardized *in vitro* assays. Overall, this study establishes oxazolidine derivatives as promising scaffolds for further optimization and development as therapeutic agents. Future investigations focusing on pharmacokinetic profiling and *in vivo* validation are warranted to strengthen their drug development potential.

**Keywords:** Oxazolidine, Synthesis, Biological activities

## *IN SILICO* STUDIES UNVEILING THE HEPATOPROTECTIVE POTENTIAL OF CAREYA ARBOREA: DOCKING AND ADMET ANALYSIS

Sanapala Usha Rani, Galanki Vasantha
Vignan institute of Pharmaceutical Technology, Duvvada,
Visakhapatnam, Andhra Pradesh, India - 530049
usharani.sanapala2004@gmail.com

The traditional medicinal plant Careya arborea has great therapeutic potential, with a history of use in liver medicines, and has been shown to be hepatoprotective, although its mechanism of action is largely unexplored *in silico* studies. The current study will seek to explain the hepatoprotective effect of Careya arborea through molecular docking and ADMET analysis. The literature and phytochemical databases were curated with key bioactive flavonoids, such as quercetin, kaempferol, catechin, and rutin, which were found previously in Careya arborea and also share similarity with Morus alba. These compounds were docked to liver-related target proteins and were targeted on pathways implicated in hepatotoxicity, oxidative stress, and inflammation. The binding affinities (binding energies in the range of -8.1 to -10.3 kcal/mol) between Careya arborea flavonoids and key hepatic targets under docking were found to be strong, suggesting their functional use as regulators of liver protection processes. This top-ranked ADMET profiling of such hits forecasted good pharmacokinetic characteristics, which included high gastrointestinal uptake, non-hepatotoxicity, and low risk of off-target toxicity. Combined with the ADMET prediction, the built-in molecular docking workflow supports the therapeutic applicability of the flavonoids of Careya arborea in hepatoprotection. On the whole, this work offers a mechanistic framework of the traditional application of Careya arborea in liver diseases and the identification of potential bioactive compounds that have potential in experimental validation and development into natural hepatoprotective agents.

mgeethakowsalya@gmail.com

Polycystic Ovarian Syndrome (PCOS) affects 8–13% of women of reproductive age worldwide, underscoring the urgent need for innovative therapeutic and diagnostic strategies. This study pioneers a dual approach by integrating artificial intelligence (AI)-driven drug discovery with advanced analytical platforms for biomarker profiling. An AI pipeline employing support vector machines, random forests, and deep neural networks screened large compound libraries against molecular targets implicated in PCOS. Network pharmacology and molecular docking simulations identified 15 novel therapeutic candidates with strong binding affinities toward ESR1, PPARG, and CYP17A1, achieving 98% accuracy in drug–target interaction predictions. Validation employed established animal models, including the letrozole-induced model. Parallelly, an innovative multi-dimensional analytical framework was developed for PCOS biomarker discovery. Fourier Transform Infrared (FTIR) spectroscopy, Raman spectroscopy, LC-MS/MS, and UPLC-QTOF-MS were applied to serum, urine, and follicular fluid samples from 150 PCOS patients and 120 controls. This revealed 94 novel biomarkers, including inflammatory markers, steroid metabolites, and metabolomic signatures. FTIR with orthogonal partial least squares discriminant analysis (OPLS-DA) achieved high classification accuracy ($R^2Y = 0.926$). Thirty-five urinary metabolites, including palmitic acid and benzoylglycine, showed differential expression with AUC values up to 0.991. Advanced LC-MS/MS profiling revealed elevated 11-oxygenated androgens as key biomarkers, outperforming conventional testosterone assays. A combinatorial biomarker panel using free fatty acid ratios and sulfated steroids achieved an AUC of 0.874 in validation studies. This integrative framework revolutionizes PCOS research by enabling rapid, economical, and precise diagnostics while accelerating AI-guided therapeutic discovery.

## CHROMATOGRAPHIC (RP-HPLC) METHOD DEVELOPMENT FOR THE ESTIMATION OF FAVIPIRAVIR FROM SOLID DOSAGE FORM

Monika S. Kare, Pranjali C. Waghmare
Dept of Postgraduate Studies in Pharmacy, SVPM'S College of Pharmacy, Malegaon (BKII) Baramati Dist Pune 413115 India
karemonika506@gmail.com

An improved reverse phase high performance liquid chromatographic (RP-HPLC) method has been developed and validated for the estimation of Favipiravir from pharmaceutical dosage form. Chromatographic separation was performed on RP-C**18** column. The optimized mobile phase (acetonitrile: water of pH 4.8 adjusted with glacial acetic acid) was pumped at a flow rate of 0.8 ml/min in the ratio of 35:65 % v/ v and the eluent was monitored at 245 nm. The assay was performed with tablet dosage form and % of assay was found 101.21 % w/w of Favipravir. Linearity was ascertained over the concentration range 1-12 µg/ml. The method was statistically validated and found SD; RSD was within acceptable limit, indicated high degree of accuracy and precision of the proposed RP-HPLC method. Due to its simplicity, rapidness, high precision and accuracy the proposed RP-HPLC method can be applied for determination of Favipiravir in routine quality control tests of dosage form.

## QUANTIFICATION OF CINNARIZINE IN HUMAN PLASMA BY DEVELOPED VALIDATED BIOANALYTICAL TECHNIQUE

ISBN: 978-81-980623-8-3

Rohan B. Lokhande, G. K. Dyade
Dept of Postgraduate Studies in Pharmacy, SVPM'S College of Pharmacy, Malegaon (BKII) Tal-Baramati Dist-Pune 413115 India
rohanlokhande2001@gmail.com

Bio analytical methods are extensively applied in quantitative evaluation of drugs and its related substances in biological fluids. In this concern Bio analytical method was developed for estimation of cinnarizine in human plasma by chromatographic technique. Bio analytical method was developed for estimation of cinnarizine CRE, with RP-HPLC, using RP-C18 column equipped with UV detector. The mobile phase [methanol: acetate buffer pH 4.0 (pH adjusted with acetic acid)] was pumped at a flow rate of 0.8 ml/min in the ratio of 76:24 % v/v and the eluent was monitored at wavelength 252nm. The method was studied for quantitative estimation of drug from human plasma. The drug CRE was shown linear response in conc ranges CRE (1000-5000 ng/ml) in plasma. Accuracy and precision study shown that % CV was varied in the range (2.4227-7.0438) for CRE at all conc. levels and; the data of % nominal conc. was varied between (102.52-106.03) at all conc. levels. The simple protein precipitation technique was applied for the separation of drug from plasma. There was no any interference within plasma and drug found.The method can be applied for relative bioavailability and bioequivalence study of cinnarizine drug or/and dosage form.

vigneshc1234@gmail.com

Alzheimer's disease (AD) is a condition that results in the degradation of brain cells and is characterized by deterioration in cognitive performance and loss of autonomy in daily activities. Two fundamental hypotheses have been proposed as potential causes of AD, the cholinergic hypothesis and the amyloid hypothesis. The complex pathogenesis of AD requires MTDL for disease management. In this study, novel 1,2,4-triazine derivatives were designed, synthesized and evaluated as multifunctional agents for AD. Molecular docking studies showed that the derivatives occupied the entire BACE1 and AChE enzyme with good binding score. The *in vitro* Ellman's assay, amyloid induced MTT assay and DPPH assay were conducted to evaluate the cholinesterase inhibition, neuroprotection and antioxidant properties of the compound respectively. The designed compounds were synthesized by conventional methods and characterized by various spectral studies. The results showed that the scaffolds of 1,2,4-triazine exhibited acetylcholinesterase inhibition with efficient neuroprotection along with comparable radical scavenging properties.

## SULPHONAMIDE-CONTAINING OXAZOLINE HYBRIDS AS NEUROPROTECTIVE AGENTS AND LEAD MOLECULE AS AUTOPHAGY INDUCER

K. Chandra Sekhar [1], B. V. Ramana[2]
Dr. K. V. Subba Reddy Institute of Pharmacy, Kurnool District
Andhra Pradesh State, India – 518218
chanduniperkol@gmail.com

Autophagy is an extremely preserved catabolic method, induced under numerous cellular stress conditions and cytotoxic insults, which prevents cellular damages and also initiates survival mechanism within the cell. Sulphonamide derived oxazoline hybrid compounds showed neuroprotective effects by inducing autophagy. In the present study, a series of sulphonamide containing oxazoline hybrids were synthesized and their neuroprotective efficacy in neuronal cell lines was explored. All the compounds showed moderate to good neuroprotection against adrenal medulla cell lines (PC-12). Compound 6j had good neuroprotective activity against PC 12 cell lines showing increased expression of autophagy regulatory proteins (ATG7, LC 3B, p62, Beclin-1) and antiapoptotic proteins (Bcl-2) and also decreased expression ofpro-apoptotic proteins (Bax and Bad). This study demonstrated clearly that compound 6j showed neuroprotective effect through the induction of autophagy and opens up new avenues for a new class of compounds as neuroprotective therapeutic agents.
**Keywords:** Autophagy, Sulphonamides, Oxazoline, Neuroprotective agents.

## DEVELOP AND VALIDATE THE STABILITY INDICATING RP HPLC METHOD FOR THE ESTIMATION IN BULK AND CAPSULE DOSAGE FORM OF ITRACONAZOLE BY QBD APPROACH.

Diksha vibhute, Anant Deshpande
Department of Pharmaceutical Sciences, Swami Ramanand teerth Marathwada university Nanded, Maharashtra, India
dikshavibhute059@gmail.com

Quality by Design is the modern approach for quality of pharmaceuticals. The aim of the pharmaceutical development is to design a quality product and its manufacturing process to consistently deliver the intended performance of the product. Quality cannot be tested into products, but quality should be built in by design. A simple, Accurate, precise method was developed and validate a stability indicating reverse phase-high performance liquid chromatography (RP-HPLC) method for the determination of Itraconazole in bulk and pharmaceutical dosage form using QbD approach. Chromatogram was run through Kromosil 150 x 4.6 mm, 5. Mobile phase containing KH2PO4: Acetonitrile taken in the ratio 60 (%v/v) and 40 was pumped through column at a flow rate of 0.924 ml/min. Temperature was maintained at 32.9°C. Optimized wavelength selected was 260nm. Retention time of Itraconazole was found to be 2.467 min. %RSD of the Itraconazole was found to be 0.5. %Recovery was obtained as 99.84% for Itraconazole. LOD, LOQ values obtained from regression equations of Itraconazole were 0.08, 0.24. Regression equation of Itraconazole is y = 41250x + 2844. Retention times were decreased, and that run time was decreased, so the method developed was simple and economical that can be adopted in regular Quality control test in Industries.
**Keywords:** Itraconazole, QbD Approach, Method development, RP-HPLC

## DISCOVERY OF THIAZOLE-BASED SGLT2 INHIBITORS FOR DIABETIC NEPHROPATHY VIA *IN SILICO* APPROACHES

Uma D. Kabra, Krishna Gupta, Milind Umekar
Department of Pharmaceutical Chemistry,
Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee,
Nagpur, Maharashtra, 441002, India
uma.kabra05@gmail.com

ISBN: 978-81-980623-8-3

Diabetic nephropathy (DN), a major microvascular complication of chronic diabetes mellitus, remains the leading cause of end-stage renal disease (ESRD). Current therapies such as renin–angiotensin–aldosterone system (RAAS) inhibitors slow progression but fail to completely halt renal decline, emphasizing the need for new treatment strategies. Sodium–glucose co-transporter 2 (SGLT2) inhibitors have shown both glycemic and renoprotective effects, yet glycosidic inhibitors are often associated with adverse outcomes including genitourinary infections and euglycemic ketoacidosis. This limitation has spurred interest in alternative, non-glycosidic scaffolds. Thiazole, a heteroaromatic framework with drug-like properties, represents a promising core for designing novel SGLT2 inhibitors. In this study, a ligand-based pharmacophore model was generated from reported thiazole derivatives and applied to virtual screening of the Drug Central and Enamine libraries. Four potential candidates were identified, exhibiting the strongest and most consistent binding during 100 ns molecular dynamics (MD) simulations. Based on these structural insights, a new thiazole-derived compound TD1 was rationally designed. TD1 achieved a high pharmacophore fit score, favourable docking energy and stable MD interactions, indicating strong potential as a non-glycosidic SGLT2 inhibitor. Collectively, this integrated computational approach, combining pharmacophore modeling, virtual screening, docking, and MD simulations provides a robust framework for the discovery of novel scaffolds. TD1 emerges as a promising lead for further optimization and preclinical evaluation in the treatment of DN.

**Keywords:** diabetic nephropathy, thiazole, SGLT2, pharmacophore, molecular dynamics simulation, molecular docking.

## DESIGN AND MOLECULAR DOCKING OF TRIAZINE DERIVATIVES TARGETING PARP-2 IN CANCER THERAPY

Ashwini Anil Jadhav [1,2], Suvarna G Kini [2], S.N. MamleDesai [1]
[1]Department of Pharmaceutical Chemistry, PES's Rajaram and Tarabai Bandekar College of Pharmacy, Ponda, Goa 403 401, India.
[2]Department of Pharmaceutical Chemistry, Manipal College of Pharmaceutical Sciences. Manipal Academy of Higher Education, Manipal, Karnataka, India.
ashwinijdhv7@gmail.com

Poly (ADP-ribose) polymerase (PARP) is a key enzyme involved in DNA damage repair and represents an important therapeutic target in oncology, particularly for tumors with defective homologous recombination repair mechanisms. Triazine-based scaffolds, recognized for their broad pharmacological relevance, have recently emerged as promising frameworks for PARP inhibition. The present study aimed to identify triazine derivatives with potential inhibitory activity against the PARP-2 enzyme through computational approaches. The crystal structure of PARP-2 (PDB ID: 4ZZX, resolution 1.65 Å) was prepared using the Protein Preparation Wizard in Maestro 11.8. A focused triazine library was generated via LigPrep, followed by molecular docking using Glide SP and XP modes. Top-ranked compounds were further evaluated through MM-GBSA binding free energy calculations in the Prime module, and their interactions within the catalytic pocket were analyzed. Six triazine-based derivatives exhibited strong binding affinity and stable interactions with key active-site residues, comparable to the reference inhibitor Olaparib. The MM-GBSA profiles supported their favorable energetic stability, highlighting robust protein–ligand complex formation. Overall, this *in silico* study underscores the potential of triazine scaffolds as leads for the development of PARP-2 inhibitors, warranting further structural optimization and experimental validation for application in cancer therapy.

**Keywords:** PARP-2 inhibition, Triazine derivatives, Molecular docking

**CH-377**

## DESIGN, SYNTHESIS, AND PHARMACOLOGICAL POTENTIAL OF CHALCONES VIA CLAISEN–SCHMIDT REACTION

K. Keerthi, G. Durga Rao
Department Of Medical chemistry, Raghu College of Pharmacy, Visakhapatnam, Andhra Pradesh, India.
Koyyakeerthi8@gmail.com

Chalcones, belonging to the flavonoid family, they are open-chain compounds characterized by an α, β-unsaturated carbonyl system. This structure acts as a pharmacophore and is responsible for a broad spectrum of biological activities, including anti-inflammatory, antimicrobial, antioxidant, anticancer, and antidiabetic effects. The structural simplicity combined with functional versatility makes chalcones important scaffolds in medicinal chemistry for drug discovery and therapeutic applications.In the present study, chalcone derivatives were synthesized using the Claisen–Schmidt condensation reaction, a base-catalyzed aldol condensation between substituted aromatic aldehydes and acetophenones. This reaction was chosen due to its simplicity, cost-effectiveness, high yield, and the ability to introduce diverse substituents on the aromatic rings.The synthesized chalcones were purified using recrystallization and column chromatography techniques. Structural characterization was performed using melting point determination, ultraviolet-visible (UV-Vis) spectroscopy, infrared (IR) spectroscopy, and nuclear magnetic resonance (NMR) spectroscopy, confirming the successful formation of the α, β-unsaturated carbonyl system.Preliminary pharmacological evaluation revealed significant biological activity in selected derivatives, demonstrating that substitution patterns on th9e aromatic rings substantially influence activity and specificity. This study underscores the Claisen–Schmidt reaction as a reliable and versatile approach for synthesizing structurally diverse chalcones with promising therapeutic potential.This focuses on the chemistry of the Claisen–Schmidt reaction and its role in generating bioactive chalcones. Emphasis is placed on structure–activity relationships, pharmacological applications, and recent advancements in synthetic modifications.This emerge as promising leads for next-generation therapeutics in oncology, infectious diseases, and inflammatory disorders.

**Keywords**: Chalcones, flavonoids, biomedical properties, novel therapeutic prospecting, chemical fabrication.

## 2D AND 3D QSAR ANALYSIS OF CHALCONE DERIVATIVES AS PTP1B INHIBITORS: AN *IN-SILICO* APPROACH

Priyanka Soni, Jitendra Sainy, Rajesh Sharma
School of Pharmacy, Devi Ahilya University, Takshashila Campus, Indore (India) - 452001
psonichemistry@gmail.com

Protein tyrosine Phosphatase 1B (PTP1B), is a highly studied target because of its involvement in signaling pathways involving Alzheimer's disease, cancer etiology & metabolic disorders like diabetes and obesity. As a result, it is currently the preferred target for scientists. Furthermore, Chalcone derivatives are being investigated for their potential as inhibitors of PTP1B and have undergone ligand-based design to identify potential lead compounds. These compounds were then analyzed using computational technology through software Sybyl X 2.0 involving 2D HQSAR methodology and 3D techniques like CoMFA and CoMSIA. Structural modification was done on the basis of Contours obtained and then new molecules (P1-P11) were generated. The findings derived from these QSAR models demonstrate statistically noteworthy models with CoMFA having q2 of 0.879 and r2 value 0.982, CoMSIA having q2 of 0.686 and r2 value 0.915 and HQSAR with q2 of 0.848 and r2 Value 0.954. The statistical data obtained from the models exhibit consistency and provide evidence of the models' adequacy and predictive capacity. Using the findings from the predictive models that were obtained, it is possible to construct Chalcone compounds with the capability to hinder Protein tyrosine phosphatase 1B.

**Keywords:** PTP1B inhibitors; Chalcones, HQSAR; CoMFA; CoMSIA.

## HYBRID TRIAZINE-THIAZINE DERIVATIVES AS PROMISING ANTIMALARIAL LEADS: DESIGN, SYNTHESIS, MOLECULAR DOCKING AND *IN-VITRO* EVALUATION

Manish Pathak[1], Rupesh Pandey[1], Lubhan Singh[1], Sokindra Kumar[1]
[1]Faculty of Pharmacy, Swami Vivekanand Subharti University, Meerut (U.P)-250005 INDIA
ranu.rupeshpandey@gmail.com

Malaria remains a major global health challenge, particularly in endemic regions, due to increasing resistance of Plasmodium falciparum to conventional antimalarials. The search for novel scaffolds with improved efficacy and dual-targeting potential is urgently needed. This study aimed to design, synthesize, characterize, and evaluate a series of hybrid 1,3,5-triazine–thiazine derivatives (6a–6e) for their antimalarial

ISBN: 978-81-980623-8-3

potential, supported by molecular docking. A multi-step synthetic route from cyanuric chloride was employed to generate the hybrids. Compounds were characterized by FTIR, 1H-NMR, 13C-NMR, MS, and HRMS. *In vitro* antimalarial activity was evaluated against P. falciparum NF54 strain by the broth dilution method, using chloroquine as standard. Molecular docking was performed using AutoDock Vina against DNA gyrase (PDB: 2XCT) and plasmepsin-2 (PDB: 1LEE) Among the synthesized compounds, 6c and 6e displayed the most potent inhibition (MIC = 6.25 µg/mL), approaching chloroquine (MIC = 3.125 µg/mL). Docking results showed strong binding affinities, with compound 6e exhibiting binding scores of –10.6 kcal/mol (DNA gyrase) and –10.8 kcal/mol (plasmepsin-2), supported by π–π stacking and hydrogen bonding interactions. These results highlight the potential of triazine–thiazine hybrids as promising scaffolds in antimalarial drug discovery. However, limitations include lack of In-vivo validation and toxicity assessment, which must be addressed in future studies. Hybrid triazine–thiazine scaffolds as promising lead structures for antimalarial drug discovery. Compounds 6c and 6e, in particular, demonstrate favorable *In-vitro* activity and molecular interactions**.**

## DEVELOPMENT AND VALIDATION OF NEW SPECTROPHOTOMETRIC METHOD FOR THE ESTIMATION OF EFAVIRENZ IN PHARMACEUTICAL FORMULATIONS

Chintakayala Akshar Sathwik, Mukthinuthalapati Mathrusri Annapurna
GITAM School of Pharmacy, GITAM (Deemed to be) University,
Visakhapatnam, India
achintak@student.gitam.edu

Efavirenz (CAS 154598-52-4) is used for the treatment of human immunodeficiency virus infection. It is a non-nucleoside reverse transcriptase inhibitor. Efavirenz is chemically, 4S)-6-chloro-4-(2-cyclo propyl ethynyl)-4-(trifluoromethyl)-1H-3,1-benzoxazin-2-one with molecular formula $C_{14}H_9ClF_3NO_2$ and molecular weight 315.675 grams/mole. It acts by binding to a non-catalytic site on the HIV-1 reverse transcriptase enzyme and prevents the enzyme from functioning properly which indirectly inhibits and also halts the conversion of HIV's RNA into DNA which is necessary for producing new virus particles. A new spectrophotometric method has been developed for the estimation of Efavirenz in pharmaceutical dosage forms (Tablets). Double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the present study (200-400 nm). Efavirenz has shown absorption maxima (λmax) at 247 nm in phosphate buffer (pH 2.1) and Beer-Lambert's law was obeyed over the concentration range 2.5-40 µg/ml with linear regression equation, y = 0.0522x + 0.0501 ($R^2$ = 0.9987). The method was validated as per ICH guidelines and found to be simple, precise and accurate and can be applied successfully for the assay of Efavirenz for the pharmaceutical formulations.

**Keywords:** Efavirenz, spectrophotometry, ICH Guidelines.

## MOLECULAR DOCKING ANALYSIS OF PRIMAQUINE-CHLOROQUINE FUMARDIAMIDES AS ANTIPLASMODIAL AGENTS

Lalit Dhakar, Nimita Manocha, Jeevandeep Mishra
Indore Institute of Pharmacy, Indore, Madhya Pradesh, India- 453331
dhakarlalit7@gmail.com

Malaria is still a serious threat to humans all round the world. This alarming situation calls for the development of novel antimalarials effective against resistance strain. This research describes a revision of hunt for new antiplasmodial drugs with enhanced potencies against the erythrocytic and hepatic stages of Plasmodium. In the present study a series of already reported eleven chloroquine and primaquine fumardiamides derivatives were subjected to molecular docking on P. falciparum Lactate Dehydrogenase enzyme complex with NADH (PDB code: 1LDG, resolution 1.74 Å) by working on Autodock tool versions 1.5.7. Molecular docking analysis results reveal that the active compounds PC-4, PC-5, PC-12, PC-14 docked well within the binding sites of P. falciparum Lactate Dehydrogenase drug target with strong affinity ranging from -8.67 to -7.20 kcal/ mol. Best docked poses showed hydrogen bond interactions with Met30, The97, Gly29, Gly 99. Whereas electrostatic interactions were seen with Ala98 and Ile3. For all the reported compounds, the binding energies of molecular interaction into the active site cleft were found to be better than co-crystallized ligand, 1,4-dihydronicotinamide adenine dinucleotide (-6.00 kcal/mol).

## COMPUTER-AIDED DRUG DESIGN (CADD) IN PHARMACEUTICAL CHEMISTRY

T. Pujitha, S. Alekhya
Department of Pharmaceutical Technology, ASN Pharmacy College,
Tenali, Guntur District, Andhra Pradesh, India – 522201
thotapujitharoy@gmail.com

Computer-Aided Drug Design (CADD) has emerged as the transformative approach in the field of pharmaceutical chemistry, significantly improving the efficiency and precision of the drug discovery and development. Traditional methods of the drug discovery are often time-consuming, expensive, and heavily reliant on trial-and-error experimentation, resulting in low success rates. CADD integrates computational tools with the principles of medicinal chemistry and molecular biology to predict molecular interactions, to optimize chemical structures, and design novel drug candidates with improved efficacy, selectivity, and safety profiles. The two main approaches in CADD are Structure-Based Drug Design (SBDD) and Ligand-Based Drug Design (LBDD). SBDD uses the three-dimensional structure of the target proteins to design molecules that fit precisely into the active site, employing techniques such as molecular docking, molecular dynamics simulations, and virtual screening. LBDD, applied when the target structures are unknown, which relies on known active ligands and Quantitative Structure-Activity Relationship (QSAR) modelling which predicts biological activity and optimize chemical structures. CADD's applications include lead identification, lead optimisation, ADMET (Absorption, Distribution, Metabolism, Excretion, Toxicity) prediction, and drug repurposing. The integration of artificial intelligence (AI) and machine learning has further enhanced predictive accuracy, accelerating the discovery of new molecules while reducing experimental workload. Despite being challenging such as the need for high-quality structural data and limitations in fully predicting *in vivo* behaviour, continuous improvements in the computational algorithms and databases are addressing these issues. In conclusion, CADD has revolutionised pharmaceutical chemistry by enabling rational, efficient, and cost-effective drug design. Its applications promise safer, more effective, and patient-centered therapeutics, shaping the future of modern drug discovery and development.

**Keywords:** Computer-Aided Drug Design (CADD), Pharmaceutical Chemistry, Medicinal Chemistry, SBDD, LBDD, Molecular Docking, QSAR, ADMET, Drug Optimisation, Drug Repurposing.

## SYNTHESIS, DOCKING STUDIES, AND BIOLOGICAL EVALUATION OF MANNICH BASES OF BENZIMIDAZOLE BEARING 1,3,4-OXADIAZOLE FOR ANTIDEPRESSANT ACTIVITY

Darshitha R
Visveswarapura Institute of Pharmaceutical Sciences
darshitha.vips@gmail.com

Benzimidazole is a well-established heterocyclic scaffold with diverse pharmacological properties, while 1,3,4-oxadiazole is a recognized CNS-active pharmacophore. Incorporation of a Mannich base moiety is known to enhance lipophilicity, bioavailability, and receptor affinity. This study aimed to design, synthesize, characterize, and evaluate a series of benzimidazole-oxadiazole Mannich base derivatives for their potential antidepressant activity. To synthesize novel Mannich base derivatives of benzimidazole bearing 1,3,4-oxadiazole, investigate their in-silico binding affinity towards GSK-3β, and evaluate their antidepressant activity using validated rodent models. The target compounds (5a–5c) were synthesized via a five-step route starting from o-phenylenediamine and succinic acid. Structural confirmation was achieved through melting point determination, TLC, IR, and $^1$H-NMR analyses. Elemental analysis (sodium fusion tests) verified the presence of nitrogen and sulfur, while esterification confirmed the carboxyl functionality. Mass spectral data supported the structures, showing molecular ion peaks at m/z 304 (5a) and m/z 364 (5c). In-silico docking studies were performed using

ISBN: 978-81-980623-8-3

Schrödinger Maestro v13 against GSK-3β (PDB: 3F88). Antidepressant activity was assessed using the Tail Suspension Test (TST) and Forced Swim Test (FST) with fluoxetine hydrochloride as standard. Docking studies revealed strong ligand-protein interactions at key hinge region residues (Val135 and Asp133). All synthesized compounds reduced immobility time compared with the control, indicating antidepressant-like activity. Compound 5b (imidazole-substituted) demonstrated the highest activity, approaching the efficacy of fluoxetine. Compound 5a also showed significant activity, whereas compound 5c exhibited no observable antidepressant effect at the tested dose. A structure–activity relationship suggested that the presence of the imidazole ring enhanced binding affinity and biological potency. The introduction of a Mannich base moiety into benzimidazole–oxadiazole hybrids significantly improves CNS activity, likely through enhanced lipophilicity and optimized receptor binding. Compounds 5a and 5b, particularly 5b, are promising lead molecules for further development as antidepressant agents, while the inactivity of 5c provides valuable SAR insight. Future work will focus on receptor-binding assays, mechanistic studies, and toxicity profiling to support their therapeutic potential.

**Keywords:** Benzimidazole, 1,3,4-oxadiazole, Mannich base, antidepressant, docking, Tail Suspension Test, Forced Swim Test.

**CH-384**

## MOLECULAR DOCKING AND DYNAMIC SIMULATION STUDY OF NAPHTHALENE TRIAZOLES AS ANTI-CANCER AGENTS AND VALIDATION BY REDOCKING

Thomas Kurian Jose Kurien
College of Pharmacy, Govt. Medical College, Kottayam Kerala,686008
thomaskurian54@gmail.com

Naphthalene-triazole derivatives contain poly cyclic aromatic hydrocarbon fragment and a naphthalene scaffold which contribute to hydrophobic membrane permeability, π-π stacking and metabolic stability in drug receptor bindings. In the present study we have selected 5-[[5-amino-3-(4-cyanoanilino)-1,2,4-triazol-1-yl]sulfonyl]naphthalene-2-carbonitrile , 3-[6-(2-pyrrolidin-1-ylethoxy) naphthalen-2-yl]-5-[5-(pyrrolidin-1-ylmethyl)-1H-1,2,4-triazol-3-yl]-1H-indazole.,(3-N-(4-chlorobenzyl)amino-1-(napthalen-1-sulfonyl)-5-amino-1H-1,2,4-triazole, 3-Napthalen-2-yl-5-(5-pyrrolidin-1-ylmethyl-1H-[1,2,4]triazol-3-yl)-1H-indazole and 3-N-(4-chlorophenethyl)amino-1-(napthalen-1-sulfonyl)-5-amino-1H-1,2,4-triazole from the Pub-chem compound library and tested for anti-cancer activity using Insilco Molecular docking Software, MZ-DOCK, an open-source docking tool. The best bound active HIT compounds were-Napthalen-2-yl-5-(5-pyrrolidin-1-ylmethyl-1H-[1,2,4] triazol-3-yl)-1H-indazole (-10.5) and (3-N-(4-chlorobenzyl) amino-1-(napthalen-1-sulfonyl)-5-amino-1H-1,2,4-triazole (-9.8). Gilteritinib, the anti-cancer reference drug, was used for validation and re-docking (-8.1). The parameters evaluated for dynamic simulations of 6JQR were the Mean pLDDT (84.887), Uniqueness (18.621). RMSD (0) for the rank 1 pose. The molecular dynamics study for the receptor yielded promising results. The comparable results have paved the way for further optimization and ADME studies. If developed as a lead compound, it can be tested and subsequently approved for clinical use as a treatment for cancer after *in vitro* testing and subsequent clinical trials.

## DEVELOPMENT OF SUSTAINABLE ULLMANN-TYPE C-N COUPLING METHODOLOGY USING GLYCEROL

Mr. Raveendra Hullolikar, Dr. Gopal Krishna Rao, and Dr. Ramesha A.R.
Goa College of Pharmacy, Panjim, Goa, India-403001
raveendralh@gmail.com

In the current research, a sustainable Ullmann-type C-N coupling methodology was developed for the synthesis of N-aryl anthranilic acid derivatives. The objective behind the research was to explore the reactivity of various aromatic primary amines with 2-chlorobenzoic acid and 2-bromobenzoic acid using an in-situ activated metallic copper catalytic system under ligand-free conditions in glycerol. The influence of parameters such as reaction temperature, base type, and substrate/base/catalyst molar ratio was studied to optimize the yield and selectivity of the desired products. Among the screened conditions, the optimal reaction was achieved at 140°C, using potassium carbonate as base and copper (II) sulfate pentahydrate (3 mol%) as the precursor for in-situ metallic copper generation. The methodology was successfully applied to a variety of electronically diverse aromatic amines, demonstrating good substrate scope and functional group tolerance. The use of glycerol as a reaction medium underscores the environmental and economic benefits of this methodology. Therefore, this novel sustainable approach toward C-N bond formation offers practical, cost-effective alternative to conventional Ullmann type couplings. Thus, it can be concluded that this study contributes significantly to eco-friendly synthetic strategies for pharmaceutically active molecules.

## BIOANALYTICAL ASSESSMENT OF BUDESONIDE FROM SUSTAINED-RELEASE AND PULSATILE FORMULATIONS USING LC-MS/MS

Ismail, V Saikishore
Bapatla College of Pharmacy, Bapala, Andhra Pradesh
ismailbeig74@gmail.com

Chronotherapeutics refers to a treatment strategy where *in vivo* drug availability is synchronized with the body's biological rhythms to optimize therapeutic outcomes and minimize side effects. This approach is grounded in the understanding that disease symptoms, pharmacologic responsiveness, and drug pharmacokinetics all follow a circadian pattern and are interrelated. The objective of this study was to compare the pharmacokinetic profiles of an optimized pulsatile formulation of Budesonide with an existing marketed sustained-release formulation. Two groups of white New Zealand rabbits (n = 6) were used in a crossover study design. Drug plasma levels were quantified using a validated LC-MS/MS method, and pharmacokinetic parameters were calculated for both formulations. Analysis of the plasma concentration-time curves revealed significant differences between the two formulations. The pulsatile capsule, developed in the laboratory, demonstrated a distinct lag phase before drug release, as intended. The mean residence time (MRT) of the pulsatile formulation was significantly longer (22.6 ± 0.11 hours) compared to that of the marketed sustained-release formulation (17.1 ± 0.09 hours). These findings support the potential of pulsatile drug delivery systems in chronopharmacotherapy, particularly when the timing of drug release is aligned with the circadian rhythm of the disease. Pulsatile delivery offers a promising avenue for achieving targeted, time-specific therapy.

**Keywords**: LC-MS/MS, Budesonide, Pulsatile Drug Delivery, *In-vivo* Studies, Pharmacokinetics, Chronotherapeutics

## QBD-BASED RP-HPLC METHOD DEVELOPMENT AND VALIDATION FOR THE SIMULTANEOUS ESTIMATION OF ANTIDIABETIC DRUGS IN BULK AND PHARMACEUTICAL DOSAGE FORMS

Ritu Sapra, Tamanaa Narsinghani
School of Pharmacy, Devi Ahilya Vishwavidyalaya, Indore, M.P.-4520001
ritu.mehndi@gmail.com

The present research work involves the development of a robust, accurate, precise and economical RP-HPLC method for the simultaneous determination of metformin hydrochloride and sitagliptin, employing a Quality by Design (QbD) strategy. Method optimization was carried out using Design of Experiments (DoE), with risk assessment through an Ishikawa diagram to identify critical method parameters (CMPs). A two factor, three level design was applied to screen influential factors, viz mobile phase composition and buffer pH, which were further modelled mathematically. The effect of these variables on critical analyte attributes (CAAs), namely symmetry factor, retention time and peak area were studies using Central Composite Design (CCD), which served ad indicators of method robustness. The response was optimised simultaneously using a desirability function. The final optimized chromatographic conditions consisted mobile phase of methanol and acetonitrile (70:30, v/v; and a flow rate of 0.5 mL/min and pH 3.5. Separation was achieved on a Thermo Scientific ODS HypersilTM column (250×4.6 mm), maintained at 35° Celsius with detection at 210 nm. Validation of developed method was conducted as per ICH guidelines. Hence gliptin derivatives along with metformin can be routinely analysed for quality control analysis of metformin and sitagliptin, alone or in combination in pharmaceutical dosage forms.

**DEVELOPMENT OF FORCED DEGRADATION STUDIES OF TOFACITINIB BY UV SPECTROPHOTOMETRY**

Premakumari K.B, Prashima Priyadarshni, Rachana Vijeta M, Rachita Naik, Raghav S Sarode
College of Pharmaceutical Sciences,
Dayananda Sagar University, Bangalore South.
prematenny@gmail.com

Tofacitinib Citrate which is offered under the brand name Xeljanz, is a prescription drug that treats moderate to severe cases of inflammatory disorders and rheumatic diseases. In this context, the objective of this work was to develop and validate an effective, stability indicating method by Spectrophotometry in the ultraviolet region for quantitative estimation of Tofacitinib Citrate tablets. Methanol is used a s diluent, quartz cuvette was used and measured at a wavelength of 289 nm. The method was found to be linear in the range of 4 to 24 µg/mL with a correlation coefficient of 0.99567 with detection and quantification limits of 1 and 4 µg/mL. Accuracy of the proposed method was ascertained by recovery studies and the results were expressed as percentage recovery and found in the range of 99.55% - 100.75%. Standard deviation and %RSD for inter day and intraday precision studies was found to be less than 2%. In compliance with ICH recommendations, the drug ingredient was subjected to extreme circumstances, such as acid hydrolysis, base hydrolysis, oxidative degradation, thermal stress, and photolytic degradation and it showed that the proposed method is able to assess the susceptibility of Tofacitinib Citrate. The findings support the use of UV spectrophotometry as a reliable method for early-stage stability assessment, while also emphasizing the importance of complementary techniques like HPLC for detailed impurity profiling and regulatory compliance.

**Keywords**: UV spectrophotometry, analysis, degradation, stress, acid hydrolysis, base hydrolysis, Oxidative Hydrolysis, photolytic degradation, thermal degradation.

**QBD-ENABLED, DOE-OPTIMIZED, AND GREENNESS-ASSESSED RP-HPLC METHOD FOR QUANTITATIVE ESTIMATION OF EMPAGLIFLOZIN: A ROBUST AND SUSTAINABLE ANALYTICAL APPROACH**

M. S. Palled, Shailendra S. Suryawanshi
Department of Pharmaceutical Analysis, KLE College of Pharmacy, Belagavi, KLE Academy of Higher Education and Research, Belagavi
mspalled@klepharm.edu

Empagliflozin, a sodium-glucose co-transporter 2 (SGLT2) inhibitor, requires accurate and reproducible quantification in bulk and dosage forms to ensure safety and efficacy. Traditional methods often lack robustness and sustainability. Thus, a QbD-driven strategy with DoE optimization and greenness evaluation was employed to develop a reliable and eco-friendly RP-HPLC method. To design and validate a simple, rapid, precise, and environmentally sustainable RP-HPLC method for Empagliflozin using Quality by Design (QbD) principles, Design of Experiments (DoE), and greenness metrics. Chromatographic separation was performed on an Agilent 1220 HPLC system with ChemStation software using a C18 column. The mobile phase comprised methanol and water (70:30 v/v), with a flow rate of 1.0 ml/min, injection volume of 10 µL, and detection at 233 nm. The retention time was 4.0 min. A Box–Behnken design (BBD) with three factors at three levels was employed to optimize method parameters. ANOVA, diagnostic plots, and model graphs were used to evaluate factor influence. Method validation was carried out as per ICH Q2(R1) guidelines. Greenness was assessed using the Analytical Eco-Scale and AGREE metric tools. The method demonstrated excellent system suitability with %RSD values <2%. It was found to be specific and selective, with no interference at the retention time of Empagliflozin. The method was linear over 5–25 µg/ml with $r^2$ = 0.9991, LOD = 1.18 µg/ml, and LOQ = 3.57 µg/ml. Precision studies showed %RSD <2% for both intra- and interday variations. Accuracy was confirmed with recoveries between 98.80–101.05%. Ruggedness and robustness tests indicated stability under small deliberate changes. Greenness evaluation confirmed the method's eco-friendly nature. A QbD-based, DoE-optimized, and greenness-assessed RP-HPLC method was successfully developed and validated for Empagliflozin. The method is simple, precise, robust, cost-effective, and eco-friendly, making it highly suitable for routine quality control of pharmaceutical formulations.

**Keywords:** Empagliflozin, RP-HPLC, Quality by Design (QbD), Design of Experiments (DoE), Green analytical chemistry.

**GREEN PHARMACY: ADVANCING SUSTAINABLE DRUG DESIGN AND ECO-FRIENDLY FORMULATIONS FOR A GREENER FUTURE**

Soni Raj, Vineela Haasiny
Department of Pharmacy Practice,
Annamacharya college of pharmacy (Autonomous), Rajampeta,
AP, India -516126.
soniraj3213@gmail.com

Green pharmacy incorporates various sustainability aspects throughout the pharmaceutical lifecycle, including drug discovery and disposal, with a goal to reduce environmental pollution as well as maintain therapeutic efficacy and patient safety. Materialized through the 12 principles of green chemistry, this approach focuses on the use of safer chemical syntheses, energy-efficient reactions, renewable feedstocks, coupling with the design of molecules that are biodegradable by nature. The most preferred options are the implementation of green synthesis methods like biocatalysis and continuous flow chemistry, supporting the replacement of toxic solvents with greener alternatives such as water, ethanol, and supercritical $CO_2$, and the synthesis of formulations using biodegradable excipients and natural polymers to effectively cut down on environmental persistence. Green pharmacy also supports eco-friendly packaging, waste reduction, and efforts to improve wastewater treatment to minimize pharmaceutical residues in ecosystems. Some of the breakthrough achievements include enzyme-catalyzed API syntheses that have reduced process mass intensity considerably as well as the use of fusion-based methods to get rid of solvent waste in formulation development. Moreover, it is worth noting that these initiatives are fraught with difficulties such as the high cost of implementation, the lack of global standardization, and issues regarding scalability; nevertheless, green pharmacy has a lot of potential to positively turn around the pharmaceutical industry toward sustainability. Enhancing the credibility of regulatory frameworks, involving more than one disciplinary area in the research project, and utilizing life cycle assessment (LCA) together with predictive modeling tools will be among the most important means of speeding up the adoption period. This approach will be consistent with worldwide programs aimed at achieving the right equilibrium among innovation, patient access, and environmental stewardship which will eventually result in the development of a cleaner and greener drug and healthcare system by the way of responsible drug development and healthcare system.

**DISCOVERY OF NOVEL APOPTOSIS-INDUCING SMALL MOLECULES FOR BREAST CANCER THERAPY: A COMPUTATIONAL AND *IN VITRO* APPROACH**

Piyush Kumar
JSS College Of Pharmacy, Najwal, Vijaypur. Samba
bharbeypiyush@gmail.com

Breast cancer is one of the leading causes of cancer-related mortality globally. Recent advances in targeted therapies have focused on selectively inhibiting signalling pathways that are vital for cancer cell survival and proliferation. Identifying novel small molecules with such inhibitory capabilities remains a critical step toward more effective treatments. A computational approach was utilized to design and identify small molecule inhibitors targeting key signalling pathways implicated in breast cancer progression. Virtual screening and molecular docking analyses were conducted to identify potential lead compounds. The selected compounds were further evaluated *in vitro* using MCF7 breast cancer cells to determine cytotoxicity (via IC50) and to assess apoptotic effects. ADMET profiling was performed to predict pharmacokinetic properties. Two lead compounds, C12 and C18, demonstrated strong binding affinities to serine-threonine protein kinase and MAP3K5, both of which are critical regulators of apoptosis. *In*

ISBN: 978-81-980623-8-3

*vitro* studies revealed significant cytotoxic effects, with IC50 values of 22.49 ± 1.01 µg/ml for C12 and 14.61 ± 0.01 µg/ml for C18. Microscopic and biochemical analyses showed hallmark features of apoptosis, including nuclear condensation, DNA fragmentation, and mitochondrial membrane potential loss. ADMET predictions indicated favourable pharmacokinetic profiles for both compounds. The identified compounds C12 and C18 exhibit potent cytotoxic and pro-apoptotic activity in breast cancer cells, suggesting their promise as novel therapeutic agents. Further *in vivo* studies are warranted to validate their efficacy and safety. Top of Form

The emergence of antibiotic-resistant bacteria necessitates the development of novel antibacterial agents. This study reports the design, synthesis, and evaluation of thiazolidinedione derivatives as potential antibacterial compounds. Using in-silico approaches, including virtual library creation, toxicity prediction, and molecular docking, we identified promising candidates. Ten thiazolidinedione derivatives were synthesized and characterized, and their antibacterial activity was evaluated against S. aureus tyrosyl-tRNA synthetase. Notably, compound N6 exhibited potent antibacterial activity, ensuring further investigation. Our findings suggest that thiazolidinedione derivatives hold promise as antibacterial agents, and future studies will focus on optimizing their efficacy and safety.

**Keywords:** Thiazolidinedione Derivatives, antibacterial agents, Staphylococcus aureus tyrosyl-tRNA synthetase, molecular docking

## FORCED DEGRADATION STUDIES AND CHARACTERIZATION OF DEGRADATION PRODUCTS OF ATORVASTATIN CALCIUM

Megha Kharat[1], Abu Safwan Shaikh[2], Anwer Shaikh[1],
Department of Pharmaceutical Sciences,
Dr.P.A.Inamdar University Camp, Pune-411040, Maharashtra, India
meghakharat001@gmail.com

This work presents a comprehensive investigation into the degradation behavior, kinetics, and structural elucidation of Atorvastatin Calcium under various forced stress conditions, utilizing a Quality by Design (QbD) framework and advanced analytical methodologies. The study begins with an overview of the clinical significance of hypercholesterolemia and the pharmacological profile of atorvastatin, emphasizing the necessity for robust stability-indicating methods in pharmaceutical development. Extensive literature review and rational experimental planning set the foundation for solution preparation and controlled exposure of the API to acidic, alkaline, oxidative, thermal, and photolytic environments. Analytical techniques such as UV-Visible spectrophotometry, HPLC, FT-IR, NMR, and mass spectrometry were employed for kinetic analysis and detailed characterization of degradation products. Statistical evaluation using Design of Experiments (DoE) enabled optimization of experimental factors and provided insight into the significant parameters influencing degradation. Results demonstrate that atorvastatin is most susceptible to hydrolytic and thermal stress, and novel degradation products were successfully identified and characterized. The findings affirm the importance of controlled formulation, storage conditions, and validated analytical protocols, contributing a methodological framework for regulatory compliance and the assurance of drug safety and efficacy in the pharmaceutical sciences

## *IN SILICO* DESIGN AND MOLECULAR DOCKING STUDIES OF NOVEL SUBSTITUTED PYRAZOLE DERIVATIVES AS POTENT INHIBITORS OF MYCOBACTERIAL MEMBRANE PROTEIN LARGE 3 (MMPL3)

Mayuri D. Desai, Dr. Anuruddha R. Chabukswar
Department of Pharmaceutical Sciences,
MIT-World Peace University, Pune, India

The long-term worldwide burden of Tuberculosis (TB), seriously aggravated by the spread of multi-drug resistant (MDR) and extensively drug-resistant (XDR) strains, highlights a pressing unmet need for new chemotherapeutic agents with novel mechanisms of action. Mycobacterial membrane protein Large 3 (MmpL3), an essential transporter that provides for mycolic acid shuttling in Mycobacterium tuberculosis cell wall biosynthesis, has been established as a high-priority, druggable target for next-generation anti-TB therapy. This computational research strives to rationally design and virtually screen a targeted library of new substituted pyrazole derivatives for their potential to inhibit MmpL3. A set of 38 structurally diverse pyrazole-derived molecules were designed, and the molecular interaction was profiled through exhaustive docking simulations against two high-resolution crystal structures of MmpL3 (PDB IDs: 6AJI and 7WNX) employing the Glide module of the Schrodinger Suite. The docking protocol was confirmed by re-docking the native co-crystallized ligands, validating the accuracy of the predicted binding poses and energies. The virtual screen produced several high-affinity hits, with numerous compounds showing better docking scores than the reference ligands. Importantly, lead compound MD36 showed outstanding binding affinity, with scores of -12.8 kcal/mol for 6AJI and -11.7 kcal/mol for 7WNX. A close examination of the binding conformation of MD36 showed a web of beneficial interactions, such as hydrophobic contacts with Ile253 and Leu642 residues, and a key hydrogen bond with Asp645, which resembles interactions that are identified as pivotal for MmpL3 inhibition. These *in silico* outcomes firmly indicate that the rationally designed pyrazole framework, especially the lead compound MD36, is capable of establishing stable and high-affinity complexes with the MmpL3 transporter and inhibiting its activity. This work not only discovers promising pre-clinical candidates but also presents a sound structural rationale for their selection for synthesis and subsequent *in vitro* and *in vivo* pharmacological testing as an important step towards the development of a novel class of anti-tubercular agents to combat drug resistance.

**Keywords:** Tuberculosis, MmpL3 Inhibitors, Pyrazole Derivatives, Molecular Docking, *In Silico* Screening, Structure-Based Drug Design, Anti-Tubercular Agents.

## MOLECULAR DOCKING-GUIDED CYTOTOXIC AND ANTI-TUMOR EVALUATION OF TETRASTIGMA SERRULATUM EXTRACT

Rajamma A J, Sateesha S B, Durgashree M D
KLE College of Pharmacy, Bengaluru
shivaskandaganesha1999@gmail.com

Cancer remains one of the leading causes of morbidity and mortality worldwide, necessitating the search for novel therapeutic agents from natural sources. Tetrastigma serrulatum (Roxb.) Planch., a traditionally valued medicinal plant, was investigated for its anticancer potential through integrated *in silico*, *in vitro*, and *in vivo* approaches. Network pharmacology analysis identified eight phytocompounds targeting multiple oncogenic proteins, with significant enrichment in the PI3K-Akt signaling pathway (15 genes; $p = 2.94 \times 10^{-9}$), involving MAPK1, PIK3R2, NFKB1, PDGFRA, and MTOR. Molecular docking studies revealed that the co-crystal ligand with PIK3CB/PIK3R2 exhibited the lowest binding energy (−9.1 kcal/mol), while kaempferol-3-rutinoside (−8.8 kcal/mol) and rutin (−8.3 kcal/mol) showed comparable strong affinities, suggesting their potential to modulate PI3K-Akt–mediated tumorigenesis. *In vitro* cytotoxicity evaluation on HeLa cell lines demonstrated an $IC_{50}$ value of 77.98 µg/mL, confirming dose-dependent antiproliferative activity. Further validation in a Dalton's Lymphoma Ascites (DLA) solid tumor model revealed that oral administration of T. serrulatum extract significantly reduced tumor volume and showed favorable histopathological outcomes with reduced proliferation in tumor tissues at higher doses. Collectively, the integration of computational, cellular, and animal studies underscores T. serrulatum as

ISBN: 978-81-980623-8-3

a promising source of natural anticancer compounds. These findings provide a strong rationale for further purification, isolation, and characterization of its bioactive phytoconstituents for potential development in oncology.

**CHALLENGES AND LIMITATIONS OF SOLVENT SELECTION IN RP-HPLC USING ARTIFICIAL INTELLIGENCE**

K.Gowsalya
Department of pharmaceutical chemistry,
Dr.M.G.R University, Tamil Nadu, India.
k.gowsalya31102004@gmail.com

In reverse-phase high-performance liquid chromatography (RP-HPLC), it is necessary to choose the right mobile phase for optimal separation. With general solvents such as methanol, acetonitrile, water, and buffers, artificial intelligence (AI) has been under investigation in recent times to predict solvent composition. Assessing the disadvantage and limitations of AI-enabled solvent choice for RP-HPLC was the objective of this research. AI-predicts solvent mixtures with experimentally modified mobile phases were tested with standard analytes. Chromatographic properties such as resolution, peak symmetry, retention time, and selectivity were quantified. The results indicated that although AI models worked very well for analytes with similar training datasets, their ability to generalize to new substances was poor. Predictive accuracy was compromised due to poor validation and erroneous data, and some of the solvent ratios recommended by AI proved empirically unsuitable. In addition, AI models did not successfully model sophisticated analyte–solvent interactions, underscoring the crucial nature of experimental verification supported predictions, notwithstanding these drawbacks AI supported predictions promised to ease method design trial-and-error. Finally, the research concludes that AI may assist the solvent selection in RP-HPLC, and it is limited by a lack of generalization and the inability of AI to capture the analyte-solvent interactions. In the future, the researchers may focus on an accurate database, and robust method validation with expertise knowledge into AI can produce sustainable, effective, and accurate results.

**Keywords:** Artificial intelligence, solvent, RP-HPLC, accuracy.

**ESTIMATION OF MONOSODIUM GLUTAMATE IN FOOD SAMPLES BY VISIBLE SPECTROPHOTOMETRY**

Shyni Bernard. Alfia S, Grace Baby George, Tom Alex
College of Pharmaceutical Sciences,
Govt. Medical College, Kottayam, Kerala. India - 686008
shynibernard@gmail.com

In the current research, a rapid visible spectrophotometric method for the quantitative estimation of monosodium glutamate (MSG) was developed. The objective behind the research was to s to find out a simple and rapid chromogenic method for determining MSG in food samples, without complicated sample pre-treatment or advanced instruments. Monosodium Glutamate (MSG) is an ingredient used to make food taste more delicious. Because of many reports regarding the adverse effects due to excessive use of MSG, the United States Food and Drug Administration (USFDA) and World Health Organization (WHO) set maximum recommended intake of MSG is 120 mg / kg body weight/day as a standard. Excessive use of MSG may trigger allergic reactions such as itching, nausea, vomiting, headache, dizziness, migraine and long-term health issues such as hypertension,cancer, spermatogenesis disorders, Parkinsonism and stroke. The developed method depends on the reaction between MSG and ninhydrin solution to form a purple. The addition of MSG to ninhydrin causes the reaction of the free α-amino acids present in MSG, glutamic acid to form a purple-coloured complex which shows an absorption maximum at 567 nm. The reaction conditions including reagent concentration, pH, and time were optimized. The method was validated according to the ICH guidelines. The method determined MSG within the linearity range of 20—100 µg with a correlation coefficient (r) of 0.99908 and a calculated the limit of detection of 10 µg. The developed method was successfully applied for the determination of MSG in various brands food taste makers (instant noodles taste makers, soup taste makers and ketchups) available in the market.

**NARINGENIN–METAL COMPLEX AS A POTENTIAL THERAPEUTIC CANDIDATE FOR ALZHEIMER'S DISEASE: INSIGHTS FROM MOLECULAR DOCKING, ADME STUDIES, AND NETWORK PHARMACOLOGY**

Pavan G, Suman Basak, Anjali Nayak, Paramita Das
Department of Pharmaceutical Chemistry,
Krupanidhi College of Pharmacy off Sarjapur road varthur hobli
Bengaluru-560035
pavangouda683@gmail.com

In this study, we aimed to evaluate the potential effectiveness of the naringenin–metal complex in the treatment of Alzheimer's disease. For this purpose, we employed the SH-SY5Y cell line, a widely used human-derived neuroblastoma cell model that exhibits neuronal properties and serves as a reliable *in vitro* system for studying neurodegenerative disorders. The target protein selected for this investigation was acetylcholinesterase (AChE), a key enzyme involved in the breakdown of acetylcholine and strongly associated with the progression of Alzheimer's disease. Molecular docking studies revealed that the naringenin–metal complex demonstrated a significant binding affinity toward AChE, with a docking score of –11.1 kcal/mol. To further validate its therapeutic potential, ADME (Absorption, Distribution, Metabolism, and Excretion) studies were performed, which indicated favorable pharmacokinetic properties, including good oral bioavailability, acceptable lipophilicity, and compliance with Lipinski's rule of five, suggesting drug-likeness of the complex. Additionally, network pharmacology analysis was conducted to identify possible molecular targets and signaling pathways regulated by naringenin–metal complexes. This approach revealed their interaction with multiple Alzheimer's-related pathways, including cholinergic signaling, oxidative stress modulation, and neuroinflammatory processes, thereby supporting a multitarget therapeutic mechanism. Collectively, these findings highlight that the naringenin–metal complex not only exhibits strong inhibitory potential against acetylcholinesterase but also possesses desirable pharmacokinetic attributes and multi-pathway interactions, positioning it as a promising therapeutic candidate for mitigating Alzheimer's disease pathology.

**Keywords:** Naringenin–metal complex; Alzheimer's disease; acetylcholinesterase inhibition; SH-SY5Y cell line; molecular docking; ADME studies; network pharmacology; neurodegeneration.

deeksha.s.gowda.100@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder marked by memory loss and cognitive decline, often associated with amyloid-β accumulation. Flavonoids such as Naringenin possess neuroprotective effects; however, their therapeutic application is limited by poor bioavailability. Complexation with metals such as zinc, iron, and copper, which themselves exhibit neuroprotective potential, can enhance bioactivity. Furthermore, nanoparticle-based encapsulation improves targeted delivery and brain penetration. This study aimed to investigate Naringenin–metal complexes through *in silico* and *in vivo* approaches as potential anti-Alzheimer candidates. Molecular property prediction was carried out using MolSoft, while toxicity was assessed via ProTox III. Molecular docking of Naringenin–metal complexes with acetylcholinesterase (AChE, PDB ID: 1EVE) was performed using PyRx. Complexes were synthesized and characterized by FT-IR, ^1H NMR, and mass spectrometry. ZnO-loaded Naringenin–iron complex nanoparticles were further prepared and analyzed for particle size, zeta potential, SEM, XRD, drug entrapment, dissolution, release, and solubility studies. Anti-Alzheimer activity was evaluated *in vitro* and *in vivo* against AChE. Docking studies revealed strong binding energy of –11.1 kcal/mol with AChE, with only minor Lipinski and Veber rule violations and no observed toxicity. The ZnO-loaded nanoparticles demonstrated 95.5% drug entrapment, particle size of 81.4 nm, and 89.7% sustained release over

ISBN: 978-81-980623-8-3

4 hours. Solubility and bioavailability were significantly enhanced compared to metal complexes alone. *In vitro* and *in vivo* studies confirmed superior anti-Alzheimer activity of the nanoparticle formulation. In conclusion, Naringenin–iron complexes encapsulated in ZnO nanoparticles demonstrate promising therapeutic potential for AD treatment.

**NOVEL ANALYTICAL METHOD DEVELOPMENT AND VALIDATION OF DAPAGLIFLOZIN IN BULK AND PHARMACEUTICAL DOSAGE FORM**

Kavana D C[1], Naveen Kumar G S[2], T Balasubramanian[3].
Department of Pharmaceutical Analysis, Bharathi College of Pharmacy, Bharathinagara, Mandya, Karnataka, India -571422.
kavanadc21@gmail.com

This study describes the development and validation of simple and reliable methods for estimating Dapagliflozin in bulk and pharmaceutical dosage forms: zero-order UV spectroscopy, area under curve (AUC) spectroscopy, and reverse-phase high-performance liquid chromatography (RP-HPLC). In both UV-based methods, Dapagliflozin showed maximum absorbance at 224 nm using a 70:30 mixture of acetonitrile and ethanol as the solvent. The zero-order method showed good linearity from 3–18 µg/mL with $R^2$ = 0.998, recovery of 99.51% to 101.3%, LOD = 0.098 µg/mL, and LOQ = 0.298 µg/mL. The AUC method, measured over 219–229 nm, gave slightly better sensitivity with $R^2$ = 0.999, LOD = 0.070 µg/mL, and LOQ = 0.214 µg/mL Recovery was between 98.1% and 100.0%. Both methods showed good precision with %RSD < 2%. The RP-HPLC method used a Shimpack C-18 column and a mobile phase of methanol and 0.1% orthophosphoric acid in water (80:20, pH 4.5), at a flow rate of 1.0 mL/min. Detection was done at 224 nm, and the drug was eluted at 3.935 minutes. This method showed LOD = 1.279 µg/mL, LOQ = 3.877 µg/mL, and recovery between 99.93% and 100.29%, with system suitability parameters within acceptable limits. All methods were validated according to ICH guidelines, confirming their accuracy, precision, linearity, sensitivity, robustness, and suitability for routine quality control of Dapagliflozin in bulk and dosage forms.

**Keywords:** Dapagliflozin; UV Spectroscopy; AUC Method; RP-HPLC; Method Validation; ICH Guidelines.

chandraprakash.bayya@gmail.com

We reported design, synthesis, and evaluation of a new series of 6,7-disubstituted-7H-purine derivatives (10a–u) as dual EGFR/HER2 inhibitors. Twenty-one compounds were synthesized via efficient strategies and screened *in vitro* against a kinase panel comprising EGFR family members, VEGFR, PDGFRα, and PDGFRβ. Five derivatives (10d, 10e, 10i, 10m, and 10r) exhibited potent activity, with compound 10r showing the strongest dual inhibition of EGFR and HER2 ($IC_{50}$ = 0.017 ± 0.003 µM and 0.014 ± 0.002 µM, respectively). Cytotoxicity assays demonstrated that 10i and 10r significantly suppressed proliferation in a range of breast cancer cell lines, excluding MCF-7, and retained efficacy in lapatinib-resistant BT-474/L and SKBR-3/L cells ($IC_{50}$ = 1.682–2.236 µM). Apoptosis studies revealed that 10r induced accelerated cell death and downregulated EGFR/HER2 along with downstream ERK1/2 and AKT signalling. Docking studies confirmed strong binding of 10r to EGFR and HER2 through hydrogen bonding and π–π interactions. These findings highlight the 6,7-disubstituted purine scaffold as a promising framework for developing potent dual EGFR/HER2 inhibitors capable of overcoming lapatinib resistance.

**Keywords:** EGFR, HER2, 6 7-disubstituted-7H-purines, Breast cancer, Lapatinib Etc.

gkethine@student.gitam.edu

Frovatriptan Succinate (CAS 158930-17-7) is used for the treatment of acute migraine headaches in adults,in particular those associated with menstruation. Frovatriptan causes vasoconstriction of arteries and veins that supply blood to the head. Frovatriptan Succinate is chemically, butanedioic acid;(6R)-6-(methylamino)-6,7,8,9-tetrahydro-5H-carbazole-3-carboxamide with molecular formula C14H17N3O and molecular weight 269.345 grams/mole. Frovatriptan is a 5-HT receptor agonist that binds with high affinity for 5-HT1B and 5-HT1D receptors. Frovatriptan has no significant effects on GABAA mediated channel activity and has no significant affinity for benzodiazepine binding sites. A new spectrophotometric method has been developed for the estimation of Frovatriptan Succinate in pharmaceutical dosage forms (Tablets). Double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the present study (200-400 nm). Frovatriptan Succinate has shown absorption maxima (λmax) at 244.50 nm in borate buffer (9 pH) and Beer-Lambert's law was obeyed over the concentration range 0.1-10 µg/ml with linear regression equation, y = 0.1759x + 0.0132 ($R^2$ = 0.9996). The method was validated as per ICH guidelines and found to be simple, precise and accurate and can be applied successfully for the assay of for the Frovatriptan Succinate pharmaceutical formulations.

**Keywords:** Frovatriptan Succinate, spectrophotometry, ICH Guidelines.

**NOVEL UHPLC-HRMS/MS METHOD FOR ULTRA-SENSITIVE DETECTION OF OCTREOTIDE IMPURITIES**

Mounica Peela[1], Chiranjeevi Ponnam[2], G S V Girish kumar Gandi[3].
Vignan Institute of Pharmaceutical Technology (A), Duvvada,
Visakhapatnam, Andhra Pradesh, 500049, India.
srimoulica993@gmail.com

Octreotide, a synthetic somatostatin analogue, requires stringent impurity profiling to ensure safety and efficacy. A high-resolution UHPLC-HRMS/MS method was developed and validated for the qualitative and quantitative analysis of peptide-related impurities at or above 0.10 % of the drug substance. Chromatography was performed using a trifluoroacetic acid–acetonitrile–water system compatible with mass spectrometry. Qualitative analysis employed ESI+ scanning from m/z 100–1500, while quantitative analysis used ESI+ scanning from m/z 200–1500 at 70,000 resolutions with optimized gas and voltage parameters. Following U.S. FDA guidance, impurity profiles were compared across six reference-listed drug (RLD) batches of three strengths (sampled from 27 months prior to expiry through end-of-shelf-life) and nine ANDA exhibit batches of the proposed generic product (tested at release and again 4–9 months before expiry). Results demonstrated that the generic product's impurity profile closely matched the RLD, with no new peptide-related impurities ≥0.10 % detected. A combined peak at relative retention time (RRT) 1.31 contained [Des-Threoninol]-Octreotide and an unknown impurity of molecular weight 1076.4 Da; the latter was the major component, while [Des-Threoninol]-Octreotide remained below the 0.05 % disregard limit. Because these cannot be chromatographically resolved, they are jointly controlled at a 0.5 % limit. Additionally, six other unknown impurities ≥0.10 % were fully characterized by UHPLC-HRMS/MS or reference standards. This study confirms that the proposed generic octreotide product exhibits an impurity profile equivalent to the RLD and meets regulatory expectations for safety and quality.

**Keywords:** Octreotide, UHPLC-HRMS/MS, Reference listed drug, Impurities, and USFDA Guidelines.

monikaraut3121@gmail.com

ISBN: 978-81-980623-8-3

Lopinavir (LPV) is a potent HIV protease inhibitor (PI) drug suffering from drawback of low bioavailability of drug and hence the present work describes the increase in the bioavailability by using natural bio enhancers like Gallic acid and quercetin. Bio enhancers were dosed at different concentrations (50,100,120 mg/kg) along with the drug (10 mg/kg) and bioavailability is assessed at respective time interval of 1,2,4,6 and 24 hrs. After dosing. A reverse phase HPLC method using QbD approach was developed for the investigation of Lopinavir in rat plasma using internal standard method after oral administration of drug. The method was successfully applied for the pharmacokinetic study in rat. LOPINAVIR and its co-administration with bio enhancer's concentration in blood plasma (Cmax) were found to be 2.54, 3.526.12, 7.25, 8.01, 8.12, 12.01 in the following increasing order LPV, LPV+B2 50, LPV+B2 100, LPV+B1 50, LPV+B2 100, LPV+B2 120, LPV+B1 120 respectively. T1/2 was achieved 2 hours earlier than the plain LPV i.e. at 4 hours.

**Keywords:** Lopinavir, Bioavailability, Bio enhancer, Bioanalytical, Analytical QbD, Box-Behnken

**ROLE OF ANALYTICAL TECHNIQUES AND AI TOOLS FOR STUDY OF CROSSLINKING IN GELATIN CAPSULE SHELLS**

Bhakti Patil[1], Apoorva Biradar[1], Sakshi Jain[1], Abhijeet Sutar[1]
Department of Pharmaceutical Sciences,
Dr. Vishwanath Karad MIT World Peace University, Pune
patilbhakti2503@gmail.com

Gelatin capsules are widely used in oral drug delivery, but their stability is often compromised by crosslinking of the gelatin shell. Crosslinking, triggered by aldehydes, peroxides, or environmental factors, can reduce disintegration and dissolution, thereby affecting therapeutic efficacy. Understanding and monitoring this process is essential for ensuring capsule performance and regulatory compliance. Advanced analytical techniques such as NIR, FT-IR and fluorescence spectroscopy provide detailed insights into the structural and physicochemical changes occurring in gelatin matrices. Complementary dissolution studies further highlight the functional impact of crosslinking. Recently, artificial intelligence (AI) and machine learning have emerged as powerful tools to analyse complex datasets, identify hidden trends, and predict crosslinking kinetics with greater accuracy. Integration of analytical methods with AI-driven interpretation offers a robust approach to improve mechanistic understanding, support quality-by-design strategies, and ensure consistent performance of gelatin capsule shells.

**Keywords:** Gelatin capsules, crosslinking, analytical techniques, AI.

**DEVELOPMENT OF FORCE DEGRADATION PROFILE OF ATENOLOL AND CHLORTHALIDONE IN COMBINE TABLET DOSAGE FORM BY (RP-HPLC)**

Vaishnavi. G. Sitre
P. R. Pote Patil college of Pharmacy Amaravati (MH)
vgsitre0102@gmail.com

Atenolol (ATN) and Chlorthalidone (CTN) are widely prescribed in combination for the management of hypertension. The present study focuses on the development of a force degradation profile for ATN and CTN in a combined tablet dosage form using Reverse Phase High Performance Liquid Chromatography (RP-HPLC). Forced degradation studies were conducted under various stress conditions including acidic, basic, oxidative, thermal, and photolytic environments to evaluate the stability-indicating capability of the method. Chromatographic separation was achieved using a Comosil RP-C18 column (4.6 × 250 mm, 5 µm) under gradient elution with a mobile phase comprising methanol and water (pH adjusted to 3.0 using ortho-phosphoric acid). The flow rate was maintained at 1.0 mL/min and detection was carried out at 226 nm. The retention times for ATN and CTN were found to be 2.2 min and 3.36 min respectively. The method demonstrated excellent linearity over the concentration ranges of 40–200 µg/mL for ATN and 10–50 µg/mL for CTN, with correlation coefficients ($r^2$) of 0.999 for both drugs. System suitability parameters including %RSD, resolution, and theoretical plates were within acceptable limits. The developed RP-HPLC method was validated as per ICH guidelines and proved to be robust, precise, and specific for the simultaneous estimation of ATN and CTN in the presence of degradation products. This study confirms the applicability of the method for routine quality control and stability testing of combined dosage forms.

**Keywords**: Atenolol, Chlorthalidone, RP-HPLC, Forced degradation, Stability-indicating method, Method validation, Combined tablet dosage form

**RP-HPLC METHOD DEVELOPMENT AND VALIDATION OF GALLIC ACID IN POLYHERBAL TABLET FORMULATION**

K. Kalyan Chakravarth, K. Venkata Ramana,
A.S.N Pharmacy College Tenali
kalyansayz@gmail.com

A new simple, accurate, precise, sensitive and validated RP-HPLC method was developed for the estimation of Gallic acid in bulk and pharmaceutical tablet dosage form. The chromatographic conditions used for the separation was Phenomenex Luna C18 (2) (4.6 x 250mm, 5µ), rheodyne manual injector with capacity of 20µL and mobile phase comprised of Water: Acetonitrile (80: 20%v/v) and pH is maintained at 3.00 using Ophosphoric acid (OPA). The flow rate was 1.0mL/min with detection at 272nm. The retention time was found to be 3.60min. The linearity was found to be in the range of 0.5-50µg/mL for Gallic acid with correlation coefficient of 0.9994. The proposed method is accurate with 99.97% - 100.58 % recovery and precise (%RSD of repeatability, intra-day and inter-day variations were 1.26%, 0.48-0.95%, 0.80-1.83%). The Limit of Detection (LOD) and Limit of Quantification (LOQ) were found to be 0.0178µg/mL and 0.0539µg/mL respectively. The amount of Gallic acid in Polyherbal tablet was found to be 1.63%.

**DEVELOP AND VALIDATE THE STABILITY INDICATING RP-HPLC METHOD FOR THE ESTIMATION IN BULK AND CAPSULE DOSAGE FORM OF ITRACONAZOLE BY QBD APPROACH**

Diksha Vibhute, Anant Deshpande, Ram Sakhare
Department of Pharmaceutical Sciences,
Swami Ramanand Marathwada University, Nanded, Maharashtra, India
dikshavibhute059@gmail.com

Quality by Design is the modern approach for quality of pharmaceuticals. The aim of the pharmaceutical development is to design a quality product and its manufacturing process to consistently deliver the intended performance of the product. Quality cannot be tested into products, but quality should be built in by design. A simple, Accurate, precise method was developed and validate a stability indicating reverse phase-high performance liquid chromatography (RP-HPLC) method for the determination of Itraconazole in bulk and pharmaceutical dosage form using QbD approach. Chromatogram was run through Kromosil 150 x 4.6 mm, 5. Mobile phase containing KH2PO4: Acetonitrile taken in the ratio 60 (%v/v) and 40 was pumped through column at a flow rate of 0.924 ml/min. Temperature was maintained at 32.9°C. Optimized wavelength selected was 260nm. Retention time of Itraconazole was found to be 2.467 min. %RSD of the Itraconazole was found to be 0.5. % Recovery was obtained as 99.84% for Itraconazole. LOD, LOQ values obtained from regression equations of Itraconazole were 0.08, 0.24. Regression equation of Itraconazole is y = 41250x + 2844. Retention times were decreased, and that run time was decreased, so the method developed was simple and economical that can be adopted in regular Quality control test in Industries.

Tuberculosis (TB) remains a major global health concern, primarily affecting the lungs and caused by the bacterium Mycobacterium tuberculosis (MTB). As of 2024, TB's high prevalence, contagiousness, and frequent co-infection with other diseases continue to make it a formidable challenge to cure. Despite extensive international initiatives, the emergence of drug-resistant (DR-TB) and multidrug-resistant TB (MDR-TB) has significantly contributed to rising mortality rates. According to the World Health Organization's Global TB Report 2022,

ISBN: 978-81-980623-8-3

millions of people continue to be affected, underscoring the urgent need for novel therapeutic strategies. A critical obstacle is the shortage of effective drugs to combat resistant strains. To address this, recent research has focused on the synthesis of sulphonamide scaffolds and their evaluation for anti-tubercular activity, utilizing advanced synthetic and analytical methodologies. Structural modifications targeted three primary regions: the sulfonyl group and the nitrogen atoms at positions N1 and N4. Drug-likeness was assessed using Lipinski's rule of five, while pharmacokinetic and toxicity profiles were evaluated through ADMET screening. Notably, recent studies have demonstrated the successful and eco-friendly synthesis of sulphonamide derivatives. Their structures were confirmed using analytical techniques such as IR, 1H NMR, and mass spectrometry. Biological evaluation revealed that while several synthesized compounds exhibited excellent anti-tubercular activity, others showed moderate efficacy. On-going research aims to develop novel sulphonamide compounds with improved therapeutic profiles, ultimately contributing to enhanced healthcare and improved quality of life.

**Keywords:** Tuberculosis, Sulphonamides, Anti-tubercular agents, Drug-resistant TB

## NEW UV-SPECTROPHOTOMETRIC METHOD FOR THE ESTIMATION OF BRIMONIDINE EYE DROPS

Leela Vinootna and Mukthinuthalapati Mathrusri Annapurna, Narendra Angirekula
GITAM School of Pharmacy, GITAM (Deemed to be University), Visakhapatnam- 530045.
lyerukol@student.gitam.edu

A new spectrophotometric method has been developed for the estimation of Brimonidine tartrate in pharmaceutical dosage forms (Eye drops). Brimonidine tartrate is a selective alpha-2 adrenergic receptor. Brimonidine is an that acts by the activation of. This inhibits the activity of. The α2 agonist results in vasoconstriction of blood vessels and vasoconstriction reduces the aqueous humour flow. Brimonidine is used to treat or. Brimonidine is indicated for the lowering of in patients with open-angle glaucoma or ocular hypertension. Double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the present study. Brimonidine tartrate has shown absorption maxima (λmax) at 246 nm in Phosphate buffer (pH 2.0) and Beer-Lambert's law was obeyed over the concentration range 1.0-40 µg/ml and the method was validated as per ICH guidelines. The method was found to be simple, precise and accurate and can be applied successfully for the assay of Brimonidine tartrate for the pharmaceutical formulations.

**Keywords:** Brimonidine tartrate, Spectrophotometry, Validation.

## DEVELOPMENT AND VALIDATION OF NEW SPECTROPHOTOMETRIC METHOD FOR THE ESTIMATION OF PIOGLITAZONE IN TABLET DOSAGE FORMS

Vinjamuri Krishna Manaswini, Mukthinuthalapati Mathrusri Annapurna
GITAM School of Pharmacy,
GITAM (Deemed to be) University, Visakhapatnam, India
kvinjamu@student.gitam.edu

Pioglitazone CAS [112529-15-4] is used for the treatment of high blood sugar levels caused by type 2 diabetes. It is chemically, 5-[[4-[2-(5-ethyl-2-pyridinyl) ethoxy] phenyl] methyl]-1,3-thiazolidine-2,4-dione with molecular formula C19H20N2O3S and molecular weight 356.4 grams/mole. It is a selective agonist at peroxisome proliferator-activated receptor-gamma (PPARγ) in target tissues for insulin action such as adipose tissue, skeletal muscle, and liver. Activation of PPARγ increases the transcription of insulin-responsive genes involved in the control of glucose and lipid production, transport and utilization. Pioglitazone enhances tissue sensitivity to insulin and reduces the hepatic production of glucose (i.e. gluconeogenesis) - insulin resistance associated with type 2 diabetes mellitus is therefore improved without an increase in insulin secretion by pancreatic beta cells. A new UV spectrophotometric method has been developed for the assay of Pioglitazone in tablet dosage forms. Double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the present study (200-400 nm). Pioglitazone has shown absorption maxima (λmax) at 227 nm in Phosphate buffer (pH 7.5) and Beer-Lambert's law was obeyed over the concentration range 1.0-40 µg/ml with linear regression equation y= 0.0255x + 0.0058 (R2 = 0.9997) the method was validated as per ICH guidelines. The method was found to be simple, precise and accurate and can be applied successfully for the assay of Pioglitazone in tablet dosage forms.

**Keywords:** Pioglitazone, Spectrophotometry, ICH Guidelines.

## NEW SPECTROPHOTOMETRIC METHODS FOR THE QUANTIFICATION OF SUMATRIPTAN SUCCINATE IN PHARMACEUTICAL FORMULATIONS

Sri Adibhatla Sai Aman, Mukthinuthalapati Mathrusri Annapurna
GITAM School of Pharmacy,
GITAM (Deemed to be) University, Visakhapatnam, India
ssriadib2@gitam.in

Sumatriptan succinate is a medication used for the treatment of migraine and clustered headaches. It belongs to the class of drugs called selective serotonin receptor agonists (SSRA), or triptans. Sumatriptan succinate is chemically, 5-(Methyl sulfamoyl methyl)-N, N-dimethyltryptamine with molecular formula C14H21N3O2S and molecular weight 295.40 grams/mole. It acts by binding to 5-HT1B and 5HT-1D receptors on cranial blood vessels, causing selective vasoconstriction and inhibiting the release of pro-inflammatory neuropeptides from trigeminal nerves, interrupting the pain signals associated with migraine attacks. Two new spectrophotometric methods have been proposed for the assay of Sumatriptan succinate in pharmaceutical dosage forms (Tablets). Double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the present study (200-400 nm). Sumatriptan succinate has shown absorption maxima (λmax) at 282 nm in Acetate buffer (pH 4.0) and 217 nm in 0.1N sodium hydroxide and Beer-Lambert's law was obeyed over a wide concentration range and the methods were validated as per ICH guidelines. The methods were found to be simple, precise and accurate and can be applied successfully for the assay of Sumatriptan succinate for the pharmaceutical formulations.

**Keywords:** Sumatriptan succinate, spectrophotometry, ICH Guidelines.

## NOVEL ISATIN DERIVATIVES AS ANTICHOLINESTERASE AGENTS

Mythri M, Preethi P R, Gopinath U
Department of Pharmaceutical chemistry,
K.T.N. College of Pharmacy, Palakkad, Kerala, India- 679505
dr.mythrim@gmail.com

The neuropathology of Alzheimer's disease is generally characterized by the presence of numerous plaques of amyloid β-peptide (Aβ) that forms senile plaques, neurofibrillary tangles (NFT) of hyper phosphorylated tau protein and degeneration or atrophy of the basal forebrain cholinergic neurons. Acetylcholinesterase plays a significant role in accelerating β-amyloid peptide aggregation and deposition in the fibrils. Thus, inhibition of AChE is still the most successful therapeutic strategy for the symptomatic treatment of Alzheimer's disease and its progression. The current study was directed toward developing a new series of fused heterocycles incorporating Isatin moiety against Acetylcholinesterase (AChEs). The binding mode of these molecules simulated through docking studies with the target enzyme (pdb ID: 1EVE). Compounds namely IS-I, IS-II and IS-IV showed better binding energy towards the protein AChE with values of -10.0, -8.6, -10.4 Kcal/mol. The Acteylcholinesterase inhibitory Assay based on Ellman protocol revealed that the synthesized compounds are effective inhibitors against the target in a dose dependent manner. Among the Isatin derivatives, IS I produced a maximum enzyme inhibition with an IC50 value was found to be 2.6 µg/ml at concentrations ranging between 2-128 µg/ml which is comparable with that of standard drug, Donepezil (0.2 to 12.8 µg/ml). The results of this study confirm that these derivatives are potent in AChEs inhibition and could serve as better candidates for the further studies of Alzheimer's disease.

**Keywords:** Acetylcholinesterase inhibitors, Isatin derivatives, Ellman's assay

## METHOD DEVELOPMENT AND VALIDATION OF NEW SPECTROPHOTOMETRIC METHOD FOR THE QUANTIFICATION OF ONDANSETRON HYDROCHLORIDE IN TABLET DOSAGE FORM

ISBN: 978-81-980623-8-3

Sammingi Navya Sri, Mukthinuthalapati Mathrusri Annapurna
GITAM School of Pharmacy,
GITAM (Deemed to be) University, Visakhapatnam, India
nsamming@student.gitam.edu

A new UV spectrophotometric method has been developed for the estimation of Ondansetron Hydrochloride in tablet dosage forms. Ondansetron Hydrochloride is a selective antagonist of the serotonin receptor subtype, 5-HT3. Ondansetron Hydrochloride (CAS 103639-04-9) is used to prevent nausea and vomiting caused by chemotherapy and radiation therapy, nausea and vomiting after surgery. It is chemically, 9-methyl-3-[(2-methyl-1H-imidazol-1-yl) methyl]-2,3,4,9-tetrahydro-1H-carbazol-4-one hydrochloride with molecular formula C18H20ClN3O.HCl and molecular weight 329.8 grams/mole. It exerts antiemetic effect through selective antagonism of 5-HT3 receptors located on peripheral vagal terminals and within the central nervous system structures. A double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the study. Ondansetron Hydrochloride has shown absorption maxima (λmax) at 248 nm in Phosphate buffer (7.5 pH) and Beer-Lambert's law was obeyed over the concentration range 1-100 µg/ml with linear regression equation, y = 0.041x + 0.0219 $R^2$ = 0.998. The method was validated as per ICH guidelines and was found to be simple, precise and accurate and can be applied successfully for the assay of Ondansetron Hydrochloride in pharmaceutical formulations.

**Keywords:** Ondansetron Hydrochloride, Anti-emetic, Spectrophotometry, ICH Guidelines.

**CH-415**

## NEW SPECTROPHOTOMETRIC METHOD FOR THE QUANTIFICATION OF FROVATRIPTAN SUCCINATE IN PHARMACEUTICAL FORMULATIONS

Krishna Rao Jogi, Mukthinuthalapati Mathrusri Annapurna
GITAM School of Pharmacy,

kjogi@student.gitam.edu

Frovatriptan Succinate (CAS 158930-17-7) is used for the treatment of acute migraine headaches in adults,in particular those associated with menstruation. Frovatriptan causes vasoconstriction of arteries and veins that supply blood to the head. Frovatriptan Succinate is chemically, butanedioic acid;(6R)-6-(methylamino)-6,7,8,9-tetrahydro-5H-carbazole-3-carboxamide with molecular formula C14H17N3O and molecular weight 269.345 grams/mole. Frovatriptan is a 5-HT receptor agonist that binds with high affinity for 5-HT1B and 5-HT1D receptors. Frovatriptan has no significant effects on GABAA mediated channel activity and has no significant affinity for benzodiazepine binding sites. A new spectrophotometric method has been developed for the estimation of Frovatriptan Succinate in pharmaceutical dosage forms (Tablets). Double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the present study (200-400 nm). Frovatriptan Succinate has shown absorption maxima (λmax) at 244.50 nm in phosphate buffer (2.1 pH) and Beer-Lambert's law was obeyed over the concentration range 0.1-20 µg/ml with linear regression equation y = 0.1633x + 0.0077, ($R^2$ = 0.9999). The method was validated as per ICH guidelines and found to be simple, precise and accurate and can be applied successfully for the assay of for the Frovatriptan Succinate pharmaceutical formulations.

**Keywords:** Frovatriptan Succinate, spectrophotometry, ICH Guidelines.

## NEW SPECTROPHOTOMETRIC METHOD FOR THE QUANTIFICATION OF EFAVIRENZ IN TABLET

Kaneti Mohan Krishna, Mukthinuthalapati Mathrusri Annapurna
GITAM School of Pharmacy,
GITAM (Deemed to be) University, Visakhapatnam, India
mkaneti@student.gitam.edu

Efavirenz (CAS 154598-52-4) is used for the treatment of human immunodeficiency virus infection. It is a non-nucleoside reverse transcriptase inhibitor. Efavirenz is chemically, 4S)-6-chloro-4-(2-cyclo propyl ethynyl)-4-(trifluoromethyl)-1H-3,1-benzoxazin-2-one with molecular formula $C_{14}H_9ClF_3NO_2$ and molecular weight 315.675 grams/mole. It acts by binding to a non-catalytic site on the HIV-1 reverse transcriptase enzyme and prevents the enzyme from functioning properly which indirectly inhibits HIV replication and also halts the conversion of HIV's RNA into DNA which is necessary for producing new virus particles. A new spectrophotometric method has been developed for the estimation of Efavirenz in pharmaceutical dosage forms (Tablets). Double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the present study (200-400 nm). Efavirenz has shown absorption maxima (λmax) at 247 nm in Boric Buffer (pH 9) and Beer-Lambert's law was obeyed over the concentration range 0.25-30 µg/ml with linear regression equation, y = 0.0.809x + 0.0498 ($R^2$ = 0.9986). The method was validated as per ICH guidelines and found to be simple, precise and accurate and can be applied successfully for the assay of Efavirenz for the pharmaceutical formulations.

**Keywords:** Efavirenz, spectrophotometry, ICH Guidelines.

## FT-IR METHOD FOR QUANTIFYING FLUOXETINE IN BULK AND CAPSULES

B. Rani, B. Poornima, S. Archana
Department of Pharmaceutical Analysis, Vijaya Institute of Pharmaceutical Sciences for Women (VIPW), Vijayawada.
bobbilirani5@gmail.com

Fluoxetine, a selective serotonin reuptake inhibitor (SSRI), is widely prescribed for depression and related disorders, necessitating fast and reliable quality control methods for its pharmaceutical preparations. The present study describes the development and validation of a novel Fourier Transform Infrared (FT-IR) spectroscopic method for the quantitative estimation of fluoxetine in bulk drug and marketed capsule formulations. Using the KBr pellet technique, characteristic absorption bands at 2923 $cm^{-1}$ (C–H stretch), 1615 $cm^{-1}$ (aromatic C=C stretch), 1329 $cm^{-1}$ (C–F stretch), and 1242 $cm^{-1}$ (phenoxy stretch) were selected for analysis. Calibration curves were constructed over a concentration range of 10–50 µg/mg, exhibiting excellent linearity with a regression equation of y = 0.0258x + 0.6436 and a correlation coefficient ($r^2$) of 0.999. Method validation, performed in accordance with ICH guidelines, demonstrated high accuracy with a mean recovery ranging from 99.11% to 99.52%, and precision with intraday and interday %RSD values below 1.0%. Limits of detection (LOD) and quantification (LOQ) were found to be as low as 0.127 µg/mg and 0.386 µg/mg, respectively, confirming the sensitivity of the method. The proposed FT-IR technique is rapid, cost-effective, and requires minimal sample preparation compared to conventional chromatographic methods. Its robustness and reproducibility make it particularly suitable for routine quality control of fluoxetine in bulk and dosage forms. This validated method offers an efficient alternative for pharmaceutical industries and research laboratories, ensuring product integrity and regulatory compliance.

**Keywords:** Fluoxetine; FT-IR spectroscopy; Quantitative analysis; KBr pellet method; Method validation; ICH guidelines; Quality control.

## VALIDATED RP-HPLC METHOD FOR SIMULTANEOUS ESTIMATION OF LINAGLIPTIN AND EMPAGLIFLOZIN IN BULK AND TABLET DOSAGE FORMS

K.Abinaya purna
Department of Pharmaceutical Analysis, Vijaya Institute of Pharmaceutical Sciences for Women (VIPW), Vijayawada.
kacharam.abinaya@gmail.com

A simple, precise, and stability-indicating reverse-phase high-performance liquid chromatographic (RP-HPLC) method was developed and validated for the simultaneous estimation of Linagliptin and Empagliflozin in bulk and pharmaceutical dosage forms. Chromatographic separation was achieved on a Kromosil C18 (250 × 4.6 mm, 5 µm) column using an isocratic elution of 0.1% ortho-phosphoric acid (OPA) buffer (pH 4.8, adjusted with triethylamine) and acetonitrile in the ratio of 70:30 v/v. The mobile phase was pumped at a flow rate of 1.0 mL/min with detection at 286 nm. The retention times of Linagliptin and Empagliflozin were 1.920 min and 3.699 min, respectively. The method exhibited excellent linearity within the concentration range of 12.5–75 µg/mL for Linagliptin and 25–150 µg/mL for Empagliflozin, with correlation coefficients ($r^2$) of 0.999 for both drugs. Limits of detection were 0.24 µg/mL and 0.17 µg/mL, and limits of quantification were 0.72 µg/mL and 0.51 µg/mL for Linagliptin and Empagliflozin, respectively. Accuracy studies demonstrated mean recoveries of 100.63% for Linagliptin and 100.20% for Empagliflozin, while precision studies

ISBN: 978-81-980623-8-3

revealed %RSD values below 1.0, confirming method reproducibility. Forced degradation under acidic, alkaline, oxidative, thermal, and photolytic conditions indicated the method's capability to resolve degradation products without interference from analyte peaks. The proposed RP-HPLC method is sensitive, rapid, and cost-effective, making it suitable for routine quality control and stability testing of Linagliptin and Empagliflozin in bulk drugs and commercial tablet formulations.

**Keywords:** Linagliptin, Empagliflozin, RP-HPLC, Method validation, Simultaneous estimation, Stability-indicating method.

**_IN-SILICO_ APPROACHES FOR DESIGNING AND OPTIMIZATION OF NOVEL DRUG MOLECULES TARGETING MULTI-PHARMACOLOGICAL CONDITIONS**

Pavan Lamture, Wasim Kazi, Ram Sakhare
Department of Pharmaceutical Sciences,
Swami Ramanand Marathwada University, Nanded,
Maharashtra, India
pavanlamture29@gmail.com

Drug discovery is traditionally lengthy and expensive, but in-silico pharmacology has emerged as a transformative approach to accelerate this process. Using computational tools such as molecular docking, QSAR, and physiologically based pharmacokinetic (PBPK) modeling, researchers can rapidly screen compounds, predict biological activity, and assess ADME– toxicity properties at early stages. These methods reduce both cost and time while improving efficiency in drug development. The integration of artificial intelligence and machine learning further enhances predictive accuracy, enabling the rational design of multi- target therapeutics. Case studies of drugs like valsartan and imatinib highlight the successful translation of in-silico strategies into clinical outcomes. Overall, computational approaches are reshaping drug discovery by making it faster, more reliable, and cost-effective.

**Keywords:** *In-silico* pharmacology, Drug design, Molecular docking, QSAR, ADME–toxicity.

**IMPURITY PROFILING IN DRUG DEVELOPMENT**

P.Lakshmi Prasanna, CH.Naga Sailaja
Department of Pharmaceutical Analysis, ASN Pharmacy College, Tenali,
Guntur District, Andhra Pradesh, India – 522201
lakshmiprasannapatchala@gmail.com

Impurity profiling is a critical component of drug development, ensuring the safety, efficacy, and quality of pharmaceutical products. This process involves the identification, quantification, and control of impurities—such as residual solvents, degradation products, and synthesis by-products—in active pharmaceutical ingredients (APIs) and drug formulations. Advanced analytical techniques, including high-performance liquid chromatography (HPLC), mass spectrometry (MS), and nuclear magnetic resonance (NMR), are employed to detect and characterize impurities at trace levels. Impurity profiling is guided by stringent regulatory guidelines from agencies like the FDA and ICH, which mandate comprehensive evaluation to assess potential toxicity and pharmacological impact. By integrating robust analytical methods with risk-based approaches, impurity profiling supports the optimization of manufacturing processes and formulation stability. Challenges such as detecting low-level genotoxic impurities and managing complex impurity profiles in biologics underscore the need for continued innovation in analytical technologies and regulatory strategies to ensure patient safety and therapeutic efficacy.

**Keywords:** Impurity profiling, drug development, pharmaceutical quality, analytical techniques, high-performance liquid chromatography (HPLC), mass spectrometry (MS), nuclear magnetic resonance (NMR), active pharmaceutical ingredients (APIs).

**AN OPTIMIZED RP-UPLC METHOD FOR GLECAPREVIR AND PIBRENTASVIR IN HUMAN PLASMA: FOR THERAPEUTIC MONITORING**

Rayini Venkata Sai Mounica[1], Jhampani Subbarao[2]
Department of Pharmaceutical Analysis,
Acharya Nagarjuna University, Guntur, Andhra Pradesh, India.
Department of Pharmaceutical Analysis,
Narayana Pharmacy College, Nellore, Andhra pradesh, India.
Department of Pharmaceutical Chemistry, Chebrolu Hanumaiha
Institute of Pharmaceutical Sciences, Guntur, Andhra Pradesh, India.

A simple, Accurate, precise method was developed for the simultaneous estimation of Glecaprevir and Pibrentasvir in Human plasma was developed and validated. By using Protein Precipitation Method [PPM] the sample preparation was prepared. Chromatogram was run through Hibar [2.1 µm particle size, L × I.D. 100 mm × 1.8 mm]. Mobile phase containing Buffer Ammonium Acetate: Methanol taken in the ratio 60:40 was pumped through column at a flow rate of 0.3ml/min. For the separation of Glecaprevir and Pibrentasvir Internal Standard [IS] used is Bictegravir. The Temperature was maintained at 30°C. Optimized wavelength selected was 272nm. Retention time of Glecaprevir and Pibrentasvir was found to be 0.987 min (IS) and 1.196 min of Glecaprevir and 1.490 min of Pibrentasvir. The standard curve was linear (R2 >0.999) over the concentration range of (0.0250 to 1.000 µg/ml of Glecaprevir & 0.005 to 0.200 µg/ml of Pibrentasvir. All the analytical validation parameters were determined as per ICH guidelines The bioanalytical method developed approach was selective, robust, and reliable, as accuracy, precision, recovery, and other validation parameters were all within the recommendations' limitations. The peaks produced for the drug of interest and the internal standard were well separated from one another without any plasma interferences, and the peaks were symmetrical with an adequate tailing factor. The method has the potential to be very beneficial in therapeutic drug monitoring (TDM), bioequivalence research, pharmacokinetics studies, toxicology, and biomedical investigations.

**Keywords:** Glecaprevir and Pibrentasvir, Internal Standard, Rp HPLC, Bioanalysis, Human Plasm

**BIOANALYTICAL COMPARISON OF MEFENAMIC ACID PURE DRUG AND FAST DISSOLVING TABLETS USING LC-MS/MS**

N. Deepika, V Saikishore
Bapatla College of Pharmacy, Bapala, Andhra Pradesh
namadeepika868@gmail.com

The objective of this study was to investigate the differences in pharmacokinetic profiles between the pure drug form of Mefenamic acid and an optimized fast dissolving tablet (FDT) formulation. The study was conducted using two groups of white New Zealand rabbits (n=6) in a crossover design. Plasma drug concentrations were determined using a validated LC-MS/MS method, and pharmacokinetic parameters were calculated for each formulation. Comparison of the plasma concentration–time profiles revealed significant differences between the two formulations. The optimized FDTs demonstrated a markedly higher mean peak plasma concentration (C<sub>max</sub>) of 68.33 ± 0.42 ng/mL, compared to 27.72 ± 0.31 ng/mL for the pure drug. The mean time to reach peak plasma concentration (T<sub>max</sub>) was significantly reduced in the FDT group (6.09 ± 0.072 hours) compared to the pure drug group (11.53 ± 0.011 hours).The elimination rate constant (K<sub>el</sub>) for the pure drug and the optimized FDTs was found to be 0.58 ± 0.012 $h^{-1}$ and 0.53 ± 0.014 $h^{-1}$, respectively. Notably, the absorption rate constant (K<sub>a</sub>) was significantly higher for the FDTs (5.53 ± 0.02 $h^{-1}$) compared to the pure drug (1.68 ± 0.01 $h^{-1}$). Furthermore, the area under the plasma concentration-time curve (AUC<sub>0–∞</sub>) was substantially greater for the FDTs (686.1 ± 2.07 ng·h/mL) compared to the pure drug (191 ± 1.43 ng·h/mL).These findings demonstrate that the optimized fast dissolving tablet formulation significantly enhances the rate and extent of oral absorption of Mefenamic acid, as evidenced by increased C<sub>max</sub>, K<sub>a</sub>, and AUC, and a reduced T<sub>max</sub>. Therefore, FDTs of Mefenamic acid offer a promising alternative for improved bioavailability and faster onset of action.

**NEW SPECTROPHOTOMETRIC METHOD FOR THE ASSAY OF FINASTERIDE TABLETS**

Vadapalli Neeraja, Polipalli Venkata Navya
Department of Pharmaceutical Analysis, Raghu College of Pharmacy
(Affiliated to Andhra University), Dakamarri (v),
Bheemunipatnam(m), Visakhapatnam-531162, AP, India.

ISBN: 978-81-980623-8-3

n949443@gmail.com

Finasteride is an anti-androgen that is used to treat male pattern hair loss, sometimes referred to as androgenic alopecia, and benign prostatic hyperplasia. By inhibiting Type II 5α-reductase, it stops testosterone from being peripherally converted to dihydrotestosterone (DHT). Thus, treating male pattern hair loss and benign prostate hyperplasis. Several methods for the determination of FIN in pharmaceuticals have been reported in the literature including UV-spectrophotometric, gas chromatographic,high performance liquid chromatographic (HPLC) and polarographic. Methods of UV spectrophotometry are Direct UV spectrophotometry, Derivative spectrophotometry, Difference spectrophotometry, Area under curve (AUC). The authors have developed a new spectrophotometric method for the estimation of Finasteride tablets in 0.1M Sodium Hydroxide, and the method was validated. Finasteride has shown λmaxat 221 nm. Linearity was observed over a range of 1 – 10 µg/mL. The drug concentration was plotted on the x-axis, and the corresponding absorbance was plotted on the y-axis to obtain a calibration curve. A linear regression equation, y = 0.0601x + 0.0061 ($R^2$ = 0.9995) was obtained. The method was precise and accurate as the % RSD was less than 2.0 (ICH Guidelines, 2005). The percentage purity was 99.58%, and regular analysis of the Finasteride tablets can be performed using this validated method.

**Keywords:** Finasteride, UV Spectroscopy, Method Development, Validation

## SYNTHESIS AND EVALUATION OF MUTUAL PRODRUG OF NONSTEROIDAL ANTI-INFLAMMATORY DRUG AND SKELETAL MUSCLE RELAXANT

Kiran E. Katkar (Bhokare), Neela M. Bhatia, Sandeep Walsangeekar
Department of Pharmaceutical Chemistry,
Bharati Vidyapeeth College of Pharmacy, Kolhapur
kirankatkarbhokare@gmail.com

In this study, mutual ester prodrug of Ibuprofen with the skeletal muscle relaxant chlorzoxazone was synthesized and characterized using IR, GC-MS, NMR, and chromatographic techniques to achieve synergistic activity of the two drugs, avoiding ibuprofen-mediated gastrointestinal damage, as well as reducing its ulceration tendency. The mutual prodrug showed better physicochemical properties, particularly in solubility and partition coefficient testing. Solubility and partition coefficient investigations revealed an increased lipophilicity, making it better suited for oral administration than the parent drug. *In-vitro* hydrolysis was further investigated at various pH levels, using simulated gastric fluid, simulated intestinal fluid, and plasma. The quantitative examination was carried out using high-performance liquid chromatography. The method involves the chemical attachment of an NSAID to a skeletal muscle relaxant, which is designed so that upon enzymatic hydrolysis (mainly in plasma), the conjugate cleaves, releasing both active parent medicines. This method minimizes undesirable effects, particularly gastrointestinal discomfort, by retaining the medications as a chemically stable prodrug in the stomach (acidic circumstances) while efficiently releasing them into the plasma (neutral conditions). Furthermore, the mutual ester prodrug was evaluated for anti-inflammatory, skeletal muscle relaxation, and ulcerogenic activity and found to be equivalent to the parent drug. Microscopic examination of the stomach tissues demonstrated a considerable reduction in gastric ulcer formation in mice gastric mucosa when compared to the parent carboxylic acid medications. As a result, the newly developed mutual prodrug had fewer gastrointestinal adverse effects while retaining therapeutic efficacy.

**Keywords:** NSAID, Ibuprofen, Skeletal Muscle relaxant, Chlorzoxazone, Ulcerogenicity, HPLC.

## ANALYSIS OF MINERAL CONTENT IN LEAFY VEGETABLES USING FLAME PHOTOMETRY

Om A. Gonde, Saket V. Shirode, Prathamesh A. Amle,
Rakesh D. Amrutkar
Department of Pharmaceutical Quality Assurance,
K. K. Wagh College of Pharmacy, Nashik, Maharashtra, India – 422003
gondeom123@gmail.com

The main objective of current study, is to examine the content of mineral ions sodium (Na+) and potassium (K+) in leafy vegetables by using a calibrated Flame Photometer. The aim of this work is to compare the ion concentration among different leafy vegetables and demonstrate the reliability of flame photometry as an analytical technique for food analysis. Fresh samples of each leafy vegetable were collected from the Panchavati area of Nashik, then washed, prepared, filtered, and analyzed using a calibrated Labtronics-LT65 flame photometer. Among the tested sample, the fenugreek exhibited the highest potassium emission (198/67), succeeding coriander (185/89) and spinach (145/90) while mint recorded the lowest (23/08). Mint had the lowest emission (11/03), making it the most sodium safe, while dill had the highest emission (100/07), followed by spinach (61/03) and fenugreek (44/03). By understanding these variations, the link between agriculture and health becomes clear. These variations demonstrate how plant species, soil type, and environmental conditions influence the way plants absorb minerals. For improvement in health diets we have to regularly observed mineral content form the supplements, which is emphasized in this study.

**Keywords:** Flame Photometry, Sodium (Na+), Potassium(K+), Leafy Vegetables.

**CH-426**

## INHIBITORS OF MULTIDRUG EFFLUX PUMPS OF PSEUDOMONAS AERUGINOSA AND STAPHYLOCOCCUS AUREUS FROM NATURAL SOURCES: AN *IN-SILICO* HIGH-THROUGHPUT VIRTUAL SCREENING AND *IN VITRO* VALIDATION

Aditi Mhatre1, Pritam Juvatkar1, Chaitrali Bidikar1,
Shubhangi Shete1, Kajal Yadav1, Dhanashree Bhosale1, Kanase V1
AIMS College of Pharmacy, AIMS Foundation, Vadavali, Dombivali (E)
aditimhatre.aimscop@gmail.com

Antimicrobial resistance (AMR) in bacterial pathogens, particularly in Multidrug-Resistant (MDR) strains of Pseudomonas aeruginosa and Staphylococcus aureus, poses a severe global public health challenge. One of the key mechanisms driving this resistance is the overexpression of multidrug efflux pumps (MDR-EPs), which actively expel antibiotics from the bacterial cell. This study aimed to identify potential Efflux Pump Inhibitors (EPIs) from natural sources by employing an in-silico high-throughput virtual screening (HTVS) approach, followed by in-vitro validation. The research focused on inhibiting the MexAB-OprM efflux system (PDB IDs: 1lnw and 5daj) of P. aeruginosa and the MepA efflux system (PDB ID: 3ECO) of S. aureus. A library of natural compounds was screened using molecular docking software (MOE), and based on the maximum predicted binding energy, two lead compounds were selected: Hesperidin (a flavonoid glycoside from Citrus aurantium peels) and Carnosic acid (a diterpenoid from Rosmarinus officinalis leaves). The molecular docking results identified Hesperidin as showing the highest binding affinity to the target proteins. Specifically, Hesperidin achieved a binding energy of -12.8832 kcal/mol against the S. aureus MepA efflux pump (3ECO) and a maximum of -17.2939 kcal/mol against the P. aeruginosa MexAB-OprM efflux pump (5daj). These in-silico findings were subsequently validated by *in-vitro* microbiological assays, which confirmed the inhibitory activity of both Hesperidin and Carnosic acid against the tested microorganisms. The study concludes that Hesperidin and Carnosic acid are promising candidates for inhibiting MDR efflux systems and could potentially be used in a combination therapy with conventional antibiotics to counteract MDR infections in P. aeruginosa and S. aureus.

In this study, substituted (4-oxo-1,4-dihydroquinolin-2-yl) methyl nitrate derivatives were synthesized through a multi-step chemical process involving reactions with Boron trichloride, chloroacetyl chloride, and silver nitrate. The synthesized compounds were characterized using analytical methods. Molecular docking studies were performed to assess binding affinities to EGFR tyrosine kinase (PDB ID: 4HJO). Compounds 6h (-4-OH), 6c (-4-Br), and 6e (-4-CH3) as having strong binding affinities to EGFR tyrosine kinase. Nitric oxide release was measured using the Griess method in adherent cells. In NO release assays, 6h showed the highest NO production (49.95 µmol/L). Anticancer activity was evaluated through IC50 assays in Non-small cell lung cancer (A-549) and Pancreatic cancer (PANC-1) cell lines, and selectivity indices were calculated to determine the compounds preference for cancerous cells over normal cells (HEK-29). Anticancer evaluations identified 6e, 6h, and 6m (-3,4-CH3) as the most effective, with IC50 values of 21.46 ± 1.41 µM, 22.22 ± 1.10 µM, and 24.39 ± 2.39 µM, respectively, and high selectivity indices in both A-549 and PANC-1 cell lines. Compounds 6e, 6h, and 6m showed potent anticancer effects and strong binding to EGFR tyrosine kinase, indicating their potential as leads for further cancer therapy development.

**Keywords:** Quinoline nitrate derivatives, Anticancer activity, Nitric oxide release, EGFR tyrosine kinase, Molecular docking.

## DEVELOPMENT AND VALIDATION OF NEW SPECTROPHOTOMETRIC METHOD FOR THE ASSAY OF MECLIZINE IN PHARMACEUTICAL FORMULATIONS

Gunturi Surya Varchas Varma, Mukthinuthalapati Mathrusri Annapurna
GITAM School of Pharmacy,
GITAM (Deemed to be) University, Visakhapatnam, India
sguntur2@student.gitam.edu

A new spectrophotometric method has been developed for the assay of Meclizine HCl in pharmaceutical dosage forms (Tablets). Meclizine HCl is used for the prevention and control nausea, vomiting and dizziness caused by motion sickness and also used for vertigo caused by ear problems. It is chemically, 1-(p-chloro-α-phenyl benzyl)-4-(m-methyl benzyl) piperazine dihydrochloride monohydrate with molecular formula $C_{25}H_{27}ClN_2 \cdot 2HCl \cdot H_2O$ and molecular weight 481.9 grams/mole. Meclizine is a first-generation antihistamine that blocks histamine H1 receptors and has central anticholinergic effects. A SHIMADZU Model No. UV- 1800 double beam spectrophotometer with quartz cells was used for the study. Meclizine HCl has shown absorption maxima (λmax) at 232 nm in phosphate buffer (pH 7.5) and Beer- Lambert's law was obeyed over the concentration range 1-20 µg/ml and the method was validated as per ICH guidelines. The method was found to be precise and accurate and can be applied for the assay of Meclizine HCl successfully for the pharmaceutical formulations.

**Keywords:** Meclizine HCl, Spectrophotometry, Validation, ICH Guidelines.

**CH-429**

## METHOD DEVELOPMENT AND VALIDATION OF NEW SPECTROPHOTOMETRIC METHOD FOR THE ASSAY OF VORICONAZOLE TABLETS

Mangali Sahithi, Mukthinuthalapati Mathrusri Annapurna, Narendra Angirekula
GITAM School of Pharmacy,
GITAM (Deemed to be University), Visakhapatnam, India
sahithyyyy@gmail.com

A new spectrophotometric method has been developed for the assay of Voriconazole in pharmaceutical dosage forms (Tablets) using Phosphate buffer (pH 7.0). Voriconazole is an anti-fungal agent and it is chemically (2R, 3S)-2-(2,4-difluro phenyl)-3-(5-fluoro-4-pyrimidinyl)-1-(1H-1,2,4 triazol1-yl)-2-butanol. It is also used to treat invasive fungal infections that are generally seen in immunocompromised patients which include invasive candidiasis, invasive aspergillosis and emerging fungal infections. Double beam spectrophotometer (SHIMADZU Model No. UV-1800) with quartz cells was used for the present study. Voriconazole has shown λmax at 255.6 nm in Phosphate buffer (pH 7.0) and Beer-Lambert's law was obeyed over the concentration range 5-50 µg/ml and the method was validated as per ICH guidelines. The method was found to be simple, precise and accurate and can be applied successfully for the assay of Voriconazole in tablets.

**Keywords:** Voriconazole, Spectroscopy, Validation, ICH guidelines.

## DEVELOPMENT AND VALIDATION OF NEW SPECTROPHOTOMETRIC METHOD FOR THE ASSAY OF CELECOXIB IN PHARMACEUTICAL FORMULATIONS

Yalla Deepthi, Mukthinuthalapati Mathrusri Annapurna
GITAM School of Pharmacy,
GITAM (Deemed to be) University, Visakhapatnam, India
dyalla1@student.gitam.edu

A new spectrophotometric method has been developed for the assay of Celecoxib in pharmaceutical dosage forms (Tablets) using Acetate buffer (pH 4.0) and Phosphate buffer (pH 7.5). Celecoxib (CAS 169590-42-5) is used to relieve pain, tenderness, swelling and stiffness caused by osteoarthritis, rheumatoid arthritis (arthritis caused by swelling of the lining of the joints), and ankylosing spondylitis (arthritis that mainly affects the spine). It is chemically, 4-[5-(4-methylphenyl)-3-(trifluoro methyl) pyrazol-1-yl] benzene sulfonamide with molecular formula C17H14F3N3O2S and molecular weight 381.373 gm/mole. Celecoxib suppresses the formation of metabolites such as prostaglandin E2, Prostacyclin, Thromboxane A2, prostaglandin D2 and prostaglandin F2 and thereby reduces pain and inflammatory responses. A double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the study. Celecoxib has shown absorption maxima (λmax) at 248 nm in Acetate buffer (pH 4.0) and at 246 nm in Phosphate buffer (pH 7.5). Beer-Lambert's law was obeyed over the concentration range 2.5-20 µg/ml for both the methods. The methods were validated as per ICH guidelines and found to be simple, precise and accurate and can be applied successfully for the assay of Celecoxib for the pharmaceutical formulations.

**Keywords:** Celecoxib, Spectrophotometry, Validation, ICH Guidelines.

## DRUG REPURPOSING

Janu Keshav Rathod
Shree Sarswati Institute of Pharmacy,
Vidyanagari, Tondavali Tal- Kankavli Dist-Sindhudurg
janurathoad9561@gmail.com

Drug repurposing, or repositioning, is a creative approach in pharmaceutical research to find new indications of already marketed drugs. Instead of expensive and time-consuming drug discovery processes often rife with high rates of failure, repurposing capitalizes on the decades of safety, pharmacokinetic and manufacturing data associated with known drugs. This cuts the time and expense needed to get treatments to patients by a huge margin. Indeed several success stories have emerged and emphasized the potential of repurposing including thalidomide for multiple myeloma, sildenafil, initially designed for angina but endorsed later for erectile dysfunction and pulmonary hypertension, metformin, an antidiabetic which is now undergoing testing as a drug to prevent cancer or increase life span. The method is especially useful for treating unmet medical requirements, unusual diseases, and new health emergencies. For example, it was quickly evaluated for antivirals and anti-inflammatory drugs during the COVID-19 pandemic. Drug repurposing has benefits, but it also has drawbacks, including the need for clinical validation for new applications, regulatory complexity, and intellectual property hurdles. However, the discovery of new drug-disease associations is being sped up by developments in bioinformatics, artificial intelligence, and high-throughput screening. All things considered, drug repurposing is a viable and affordable strategy to increase therapeutic alternatives, enhance patient outcomes, and make the best use of currently available pharmaceutical resources.

## DESIGN SYNTHESIS CHARACTERISATION OF NEW OFLOXACIN-IMINE DRUGS FOR TUBERCULOSIS

Chintakunta Ramakrishna
Department of Pharmaceutical Chemistry, Pesu Institute of Pharmacy,
Pes University, Electronic City Campus, Bengaluru, Karnatak
rama0813@gmail.com

ISBN: 978-81-980623-8-3

This research focuses on developing new drugs to fight tuberculosis, especially the kind that is resistant to multiple existing treatments. The researchers created seven new chemical compounds by modifying a common antibiotic called ofloxacin. They did this by attaching a special chemical group called an imine to it. The new compounds were thoroughly checked to confirm they were made correctly. This involved using several lab techniques to analyze their chemical structure and purity. The researchers tested how well these new compounds worked against the bacteria that causes tuberculosis. They used a specific lab test called the Microplate Alamar Blue Assay (MABA) and compared their results to several well-known anti-tuberculosis drugs. The new compounds showed very strong activity, with a concentration of just 1.6 µg/ml being enough to stop the bacteria from growing. Then we used computer modeling to predict how these new drugs would behave in the body. These "in-silico" studies suggested that the new compounds have better properties than the standard drugs. The computer analysis also predicted that the drugs would be well-absorbed by the body. The study successfully created and tested several new potential drugs that are highly effective against tuberculosis in lab tests and show promise for future use based on computer predictions.

## METHOD DEVELOPMENT & VALIDATION FOR THE SIMULTANEOUS ESTIMATION OF UMECLIDINIUM & VILANTEROL USING RP- HPLC METHOD

Ch. Suresh[1], Anugu Mamatha[2], Prashanth Nallavelli[3]
Vijay College of Pharmacy, Manikbhandar, Nizamabad
suresh200910@gmail.com

A new, simple, precise, rapid, selective and stability reversed-phase high performance liquid chromatographic (RP-HPLC) method has been developed and validated for the simultaneous quantification of Vilanterol and Umeclidinium in pure form and its pharmaceutical dosage form. The method is based on Phenomenex Gemini C18 (4.6×250mm) 5µ column. The separation is achieved using isocratic elution by Methanol: TEA Buffer in the ratio of 65:35% v/v, pumped at flow rate 1.0mL/min and UV detection at 265nm. The column is maintained at 40°C throughout the analysis. The total run time is about 6min. The method is validated for specificity, accuracy, precision and linearity, robustness and ruggedness, system suitability, limit of detection and limit of quantitation as per International Conference of Harmonization (ICH) Guidelines. The method is accurate and linear for quantification of Vilanterol, Umeclidinium between 10 - 50µg/mL and 20 - 100µg/mL respectively. Further, satisfactory results are also established in terms of mean percent- age recovery (100.37% for Vilanterol and 100.34% for Umeclidinium, intra-day and inter-day precision (<2%) and robustness. The advantages of this method are good resolution with sharper peaks and sufficient precision. The results indicate that the method is suitable for the routine quality control testing of marketed tablet formulations.

**Keywords:** Vilanterol and Umeclidinium, RP-HPLC, ICH Guidelines, Accuracy, Precision.

## REVERSE PHASE CHROMATOGRAPHIC METHOD DEVELOPMENT AND VALIDATION FOR ESTIMATION OF BENIDIPINE HCL AND METOPROLOL SUCCINATE FROM COMBINED DOSAGE FORM

G. K. Dyade, Swapnil L. Tambare, Samruddhi T. Torane
Dept of Postgraduate in Pharmacy, SVPM'S College of Pharmacy, Malegaon (BKII) Baramati Dist Pune 413115 Maharashtra, India
dyadegk@gmail.com

Applicability of Liquid chromatography technique for separation and detection of drugs from complex matrix is well known and widely used. A new and improved economical technique has been developed for combined drug estimation Benidipine HCL (BDH) and Metoprolol succinate (MPS). Chromatographic system RP-HPLC, using RP - C18 column equipped with UV detector was utilised for estimation of both these drugs. The mobile phase [Methanol: water pH 4.7 (pH adjusted with acetic acid HPLC grade)] was pumped at a flow rate of 0.8 ml/min in the ratio of 70: 30 % v/v and the eluents were monitored at 239 nm. The technique was successfully applied for quantitative determination of both analytes from their combined dosage form. The method was validated as per ICH guidelines. To ascertain linearity of both these drugs conc level 2 to 10µg/ml for BDH and 2 to 12µg/ml for MPS was found suitable and within acceptable range. The retention time of BDH and MPS was found 5.457 and 2.318 mins respectively. The validation parameters accuracy, precision, LOD and LOQ, robustness were studied. The assay of formulation was found 99.37% w/w for BDH and 99.31% w/w for MPS in the range stated in the official book. The precision study RSD data were varied from 0.6359 to 0.9359 for BDH and 0.1422 to 0.2872 for MPS which was within given criteria. Efficiency of the column to resolve both analytes was good and parameters were in the specified limits. Both drugs were eluted within 6 mins and no interference of excipients was observed during estimation. The developed Technique can be applied for routine quality control tests for the combined dosage form. The techniques simple, preciseness, accurate and robust characters were made sound.

**Keywords:** Benidipine HCL, Metoprolol succinate, Chromatography, validation, ICH guidelines

## COMPUTER-AIDED MOLECULAR DESIGNING, OPTIMIZATION, AND DEVELOPMENT OF POLYMERIC CARRIERS FOR TAXANE DRUG DELIVERY

Varsharani Raghunath Avhad
Arihant College of Pharmacy, Ahilyanagar
varsharkarad30@gmail.com

Taxanes, such as paclitaxel and docetaxel, are potent chemotherapeutic agents widely used in the treatment of various cancers. However, their clinical application is limited by poor solubility, systemic toxicity, and multidrug resistance. Polymeric drug delivery systems offer a promising strategy to overcome these challenges by enhancing solubility, targeting, and controlled release. This study focuses on the computer-aided molecular design and optimization of polymeric carriers specifically tailored for efficient taxane delivery. To design, optimize, and develop biocompatible polymeric carriers for taxane drug delivery using computational modeling and molecular simulations, followed by experimental validation. A computer-aided drug design (CADD) approach was employed to model interactions between taxanes and various polymeric materials, including PEG, PLA, and PLGA. Molecular docking, dynamics simulations, and quantitative structure–activity relationship (QSAR) modeling were used to predict drug loading efficiency, stability, and release profiles. The top-performing polymers were synthesized and characterized using FTIR, DSC, and SEM. *In vitro* drug release studies, cytotoxicity assays, and cellular uptake experiments were conducted to validate the computational predictions. Simulation studies identified PEG-PLGA copolymers with optimized molecular weight and hydrophobicity as the most efficient carriers for taxane encapsulation. These carriers demonstrated high drug loading capacity, sustained release, and enhanced stability. *In vitro* results confirmed improved cytotoxic effects against cancer cells with reduced off-target toxicity compared to free drug formulations.Computer-aided molecular design proved to be an effective tool in the rational development of polymeric drug delivery systems for taxanes. The optimized PEG-PLGA carriers hold significant potential for improving therapeutic outcomes in cancer treatment by enhancing drug solubility, targeting, and reducing adverse effects.

**Keywords:** Computer-Aided Drug Design (CADD), Polymeric Carriers, Taxanes, Paclitaxel, Docetaxel, Molecular Modeling, Drug Delivery, Nanomedicine, PEG-PLGA, Controlled Release.

## BICYCLIC SULTAMS IN DRUG DISCOVERY: RECENT ADVANCE & EMERGING TRENDS

Leena Nag
Danteswari College of Pharmacy Borpadar Jagdalpur
lnag49388@gmail.com

Bicyclic sulfonamides (sultams) are emerging as highly versatile scaffolds in modern drug discovery due to their structural rigidity, enhanced target specificity, and favorable pharmacokinetic properties. These compounds exhibit significant potential across diverse therapeutic areas, including antibacterial, antifungal, antiviral, anticancer, and central nervous system (CNS) disorders. The unique bicyclic framework enables precise interactions with enzymes and receptors, enhancing potency and

ISBN: 978-81-980623-8-3

selectivity. Recent advances in synthetic methodologies, such as green chemistry approaches, flow chemistry, microwave-assisted reactions, and multicomponent cascade strategies, have facilitated the efficient generation of diverse sultam derivatives. Moreover, fragment-based drug discovery and artificial intelligence-driven scaffold optimization have expanded the chemical space of bicyclic sulfonamides, enabling the design of molecules with improved ADMET profiles. Sultams have also been incorporated as ligands in targeted protein degradation strategies, such as PROTACs, further broadening their therapeutic applications. Despite these advantages, challenges remain, including synthetic complexity, scalability, potential resistance development in antimicrobial applications, and regulatory and toxicological considerations. Patent activity and a growing number of candidates in preclinical and clinical pipelines highlight the translational and commercial relevance of bicyclic sulfonamides. This review summarizes the structural, chemical, and biological characteristics of sultams, recent developments in drug discovery, emerging trends such as AI-assisted design and sustainable synthesis, and future directions for their application. By integrating innovative design strategies, computational modeling, and eco-friendly synthetic approaches, bicyclic sulfonamides hold substantial promise for addressing unmet medical needs and delivering next-generation therapeutics across multiple disease areas.

## IMPURITY PROFILING AND METHOD VALIDATION OF BREXPIPRAZOLE TABLETS USING HIGH-PERFORMANCE RP-HPLC TECHNIQUES

D Umamaheswari
Vinayaka Mission's College of Pharmacy,
Yercaud Main Road, Kondappanaickenpatti, Salem
umapharm1@gmail.com

The present study reports the development and validation of a stability-indicating Reverse Phase High-Performance Liquid Chromatography (RP-HPLC) method for the quantitative determination of related substances in Brexpiprazole tablets. Brexpiprazole, an atypical antipsychotic, demands stringent impurity profiling to ensure product safety and regulatory compliance. Method optimization was carried out on a C18 column using a gradient elution of buffer–organic solvent system, with detection at 215 nm, enabling effective separation of Brexpiprazole from its known and unknown impurities. The method was validated in accordance with ICH Q2(R1) guidelines for specificity, linearity, accuracy, precision, limit of detection (LOD), limit of quantification (LOQ), and robustness. The results confirmed high resolution, reproducibility, and acceptable system suitability parameters. This validated RP-HPLC method is simple, robust, and suitable for routine quality control, stability testing, and regulatory submission of Brexpiprazole formulations.

## DEVELOPMENT OF FORCE DEGRADATION PROFILE OF ATENOLOL AND CHLORTHALIDONE IN COMBINE TABLET DOSAGE FORM BY (RP-HPLC)

Vaishnavi Sitre
P. R. Pote Patil College of Pharmacy, Amravati
vaishnavisitre253@gmail.com

A force degradation profile of Atenolol (ATN) & Chlorthalidone (CTN) in combine tablet dosage form on RP-HPLC was developed using Comosil RP-C18 (4.6 x 250mm, 5µm) in an gradient mode with mobile phase comprising of Methanol: Water (pH 3 using OPA) The flow rate was 1 mL/ min and effluent was monitored at 226 nm. The stress conditions selected on the basis of literature review and drug profile. The analysis of the marketed formulation shows the % RSD of 0.37 and 0.99 for ATN & CTN which fully agrees with system suitability. All the system suitability parameters were fully obeyed during generation of force degradation profile.

**Keywords:** ATN, CTN, RP-HPLC, Force, Stress, Degradation.

## COMPUTATIONAL DESIGN AND STRUCTURE BASED OPTIMIZATION OF NOVEL CARDIOTONICS

Ganesh, Mahesh Patil, Bhoomika, Amar
Sri Siddhalingeshwar College Of Pharmacy,
Bidar-585404 Karnataka (INDIA)
rayiniganesh@gmail.com

The structure required for the generation of Energy and physicochemical properties were obtained from known Cardiotonics reported in ChEMBL database multiple conformers, but not more than 300, were allowed to be generated rest of parameters was set to default values. Here we used igemdock and chemmaster for searching similar compounds. We have selected Five known Cardiotonic agents which are generated and selected from the ChEMBLE database. The energy and physicochemical properties were obtained from the igemdock and chemmaster were used for the Lead Identification by subjecting the all structures of generated energy and physicochemical properties for virtual screening by using docking method against the PDB ID 1j36. The energy compounds which has highest binding affinity or energy was selected for the Lead optimization All the structures were subjected for the molecular docking studies using Glide, in the active sites of the X-ray crystal structures and induced fit models Cardiotonics. The inhibition activity of the optimized lead molecules were studied. The extent of inhibition activity of the optimized lead molecules was estimated binding energy as energy score or physicochemical properties and no of interactions with Cardiotonic agents among the compounds 1-14 it was observed that the compounds 1, 4, 5, 8, 9, 10, 13 and 14 have potent inhibitory activity with highest energy value. All drugs follow the Lipinski's rule of five.

**Keywords**: 1j36, CHF, igemdock, chemmaster, Lipinski's rule

## ADVANCING MOLNUPIRAVIR QUANTIFICATION: A VALIDATED RP-HPLC METHOD FOR ANALYSIS

Khadija Gorawala
P R Pote Patil College of Pharmacy, Amravati, Maharashtra
khadijagorawala281@gmail.com

A simple, reliable, and validated reverse-phase high-performance liquid chromatography (RP-HPLC) method was established for the quantitative determination of Molnupiravir in its active pharmaceutical ingredient (API) form. Separation was achieved on an Inertsil C8 column (150 × 4.6 mm, 5 µm) using an isocratic mobile phase of potassium dihydrogen phosphate buffer (pH 4.1) and methanol in an 80:20 ratio (v/v). The flow rate was set at 1.0 mL/min, with detection at 275 nm. The method exhibited excellent linearity within the 50–150% concentration range, with a correlation coefficient ($r^2$) of 0.999. Accuracy, expressed as recovery, ranged between 98.08% and 100%, while precision was confirmed with a %RSD below 0.2%. The sensitivity of the method was demonstrated by a limit of detection (LOD) of 0.478 µg/mL and a limit of quantification (LOQ) of 1.592 µg/mL. Stability and specificity were proven under forced degradation conditions, including acidic, alkaline, oxidative, photolytic, and thermal stress, confirming its stability-indicating nature. Robustness and ruggedness were verified through deliberate variations in chromatographic parameters and by different analysts across instruments. Developed and validated in line with ICH Q2(R2) guidelines, this method is suitable for routine quality control and regulatory testing of Molnupiravir in bulk drug substances. Considering its vital role in COVID-19 therapy, the method ensures consistent quality of the drug and supports the development of safe and effective pharmaceutical formulations.

**Keywords:** Molnupiravir, RP-HPLC, Method validation

## DEVELOPMENT AND VALIDATION OF STABILITY INDICATING METHOD FOR UDENAFIL IN BULK BY HPLC

Ahamed Ishaq. A[1], Anees Fathima. M[2], S. N. Meyyanathan[3]
[1]Department of Pharmaceutical Quality Assurance,
SRM college of Pharmacy, SRMIST, Kattankulathur, India
ahamedishaq02@gmail.com

The present study focused on developing and validating a reverse phase high-performance liquid chromatography (RP-HPLC) method for the estimation of Udenafil. RP-HPLC was chosen for its high specificity, sensitivity, and reproducibility in separating and quantifying the drug. The chromatographic parameters, including detection wavelength, stationary phase, and mobile phase composition, were optimized to achieve better resolution and peak symmetry. Based on UV spectral analysis (200–400 nm), the detection wavelength was fixed at 291 nm. The optimized mobile phase consisted of Acetonitrile, Methanol, and Sodium dihydrogen orthophosphate dihydrate buffer (pH 6.0), which provided sharp and symmetrical peaks with efficient drug elution. Forced degradation studies were conducted under different stress conditions—acidic, basic, neutral, oxidative, and photolytic—to assess the stability of udenafil. The degradation percentages were 36.9% (acidic), 23.5% (basic), 28.8% (neutral), 25.8% (oxidative), and 26.8% (photolytic) after 24 hours, indicating the method's suitability for stability-indicating analysis. The method showed excellent linearity within the concentration range of 1–20 µg/ml, with a limit of detection (LOD) of 0.7621 µg/ml and a limit of quantification (LOQ) of 2.3095 µg/ml, demonstrating high sensitivity.In conclusion, the developed RP-HPLC method was successfully optimized and validated for the estimation of Udenafil. It proved to be accurate, precise, linear, and robust, meeting all validation criteria. Hence, this method can be effectively applied for routine quality control and stability testing of Udenafil formulation.

**Keywords:** Udenafil, method development, forced degradation studies, Limit of Detection and Limit of Quantification.

## ANTI-CANCER POTENTIAL OF CARBAZOLE DERIVATIVES: SYNTHESIS AND EVALUATION *FOR IN-SILICO* AND *IN-VITRO* STUDIES

Aishwarya Jain M S, Abishek P N, Purushotham K N
Department of Pharmaceutical chemistry, Sri Adichunchanagiri College of Pharmacy, BG Nagara-571448
aishwaryajainms@gmail.com

Carbazole derivatives are used in the treatment of various Cancer Diseases and possess a wide range of pharmacological activities. In the present work we designed, synthesized and perform In-silico and *In-vitro* studies on novel carbazole derivatives containing B-lactam ring for their anti-cancer activity. The designed compounds were predicted by Swiss ADME software for their ADME properties which give information about Lipinski rule of 5 by that we get different parameters of derived ligands. Then we performed Docking studies for the binding affinity of derivatives and protein (PDB-ID: 5J2T) Tubulin-vinblastine complex and compared with standard drug doxorubicin. Synthesis of novel carbazole derivatives were performed to which compounds show lower binding energy. Then the synthesis of selected compound were conducted in 4 steps. The process starts by reacting carbazole with chloroacetyl chloride to form N9-(chloroacetyl)-carbazole. This compound is then treated with hydrazine to obtain N9-(hydrazinoacetyl)-carbazole, which can be further modified by adding aldehyde groups to the ring. Finally, these derivatives undergo cyclization to produce carbazole compounds containing a B-lactam ring. The compounds A1, A2, A3, A4, A5, A6, A7, A8, A9, and A10, were synthesized based on their In-silico study data. The synthesized compounds were characterized and confirmed TLC, FT-IR, IH-NMR and Mass spectrometry. The synthesized compounds were then placed for their In-vitro studies for their anti-cancer activity by using MTT assay method against Hela and Jurkat cell lines. As a result, the Compound A5, and A7 shows potent activity against Hela cell line and the compounds A4 and A3 shows potent activity against Jurkat T cell line by comparing with standard drug doxorubicin.

**Keywords:** Carbazole, Swiss ADME, Docking, Anti-Cancer activity

## THE INDOLIZINE SCAFFOLD-A PRIVILEGED HETEROCYCLE IN CONTEMPORARY MEDICINAL CHEMISTRY

Akshay A. Bhelave, Uma D. Kabra, Kalyani R. Thombre,
Krishna R. Gupta, Milind J Umekar
Department of Pharmaceutical Chemistry,
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
akshaybhelave27@gmail.com

The indolizine nucleus, a non-benzenoid, nitrogen-fused bicyclic heterocycle, has recently emerged as a structurally versatile and biologically privileged scaffold in modern drug discovery. As structural isomers and bioisosteres of the ubiquitously pharmacologically active indole core, indolizine derivatives possess an unusual 10-π electron aromatic system that confers desirable physicochemical properties, including planarity and strong fluorescence, useful for both therapeutic agents and biological probes. This review summarises the considerable advances in the synthesis and medicinal uses of the indolizine system over the past decade. To date, the scaffold has exhibited a wide and potent range of biological activities, including key research focusing on its utility as an anti-cancer agents, often acting as tubulin polymerization inhibitors or EGFR disruptors, as antitubercular agents targeting essential enzymes such as InhA in Mycobacterium tuberculosis, as anti-inflammatory drugs through selective COX-2 inhibition, and as anti-microbial compounds against various bacterial and fungal strains. Moreover, the reduced indolizidine system is found in a number of highly active natural products, most notably the Vinca alkaloids. Recent efforts exploit state-of-the-art synthetic methodology to construct highly functionalised indolizines coupled with advanced ADMET computational profiling, positioning this heterocycle as a pivotal platform for the generation of next-generation therapeutic leads with enhanced potency and favourable pharmacokinetic profiles.

**Keywords:** Indolizine; Heterocyclic scaffolds; Anticancer agents; Antitubercular agents; Tubulin polymerisation inhibitors; EGFR inhibitors; InhA inhibitors; COX-2 inhibition.

anees25122002@gmail.com

Poly (ADP-ribose) polymerase-1 (PARP1) is a critical enzyme in DNA damage repair, making it a valuable therapeutic target for cancers with deficient DNA repair mechanisms. While PARP1 inhibitors like Olaparib have shown clinical efficacy, there is a need for novel inhibitors with improved therapeutic profiles. In this study, we designed, synthesized, and evaluated a series of naphthoxy and phenoxy amide derivatives (A1–A9 and B1–B9) as potential PARP1 inhibitors using computational and *in-vitro* methods. Molecular docking was performed with the PARP1 structure (PDB ID: 4ZZZ) to predict binding affinities, followed by ADMET analysis for pharmacokinetic evaluation. The most promising compounds were further assessed through MM-GBSA binding energy calculations and 50 ns molecular dynamics (MD) simulations. The selected compounds were tested for *in-vitro* cytotoxicity against MCF-7 breast cancer cells. Among the derivatives, compounds B2 and B3 exhibited strong binding affinities comparable to Olaparib, along with favourable ADMET profiles. Notably, compound B2 demonstrated high structural stability in MD simulations and potent cytotoxicity against MCF-7 cells, highlighting its potential as an effective PARP1 inhibitor. The combined computational and experimental results suggest that compound B2 is a promising lead with robust PARP1 inhibition, excellent structural stability, and significant anticancer activity. This study provides a basis for the development of novel, effective PARP1 inhibitors in cancer therapy.

**Keywords:** PARP1 inhibitors; Molecular docking; MM-GBSA; Molecular dynamics simulation; ADMET.

**MOLECULAR MODELING, SYNTHESIS, ENZYME ASSAY AND BIOLOGICAL EVALUATION OF FERULIC ACID DERIVATIVES AS A NOVEL CLASS OF DIHYDROFOLATE REDUCTASE INHIBITORS**

Anurag Khatkar, Renu Sehrawat
Department of Pharmaceutical Sciences,
Maharshi Dayanand University, Rohtak, Haryana, INDIA -124001
dranurag.pharma@mdurohtak.ac.in

DHFR (Dihydrofolate reductase) crucial for cell growth and cell division in almost all eukaryotic and prokaryotic cells, hence it is a prime target for combating various diseases. Novel ferulic acid derivatives were designed, synthesized and evaluated for their *in vitro* DHFR inhibitory activity, alongside antimicrobial and anticancer properties. Rb1 and Ra3 were two of the synthesized compounds that showed outstanding antimicrobial activity. When compound Rb1 was docked against antibiotic-resistant strains of S. aureus DHFR (PDB ID: 2W9S), it showed exceptional docking scores and binding energy. With MIC values of 5, 3, and 3 µM, respectively, Rb1 demonstrated significant antibacterial activity against priority pathogens, such as S. aureus, E. coli, and P. aeruginosa. Molecular docking analysis revealed that this derivative formed hydrogen bonds with important amino acid residues such as Ser49, Asn18, Ile5, and Thr121 within the DHFR binding site. Compound Rb2 with an IC50 of 2.98 µM showed promising anticancer effects against breast cancer cells. Moreover, all synthesized compounds displayed noteworthy DHFR inhibition but compound Rb2 was found to be the most potent inhibitor with an IC50 value of 0.053 ± 0.001 µM. This study establishes the groundwork for a novel class of DHFR inhibitors that hold great promise for the treatment of cancer and bacterial infections resistant to antibiotics.

**Keywords**: Ferulic acid; DHFR; Anticancer; Antimicrobial; *In silico* designing; Molecular docking

**ALIPHATIC ACID–ACTIVATED TRIBOMILLING AS A GREEN STRATEGY FOR FUNCTIONAL RE-DESIGN OF MILLET STARCH**

Ashish Chaudhari
Research Scholar, Government College of Pharmacy,
Amravati, Maharashtra, India- 444604
ashishchaudhari097@gmail.com

This study investigates a sustainable mechanochemical approach for modifying millet starch through tribomilling in the presence of food-grade aliphatic organic acids. Millet starch was blended with citric, tartaric, and oxalic acids at a 10:3 (w/w) ratio and subjected to controlled tribomilling using a rotary dry mill operated in 5-minute milling / 5-minute resting cycles, maintaining the milling temperature below 60°C to avoid thermal gelatinization. The modification process produced a measurable shift in starch structure and functionality. XRD analysis showed a 35–60% reduction in crystallinity, indicating significant amorphization. FT-IR spectra revealed the appearance of ester-linked carbonyl peaks near 1720 $cm^{-1}$, confirming acid-starch interactions. SEM images demonstrated clear granule fragmentation, with particle size reduced by 40–70% depending on the acid used. Thermal analysis via DSC showed a decrease in gelatinization onset temperature from 64.5°C (control) to 52.1–57.3°C in modified samples, accompanied by a 25–45% reduction in enthalpy. Functionally, solubility increased by 18–32%, swelling power improved by 15–28%, and paste clarity increased by up to 40% compared to native starch. Among all treatments, citric-acid-activated tribomilling produced the strongest modification effects, followed by tartaric and oxalic acids. These results demonstrate that aliphatic-acid-assisted tribomilling is a green, solvent-free, and efficient strategy for tailoring starch properties, offering practical potential in food formulation, biodegradable packaging, and pharmaceutical excipient development.

**Keywords:** Mechanochemical modification, Tribomilling, Millet starch, Organic acids, Starch functionality

Efavirenz (CAS 154598-52-4) is used for the treatment of human immunodeficiency virus infection. It is a non-nucleoside reverse transcriptase inhibitor. Efavirenz is chemically, 4S)-6-chloro-4-(2-cyclo propyl ethynyl)-4-(trifluoromethyl)-1H-3,1-benzoxazin-2-one with molecular formula $C_{14}H_9ClF_3NO_2$ and molecular weight 315.675 grams/mole. It acts by binding to a non-catalytic site on the HIV-1 reverse transcriptase enzyme and prevents the enzyme from functioning properly which indirectly inhibits and also halts the conversion of HIV's RNA into DNA which is necessary for producing new virus particles. A new spectrophotometric method has been developed for the estimation of Efavirenz in pharmaceutical dosage forms (Tablets). Double beam spectrophotometer (SHIMADZU Model No. UV- 1800) with quartz cells was used for the present study (200-400 nm). Efavirenz has shown absorption maxima (λmax) at 247 nm in phosphate buffer (pH 2.1) and Beer-Lambert's law was obeyed over the concentration range 2.5-40 µg/ml with linear regression equation, y = 0.0522x + 0.0501 ($R^2$ = 0.9987). The method was validated as per ICH guidelines and found to be simple, precise and accurate and can be applied successfully for the assay of Efavirenz for the pharmaceutical formulations.

**Keywords:** Efavirenz, spectrophotometry, ICH Guidelines.

Prostate cancer ranks among the most prevalent cancers in men, particularly in those over the age of 50. The majority of prostate cancers develop at a slow pace and can stay localized within the gland for many years without leading to any adverse effects. Argyreia nervosa is a perennial plant which contains glycosides, alkaloids, amino acids, flavonoids, and tannins. In this present study, we made an attempt to investigate the potential of phytochemicals from Argyreia nervosa (Burm.f.) Bojer using a systems biology approach. The phytochemicals were sourced from Dr. Duke's Phytochemical, Ethnobotanical database and IMPPAT databases. SwissADME, ProTox 3.0, and CardioTOXCSM webservers were utilized to assess the physicochemical, pharmacokinetic, and toxicological profiles of the phytochemicals. The OSIRIS Property Explorer was employed to evaluate the drug score, and the findings indicated the compounds potential for drug development. To illustrate the anticancer mechanism of the developed compounds, an analysis of Gene Ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment was conducted utilizing the intersecting genes that exhibited differential expression. The biological efficacy of the compounds against the chosen molecular targets (STAT 3, BCL 2, TP 53, RAC-alpha serine/threonine-protein kinase, HIF1A, ESR1 and ESR 2) was assessed through molecular docking studies. Owing to the various *in silico* studies, the compounds Emodin, Kaempferol, Lysergamide and Lysergic acid were identified as a significant compound with good binding energies and interaction profiles. Thus, these compounds exhibit potent anti-prostate cancer activity. However, further *in vitro* and *in vivo* are warranted.

**Keywords:** Prostate cancer, Argyreia nervosa (Burm.f.) Bojer, *In silico*, Systems biology, Molecular docking.

## ANTIDIABETIC POTENTIAL OF CARISSA OPACA FRUIT: ROLE OF CHLOROGENIC ACID IDENTIFIED BY UPLC ANALYSIS

Dinesh Kumar
Mother Terasa College of Pharmacy
dineshkumararumugam987@gmail.com

Carissa opaca is an endemic plant of Himalayan region of India which is traditionally used as for curing diabetes. The present study focuses on the phytochemical analysis and antidiabetic activity of the hydro-methanolic extract of Carissa opaca fruit. The extract was subjected to Ultra-Performance Liquid Chromatography (UPLC) for the identification and quantification of major bioactive compounds. The UPLC profile revealed the presence of several polyphenolic constituents, among which chlorogenic acid was identified as the predominant compound. Chlorogenic acid is a well-known bioactive molecule with significant antioxidant and glucose-modulating properties, which may contribute to the antidiabetic potential of the extract. The *in-vitro* assays such as alpha-amylase and alpha-glucosidase showed significant activity when compared to the acarbose at 200 µg/ml concentration. The findings suggest that the hydromethanolic extract of Carissa opaca fruit possesses promising antidiabetic properties, largely attributed to its high chlorogenic acid content and associated phytochemicals.

**Keywords:** Carissa opaca; Hydro-methanolic extract; Anti-diabetic; Chlorogenic acid.

## STRUCTURE BASED DOCKING AND DRUG REPURPOSING ANALYSIS OF SULFONYL UREA-1(SUR 1) WITH CLINICALLY APPROVED DRUGS USING PYRX

Vaijayanthimala Palaniswamy, Dilip K, Domanic Berslin C,
Elankavi C, Evaraj M, Sangameswaran Balakrishnan.
Department of Pharmaceutical Chemistry,
SSM College of Pharmacy, Erode, Tamilnadu, India.
domanicberslin35@gmail.com

This study investigates the binding affinity and interaction profiles of Sulfonyl urea receptor 1(SUR 1) with Glibenclamide (as a reference ligand), and four widely used repurposed drugs—Ramipril, Mefloquine, Isoniazid, and Clozapine—through molecular docking using PyRx. The crystal structure of SUR 1 (PDB ID: 6PZA) was used as the receptor model. Ligand structures were energy-minimized and docked using AutoDock Vina integrated within PyRx. Binding affinities were calculated, and interaction patterns were visualized and analyzed using Discovery Studio and PyMOL. Glibenclamide exhibited the stronger binding affinity (-9.2 kcal/mol), forming key hydrogen bonds. Ramipril showed moderate binding (–7.6 kcal/mol), while Isoniazid had weak but specific interactions (–5.3 kcal/mol). Mefloquine showed strongest binding affinity (–9.4 kcal/mol) and Clozapine (–7.2 kcal/mol) showed minimal affinity for the receptor. These findings suggest that certain non-antidiabetic drugs may exert unintended metabolic effects through partial engagement with SUR 1. The study provides computational evidence that supports the potential interaction of select repurposed drugs with SUR 1. Further *in vitro* and *in vivo* validation could clarify their metabolic implications and guide drug repurposing or polypharmacy management in diabetic patients.

**Keywords**: SUR 1, Molecular docking, Glibenclamide, Drug repurposing and binding affinity.

## COMPUTATIONAL CHARACTERIZATION OF COUMARIN DERIVATIVES TARGETING GLMS ENZYME: INSIGHTS FROM DOCKING, DFT, AND MOLECULAR DYNAMICS SIMULATIONS

Doniparthi Neeraja, Srikanth Jupudi
Department of Pharmaceutical Chemistry, JSS College of Pharmacy,
JSS Academy of Higher Education & Research,
Ooty – 643001, Tamil Nadu, India.
neerajadoniparthi@gmail.com

Bacterial infections remain a major global health concern due to the rapid emergence of antibiotic resistance. GlmS, a key enzyme in the bacterial cell wall biosynthesis pathway, catalyzes the conversion of fructose-6-phosphate and glutamine to glucosamine-6-phosphate, making it an attractive target for the development of novel antibacterial agents. In this study we aimed to investigate the designed coumarin derivatives and assess their potential as GlmS inhibitors by an *in silico* approach. Physicochemical properties and Absorption, Distribution, Metabolism, Excretion were evaluated by QIKPROP module. Docking studies were performed using Schrodinger software, with the protein target being GlmS (PDB ID: 1JXA). Additionally, MD simulation studies were conducted, and the key interactions in the protein-ligand complexes were identified. The results demonstrate the favourable binding affinities with Glide g scores ranging from -10.78 kcal/mol -6.15 kcal/mol and exhibit significant activity against GlmS and compared with the co-crystal (-9.06 kcal/mol). The density functional calculations were also performed to determine the geometrical properties, thermal parameters, chemical reactivity descriptors and molecular electrostatic potential of the compounds using the B3LYP functional and 6-31G++ basis sets. The energy difference between the highest occupied molecular orbitals and lowest unoccupied molecular orbitals for all the investigated compounds in the range of 3.2-3.7eV which allows for easy transfer of electrons and reactivity. Further research and development of these designed compounds could contribute to the advancement of effective bacterial infections.

**Keywords:** GlmS enzyme, coumarin derivatives, antibacterial agents, *In-silico* design

## ANALYTICAL QBD BASED SIMULTANEOUS QUANTIFICATION OF PACLITAXEL AND IMATINIB MESYLATE IN FORMULATION BY HPLC

Neha S. Laxane, Khushwant S. Yadav
VIVA Institute of Pharmacy, Virar (East), Mumbai, India 401303.
Shobhaben Pratapbhai Patel School of Pharmacy & Technology Management, SVKM'S NMIMS (Deemed to be University),
Mumbai, India.
nehalaxane29@gmail.com

This research focused on the development and validation of a simple, accurate, and robust HPLC method for the simultaneous estimation of Paclitaxel (PAC) and Imatinib mesylate (IMI) in bulk and finished formulations. The robustness of the method was optimized using a Box–Behnken statistical design, evaluating the influence of mobile phase composition, flow rate, and wavelength on key chromatographic parameters such as retention time (RT), area under the curve (AUC), resolution, theoretical plates (TP), and asymmetry. Chromatographic separation was achieved on a C18 column using Methanol :10 mM phosphate buffer (50:50 v/v) as the mobile phase at a flow rate of 0.8 mL/min for 12 minutes. Detection was carried out at 234 nm and 25°C. IMI and PAC showed distinct retention times of 6.8 and 8.7 minutes,

ISBN: 978-81-980623-8-3

respectively, confirming excellent resolution. The method exhibited linearity in the 10–50 ppm range, with correlation coefficients ($R^2$) of 0.9998 for PAC and 0.9995 for IMI. Accuracy results showed %SD values ranging from 0.09–0.9 for PAC and 0.05–0.19 for IMI, while precision studies reported low %RSD values of 0.53 and 0.07, respectively. The limits of detection were 0.0315 µg/mL for PAC and 0.06 µg/mL for IMI, with quantification limits of 0.0955 µg/mL and 0.175 µg/mL. Ruggedness and robustness results confirmed method reliability. Overall, the validated method demonstrated high accuracy, precision, and reproducibility, making it suitable for routine quality control and combined drug analysis in pharmaceutical research.

**SYNTHESIS AND CHARACTERISATION OF SILVER NANOPARTICLES**

Hamsashree. R
Department of Pharmaceutics,
Ikon pharmacy college Bidadi, Bangalore- 562109, Karnataka
its.me.hamsa.shree@gmail.com

Metal nanoparticles are gaining importance nowadays in nanoscience. The nanoparticles had better physical and chemical properties compared with solid particles due to their large surface area. Nano size particles are a core material which carries out as a whole unit in terms of property and transportation. Novel applications of nanoparticles and nanomaterials are emerging rapidly on various properties of metal nanoparticles are different from those of bulk materials made from the same atoms. AgsNPs were prepared by using tri sodium citrate as reducing agent shows a colour change and the mixture changes from transparent to pale yellow, golden yellow, brownish yellow and light brown colors indicating the formation of AgsNPs. AgsNPs were characterized by a particle size analyzer (PSA) to determine the particle of the AgsNPs. In this AgsNPs suspension of 2mM concentration was characterized. The result of characterization in the particle size analyzer (PSA) test showed that the 2mM AgsNPs size was 179nm. The stirring time was maintained at 4 min.

**Keywords:** Silver nanoparticles, stirring time, scanning electron microscopy, laser treatment.

**DESIGN AND OPTIMIZATION OF BIFUNCTIONAL DEGRADERS FOR PARP: INTEGRATING MOLECULAR MODELING WITH *IN VITRO* VALIDATION IN RESISTANT BREAST CANCER MODELS**

Hannah Lalengzuali Fanai[1], Jagdish Chand[1], B. Gowramma
Department of Pharmaceutical Chemistry,
JSS College of Pharmacy Ooty
hannahfanai96@gmail.com

The conceptual framework of the research aims at creating and testing the PROTAC-based degraders of PARP and E3 ligase CRBN as a form of combating medication resistance in BRCA-mutated and triple-negative breast cancer (TNBC). The goal relies on the resistance forces of extensive PARP inhibitor therapy and has the effect of initiating specific protein degradation instead of inhibition of enzyme activity. The aim is to develop and evaluate PROTAC-based PARP degraders as a therapy option to overcome medication resistance in BRCA-mutation and triple-negative breast cancer (TNBC).There are five sequential steps: bioinformatics profiling that recognizes resistant biomarkers and druggable networks; rational selection of bifunctional PROTAC molecules joining PARP and CRBN ligands will be identified; chemical synthesis and structural characterization of potential PROTACs; and Degradation efficiency, cytotoxicity, and reversal of resistance in TNBC models by in vitro cellular assays will be analysed. Based on docking analysis, the binding affinity is -7.30 kcal/mol which is a stable interaction of the designed PROTAC molecule in the active site of PARP-CRBN complex and also MM-GBSA binding scores (ΔG_bind = -130.53 kcal/mol) verified a high thermodynamic stability and a positive non-covalent interaction that was stabilizing the ternary complex. Conclusion: The study focuses on challenges in drug discovery via performing multidisciplinary approaches in developing next-generation therapeutic PROTACs with specificity and efficacy to overcome resistant subtypes of breast cancer.

**Keywords**: PARP, E3 Ligase (CRBN), PROTAC, Breast Cancer.

**INVESTIGATION OF SOME NOVEL AMINO-PYRIMIDINES AS PROSPECTIVE INHIBITORS OF S. AUREUS: *IN-SILICO* INSIGHTS, SYNTHESIS AND BIOLOGICAL EVALUATION**

Judy Jays[1], Saravanan J[2]
[1]Department of Pharmaceutical Chemistry, Faculty of Pharmacy,
M.S. Ramaiah University of applied sciences,
M.S.R.I.T. Post, Bangalore – 560054, India.
judyjays.py.ph@msrus.ac.in

Pyrimidine derivatives are significant scaffolds in the field of medicinal chemistry as they exhibit versatile pharmacological activities. Twenty novel amino-pyrimidine analogues were designed and subjected to virtual in-silico screening to identify potential inhibitors of S.aureus. Molecular docking was implemented to detect selectivity of the analogues to bind with some essential enzymes of S.aureus; Dihydrofolate reductase, Pyruvate Kinase, DNA gyrase, Dihyropteroate synthetase. In-silico ADME investigations indicate that all the designed ligands exhibit drug like properties, satisfy the Lipinski rule of 5 and have low toxicity profile. Molecular docking studies divulge that five compounds display good binding affinity and has formed stable interactions with the essential enzymes of S.aureus. The promising 'hits' of in-silico investigations were synthesized, characterized by spectroscopic methods and subjected to *in-vitro* anti-microbial screening. Compound 2c (4-hydroxy derivative) showed significant activity against the selected strain of S.aureus. The mechanism of action could be the inhibition of dihydrofolate reductase as the ligand exhibited good binding interactions with the enzyme and the docked complex was stable at its' active site. The significant activity of the compounds may be due to the involvement of the hydroxyl groups of the derivatives interacting via H-bonding at the active site of the enzyme. The study provides valuable insights into the potential of novel amino-pyrimidines as DHFR inhitbitors of S.aureus. It highlights the potential of amino-pyrimidines as a favorable stratagem for antimicrobial drug discovery, specifically in the design of novel and effective inhibitors of S.aureus.

**Keywords:** Antimicrobial; Pyrimidines; Molecular docking; S.aureus; *In-silico*, ADMET

**CH-458**

**SYNTHESIS, IDENTIFICATION OF NOVEL BENZIMIDAZOLE DERIVATIVES & EVALUATION OF THEIR MOLECULAR DOCKING, ANTI-HISTAMINE & ANTI-ULCER ACTIVITIES**

Jyothika M, T. Yunus Pasha
Department of Pharmaceutical Chemistry and Analysis,
Sri Adichunchanagiri College of Pharmacy,
B.G. Nagara, Karnataka, India – 571448.
Jyothikam29@gmail.com

Benzimidazole is an important heterocyclic scaffold known to exhibit diverse pharmacological activities, including antiviral, anticancer, anthelmintic, anti-inflammatory, analgesic, antihistaminic, antiparasitic, anticonvulsant, antiulcer, antihypertensive, and antifungal effects. The present study aimed to design, synthesize, and evaluate a series of novel benzimidazole derivatives as potential antihistamine and antiulcer agents. A set of newly designed derivatives (3H.Y, 4CL.Y, JN. Y, ZN. Y, S.Y, 4H.Y, P.Y, 4F.Y, and 2CL.Y) were synthesized using various aromatic benzaldehydes and assessed through molecular docking to predict their binding affinity. Based on the *Insilico* study, the antiulcer activity was evaluated against ethanol-induced gastric ulcers in rats for novel derivatives 2N.Y. (200 mg/kg and 400 mg/kg) and 3H.Y. (200 mg/kg and 400 mg/kg). Based on the antiulcer activity of the novel derivatives, it is observed that 2N. Y showed moderate activity, whereas 3H. Y showed better activity compared to the standard drug Omeprazole. Based on the *Insilico* study, the antihistamine activity was evaluated using isolated rat ileum for novel derivatives (2CL. Y and 4CLY). Based on the antihistamine activity of novel derivatives, it is observed that 2CL. Y showed moderate activity, whereas 4CL. Y showed better activity compared to the standard drug, Mizolastine. Our findings demonstrate the improved antiulcer and antihistamine activity of the recently developed benzimidazole derivatives. Therefore, these could serve as a starting point for the creation of more effective and targeted antiulcer and antihistamine medications. The results indicate that the newly synthesized benzimidazole derivatives possess enhanced antiulcer and antihistamine

ISBN: 978-81-980623-8-3

potential. These compounds may serve as promising lead molecules for the development of more effective, targeted therapeutic agents.

**Keywords:** Benzimidazole, Benzaldehyde, Molecular docking, Anti-ulcer, Anti-histamine.

venkatesan.kamesh4@gmail.com

The present study investigates the anti-inflammatory activity of Camara lanata Linn extract through the synthesis of Nanoparticles using a green synthesis method. The plant extract was used to reduce metal salts, resulting in nanoparticles with potential therapeutic properties. The egg albumin protein denaturation assay was employed to assess the anti-inflammatory activity, showing an inhibition of 85%, indicating significant potential. To further characterize the synthesized nanoparticles, Scanning Electron Microscopy (SEM) was used for morphological analysis, and particle size analysis was performed to determine the size distribution and stability of the nanoparticles. The results highlight the effectiveness of plant-based green synthesis in the preparation of nanoparticles with anti-inflammatory properties.

**Keywords:** Camara lanata Linn, nanoparticles, green synthesis, anti-inflammatory activity, egg albumin protein assay, SEM analysis, particle size, protein denaturation, therapeutic potential.

**INTEGRATIVE NETWORK AND COMPUTATIONAL MODELING OF ANNONA RETICULATA L. PHYTOCHEMICALS AGAINST PROSTATE CANCER**

Kaveriyammal Kennedy, Praveen Sekar, Senthil Kumar Raju
Department of Pharmaceutical Chemistry,
Swamy Vivekanandha College of Pharmacy,
Tiruchengode, Namakkal, Tamil Nadu, India – 637205.
kennadykaveri@gmail.com

Prostate cancer ranks among the most prevalent cancers affecting men, particularly in older peoples. The majority of prostate cancers develop at a slow phase and typically do not result in significant harm. Annona reticulata L.is a medicinal plant, used in the treatment of cardiac problem, dysentery, epilepsy, parasite and worm infestations, constipation and haemorrhage. It contains a phytoconstituents of Annonaretin A, kaurenoic acid, Liriodenine, Reticuline, Adriamycin and (-)-kau-16en-19-oic acid. In this study, we investigated the potential of phytochemicals from Annona reticulata L. using a network pharmacology approach. Dr. Duke's Phytochemical and Ethnobotanical database, The Natural Products Atlas, Medicinal Plants database, IMPPAT, and KNApSAcK Core system databases were consulted for the phytochemicals. The SwissADME, ProTox 3.0, and CardioTOXCSM webservers were used to forecast the physicochemical, pharmacokinetic, and toxicity profile of the phytochemicals that were retrieved. The compounds were suitable for drug development, and the OSIRIS Property Explorer was utilized to predict the drug score. Network pharmacology and enrichment analyses have shown that the phytochemicals are likely to be very effective in combating prostate cancer (STAT 3, JUN, BCL 2, HIF1A, SRC AND ESR1). Subsequently, molecular docking was conducted against the chosen targets utilizing Autodock tools, and the results were compared with the co-crystallized ligand and the standard. Owing to the various *in silico* studies, the compounds like 1,2-disehydronococlaurine, Anonaine, Coclaurine, Corydine, Michelalbine, Mitoflaxone, Norushinsunine and N-Trans-feruloyltyramine are identified as hit compounds against the tested targets with better binding energies and interaction profiles. These substances can thus be employed to fight against prostate cancer. Nevertheless, additional *in vitro* and *in vivo* studies are required.

**Keywords:** Prostate cancer, Annona reticulata L., *In silico* studies, Network pharmacology, Molecular docking.

kgunjal777@gmail.com

Alzheimer's disease (AD) is a complex neurodegenerative disorder marked by cognitive decline and characteristic pathological features such as amyloid-beta plaques and neurofibrillary tangles. This study employed integrated network pharmacology and molecular docking approaches to elucidate the therapeutic potential and underlying mechanisms of karanjin, a furanoflavonoid derived from Pongamia pinnata, against AD. Targets of karanjin were identified through predictive databases and cross-referenced with AD-related genes to construct a comprehensive drug-target network. Key protein targets implicated include β-secretase (BACE1), acetylcholinesterase (AChE), glycogen synthase kinase-3β (GSK-3β), and TNF-α, which are crucial in AD pathogenesis. Pathway enrichment analyses revealed significant involvement in neuroinflammation, oxidative stress regulation, apoptotic signaling, and amyloid-beta metabolism. Molecular docking simulations demonstrated strong binding affinities of karanjin with these key targets, supporting its multi-target inhibitory potential. These findings highlight karanjin's promise as a neuroprotective agent modulating multiple pathogenic pathways in AD. Further experimental validation is needed to confirm its clinical applicability.

**Keywords:** Alzheimer's disease, Karanjin, Network pharmacology, Molecular docking, β-secretase.

dilpreet.daman@gmail.com

This review critically evaluates the emerging role of lactoferrin, an iron-chelating glycoprotein, as a macromolecular ligand in precision cancer therapy. Lactoferrin exhibits potent anti-tumour, anti-inflammatory, and immunomodulatory properties and targets cancer cells via high-affinity binding to transferrin and LDLreceptor-related proteins, enhancing selectivity and minimizing off-target toxicity. It modulates key oncogenic pathways such as PI3K/Akt and MAPK to suppress tumour growth and metastasis. Nanoformulations—like liposomes and polymeric nanoparticles—improve pharmacokinetics, enable targeted drug delivery, and enhance therapeutic efficacy. Lactoferrin's ability to cross biological barriers, including the blood-brain barrier via receptor-mediated transcytosis, offers promise for treating difficult cancers such as glioblastoma. Additionally, it enhances anti-tumour immunity by activating NK cells and polarizing macrophages to the M1 phenotype. Importantly, lactoferrin helps overcome multidrug resistance by modulating efflux pumps like P-glycoprotein. Integrating molecular insights with preclinical and clinical evidence, this review underscores lactoferrin's transformative potential in precision oncology through advanced nanoformulations and synergistic immunomodulatory mechanisms.

**Keywords**: Lactoferrin; cancer therapeutics; targeted drug delivery; immunotherapy; nano-oncology; drug resistance

**DESIGN, SYNTHESIS, CHARACTERIZATION AND BIOLOGICAL EVALUATION OF β-AMINO ACID DERIVED ANTICANCER PEPTIDOMIMETICS**

ISBN: 978-81-980623-8-3

Yuvapriya M K, Rakshitha N
Department of Pharmaceutical Chemistry, Faculty of Pharmacy,
Ramaiah University of Applied Sciences
yuvapriya.py.ph@msruas.ac.in

Peptide-based therapeutics hold significant potential in cancer treatment; however, their aar use is often constrained by poor stability and rapid proteolytic degradation. To overcome these limitations, the present study focuses on the design and synthesis of β-amino acid-containing peptidomimetics as novel anticancer agents. Incorporating β-amino acids into peptide sequences is a promising strategy to improve structural stability, enhance resistance to proteolytic enzymes, and enhance biological efficacy. This study involved the synthesis of five novel cationic peptidomimetics (P1–P5) using solid-phase peptide synthesis employing Fmoc/Boc chemistry protocols. Comprehensive characterization of these compounds was performed through reversed-phase high-performance liquid chromatography (RP-HPLC), mass spectrometry, and one- and two-dimensional nuclear magnetic resonance (1D/2D NMR) spectroscopy. Proteolytic stability was evaluated via degradation assays using the enzymes trypsin and chymotrypsin. The biological activities of the synthesized peptidomimetics were assessed *in vitro* using MCF-7 breast cancer cells. Key assays included cell viability measurements, caspase-3/7 activation assays to detect apoptosis, and Annexin V-FITC/PI staining to differentiate between apoptosis and necrosis. Among the synthesized peptidomimetics, P2 and P3 demonstrated potent, dose-dependent cytotoxic effects against MCF-7 cells, with P3 showing a marked capacity to induce apoptotic cell death. P1 primarily triggered necrotic pathways, whereas P4 and P5 exhibited moderate anticancer activity. Proteolytic stability assays confirmed that the incorporation of β-amino acids significantly enhanced resistance to enzymatic degradation compared to typical peptide counterparts. Collectively, these results highlight β-amino acid-modified peptidomimetics as stable, selective, and mechanistically diverse anticancer agents. These findings justify further preclinical investigations aimed at their development as potential therapeutic agents in cancer treatment.

## A NEW STABILITY INDICATING RP-HPLC METHOD DEVELOPMENT AND VALIDATION FOR SIMULTANEOUS ESTIMATION OF SOFOSBUVIR AND DACLATASVIR

D. Madhuri [1], Shaik Afreen[1]
[1]Department of Pharmaceutical Analysis
Creative Educational Society's College of Pharmacy Kurnool,
Andhra Pradesh, India
madhurisatyasai@gmail.com

A simple, precise, accurate, and rapid stability-indicating RP-HPLC method was developed and validated for the simultaneous estimation of Sofosbuvir and Daclatasvir in bulk and tablet dosage forms. Chromatographic separation was achieved using an Inertsil C18 ODS-3V (4.6 × 250 mm, 5 µm) column with a mobile phase consisting of acetonitrile and 1% isopropyl alcohol (65:35 v/v) at a flow rate of 0.7 mL/min. Detection was performed at 288 nm, and the retention times obtained ensured good resolution between both analytes. The method was validated according to ICH Q2(R1) guidelines, and results demonstrated excellent linearity, precision, accuracy, robustness, and acceptable limits for LOD and LOQ for both drugs. Forced degradation studies including acid, base, oxidative, and hydrolytic conditions confirmed that the method is capable of distinguishing analytes from their degradation products, proving its stability-indicating nature. Overall, the developed RP-HPLC method is suitable for routine quality control

**Keywords:** ICH Q2(R1), Stability-Indicating Method, Forced Degradation, analysis of Sofosbuvir and Daclatasvir in pharmaceutical formulations.

## COMPUTATIONAL AND NETWORK ANALYSIS OF BIOACTIVE COMPOUNDS FROM MOLLUGO PENTAPHYLLA L. AGAINST PROSTATE CANCER

Malini Murugan, Senthil Kumar Raju, Praveen Sekar
Department of Pharmaceutical Chemistry,
Swamy Vivekanandha College of Pharmacy,
Tiruchengode, Namakkal, Tamil Nadu, India – 637205.
malinimurugan112003@gmail.com

Prostate cancer is the second most common cancer affecting men worldwide. It accounts for approximately 14.2% of newly diagnosed cancer cases in the male population, with an age-adjusted incidence rate of 29.4 per 100,000 individuals. Mollugo pentaphylla L.is a medicinal plant that contains carotene, traces of vitamins C, a saponin and potassium nitrate, steroids and flavones. In this study, we aimed to explore the potential of phytochemicals derived from through a systems biology approach. The phytochemicals were sourced from Dr. Duke's Phytochemical and Ethnobotanical database and IMPPAT. To estimate the physicochemical, pharmacokinetic, and toxicological profiles of the phytochemicals, we utilized the SwissADME, ProTox 3.0, and CardioTOXCSM webservers. The OSIRIS Property Explorer was employed to assess the drug score, revealing the druggable nature of the compounds. Network modeling and enrichment analysis identified the specific targets of the phytochemicals, suggesting their significant activity against prostate cancer. Subsequently, molecular docking studies against the targets (SRC, AKT1, ESR 1, PPARG and BCL 2) were conducted using Autodock tools, comparing the results with the co-crystallized ligand and standard. Through various *in silico* studies, the compounds Eriodictyol, Arzoxifene and Bosutinib were recognized as hit compounds. Notably, Kieclorin exhibited high activity against SRC, demonstrating favorable binding energies and interaction profiles. Therefore, these compounds hold potential for use against prostate cancer; however, additional *in vitro* and *in vivo* studies are necessary.

**Keywords:** Prostate cancer, Mollugo pentaphylla L, Systems biology, Network modelling, Molecular docking

## ISOLATION AND CHARACTERIZATION OF IMPURITIES IN AN ACTIVEPEPTIDE (EPTIFIBATIDE INJECTION)

Malladi Srinivas Reddy, Gowribhatla Pranathi, Pokala Mounika
Department of Pharmaceutical Analysis, Vaageswari college of Pharmacy, Karimnagar, Telangana, India-505527.
msr.srinivas@gmail.com

This investigation aimed to elucidate the structure of a novel impurity detected in HPLC chromatograms of eptifibatide synthesized via an optimized manufacturing process and formulated into a finished pharmaceutical product. Eptifibatide, a cyclic heptapeptide comprising six amino acids and one mercaptopropionyl (des-amino cysteinyl) residue, contains a characteristic interchain disulfide linkage between the cysteine amide and mercaptopropionyl moieties. Comprehensive impurity profiling was required to understand the mechanistic pathway underlying the formation of the newly observed entity.Analytical characterization was performed using RP-HPLC coupled with high-resolution mass spectrometry. Chromatographic separation was optimized on a Hypersil C18 column (250 × 4.6 mm, 3 µm) employing a mobile phase system of 0.1% formic acid in water and acetonitrile at a flow rate of 0.7 mL/min, with UV detection at 280 nm. Asp-clipped eptifibatide eluted at 10.495 minutes, whereas the unknown impurity exhibited a markedly delayed retention at 40.125 minutes. The use of advanced reversed-phase silica significantly enhanced selectivity, resolution, recovery, and peptide loading capacity. Method validation demonstrated excellent linearity ($r^2$ = 0.9984), mean recovery of 97.5%, and complete absence of interference from excipients or solvent artifacts, meeting all ICH requirements.High-resolution MS analysis revealed a protonated ion at m/z 811.9619 corresponding to $C_{33}H_{42}N_{11}O_3S_2$. Structural interpretation confirmed the impurity as a dehydration product of asp-clipped eptifibatide formed under stability stress conditions.

**Keywords:** Eptifibatide, peptide impurity profiling, RP-HPLC, high-resolution mass spectrometry, degradation mechanism, stability-indicating analysis, ICH validation.

## SIMULTANEOUS ESTIMATION OF BENEDIPINE HCL AND NEBIVOLOL HCL IN BULK AND TABLET DOSAGE FORMS BY STABILITY INDICATING USING RP-HPLC

Malladi Srinivas Reddy, Chekkilla Geetha, Thallapalli Sushma
Department of Pharmaceutical Analysis, Vaageswari College of Pharmacy, Karimnagar, Telangana, India-505527.
msr.srinivas@gmail.com

ISBN: 978-81-980623-8-3

This study presents the development, optimization, and ICH-compliant validation of robust RP-HPLC methods for the quantitative estimation of Benidipine HCl and Nebivolol HCl, along with the structural identification of a newly observed impurity in eptifibatide. Chromatographic separation of both drugs was achieved on a Thermo C18 column using a methanol–$KH_2PO_4$ buffer mobile phase (30:70, pH 4.0) with detection at 219 nm. The method demonstrated excellent linearity over 4–12 µg/mL for Benidipine HCl and 5–15 µg/mL for Nebivolol HCl. Validation confirmed high accuracy (≈99–100%), precision (RSD <0.30%), and significant sensitivity (LOD 0.068 µg/mL). Forced-degradation studies showed complete separation of degradation products, establishing the method as a reliable stability-indicating tool for routine quality control.The second part of the investigation focused on the characterization of an unknown impurity detected in eptifibatide produced via a modified synthetic process. RP-HPLC coupled with high-resolution mass spectrometry enabled baseline separation of the impurity from asp-clipped eptifibatide. LC-MS analysis revealed a protonated ion at m/z 811.9619, corresponding to the molecular formula $C_{33}H_{42}N_{11}O_3S_2$. Structural analysis indicated that the impurity resulted from dehydration of asp-clipped eptifibatide under stability stress conditions. Overall, the method demonstrated excellent selectivity, resolution, and full compliance with ICH requirements, confirming its suitability for peptide impurity profiling.

**Keywords:** RP-HPLC, Benidipine HCl, Nebivolol HCl, eptifibatide impurity, high-resolution mass spectrometry, stability-indicating method, ICH validation.

## COMPARISON OF PHYTOCHEMICAL PROFILE IN ETHANOL EXTRACT AND CHLOROFORM FRACTION OF PAPAYA (CARICA PAPAYA L.) LEAF BY UV AND HPTLC METHODS

Sai Kiran Lakamasani [1], Gowri. R2, Manasvi Srikanth[1],
K Sundara Saravanan[2], Lakshmi M. Sundar[1]
[1] Department of Pharmaceutical Chemistry,
2 Department of Pharmacognosy,
Faculty of Pharmacy, M. S. Ramaiah University of Applied Sciences,
Bengaluru, Karnataka, India
lakshmipharmchem@gmail.com

Carica papaya has high nutritional and medicinal values in both traditional and modern health management. Among them, the most famous application is the role of papaya leaf extract for improving platelet level in dengue infected patients. Though alcoholic extract of papaya leaves has been studied widely for it therapeutic benefits, there are limited reports on its non-polar fractions. The objective of the present study was to prepare chloroform fraction from ethanol extract of papaya leaves and compare phytochemical profile by UV spectroscopic and HPTLC methods. UV spectroscopic analysis was carried out for determining total alkaloid content (TAC), total flavonoid content (TFC) and total phenolic content (TPC) equivalent to atropine, rutin and gallic acid standards respectively. CAMAG HPTLC system equipped with Linomat 5 applicator, CAMAG TLC scanner and Win CATS software was used for analysis of both ethanol extract and chloroform fraction of papaya leaves. Chloroform and methanol (7:3) were used as mobile phase on precoated TLC plate. The developed TLC plate was scanned at 366 nm followed by treatment with Dragendorff's reagent to detect alkaloid. Phytochemical analysis by UV spectroscopy showed that TAC (2.38 ± 0.34 mg/g), TFC (4.75 ± 0.05 mg/g) and TPC (2.63 ± 0.36 mg/g) was significantly higher in ethanol extract than those in chloroform fraction (TAC: 1.68 ± 0.43 mg/g, TFC: 1.15 ± 0.18 mg/g and TPC: 1.82 ± 0.14 mg/g). The HPTLC profile indicated variation in the number of spots detected for ethanol extract (three spots at Rf value of 0.02, 0.87 and 0.91) and chloroform fraction (four spots at Rf value of 0.04, 0.12, 0.86 and 0.90) of papaya leaves. The presence of additional peak at Rf = 0.12 could be due to the enrichment of alkaloid in chloroform fraction of papaya leaves.

**Keywords**: Carica papaya, ethanol extract, chloroform fraction, UV spectroscopy, HPTLC, alkaloid, flavonoid, phenolic content

## NETWORK PHARMACOLOGY AND MOLECULAR MODELING-BASED INVESTIGATION OF BIOACTIVE COMPOUNDS FROM CALOPHYLLUM INOPHYLLUM AGAINST NON-SMALL CELL LUNG CANCER

Manjushree B V[1], Gurubasavaraja Swamy Purawarga Matada[1]
Integrated Drug Discovery Centre, Department of Pharmaceutical Chemistry, Acharya & BM Reddy College of Pharmacy,
Bengaluru 560107, Karnataka, India
manjushreebv324@gmail.com

Calophyllum inophyllum is a tropical evergreen tree rich in bioactive compounds like coumarins and xanthones, which show significant anticancer potential by inducing apoptosis, inhibiting cell proliferation, and suppressing tumour growth in various cancer models. However, its mechanisms of action are unclear. In this study, we systematically explored the effects and mechanism of action of Calophyllum inophyllum using network pharmacology, molecular docking, and molecular dynamics simulation studies. Active compounds and targets of Calophyllum inophyllum were obtained from Swiss target prediction. Non-small cell lung cancer-related targets were retrieved from GeneCards and OMIM databases. A protein-protein interaction (PPI) network was built to screen the core targets. DAVID was used for GO and KEGG pathway enrichment analyses. The tissue and organ distribution of targets was evaluated. Interactions between potential targets and active compounds were assessed by molecular docking. A molecular dynamics simulation was conducted for the optimal core protein–compound complexes obtained by molecular docking. In total, 53 active compounds and their relative targets, along with non-small cell lung cancer-related targets, were identified. The number of common targets between Calophyllum inophyllum and NSCLC was 290. A topological analysis of the PPI network revealed the core targets. The GO enrichment analysis showed that the target genes were predominantly involved in metabolic and inflammatory biological processes, localised mainly in the mitochondria and cytoskeleton, and exhibited molecular functions related to kinase and oxidoreductase activities-suggesting a multifaceted mechanism potentially relevant to cancer regulation. Molecular docking and molecular dynamics simulations revealed a good binding ability between the active compounds and the screened targets.

**Keywords:** Calophyllum inophyllum, Anticancer, Network pharmacology, Docking

## EVALUATION OF ANTI-EGFR POTENTIAL OF NATURAL TERPENOIDS USING MOLECULAR DOCKING: AN *IN-SILICO* APPROACH

Manu Shree Mali Patil[1], Haripriya E[2],
Gurubasavaraja Swamy Purawarga Matada[3]
Acharya and BM Reddy College of Pharmacy,
Bengaluru-560107, Karnataka.
manupatil615@gmail.com

Breast cancer is characterized by the uncontrolled growth of cells in the milk ducts or lobules. Breast cancer is the second most common cancer worldwide with new cases (11.7%) and mortality rate (6.9%) on 2020. Among the different reported receptors, Human Epidermal Growth Factor Receptor (EGFR) is one of the potential targets for the breast cancer. Although number of small molecules reported as EGFR inhibitor. However, these are associated with diverse number of limitations (resistance, severe to moderate side effects). Therefore, there is a serious quest for searching the natural compounds as potential EGFR inhibitors. In this in-silico study, we have explored the terpenoids using pharmacoinformatic approach for the identification of active compounds against the EGFR. We have explored the Terokit data base and scrutinized the four molecules (C1, C2, C3, C4) after evaluating ADMET, pharmacokinetic, docking and pocket binding analysis. Crystal three dimensional structures of EGFR tyrosine kinase domain (PDB ID:1M17) was downloaded from RCSB PDB database and Molprobity Ramachandran analysis showed the favoured region (89.2%) and allowed region (97.8%) of EGFR. Finally, we observed that the compound C3 (-9.87) shows highest binding energy among the four compounds and compared with the commercially available antitumour drug 4-Hydroxytamoxifen (-8.36). The lead compound and 1M17 complex structural stability and dynamic behaviour were monitored with the help of molecular dynamic simulation using Gromacs. Results from our simulation revealed that our compound is more stable against the standard molecule for EGFR inhibition.

## GREEN SYNTHESIS OF SILVER NANOPARTICLES USING PLANT EXTRACTS: RECENT ADVANCES, MECHANISMS AND ANTIOXIDANT POTENTIAL

Md. Sarvar Pasha, R. Ramakrishna
Vaageswari Institute of Pharmaceutical Sciences,
Karimnagar, Telangana-505527
ambupasha@gmail.com

The synthesis of metal nanoparticles using plant extracts has emerged as a simple, economical, and environmentally sustainable method that avoids the use of toxic chemical reductants and stabilizers. Among various metal nanomaterials, silver nanoparticles (AgNPs) have gained significant attention due to their diverse applications in medicine, agriculture, and industry. In recent years, numerous ecofriendly and rapid synthesis approaches have been reported using aqueous extracts obtained from different plant parts, including leaves, roots, stems, bark, and fruits. These phytochemical-rich extracts act as natural reducing and capping agents, facilitating efficient nanoparticle formation under mild conditions. This review comprehensively highlights recent findings on the green synthesis of AgNPs, emphasizing the role of plant-derived biomolecules, optimization strategies, characterization techniques, and mechanisms of nanoparticle formation. Furthermore, the potential applications and antioxidant properties of plant-mediated AgNPs are discussed, showcasing their relevance in biomedical and therapeutic fields. Overall, green synthesis represents a promising, sustainable alternative to conventional methods for the production of silver nanoparticles.

The quantity of drugs and their metabolic constituents in plasmatic matrices is routinely determined in this article utilizing bioanalytical methods. Both clinical and non-clinical research should use these strategies. Bioanalytical procedures, which are used to quantitatively describe medicinal drugs and their constituents in a biological environment, are heavily relied on for the interpretation and evaluation of bioequivalence, pharmacokinetics, and toxicokinetic in conjunction. Bioanalysis' key tasks include technology development, validation, and sample evaluation. Determining the amount to which the material, environment, or operational variables can influence the analyte's estimate in the material from implementation to analysis necessitates a detailed evaluation of each stage of the process. The drug compounds present in the body can be identified using procedures such as liquid chromatography at high pressure (HPLC) or liquid chromatography at double mass spectrometry (LCMS MS). Every tool has advantages and disadvantages of its own. The bioanalysis of large molecules has primarily used gaseous chromatography, HPLC, and the LC/MS/MS method. Precision, reproducibility, accuracy, linearity, sensitivity, stability, and selectivity are some of the most commonly utilized metrics. In this review paper, we will cover information regarding the development and validation parameters of bioanalytical methods. This information in this article aids in quality assurance by determining the concentration of a medicine and its metabolite in a biological source.

**Keywords**: Analyte, Clinical and Non-Clinical Study, Method Development, Validation of Bioanalysis Techniques, Validation Parameters.

## NETWORK PHARMACOLOGY AND MOLECULAR DOCKING STUDIES OF PHYTOCONSTITUENTS OF PIPER BETLE ON TYPE 2 DIABETES MELLITUS

Mettu Omkar Bala Narasimha[1], T Durai Ananda Kumar[1]
[1] Department of Pharmaceutical Chemistry, JSS College of Pharmacy,
JSS Academy of Higher Education & Research,
Ooty, Nilgiris, Tamil Nadu, India 643001
24p07204@jssuni.edu.in

Type 2 Diabetes Mellitus is a multifactorial metabolic disorder characterized by insulin resistance, oxidative stress, and chronic inflammation. Piper betle is a medicinal plant employed here for network pharmacology and molecular docking approach to elucidate the multi-targeted therapeutic potential of Piper betle against Type 2 diabetes mellitus. Phytoconstituents of Piper betle were collected from IMPPAT data base and screened for drug-likeness and ADME properties through Swiss ADME. Potential targets were predicted using Swiss target prediction database and cross-referenced with Type 2 diabetes mellitus-associated genes through GENE Cards and OMIM database. Compound–target and protein–protein interaction (PPI) networks were constructed using STRING and Cytoscape. Gene Ontology (GO) and Reactome pathway enrichment analyses were performed to identify relevant biological processes and pathways. Molecular docking was conducted using Schrodinger suite 2025-2 to validate the interactions of key compounds with Type 2 diabetes Mellitus-related proteins. Cytoscape analysis of network among targets of phytoconstituents and genes of Type 2 diabetes mellitus identified 1-Triacontanol, 2-Undecanone, Arecoline, Beta-Caryophyllene, Piperitone, Safrole, Vitamin-E, Beta-sitosterol, Camphor, Cedrol, Chavibetol, Clionasterol, P-Methane-1,3-diol, Stearic acid, Decanal, Diosgenin, Eugenol, Iso-eugenol, Piperbetol, Retinol, Stigmasterol as major active compounds. Docking studies confirmed stable binding affinities of Piper betle phytoconstituents with AKT1, ESR1, STAT3 supporting their role in improving insulin sensitivity and reducing oxidative stress.The integrative evidence from network pharmacology and molecular docking highlights phytoconstituents of Piper betle as a promising candidate for the management of Type 2 diabetes mellitus

**Keywords:** Network pharmacology, Molecular docking, Piper betle, Type 2 diabetes mellitus.

## MOLECULAR DOCKING AND ADMET ANALYSIS OF THE MUNTINGIA CALABURA PLANT CONSTITUENT WITH MULTIPLE PHARMACOLOGICAL ACTIVITIES

N. Vasanth C. Saravanan
Department of Pharmaceutical Analysis, Aadhibhagawan College of Pharmacy, Rantham, Tiruvannamalai DT, Tamilnadu-604407
vasanthnithiyanandam@gmail.com

The identification of novel lead compounds from natural sources is paramount in modern drug discovery. This study employed a dual computational strategy that is *in silico* molecular docking followed by ADMET analysis to systemically evaluate the therapeutic potential of major phytochemicals isolated from Muntingia calabura L. Compounds including key triterpenoids and phenolic acids were screened against 14 established proteins that have been critical targets for seven major therapeutic activities: anti-thrombolytic, anti-oxidant, anti-inflammatory, anti-diabetic, hepatoprotective, COPD, and anti-cancer activities. Binding free energy was used to measure affinity, while drug-likeness rules and predictive toxicity models were used to assess pharmacokinetic property and safety. The docking phase identifies exceptional affinities, notably stigmasterol, b-sitosterol, kaempferol, oleanolic acid, etc., and shows high affinities for respective targets. Critically, the ADMET analysis revealed that the top-performing phytochemicals satisfy the majority of accepted drug-likeness filters and exhibit low-moderate probability for hERG inhibition and AMES mutagenicity. These findings conclude that the traditional use of Muntingia calabura positions its potent, druggable constituents as highly promising multi-target lead compounds for pharmacological development

**Keywords:** Muntingia calabura L., molecular docking, phytochemicals, ADMET analysis, anti-diabetic, anti-thrombolytic, anti-inflammatory, COPD, anti-cancer, anti-oxidant, hepatoprotective.

thakarenilesh730@gmail.com

Green Analytical Chemistry (GAC) is quickly changing how environmental analysis is done by helping labs have less of an impact on the environment as a whole. GAC encourages the use of safer solvents, smaller methods, and tools that use less power instead of chemical-heavy and energy-intensive methods. New methods like solid-phase microextraction (SPME), microfluidic systems, ionic-liquid extractions, and different types of spectroscopy have made it possible to use fewer reagents and make less waste. Scientists can now take accurate measurements on-site without having to move or handle samples a lot thanks to the development of portable sensors and field-based analytical tools. Greener chromatographic methods, especially those that use water-rich solvents or supercritical $CO_2$, help sustainability efforts even more. In general, GAC not only keeps up its high analytical performance, but it also helps the world reach its goals for protecting the environment, saving resources, and making labs safer. Environmental monitoring is getting cleaner, smarter, and more sustainable as more researchers use these methods.Looking ahead, the future of GAC will focus on fully automated, AI-driven analytical platforms that further cut down solvent use and energy demand. The integration of biodegradable materials in sample preparation and sensor fabrication is expected to make analytical workflows even more eco-friendly. As sustainability becomes a global priority, GAC will continue to evolve into a standard requirement rather than an optional practice in modern laboratories.

**Keywords:** Green Analytical Chemistry (GAC), solid-phase microextraction (SPME), ionic-liquid extractions, microfluidic systems, greener chrometographic methods.

## DESIGN AND SYNTHESIS OF THIAZOLO[5,4-B] PYRIDINE DERIVATIVES AS NOVEL DPP-4 INHIBITORS FOR TYPE 2 DIABETES MELLITUS

Ozair Alam, Mukund Jha
Medicinal Chemistry and Molecular Modelling Lab, Department of Pharmaceutical Chemistry, School of Pharmaceutical Education and Research, Jamia Hamdard, New Delhi-110062, India
oalam@jamiahamdard.ac.in

Type 2 diabetes mellitus (T2D) is a chronic and progressive metabolic disorder marked by impaired glucose regulation and insulin resistance, often necessitating therapeutic intervention through the modulation of incretin hormones via dipeptidyl peptidase-4 (DPP-4) inhibition. This study focused on the rational design, multi-step synthesis, and comprehensive *in vitro* evaluation of a novel series of thiazolo[5,4-b] pyridine derivatives as prospective DPP-4 inhibitors. The structural conformation of the synthesized compounds was confirmed utilizing standard spectroscopic techniques, including thin-layer chromatography (TLC), nuclear magnetic resonance 1H and 13C NMR) spectroscopy, and mass spectrometry. Molecular docking and dynamics simulations, conducted using the Schrodinger Maestro suite, revealed favorable binding affinities and stable interactions of several derivatives within the DPP-4 active site. Importantly, the *in vitro* fluorescence-based DPP-4 inhibition assay revealed that several newly synthesized derivatives displayed moderate to strong inhibitory potential, achieving up to 94.2% enzyme inhibition closely matching the 92.1% inhibition observed for the clinical standard, sitagliptin. Notably, three derivatives emerged as lead candidates, displaying superior docking scores and enzyme inhibition profiles. These findings underscore the pharmacological promise of thiazolo[5,4-b] pyridine scaffolds as potent DPP-4 inhibitors, further exploration through *in vivo* efficacy and pharmacokinetic studies. Collectively, this study establishes a foundation for the development of structurally optimized thiazolo[5,4-b] derivatives as next-generation antidiabetic therapeutics targeting DPP-4-mediated glucose regulation.

**Keywords:** Diabetes mellitus, synthesis, molecular docking, dynamics, DPP-4

## RAPID STABILITY-INDICATING RP-HPLC METHOD FOR SILODOSIN AND IMPURITY ANALYSIS

p.varshitha, B Poornima.
Department of Pharmaceutical Analysis, Vijaya Institute of Pharmaceutical Sciences for Women (VIPW), Vijayawada.
varshiivarshitha735@gmail.com

A rapid and robust reverse-phase high-performance liquid chromatography (RP-HPLC) method was developed and validated for the quantitative analysis of Silodosin and its related impurities in pharmaceutical dosage forms. Silodosin, an α1-adrenoceptor antagonist highly selective for the prostate, is used for the symptomatic treatment of benign prostatic hyperplasia (BPH). The chromatographic separation was achieved using a Waters HPLC system equipped with a UV detector, employing a mobile phase of acetonitrile and water (50:50 v/v) with a flow rate of 0.8 mL/min. The method was validated in accordance with ICH guidelines for key analytical parameters, including specificity, linearity, precision, accuracy, limit of detection (LOD), limit of quantification (LOQ), robustness, and degradation studies. The retention time of Silodosin was 2.252 min, enabling rapid determination. The method showed excellent linearity for Silodosin and its impurity over the concentration range of 1–6 µg/mL with correlation coefficients close to 0.999. LOD and LOQ values were found to be 0.03 µg/mL and 0.09 µg/mL, respectively, indicating high sensitivity. Forced degradation studies, including acid, base, oxidative, thermal, photolytic, and aqueous conditions, confirmed the stability-indicating nature of the method, with all degradation products well-resolved from the main peak. The assay of Silodosin in marketed formulations showed an average recovery of 100.85%, demonstrating the accuracy and reliability of the method. This validated RP-HPLC method is precise, rapid, cost-effective, and suitable for routine quality control, stability testing, and impurity profiling of Silodosin in bulk and finished pharmaceutical products.

**Keywords:** Silodosin, RP-HPLC, Method validation, Stability-indicating method, Impurity profiling, ICH guidelines.

p25977@gmail.com

Many first-line and second-line medications have been proven to be ineffective in treating multi-drug-resistant tuberculosis (MDR-TB). Using Dimethylaminopyridine aminopyridine (DMAP) as a base and Di cyclohexyl carbodiimide (DCC) as coupling agents, 2-amino benzothiazoles was reacted with with various (2E)-3-phenylprop-2-enoic acids to synthesize (2E)-N-(1,3-benzothiazol-2-yl)-3-phenylprop-2-enamide. These compounds were evaluated for their anti-tubercular activity against the Mycobacterium tuberculosis H37Rv strain by the Microplate Alamar Blue assay (MABA) method. (2E)-N-(1,3-benzothiazol-2-yl)-3-phenylprop-2-enamide derivatives with 4-bromo (CH-03), 4-nitro (CH 06), 4-hydroxy (CH 09), 3-chloro (CH 10), 2,4,6-trimethoxy (CH-15), and 4-methyl (CH 12) substituted cinnamic acids exhibited good anti-tubercular activity. CH-12 and CH-15 (MIC 1.6 µg/ml), CH-10 (MIC 3.12 µg/ml), and CH-09, CH-06, and CH-03 (MIC 6.25 µg/ml). All synthesized compounds complied with the Lipinski rule of five and, from the QikProp analysis, showed drug-likeness properties. Through this study, it was proved that synthesized analogues could serve as leads for further development as antitubercular agents.

**Keywords**: Mycobacterium tuberculosis H37Rv strain, antituberculosis activity, (2E)-N-(1,3-benzothiazol-2-yl)-3-phenylprop-2-enamide.

## EMERGING ROLE OF AMINO ACID CONJUGATION IN MULTI-TARGET DRUG DESIGN FOR ALZHEIMER'S DISEASE

Pranali Darro, Lokesh Thote, Jagdish Baheti
Kamla Nehru College of Pharmacy (RTMNU) Butibori, Nagpur, Maharashtra-441108
pranalidarro459@gmail.com

ISBN: 978-81-980623-8-3

Alzheimer's disease (AD) is a progressive neurodegenerative disorder affecting over 50 million individuals worldwide, characterized by amyloid-β (Aβ) aggregation, tau hyperphosphorylation, cholinergic deficits, oxidative stress, mitochondrial dysfunction, and neuroinflammation. Current therapies, including acetylcholinesterase (AChE) inhibitors (e.g., donepezil) and NMDA receptor antagonists (e.g., memantine), provide only symptomatic relief, limited by poor blood-brain barrier (BBB) permeability, short half-life, and systemic toxicities such as gastrointestinal irritation. To address these challenges, amino acid and dipeptide conjugation has emerged as a promising and innovative strategy in drug design. These conjugates enhance solubility, metabolic stability and BBB penetration via endogenous transporters (e.g., LAT1, PEPT1/2), as well as multi-target-directed ligand (MTDL) properties, while imparting synergistic neuroprotective or antioxidant effects from amino acids such as tryptophan, tyrosine, or cysteine. This review focuses on recent advancements in drug conjugates, particularly those based on ibuprofen, donepezil, curcumin, and resveratrol, which function as multi-target drugs with enhanced absorption and efficacy. We discuss these drugs, including their design, their impact on the body, their application in treating Alzheimer's, and the contribution of computer modeling in their development. We also cover challenges like stability and moving from lab research to clinical use, as well as future directions such as using artificial intelligence, eco-friendly chemistry, and nanotechnology. By combining new delivery methods with multi-target strategies, amino acid and dipeptide conjugates could change how Alzheimer's is treated in the future.

**Keywords**: Alzheimer's disease, amino acid conjugation, dipeptide conjugates, multi-target-directed ligands, blood-brain barrier, prodrugs, molecular docking, drug delivery.

## SYNTHESIS CHARACTERIZATION AND PRE-CLINICAL EVALUATION OF TRANSFERRIN CONJUGATED PH SENSITIVE EPIRUBICIN FOR BREAST CANCER TREATMENT

Pranav Ragavendra Shankar, Gayathri Kumararaja
Department of Pharmaceutics, JSS College of Pharmacy, Ooty, 643001
Faculty of Pharmacy, Karpagam Academy of Higher education, Coimbatore, 641021
pranavragavendra007@gmail.com

The development of targeted and stimuli-responsive drug delivery systems remains a pivotal strategy to enhance therapeutic efficacy and mitigate systemic toxicity in breast cancer management. This study reports the synthesis and comprehensive characterization of a novel transferrin-conjugated, pH-sensitive epirubicin nanoparticle formulation engineered for precision targeting of breast cancer cells. Conjugation with transferrin leverages the high affinity and elevated expression of transferrin receptors on malignant breast tumors, facilitating receptor-mediated endocytosis and selective intracellular delivery. The pH-sensitive design ensures preferential epirubicin release within the acidic tumor microenvironment, substantially improving drug bioavailability at the target site while minimizing off-target effects. Physicochemical characterization revealed optimal particle size, surface charge, and stability, confirming nanoparticle suitability for systemic administration. *In vitro* evaluations demonstrated enhanced cellular uptake, superior cytotoxicity against breast cancer cell lines, and minimal toxicity to normal cells versus free epirubicin. *In vivo* preclinical studies in breast cancer xenograft models exhibited pronounced tumor growth inhibition, improved pharmacokinetic profile, and reduced cardiotoxicity, underscoring the translational potential of this nanomedicine. This work exemplifies how biomolecule-guided, environment-responsive drug delivery can revolutionize breast cancer therapy by improving the therapeutic index and patient outcomes. The integration of receptor targeting with microenvironment-triggered release offers a promising platform for the next generation of oncologic nanomedicines.

**Keywords:** Breast Cancer, Drug Targeting, Transferrin Conjugation, stimuli-responsive drug delivery systems

## DESIGN AND SYNTHESIS OF 1,3,4-OXADIZOLE-2-THIONE ANALOGUES AS ANTICANCER AGENTS

Preeti Patel, Balak Das Kurmi
Department of Pharmaceutical Chemistry,
ISF College of Pharmacy, Moga, Punjab, India, 142001
ppatelpharma@gmail.com

Cancer is characterized by uncontrolled cell proliferation, apoptosis evasion, angiogenesis, and metastasis, and it is known to be a leading cause of death. As a result, there is an urgent need for the development of new and efficient chemotherapeutic drugs. In this regard, the wide range of biological properties of 1,3,4-oxadizole-2-thione, a heterocyclic scaffold, has gained interest in medicinal chemistry. The present study used a rational drug design approach to create and develop several 1,3,4-oxadiazole-2-thione analogues as possible anticancer drugs. The design approach is based on improving lipophilicity and binding affinity by structural modification. The objective of this study is to synthesize a series of 1,3,4-oxadiazole-2-thione analogues and to explore the anticancer activity and selectivity. Several compounds showed potent antiproliferative activity as compared to the standard drug when their *in-vitro* cytotoxic potential was assessed against different human cell lines. This research contributes to the development of potent and targeted 1,3,4-Oxadizole-based anticancer drugs by establishing a correlation between chemical structure and anticancer activity. It was discovered that adding thione (-C=S) to oxadiazole enhanced biological activity and target interaction. According to these findings, 1,3,4-oxadiazole-2-thione derivatives have shown great potential as a scaffold for future research into effective anticancer drugs.

**Keywords:** 1,3,4-oxadizole-2-thione, Anticancer drugs, SAR, In-silico studies.

## DOCKING DRIVEN DRUG REPURPOSING FOR ALZHEIMER'S DISEASE

Preeya Negi, Vandana Patravale
Department of Pharmaceutical Sciences and Technology, Institute of Chemical Technology, Mumbai 400019, Maharashtra, India
negipreeya2024@gmail.com

According to the Alzheimer's Association, more than 4 million people suffer from dementia in India. Alzheimer's disease (AD) is the predominant type of dementia (~75% cases). While a cure for AD remains elusive, the U.S. Food and Drug Administration (USFDA) has approved drugs that reduce symptoms progression. Many drugs that have been evaluated for the AD, failed in clinical trials owing to a lack of efficacy or toxicity issues. To explore novel treatments for AD, a repurposing approach was considered. Based on the most reported targets for AD in the literature, 5 targets were selected with PDB IDs 4EY7 (AChE), 2MZ7 (Tau), 8GRX (ApoE4), 5I2K (NMDA), and 7D8X (gamma-Secretase). The ligand dataset (2118 drugs) was taken from the e-Drug3D dataset of USFDA-approved. The ligand dataset was docked against 4EY7.pdb because acetylcholinesterase is the most explored target for AD, which led to the selection of 47 better drugs (-13.5 kCal/mol to -11.7 kCal/mol) than the standard drug donepezil (-11.7 kCal/mol). Molecular docking of the selected drugs against the remaining four targets led to selection of three model drugs with binding affinity values in kCal/mol as Drug-A (4EY7: -13.2, 2MZ7: -6.6, 8GRX: -7.5, 5I2K: -8.9, and 7D8X: -12.0), Drug-B (4EY7: -12.7, 2MZ7: -7.0, 8GRX: -8.3, 5I2K: -10.0, and 7D8X: -12.0), and Drug-C (4EY7: -12.4, 2MZ7: -6.9, 8GRX: -7.3, 5I2K: -9.6, and 7D8X: -10.0) which were better than their respective standard drugs. Further research would be undertaken to reduce the rejection of the API in clinical trials, the physicochemical properties of the selected drugs will be modified.

**Keywords:** AD, Molecular Docking, Donepezil,

**CH-483**

## NETWORK PHARMACOLOGY AND COMPUTATIONAL STUDIES OF ANNONA GLABRA L. PHYTOCHEMICALS TARGETING PROSTATE CANCER

Priyadharshini Selvaraj, Praveen Sekar, enthil Kumar Raju
Department of Pharmaceutical Chemistry,
Swamy Vivekanandha College of Pharmacy,
Tiruchengode, Namakkal, Tamil Nadu, India – 637205.
priyajeni741@gmail.com

Prostate cancer is the most frequently diagnosed cancer globally and ranks as the sixth leading cause of cancer-related mortality among men. Annona glabra L is a medicinal plant, which is widely used in ayurvedic and siddha medicines for the treatment of various ailments. It contains N-Methylactinodaphnine, reticuline, anonine, anolobine, asimilobine,

ISBN: 978-81-980623-8-3

atherospermidine, isoboldine, liriodenine, (-) N-nornuciferine and norushinsunine. In this study, we examined the effectiveness of the metabolites derived from this plant against prostate cancer, utilizing a network pharmacology approach. The phytochemicals were obtained from various sources including IMPPAT, Dr. Duke's Phytochemical and Ethnobotanical database. The physicochemical, pharmacokinetic, and toxicity profiles of the retrieved phytochemicals were forecasted using the SwissADME, ProTox 3.0, and CardioTOXCSM web servers. The OSIRIS property explorer was utilized to predict the drug likeness and drug score of the compounds. To illustrate the anticancer mechanism of the developed compounds, an analysis of Gene Ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment was conducted utilizing the intersecting genes that exhibited differential expression. The suitable targets of the phytochemicals were predicted through network modelling, which indicated that they are likely to exhibit significant activity against prostate cancer, specifically STAT3, ESR1, MAPK1 and HIF1A. The biological efficacy of the compounds against the chosen molecular targets was assessed through molecular docking studies, Discovery Studio visualizer and the prankweb webserver were utilized. From the diverse computational analysis and drug evaluations, the results indicated that the compounds Abietal, (+)-norisodomesticine, (7,7-dimethyl-1,4-dioxo-2,3,4,5,6,7-hexahydro-1H-inden-2-yl) acetic acid, and Methyleugenol exhibited significant activity with better binding energies and interaction characteristics against the evaluated targets. From this, we conclude that these compounds are effectively utilized in the management of prostate cancer. However, further in vitro and in vivo studies are warranted.

## MECHANISTIC EXPLORATION OF POLYHERBAL DECOCTION IN ENDOMETRIOSIS VIA COMPUTATIONAL NETWORK PHARMACOLOGY AND DOCKING STUDIES

Pushpaveni C[1,2], Subhash S Karki[1], Sneha Wali[1]
Department of Pharmaceutical Chemistry, KLE College of Pharmacy, Rajajinagar, Bengaluru-560010 and KLE Academy of Higher Education and Research, Belagavi Karnataka-590010, INDIA.
Department of Pharmaceutical chemistry, Institute of Pharmacy PES University, Electronic city campus, Hosur Road Bengaluru, Karnataka-560100, INDIA.
pushpavenic@klepharmblr.org

Endometriosis is a multifactorial, estrogen-dependent gynecological disorder characterized by chronic inflammation, oxidative stress, aberrant angiogenesis, and hormonal dysregulation, which collectively contribute to pelvic pain and infertility. Conventional therapeutic options remain limited by partial efficacy and undesirable adverse effects, underscoring the need for safer, multi-target strategies. The present study investigated the mechanistic basis of a polyherbal decoction composed of Curcuma longa (turmeric), Withania somnifera (ashwagandha), Mentha piperita (peppermint), Zingiber officinale (ginger), Camellia sinensis (green tea), Arachis hypogaea (peanuts), Glycine max (soybeans), Allium sativum (garlic), Vitis vinifera (grapes), and Salvia hispanica (chia seeds) using an integrative computational approach. Phytoconstituents were retrieved from IMPPAT databases, subjected to drug-likeness and ADMET screening, and their potential targets predicted via SwissTargetPrediction. Disease-associated genes were collated from GeneCards and DisGeNET, followed by construction of a protein–protein interaction network in STRING and topological analysis in Cytoscape to identify hub targets. Functional enrichment revealed significant modulation of estrogen signaling, NF-κB, TNF, IL-17, VEGF, and PI3K-Akt pathways, which are central to endometriosis pathophysiology. Key bioactive compounds, including curcumin, withaferin-A, epigallocatechin gallate, resveratrol, genistein, allicin, and quercetin, demonstrated strong binding affinities with pivotal proteins such as ESR1, TNF, IL6, VEGFA, and AKT1 in molecular docking analyses by using Autodock 4.0. Collectively, these findings suggest that the polyherbal decoction exerts its therapeutic potential through synergistic, multi-target modulation of interconnected biological networks, thereby offering a promising systems-level intervention for endometriosis. Further *in-vitro* and in-vivo investigations are warranted to substantiate these computational predictions and establish translational relevance.

**Keywords:** Endometriosis, Polyherbal decoction, Network pharmacology, Molecular docking, Multi-target therapy

## DISCOVERY OF A NOVEL PRODIGIOSIN-PRODUCING SERRATIA MARCESCENS JSSCPM1: ISOLATION, CHARACTERIZATION, AND ANTIBACTERIAL INSIGHTS

Rajaguru Arivuselvam, Raman Rajeshkumar
[a]Department of Pharmaceutical Biotechnology, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Sri Shivarathreeshwara Nagar, Mysore 570015, KA, India.
arajaguru@jssuni.edu.in

Prodigiosin, a red bioactive pigment with remarkable medicinal potential, was isolated from a newly identified bacterial strain, Serratia marcescens JSSCPM1. The compound was purified and characterized using UV–visible spectroscopy, high-performance liquid chromatography (HPLC), liquid chromatography–mass spectrometry (LC–MS), and nuclear magnetic resonance (NMR) spectroscopy. Structural elucidation confirmed the identity of the isolated compound as prodigiosin, consistent with previously reported data.The antibacterial activity of prodigiosin was assessed against Gram-positive and Gram-negative bacteria. The compound exhibited stronger inhibition against Gram-negative strains, with a minimum inhibitory concentration (MIC) of 15.9 ± 0.31 µg/mL recorded against Escherichia coli NCIM 2065. *In silico* molecular docking studies were performed to explore interactions between prodigiosin and OmpF porin proteins (PDB IDs: 4GCS, 4GCP, and 4GCQ), which serve as key antibiotic targets. The docking results indicated that prodigiosin has strong binding affinity toward these proteins, supporting its antibacterial potential.

**Keywords:** Serratia marcescens; JSSCPM1 strain; prodigiosin; OmpF porin protein; antibacterial agent; *in silico* molecular docking

## LIGAND BASED DESIGN OF THIAZOLIDINEDIONE FUSED WITH QUINOLINE AS PROMISING HYPOGLYCEMIC AGENTS

Ravikumar A, Naga prashant Koppuravuri, M Nagendra babu
Department Of Pharmaceutical Chemistry, Faculty of Pharmacy, Sri Adichunchanagiri College of Pharmacy, Adichunchanagiri University, B G Nagara-571448
ravi.pharma.research@gmail.com

Diabetes mellitus (DM) is a group of chronic metabolic disorders characterized by high blood sugar levels due to insufficient insulin production or cellular resistance to insulin.There is a growing need for safer and more effective drug candidates that target underlying disease mechanisms. Thiazolidinediones (TZDs), known PPARγ agonists, show antidiabetic, anti-inflammatory, antimicrobial, and anticancer activities, with pioglitazone and rosiglitazone as approved drugs. Quinoline, an important aromatic heterocycle, exhibits diverse activities including antimalarial, anti-inflammatory, antioxidant, and antidiabetic effects, making it a valuable scaffold in drug design. To design, synthesize, and evaluate thiazolidinedione derivatives fused with quinoline as potential hypoglycemic agents. Ligand-based design of structural analogs of thiazolidinedione fused with quinolines.Synthesis of planned derivatives using conventional and microwave methods. Characterization of synthesized compounds using IR spectral studies. *In vitro* hypoglycemic activity screening using α-amylase activity inhibition. The designed analogs were evaluated using structural similarity analysis, PASSOnline activity prediction, and molecular docking against pancreatic α-amylase. Quinoline intermediates and thiazolidinedione were synthesized using Vilsmeier–Haack and reflux methods, respectively, followed by microwave-assisted condensation to obtain the final compounds. Product formation was confirmed through TLC and IR spectroscopy. Novelty screening confirmed all four designed analogs (IVa–IVd) as new structures, with PASSOnline predicting notable antidiabetic potential (Pa = 0.650–0.709). Molecular docking showed good binding to pancreatic α-amylase, with IVc displaying the best affinity (–9.1 kcal/mol). The synthesis yielded quinoline intermediates (71%), thiazolidinedione (89%), and final products IVa and IVb (87%). IR spectroscopy confirmed the expected functional groups in the synthesized. These findings highlight the potential of the synthesized compounds, particularly IVb, as effective antidiabetic agents. Further studies, including *in vivo* evaluations and clinical trials, are recommended to fully establish their

ISBN: 978-81-980623-8-3

therapeutic efficacy and safety. Additionally, the use of both conventional and microwave synthesis methods underscores the versatility and efficiency of the synthetic approaches employed.

**Keywords:** Thiazolidinedione, Quinoline, Hypoglycemic Agents, α-Amylase Inhibition, CADD, AutoDock

## *IN-SILICO* AND *IN-VITRO* STUDIES ON SUBSTITUTED 2-METHYL BENZIMIDAZOLE DERIVATIVE AS POSSIBLE ANTI-FUNGAL AGENTS

Rosella Anushka Rodrigues, Prachita Pramod Gauns Dessai
Department Of Pharmaceutical Chemistry, PES'S Rajaram and Tarabai Bandeker College of Pharmacy, Ponda, India -403401
rosellarodrigues3002@gmail.com

The current research work deals with the computational evaluation of antifungal activity of the designed heterocyclic aromatic compounds containing 2-methyl benzimidazole nucleus using Molegro Virtual Docker (MVD) software and by conducting ADME studies. The most potent compounds are synthesised. All the synthesised compounds were characterised by chemical tests and by using IR, NMR and mass spectroscopic data. Molecular docking studies of the title compounds were carried out using molegro virtual docker softwareAll the synthesised compounds were found to be more potent than the standard, benzimidazole (-65.925) and clotrimazole (-108.819). Compound 1-((2-(2,4 dinitrophenyl)hydrazono)(4-nitrophenyl)methyl)-2-methyl-1H-benzo[d]imidazole (IIIb3) with MolDock score of -168.853 showed highest binding affinity and was found to be the most potent amongst all the synthesised compounds and showed better results than the active ligand 18H_202[A](-145.783). All the synthesised compounds also showed good ADME profile.*In vitro* antifungal activity was performed on the synthesised compounds against candida albicans using clotrimazole as the standard drug. Amongst all the synthesized compounds, (Z)-1-((2-(2,4-dinitrophenyl)hydrazono)(4-nitrophenyl)methyl)-2-methyl-1H-benzo[d]imidazole (IIIb3) was found to be the most potent as it showed zone of inhibition 38mm in comparison to clotrimazole which showed 10mm.

**Keywords:** 2-Methyl benzimidazole, Clotrimazole, Spectroscopic analysis, Molecular docking studies, Antifungal activity.

## QUANTUM CHEMISTRY METHODS FOR ESTIMATING NUCLEOPHILICITY AND ELECTROPHILICITY OF TLR-4 MODULATORS IN THE TREATMENT OF DIABETIC WOUNDS: A COVALENT DOCKING APPROACH

Sagarkanta Mohanty, Srikanth Jupudi
JSS College of Pharmacy, Ooty
sagarkantamohanty2001@gmail.com

Diabetic wounds are slow healing wounds characterized by disordered healing processes, which has characteristics of an abnormal and unresolved inflammatory response, which is primarily brought on by abnormal macrophage innate immune signaling activation. The overwhelmed infiltration of pro-inflammatory macrophages leads to elevated pro-inflammatory cytokines and further mediates pathological events of impaired diabetic wound healing. Toll-like receptor 4 (TLR4) plays a pivotal role in the inflammatory signaling cascade, making it an attractive therapeutic target.The current study aims to identify potent modulators of Toll Like Receptor-4 (TLR-4) employing covalent docking method and ADMET studies to streamline drug discovery.β methyl umbelliferone derivatives have a prominent effect in anti-inflammatory activity as it downregulates the TLR-4 activity by which the expression of pro-inflammatory cytokines such as IL-6, TNF-α and IL-1β will reduce. We have designed some β methyl umbelliferone to check their binding affinity against TLR-4 (PDB: 3FXI) by Covalent docking studies using Schrodinger suite 2021-22. EsNuEl for estimating nucleophilicity and electrophilicity. DFT study used for analysis of the stability of the designed compounds.Covalent docking studies revealed a strong ligand binding affinities at residues Cys133 with significant Cdock score and MMGBSA dG Bind scores when compared to the standard drugs. DFT results supported the molecules stability and reactivity profiling.The identified covalent antagonists show potential as TLR-4 antagonist, providing a foundation for further validation and contributing to advancement for the effective treatment of Diabetic Wounds through computational drug discovery approaches.

**Keywords:** Diabetic wounds, Toll like receptor-4, Cdock, EsNuEl

## *IN SILICO* INVESTIGATION OF SULPHONAMIDE-CHALCONE DERIVATIVES FOR ANTICANCER ACTIVITY

Sanjana C. Sahu, Disha Dhabarde, Jagdish Baheti
Kamla Nehru College of Pharmacy (RTMNU)
Butibori, Nagpur Maharashtra-441108
sanjanasahu671@gmail.com

Sulphonamide–chalcone hybrids have gained attention as potential anticancer molecules due to their capacity to interact with multiple molecular pathways implicated in tumor growth. In the present work, in-silico evaluation of newly designed sulphonamide–chalcone derivatives aimed at targeting major oncogenic proteins involved in breast and colorectal cancers. Molecular docking studies performed against HER2, EGFR, and CDK4/6 revealed that several compounds demonstrated notable binding affinities ranging from –7.8 to –9.1 kcal/mol, surpassing the reference drug 5-fluoro uracil (–8.3 kcal/mol). These derivatives formed stable hydrogen bonds and hydrophobic interactions within the receptor active sites, suggesting strong inhibitory potential. Complementary ADMET analyses predicted good absorption, distribution, metabolic stability, and minimal toxicity, indicating favorable drug-likeness. The synergistic presence of sulphonamide and chalcone pharmacophores appears to enhance biological performance while providing structural flexibility for further optimization. This study highlights the effectiveness of integrating molecular docking with computational pharmacokinetic profiling to support early-stage lead discovery. Overall, the findings suggest that sulphonamide–chalcone hybrids represent promising multi-target anticancer candidates that merit further experimental validation. The research offers useful guidance for the rational development of safer and more effective therapeutic agents for breast and colorectal cancer management.

## DESIGN, SYNTHESIS AND BIOLOGICAL EVALUATION OF OXIME DERIVATIVES WITH ANTIMICROBIAL, ANTI-INFLAMMATORY, ANTICONVULSANT AND ANTICANCER ACTIVITIES

S S Gohulram, Priya M S
[1]Department of Pharmaceutics, JSS College of Pharmacy, ooty, JSS Academy of Higher Education and Research, Mysuru, India – 643001
drx.gohulram@gmail.com

Oxime derivates are the versatile class of compounds known to have wide spectrum of Pharmacological activities including Antimicrobial, Anti-inflammatory, Anticonvulsant and Anticancer activities. Our present research study aims to derive the derivatives of oxime which are synthesised from isatin, anthraquinone and quinoxaline scaffolds through a systemic synthetic routes. The chemical structure of the synthesised compounds were confirmed by the physicochemical characterization and spectral analysis including IR, NMR and MS. Once after the confirmation the compounds were subjected for a biological evaluation. Acute oral toxicity studies has confirmed the safety of the derivatives at the tested doses. Several compounds has exhibited significant anti-inflammatory and anticonvulsant activities in in-vivo. Moreover, two compounds exhibited a strong promising anticancer potential against MCF–7 Breast cancer cell line in MTT Assay and antibacterial activity against both Gram Positive and Gram-Negative bacteria and two of the other compounds also demonstrated a notable antifungal activity. Overall, our entire research study concludes that oxime derivatives may serve as a promising lead molecule for drug discovery with various therapeutic applications.

**Keywords:** Oxime Derivatives, Synthesis, Antimicrobial, Anti-inflammatory, Anticonvulsant and Anticancer activities.

**CH-491**

## DESIGN, SYNTHESIS, CHARACTERIZATION, *IN-SILICO* MODELLING, AND BIOLOGICAL EVALUATION OF COUMARIN-BENZIMIDAZOLE DERIVATIVES FOR THEIR POTENTIAL ANTICANCER, ANTIOXIDANT, AND ANTI-INFLAMMATORY PROPERTIES

Sejal Jalmi, Soniya Phadte
Department of Pharmaceutical Chemistry, PES's Rajaram and Tarabai Bandekar College of Pharmacy, Ponda, Goa, India- 403401.
sejaljalmi2962@gmail.com

ISBN: 978-81-980623-8-3

The present research focuses on the design, synthesis, characterization, in-silico modelling, and biological evaluation of a novel series of compounds, 3-(1H-benzo[d]imidazol-2-yl)-7-(substituted alkoxy)-4-methyl-2H-chromen-2-one [IV (1–10)], for their potential anticancer, antioxidant, and anti-inflammatory properties. The synthetic route involves preparation of substituted 7-Hydroxy-4-methyl-2H-chromen-2-one from resorcinol and ethyl acetoacetate, which is further reacted with different alkyl halides to yield 7-(substituted alkoxy)-4-methyl-2H-chromen-2-one [II (1-10)]. Subsequent formulation was carried out using POCl3 and anhydrous N, N-DMF to obtain 7-(substituted alkoxy)-4-methyl-2-oxo-2H-chromene-3-carbaldehyde [III (1-10)], which then further undergo final cyclization with o-phenylenediamine in solvent free condition to obtain the target compounds 3-(1H-Benzo[d]imidazol-2-yl)-7-(substituted alkoxy)-4-methyl-2H- chromen-2-one [IV (1-10)]. Out of seventeen designed molecules, 10 were selected for synthesis based on favourable MolDock scores obtained from molecular docking studies. Structural confirmation of the synthesized compounds was achieved through IR, 1H-NMR, 13C-NMR, and mass spectrometry. Docking studies against the AKT receptor domain (PDB ID: 3QKK) for anticancer activity revealed that all selected compounds established significant hydrogen bonding and polar interactions within the active site. ADMET predictions confirmed that all synthesized compounds adhered to Lipinski's Rule of Five, indicating good drug-like properties with acceptable ranges for molecular weight, hydrogen bond donors and acceptors, lipophilicity, and solubility. Toxicity assessment classified all compounds in Class IV based on $LD_{50}$ values ranging between 300–2000 mg/kg, suggesting moderate toxicity. To conclude, the synthesized coumarin-benzimidazole derivatives exhibited promising anticancer, anti-inflammatory, and antioxidant potential, supported by both computational and experimental data, making them suitable candidates for further development in therapeutic research.

**Keywords:** Coumarin-Benzimidazole, Anticancer, Anti-inflammatory, Antioxidant, Molecular docking studies.

## IDENTIFICATION OF NATURAL ORIGIN RHO KINASE INHIBITORS TARGETING TRIPLE-NEGATIVE BREAST CANCER METASTASIS VIA VIRTUAL SCREENING, ADMET PROFILING, MM-GBSA, DFT, AND MOLECULAR DYNAMICS SIMULATIONS

Krishna Shevate, Kalirajan Rajagopal
Department of Pharmaceutical Chemistry, JSS College of Pharmacy,
JSS Academy of Higher Education & Research,
Ooty 643001, The Nilgiris, Tamil Nadu, India.
krishnashevate@gmail.com

Triple-negative breast cancer (TNBC) is a very aggressive subtype of breast cancer, associated with reduced survival rates and over 90% of mortality resulting from metastasis. Rho-associated coiled-coil kinase (ROCK) is pivotal in the development of TNBC through its regulation of cellular motility and invasion. This research aims to identify novel natural ROCK inhibitors that may prevent metastasis in TNBC, utilizing an in-silico drug development methodology. The Coconut database, including 123,971 phytochemicals, was employed for virtual screening. Additional pharmacokinetic and pharmacodynamic characteristics were predicted using the SMARTCyp web server and the Schrödinger suite QikProp module. The highest-ranking hits were next analyzed by MM-GBSA binding free energy calculations, DFT assessment for electronic property evaluation, and MD simulations to evaluate the structural stability and dynamic behavior of the docked complexes. Natural compound (CNP0115371) was projected to demonstrate significant ROCK binding affinity, ADMET characteristics, and stable interaction patterns. DFT studies indicated significant chemical reactivity and electron distribution conducive to biological interaction. MD simulations validated persistent P-L interactions during the MD trajectory, corroborating the compounds' potential as ROCK inhibitors. The research found naturally derived chemicals as possible ROCK inhibitors with anti-metastatic significance for TNBC therapy. These discoveries require more experimental validation to verify their therapeutic effectiveness and to create new anti-TNBC medicines derived from natural sources.

**Keywords:** TNBC, Rho kinase, Density functional theory, molecular dynamics

**CH-493**

## METHOD DEVELOPMENT AND VALIDATION FOR THE SIMULTANEOUS ESTIMATION OF PAROXETINE AND CLONAZEPAM IN PHARMACEUTICAL FORMULATIONS BY THERMOSIL RP C18

Sirishasanthoshpandula
Department of Pharmaceutical Analysis, Max institute of Pharmaceutical Sciences, Khammam. Telangana, India 507318
sirishalinganaboina@gmail.com

Chromatographic parameters were optimized to develop HPLC methods for individual drugs and for simultaneous estimation of combined dosage forms of Paroxetine and Clonazepam in pharmaceutical formulations with short analysis time with acceptable resolution. In the present study a simple, rapid, accurate and robust HPLC method was developed for the estimation of Paroxetine and Clonazepam in their pharmaceutical formulations. The optimum detection wavelength for Paroxetine and Clonazepam combination was 255nm. The mobile phase optimized for Paroxetine alone and Paroxetine and Clonazepam combination consists of Methanol and disodium hydrogen phosphate buffer of pH 3.5 in the ratio of 45:55. The mobile phase optimized for Clonazepam alone was ammonium formate buffer of pH 3 and acetonitrile in the ratio of 67:33 v/v. Columns finalized for individual drugs are Paroxetine and Clonazepam Thermosil RP C18 (4.6*150mm) 5µm were used as stationary phases. The solutions were chromatographed at a constant flow rate of for Paroxetine alone and Paroxetine+ Clonazepam combination the flow rate was found to be ideal at 0.7ml/min and for Clonazepam alone the flow rate selected was 0.8ml/min. Linearity was set up over the focus scope of 10ppm to 50ppm for Paroxetine, 15ppm to 75ppm for Clonazepam and Correlation coefficient was seen as 0.999. The mean % Recovery for Paroxetine bulk drug it was found to be 99.07%, 99.87% and 100.22% respectively and for Clonazepam it was found to be 99.41%, 100.02% and 99.67% respectively are within the limits. The mean percentage recovery for Paroxetine and Clonazepam combination at 50%, 100% and 150% levels were found to be 99.64%, 100.04% and 99.89% respectively for Paroxetine and 99.57%, 99.78% and 99.83% respectively for Clonazepam and are within the limits. The LOD value obtained for Paroxetine and Clonazepam combination is 2.951 for Paroxetine and 2.878 for Clonazepam and the LOQ result obtained is 9.902 for Paroxetine and 9.731 for Clonazepam.The percentage purity of Paroxetine and Clonazepam combination was found to be 98.62% for Paroxetine and that of Clonazepam was found to be 99.60%

**Keywords:** Paroxetine, Clonazepam Assay, RP-HPLC, Validation

## DESIGN, SYNTHESIS AND CHARACTERISATION OF NOVEL SUBSTITUTED BENZIMIDAZOLE DERIVATIVES AS PROMISING ANTI BACTERIAL AGENTS

Siya D Naik, Sahili S Naik
Department of Pharmaceutical Chemistry,PES's Rajaram and Tarabai Bandekar College of Pharmacy, Ponda, Goa, India-403401.
siyanaik1964@gmail.com

The current research work deals with the synthesis of various heterocyclic aromatic compounds containing benzimidazole nucleus and characterisation by IR, NMR and mass spectroscopic data and computational evaluation of their antifungal activity using molegro virtual docker (MVD) software. The sequence of reactions involves condensation of phenylenediamine with 4-amino benzoic acid to give 4-(1H-benzo(d)imidazole-2-yl)-N-benzylideneaniline(I) in the presence of O-phosphoric acid, which further on reaction with substituted aldehyde along with methanol and glacial acetic acid forms substituted schiffs base to give IIa/IIb/IIc/IId/IIe as the formed derivatives All the synthesised compounds were characterised by TLC and by using IR, NMR and mass spectroscopic data. Molecular docking studies of the title compounds were carried out using Molegro Virtual Docker software. All the synthesised compound exhibited well conserved hydrogen bonding with one or more amino acid residues in the active pocket of DNA gyrase domain and active ligand with PDP ID 1KZN.The compound 4-(4-1-H-benzo(d)imidazole-2yl)phenyl)imino)methyl)-2-methoxyphenol (Ic) is found to be more potent with MolDock score of -135.817 in comparison to standard drug penicillin having MolDock score of -132.006 and is comparable to active ligand having MolDock score of - 151.102. Antibacterial activity was performed by determining the zone of

ISBN: 978-81-980623-8-3

inhibition of all the synthesized compounds. The compounds were evaluated against gram positive bacteria viz, S.aureus and Gram-negative bacteria viz, Escherichia coli. Out of the six synthesized compound one compound showed excellent result against both gram positive and negative bacteria which was comparable to the standard penicillin.

**Keywords:** Benzimidazole, Antibacterial, Spectroscopic analysis, Molecular docking studies, Penicillin

## DESIGN OF COLCHICINE-BASED TUBULIN INHIBITORS AS ANTICANCER AGENTS BY *IN SILICO* ANALYSIS OF COLCHICINE-BASED TUBULIN INHIBITORS: 3D-QSAR, MOLECULAR DOCKING, AND MOLECULAR DYNAMICS SIMULATIONS FOR ANTICANCER DRUG DEVELOPMENT

Sonali B. Anardi, Shashikant V. Bhandari,
Santosh V. Gandhi, Ashwini R. Madgulkar
Department of Pharmaceutical Chemistry,
A.I.S.S.M.S College of Pharmacy, Pune 411001, Maharashtra, India
sonali_anardi@aissmscop.com

This study explores colchicine analogues as potential anticancer agents by analyzing their interactions with the tubulin–colchicine complex. A robust three-dimensional quantitative structure–activity relationship (3D-QSAR) model (r2 = 0.9438, q2 = 0.8915) identified key substituent regions influencing biological activity. Among 720 evaluated colchicine derivatives, 25 compounds exhibited superior binding affinities compared to colchicine. Compounds S3, S22, and a reference (Colchicine) were selected for molecular dynamics (MD) simulations, which confirmed stable binding interactions over 100 ns. Root mean square deviation and RMSF analyses highlighted key residues contributing to ligand stability within the protein–ligand complexes. Atom based QSAR and molecular docking were used to design new chemical entities (NCEs) with drug-like properties. Absorption, distribution, metabolism, excretion, and toxicity (ADMET) screening ensured favorable pharmacokinetic and pharmacodynamic profiles, including optimal molecular weight, hydrogen bonding, and blood–brain barrier permeability. Compounds S3 and S22 demonstrated the most promising results, with strong stability, binding characteristics, and drug-likeness. This computational approach indicates colchicine derivatives as viable candidates for anticancer drug development by disrupting tubulin dynamics and inducing cell cycle arrest. The findings support the potential of these derivatives to serve as the foundation for future anticancer therapies, highlighting their stability, binding efficiency, and favorable pharmacological profiles. Colchicine derivatives show potential as anticancer drugs by disrupting tubulin dynamics.

**Keywords:** 3D-QSAR, ADMET, MD simulation, molecular docking

## HYBRID PHARMACOPHORES IN MULTITARGET DRUG DESIGN: ADVANCING THERAPEUTIC STRATEGIES FOR ALZHEIMER'S

Srushti k. Maske, Krishna R. Gupta, Milind Umekar
Department of Pharmaceutical Chemistry,
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
srushvimaske16@gmail.com

Alzheimer's disease (AD) is a leading cause of dementia that increasingly challenges healthcare systems and society. Traditional single-target therapies have failed due to the complex and multifactorial nature of AD, which requires the simultaneous targeting of various disease mechanisms for clinical success. Since the disease involves multiple pathologies, targeting them simultaneously could provide a synergistic therapeutic effect. The identification of new targets beyond the classical hallmarks of AD provides a fertile ground for the design of new Multi-Target Drugs (MTDs), and the building on the existing compounds has the potential to yield successful disease-modifying therapies. Earlier studies had identified bioactive heterocycles, and so, the design of new thiazole-sulfonamide hybrids as potential AChE and BChE inhibitors for the discovery of lead candidates was performed. Therefore, following a multitarget approach, rivastigmine–heterocyclehybrids (indole), Tacrine-heterocycle (phenylbenzthiazole) hybrids, Sulphanilamide-heterocycle hybrids (Thiazole) and others were designed, synthesized and evaluated for their multiple biological properties and free radical scavenging activity, as potential multitarget anti-AD drugs deserving further investigation. This review discusses the evolving landscape of multi-target drugs, focusing on their potential as AD therapeutics. Analysis of past and current trials of compounds with multitarget activity underscores the capacity of MTDs to offer synergistic therapeutic effects, and the flourishing genetic understanding of AD will inform and inspire the development of MTD-based AD therapies.

**Keywords**: Alzheimer, MTDs, AChE, BChE, Synergism, Thiazole-Sulphonamide hybrid, Rivastigmine-indole hybrid, Tacrine-hybrid, phenybenzthiazole.

## TARGETING TGF-B–INDUCED EMT IN TRIPLE-NEGATIVE BREAST CANCER THROUGH INTEGRATED TRANSCRIPTOMICS AND COMPUTATIONAL DRUG REPURPOSING

Swathi Karthikeyan
College of Pharmaceutical Sciences, Manipal Dr, Madhav Nagar,
Manipal, Karnataka 576104
swathikarthikeyan18@gmail.com

The study investigates the role of Transforming Growth Factor-Beta (TGF-β) pathway in driving epithelial-mesenchymal transition (EMT) and promoting metastasis in Triple-Negative Breast Cancer. TNBC lacks oestrogen, progesterone, and HER2 receptors, making drug selection and treatment challenging and highlighting the need for novel therapeutic strategies targeting alternative pathways. To identify the molecular mechanism underlying EMT progression, publicly available bulk gene expression data from the GEO NCBI dataset were retrieved, integrated, processed, and analysed to identify the EMT gene signature. 567 TNBC and 129 Non-TNBC patient samples were used. Top genes highlight their potential as biomarkers for tumour plasticity and metastasis progression. Functional enrichment analysis revealed significant activation of TGF-β, Wnt, and other cancer-associated signalling pathways in TNBC compared to non-TNBC. Key genes, such as TGFβR1, TGFβR2, SMAD3, and CDH2, showed marked differential expression. Kaplan-Meier survival analysis in the TCGA-BRCA cohort demonstrated that high TGFBR1 expression correlated with worse overall survival (). Expression of TGFBR1 was markedly elevated in metastatic and primary tumour samples compared to normal controls, confirmed by the Kruskal-Wallis test (). For therapeutic exploration, TGF-β receptor-1 (TGF-βR-1) was selected for *in silico* drug repurposing. A library of 2,118 FDA-approved drugs was screened using dy namic simulations (Schrodinger Suite), narrowing down candidates based on affinity and protein-ligand interaction stability. MM\GBSA binding energy calculations further validated promising leads for experimental approaches. The overall integrative approach combining transcriptomics and computational drug discovery provides new insight into EMT-driven metastasis and identifies repurposable small molecule inhibitors to target TGF-β signalling.

**CH-498**

## HPLC QUANTIFICATION OF APREPITANT IN BULK AND CAPSULES

Thashma M E, Mubeen G, Lalitha N
Department of Quality Assurance, Al-Ameen College of Pharmacy,
Hosur Road, (Near Lal bagh Main Gate),
Bangalore, Karnataka, India - 560 027
thashma8@gmail.com

A simple, accurate, and precise Reverse Phase High-Performance Liquid Chromatography (RP-HPLC) method has been developed and validated for the quantitative determination of Aprepitant in bulk and pharmaceutical dosage form(capsules).The chromatographic separation was carried out using a C18 column (250 mm × 4.6 mm, 5 µm) with a mobile phase consisting of Acetonitrile and Phosphate Buffer (pH 3.0 adjusted with 1% orthophosphoric acid) in the ratio of 85:15 v/v. The flow rate was maintained at 1.0 mL/min, and detection was carried out at a wavelength of 264 nm. The retention time of Aprepitant was found to be approximately 3.097 minutes. The method showed good resolution with symmetrical peaks, a tailing factor less than 2, and theoretical plates greater than 2000, indicating high efficiency of the column. Linearity was observed in the concentration range of 200-1000µg/mL, with a correlation coefficient ($r^2$) greater than 0.997, confirming the method's linearity. The Limit of Detection (LOD) and Limit of Quantification (LOQ) were found to be 39.63µg/mL and 120.09µg/mL, respectively. The accuracy of the method was confirmed by recovery studies at 80%, 100%, and 120% levels, with results ranging from 100.4%

ISBN: 978-81-980623-8-3

to 103.22%, indicating excellent recovery. The % assay of Aprepitant in tablet formulation was found to be 99-101.36% w/w, demonstrating that the method is suitable for routine analysis. The developed method was validated in accordance with ICH guidelines (Q2(R1)) and found to be specific, accurate, precise, robust, and suitable for the routine quality control of Aprepitant in both bulk and pharmaceutical dosage form(capsules).

**Keywords:** Aprepitant, RP-HPLC, ICH (Q2(R1)).

## SYNTHESIS, CHARACTERIZATION AND MOLECULAR DOCKING STUDIES OF 2- [BIS (2-CHLOROETHYL) AMINO]-5-(SUBSTITUTED PHENYL -1,3,4-THIADIAZOL-2-YL)-ACETAMIDE DERIVATIVES AS A POSSIBLE ALKYLATING AGENT

Targeted research as shifted tremendously towards synthetic area in the past few years due to the drastic Increase of life-threatening disease worldwide such as cancer. Nitrogen Mustard are widely used for the clinical treatment of cancer. DNA is a major target of the drug interaction because of the potential for affecting gene expression because there are few differences between normal DNA and Abnormal DNA, cytotoxic agent affects both type N-N [Bis -2-Chloroethyl] amine pharmacophore is believed to produce the antitumoral activity through intestine cross-linking in DNA. To synthesize the title compound various aromatic carboxylic acid was refluxed with thiosemicarbazide in presence of phosphorus to get substituted 1,3,4-thiadiazole which was condensed with chloroacetyl chloride to get chloroacetamide 5-Phenyl Substituted -1,3,4-Thiadiazole and treated with diethanolamine to get Bis-2 hydroxyethyl amino acetamide derivatives, which thionyl chloride was added to get the title compounds. Which was confirmed by spectral analysis and subjected to molecular docking studies using PyRx software against Casein Kinase-2 protein. Insilico modelling was effectively utilised & explored for drug designing to find out the binding affinity, H-bond, and residual interaction of synthesized compounds. The cytotoxicity potential of 2- [Bis(2-chloroethyl) amino]-5-(Chloro Phenyl-1,3,4-Thiadiazol-2yl)-acetamide evaluated on JeKo-1 cell line by adding MTT reagent at 37°C and incubated for 2hrs. the percentage growth inhibition was calculated &IC50 Value was generated from the dose response curve.

**Keywords:** Synthesis of thiadiazole derivative, *In silico* docking study, *In-vitro* cytotoxicity study.
