The present study was designed to develop and characterize the Brucine loaded niosomal gel as a novel topical drug delivery system for arthritis therapy. Arthritis is painful joint inflammation that drastically affects quality of life; hence, there have been increasing attempts to develop therapeutic methods. Brucine, an anti-inflammatory and analgesic alkaloid is associated with poor solubility, low bioavailability, and systemic toxicity effects on oral route. Niosomes as non-ionic surfactant vesicles play a valuable role in improving the stability, permeability through skin and sustained release profile of drugs. Brucine niosomes were prepared by using Thin Film Hydration method and optimized by Box Behnken design through modification in cholesterol, Span 60 and sonication time. The optimized formula (75 mg cholesterol, 125 mg Span 60 and sonication time of 20 min) showed particle size of the 220nm. Niosomal gel was developed using Carbopol 934 and tested for pH (6.3–6.5), viscosity (6742 cp), spread-ability, extrudability revealing good topical application properties. In-vitro and ex-vivo diffusion studies with Franz diffusion cells demonstrated continued release of brucine from the niosomal gel over a period of 8 h when compared to that in control gels. The stability studies indicating both physical and chemical integrity of the formulation was confirmed under accelerated condition for one month. From the study it was concluded that Brucine niosomal loaded gel increases drug solubility, provides sustained release and improves local retention, which may decrease systemic side effects and repeated dosing. The targeted delivery represents a promising and useful non-invasive treatment and therapeutic approach for the management of arthritis.

**SORAFENIB TOSYLATE ENCAPSULATED CARRAGEENAN NANOPARTICLES FOR IMPROVE COLORECTAL CANCER TREATMENT VIA NETWORK PHARMACOLOGY, MOLECULAR DOCKING, AND IN VITRO AND IN VIVO INVESTIGATION.**

Harsh Tiwari, Sankha Bhattacharya
Department of Pharmaceutics, SVKMS NMIMS, Shirpur, Maharashtra, India - 425405.
tiwariharsh15@gmail.com

This research introduces a new biomaterial system, Sorafenib tosylate-encapsulated carrageenan nanoparticles (SF-CRG-NPs), for precise treatment of colorectal cancer (CRC). Employing Box-Behnken design, the formulation was fine tuned to achieve a particle size of 160.8 nm, zeta potential of +5.77 mV and entrapment efficiency of 90.45%, indicating stability and effective tumor targeting through the enhanced permeability and retention (EPR) effect. Various analytical techniques such as Fourier-transform infrared spectroscopy (FTIR), X-Ray Diffraction (XRD), Raman Spextroscopy, NMR and DSC confirmed successful drug loading and transformation to an amorphous state thereby improving solubility and bioavailability. In-vitro experiments on HCT-116 colorectal cancer cells demonstrated superior cytotoxicity of SF-CRG-NPs ($IC_{50}$ = 15.07 µg/mL) compared to free Sorafenib ($IC_{50}$ = 96.79 µg/mL), inducing 68% late apoptosis, G2/M cell cycle arrest and a 3.2fold increase in cellular uptake through clathrin-mediated endocytosis. Scratch assays exhibited a 31.41% reduction in migration, indicating anti-metastatic properties. Network pharmacology analysis identified three key targets: mTOR, MAPK15 and AKT1. Molecular docking simulations revealed substantial binding affinity with ΔG values ranging from 8.5 to 9.8 kcal/mol. In DMH-induced Wistar rats, SF-CRG-NPs reduced tumor burden by 90 %, CEA levels by 47%, IL-6 by 39% and mitigated oxidative stress. Anti-angiogenic safety was confirmed through hemolysis tests (<1%), low platelet aggregation and HET-CAM assays. SF-CRG-NPs offer a targeted, low-toxicity multi pathway approach for CRC therapy, facilitating potential clinical applications.

**FORMULATION AND EVALUATION OF HPMC-BASED FLOATING TABLETS OF METFORMIN HCl PREPARED BY DIRECT COMPRESSION**

Harsha Chandpure, Pankaj Dhapke, Jadish Baheti
Department of Kamla Nehru College of pharmacy, Butibori, Nagpur-441108
Harshachandpure123@gmail.com

This research investigates the formulation and assessment of floating tablets of Metformin HCl prepared using a direct compression method and Hydromellose (HPMC) as the primary polymer. Floating drug-delivery systems are designed to remain buoyant in the gastric environment, allowing the drug to stay in the stomach longer and ensuring a more controlled and consistent release. In this study, HPMC plays a crucial role in imparting buoyancy and regulating Metformin release, supporting the development of a sustained-release dosage form aimed at lowering dosing frequency and improving patient adherence. The work includes evaluation of both pre-compression properties, such as bulk density, angle of repose, and compressibility index, as well as post-compression parameters including hardness, friability, floating lag time, and in-vitro drug-release behavior. Stability testing was also performed to confirm the robustness of the formulation under different storage conditions. Overall, the optimized floating tablets provided extended gastric retention and a reliable release profile, indicating their suitability for effective diabetes management with Metformin.

**FORMULATION AND EVALUATION OF ANTIMICROBIAL CREAM USING CLEOME VISCOSA LINN SEEDS EXTRACT**

Harshada Shivarkar, Nilakshi Dhoble, Manish Kamle
Kamla Nehru College of Pharmacy, Butibori, Nagpur, Maharashtra-440018
harshadashiwarkar8@gmail.com

Cleome viscosa Linn is a medicinal plant that belongs to the family Capparaceae. The study was carried out to evaluate the antimicrobial property of cream formulated using the hydroalcoholic seeds extract of Cleome viscosa Linn. The extraction of seed was done by maceration method using ethanol: water (70:30) as solvent. Then the extract was evaluated for phytochemical investigation, thin layer chromatography and antimicrobial study by stick plate method. The Herbal face cream was prepared using hydroalcoholic seeds extract of Cleome viscosa and further evaluated for physical properties, pH determination, spreadability, viscosity, washability, after feel test, greasiness, irritancy test. The prepared herbal cream was evaluated for antimicrobial activity using test organisms; Escherichia coli, and Staphylococcus aureus. The prepared herbal cream shows promising results within a standard range like pH (5-7), viscosity (7360-8500 cps), spread ability (7.5-9.5cm). The creams had good homogeneity and washability. The extract and herbal cream show promising antimicrobial activity by inhibiting Escherichia coli and Staphylococcus aureus with inhibition zone diameter (IZD) of 22 to 28mm. After feel test for the was found to be good, not show any irritation, greasiness and no separation. The hydroalcoholic seed extract of Cleome viscosa and its formulated herbal cream demonstrated significant antimicrobial activity against E. coli and S. aureus. This research work supports the potential of Cleome viscosa–based herbal cream as a safe and effective topical antimicrobial cosmetic preparation. Further studies can be required for isolating and characterizing the specific bioactive constituents responsible for the antimicrobial activity of extract.

**Keywords**: Cleome viscosa, antimicrobial, Escherichia coli, Staphylococcus aureus

**DEVELOPMENT AND EVALUATION OF THERMORESPONSIVE NANOLIPOSOMAL IN SITU NASAL GEL FOR ENHANCED VACCINE DELIVERY**

Himaja Somisetty
Department of Pharmaceutics, A.S.N. Pharmacy College, Tenali, Guntur District, Andhra Pradesh – 522201, India
somisettyhimaja@gmail.com

Vaccines are essential tools for disease prevention, but conventional injectable routes often result in poor patient compliance and require cold chain maintenance. Nasal vaccination presents a non-invasive alternative that can stimulate both mucosal and systemic immunity. The present study aims to develop a thermoresponsive in situ nasal gel loaded with antigen-encapsulated nanoliposomes for improved vaccine delivery and stability. Nanoliposomes were prepared by the thin-film hydration technique using phosphatidylcholine and cholesterol, then incorporated into a chitosan–poloxamer 407 gel matrix. The formulation was evaluated for particle size, zeta potential, viscosity, gelation temperature, mucoadhesive strength, and in vitro antigen release. The optimized batch exhibited a mean particle size of 148 ± 9 nm and an entrapment efficiency of 83%. Gelation occurred at 33 ± 1 °C, indicating ideal thermoresponsive behavior for nasal application. In vitro release studies demonstrated sustained antigen release up to 24 hours, while ex vivo permeation through goat nasal mucosa confirmed enhanced antigen transport compared to plain antigen solution. These findings suggest that the developed thermoresponsive nanoliposomal in situ gel could serve as a promising, needle-free vaccine delivery platform offering improved stability, patient compliance, and immunogenic response potential.

**BIODEGRADABLE NATURAL POLYMER-BASED MICROSPHERE PREPARATION AND CHARACTERIZATION OF MEBEVERINE HCL**

Jampala Rajkumar, Aligeti sravan kumar
Department of Pharmaceutics,
Vaageswari College of Pharmacy, Karimnagar, Telangana, India – 505527.
jampalarajkumar@gmail.com

An effective spasmolytic medication used to relieve irritable bowel syndrome is mebeverine hydrochloride. It requires regular administration for optimal therapeutic effect due to its relatively short biological half-life. Because of this, it is ideal for this medicine to have a controlled release. The regulated release of mebeverine from a matrix system is frequently challenging, despite the drug's great solubility. With

ISBN: 978-81-980623-8-3

the possibility of drug dumping in mind, it is critical and necessary to select the correct excipients while developing a matrix system. To regulate the dosage released by the matrix systems, various polymer combinations were tested. The primary objective of this research was to create and analyze Mebeverine HCl microspheres by combining various combinations of biodegradable natural polymers (e.g., pectin, guar gum, sodium alginate) with various extended release and enteric coated polymers (e.g., ethyl cellulose, EC N100). The produced microspheres were tested for in vitro drug release kinetics, particle size distribution, encapsulation efficiency, and assay. Researchers conducted in vitro drug release experiments in two different media: 0.1N HCl for two hours and pH 6.8 phosphate buffer for six to twelve hours. As the concentration of the enteric coating polymer increased, the dissolution data showed that the medication release rate reduced. Sodium alginate exhibited quicker release in the in vitro studies compared to pectin. Mebeverine hydrochloride did not interact with carriers in any way, according to the FT-IR and DSC investigations.

**Keywords**: Mebeverine HCl, microspheres, biodegradable natural polymers.

2Sri Vasavi Institute of Pharmaceutical Sciences, Pedatadepalli, Tadepalligudem - 534 101. West Godavari Dist., Andhra Pradesh.
Indusekhar4343@gmail.com

Salicin is a alcoholic β-glucoside and is found in willow bark and leaves.it has been shown anti inflammatory, anti tumour activity. The aim of the present study is to prepare salicin phytosomes and its evaluation. UV spectroscopy method was developed for the molecule in , 0.1 N HCl and 6.8 phosphate buffer. The maximum absorbance was found at 268 nm. The phytosomes were prepared in the ratio of 1:05,1:1,1:1.5,1:2,0.5:1 and 2:1 ratio of salicin and soya lecithin were prepared by thin film hydration technique. The prepared phytosomes were characterized for invitro drug release, entrapment efficiency. there was no drug polymer interaction in prepared formulations. invitro dissolution showed that the prepared formulation showed extended release upto 24 hours,the entrapment efficiency was found around 54 %. Scanning electron microscopy(SEM) study showed irregular shaped particles of 340-430 nm sized particles

**Keywords**: Salicin, Phytosomes, Soya lecithin, Thin film hydration, DSC, FTIR, SEM.

## SOLUBILITY ENHANCEMENT OF CANDESARTAN CILEXETIL BY COMPLEXATION WITH CAVAMAX® W7 PHARMA (β -Cyclodextrin)

K. Anie Vijetha, M. Sunitha Reddy, Shaik Arshiya Sulthana
Centre for Pharmaceutical Sciences, UCESTH, JNTUH

Candesartan cilexetil (CC), a Biopharmaceutics Classification System (BCS) Class II drug, suffers from poor aqueous solubility and dissolution-rate limited absorption, resulting in low and variable bioavailability. The present study aimed to enhance the solubility and dissolution characteristics of CC through inclusion complexation with CAVAMAX® W7 Pharma (γ-cyclodextrin), a high-purity, pharmaceutical-grade excipient. Inclusion complexes were prepared by physical mixing, kneading, and solvent evaporation techniques at different drug:carrier ratios (1:1, 1:2, 1:3). The prepared complexes were evaluated for solubility, solid-state characterization, dissolution performance and stability. Phase-solubility studies revealed AL-type diagrams with 1:1 stoichiometry, increasing stability constants (K_s) with pH, and negative Gibbs free energy values confirming spontaneous complexation. Apparent solubility studies showed that all complexes improved solubility compared to pure CC, with the 1:2 ratio performing best across all methods. Among the formulations, solvent evaporation complex (F8) achieved the highest solubility (0.112 ± 0.007 mg/mL) and dissolution efficiency (91.4%), releasing ~99% of CC within 120 minutes. FTIR and PXRD analyses confirmed inclusion complex formation, with reduction or disappearance of characteristic crystalline peaks and evidence of hydrogen bonding. Accelerated stability studies of F8 under ICH conditions (40 °C/75% RH for 3 months) showed no significant changes in appearance, assay, or dissolution profile, with similarity factors ($f_2$) remaining above 50. These findings establish that γ-cyclodextrin complexation, particularly via solvent evaporation, significantly enhances the solubility, dissolution rate, and stability of CC, offering a simple and robust formulation strategy to overcome its biopharmaceutical limitations and improve oral bioavailability.

## DESIGN, FORMULATION AND EVALUATION OF LIPOSOMES FOR THE TREATMENT OF CERVICAL CANCER

Kamlesh Wadher, Chetna Hiwase, Kalyanee Nirmal
Department of Pharmaceutical Sciences,
KDK College of Pharmacy & Research Institute, Nagpur, Maharashtra, India – 440009
kamleshwadher@gmail.com

The present research was undertaken to design liposomes of 5-Fluorouracil for the effective treatment of cervical cancer. Localized delivery of 5-FU will give sustained drug exposure to tumor cells and increase its tumor penetration and decrease the rate of replication of tumor cells. The liposomes were developed by modified ethanol injection method; experiments were designed to determine the effect of the independent variables (factor) on the dependent variables (parameter/response) of a formulation. The 5-FU loaded liposomal formulation was optimised based on two parameters, entrapment efficiency (%EE) and percent in vitro drug release at 12 h (%DR). The response surface methodology i.e. 32 full factorial design was successfully employed for the optimization of 5-FU formulations. By using response surface methodology the estimated coefficient values obtained for independent variables in the regression equations, exhibited that the phospholipid (PL90H) and cholesterol (CH) concentration was observed to be highly influencing variables in optimizing percent entrapment efficiency (%EE; 94.01 ± 0.57) and percent drug release (%DR; 75.0 ± 2.28).The study demonstrated the successful formulation of 5-FU liposomes for the effective treatment of cervical cancer.

**Keywords**: 5-Fluorouracil, cervical cancer, liposomes, response surface methodology.

## EVALUATION AND PREPARATION OF RISPERIDONE NIOSOMES

Katru Navya Sri (Syed. Taskeen Taj)
Department of Pharmaceutical Sciences,
Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry, East Godavari District, Andhra Pradesh, India-533102.
navyasrikatru@gmail.com

The study introduces a significant advancement in treating schizophrenia, a chronic condition affecting roughly 1% of the global population and associated with a high suicide risk. While the atypical antipsychotic risperidone effectively manages both positive and negative symptoms, its conventional oral administration is hindered by hepatic first-pass metabolism, substantially reducing its efficacy. To overcome this, researchers developed a novel formulation: risperidone niosomes. This technique, which yielded a stable complex (stability constant of aims to significantly improve the drug's bioavailability, provide a quick onset of action, and enhance patient compliance. Comprehensive analysis using IR, DSC, XRD, SEM, and in-vitro drug release confirmed the successful creation and favourable performance of the Niosomes, establishing them as a potentially valuable tool for more effective schizophrenia management.

**PC-1008**

## FORMULATION OF NANOPARTICLE BASED IN SITU GEL DRUG DELIVERY SYSTEM FOR HYPERTENSION

Kaustubhi chavan, Pankaj Dhapke, Jagdish Baheti
Kamla Nehru College of Pharmacy, Rashtrasant Tukadoji Maharaj Nagpur University, Nagpur, Maharashtra, India 441108
kaustubhichavan233@gmail.com

ISBN: 978-81-980623-8-3

The present investigation deals with the formulation and optimization of a nanoparticle based in-situ gelling drug delivery system for management of hypertension using valsartan (VAL). Biodegradable polymers including gellan gum and HPMC K4M were selected to formulate a floating in situ gelling system containing valsartan-chitosan nanoparticles (VAL-CSNPs). In the initial tests, optimal polymer concentrations were found for gelation to occur immediately, to remain buoyant for extended periods of time and long enough for oral administration, while ion-gel dilutions were also ensured. A $3^2$ full factorial design was employed to optimize formulation variables i.e., gellan gum and HPMC K4M concentrations in order to achieve controlled drug release and good rheological characteristics. The optimized formula possessed rapid gelation, enhanced floating more than 12h and the drug was released in the manner of zero order of kinetics. Based on the FT-IR, DSC and XRD studies, drug polymer system was found to be compatible and stable. Stability testing showed the stability of formulation parameters up to one month. The resultant system offers a promising strategy for the long-term oral delivery of valsartan with improved mucoadhesion and controlled release, thereby improving therapeutic efficacy in the management of hypertension.

**Keywords**: Nanoparticles, In-situ gelling system, Gellan gum, Hypertension management, Valsartan delivery

**PC-1009**

**NANOSIZED LIPID BASED INTRANASAL IN-SITU GEL FOR BRAIN TARGETING OF SERTRALINE: STATISTICAL OPTIMIZATION, IN-VITRO, EX-VIVO AND IN-VIVO EVALUATION**

Kiran Deotale, Nilakshi Dhoble, Sujata Suruse, Jasmine Awari
1Kamla Nehru College of Pharmacy, Butibori-440018, 2Department of Pharmaceutical Sciences, Rashtrasant Tukdoji Maharaj Nagpur University, Nagpur- 440033
kirandeotale650@gmail.com

Intranasal drug delivery is a great area of interest because olfactory region of the nasal mucosa has direct connection between nose and brain. Nasally applied drug directly reaches to the brain either by direct transport from olfactory region or from blood. Present research work is carried out with aim to develop Sertraline nanoparticles loaded In-situ nasal gel through brain targeted drug delivery system. The solid lipid nanoparticles were prepared by hot high shear homogenization coupled with ultrasonication method using 32 full factorial designs. For all formulation batches (F1-F9); particle size was found to be in the range of (57- 217nm) with Polydispersity index (0.115-0.713), zeta potential (-14.9 to -23.4 mV) and %entrapment efficiency (75.61-89.93%). A Sertraline nanoparticle loaded in nasal in-situ gel was prepared by cold method. Our findings strongly suggested that administration of sertraline nanoparticles loaded nasal in-situ gel contributes solubility enhancement and avoidance of hepatic first-pass metabolism. Thus, NPs further enhanced the delivery of sertraline to brain by reducing particle size below 200 nm which eventually enhances the diffusion and permeation of sertraline through blood brain barrier. This study evidently recognized that intranasal sertraline nanoparticles loaded in-situ gel is suitable for the treatment of depression.

**Keywords**: Depression, Sertraline hydrochloride, Nanoparticles, Intranasal drug delivery, Nasal in-situ gel.

**HPMC-BASED TRANSDERMAL PATCH INCORPORATING CISSUS QUADRANGULARIS AND MORINGA OLEIFERA FOR LOCAL ANTI-INFLAMMATORY THERAPY**

Kiruba Mohandoss
Assistant Professor, Department of Pharmaceutics,
Sri Ramachandra Faculty of Pharmacy, Sri Ramachandra Institute of Higher Education and Research (DU), Porur, Chennai-116
mkirupa@sriramachandra.edu.in

A dual-herb transdermal delivery system containing Cissus quadrangularis and Moringa oleifera was developed using HPMC as a film-forming polymer to provide localized anti-inflammatory activity. The novelty of the formulation lies in combining two synergistic botanicals with proven antioxidant and anti-inflammatory potential into a sustained-release polymeric matrix suitable for topical application in joint and musculoskeletal discomfort. Five formulations (CM-F1 to CM-F5) were prepared and assessed for physicochemical properties, with CM-F5 selected as optimized due to superior tensile strength, elongation capacity, and maximum cumulative release (75 mg/g at 12 h). Release modeling confirmed anomalous diffusion. Antioxidant assays showed strong DPPH (89.00%) and nitric-oxide scavenging activity (89.50%), while biochemical anti-inflammatory tests demonstrated high proteinase inhibition (85.00%), protein-denaturation protection (80.50%), and LOX suppression (68.50%). RAW 264.7 macrophage studies confirmed good cytocompatibility and a 68.2% reduction in LPS-induced nitric oxide at 100 µg/mL, validating the patch's biological relevance. These results indicate that the Cissus–Moringa TDDS can serve as a natural alternative for managing localized inflammation and pain. Future perspectives include ex-vivo permeation studies, development of adhesive backing, and scaling the prototype toward clinical and commercial translation.

**Keywords**: Cissus quadrangularis, Moringa oleifera, Transdermal patch, Anti-inflammatory activity, RAW 264.7 macrophages, Sustained release

**DEVELOPMENT AND EVALUATION OF MUCOADHESIVE BUCCAL FILMS**

Korikana Padma1, Mukkanti Srilatha2, G. Sucharita
Department of Pharmaceutics, Jagan's Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh, India
korikanapadma777@gmail.com

The present study focuses on the development and evaluation of mucoadhesive buccal films for controlled drug delivery through the buccal mucosa. Buccal films were formulated using various film-forming polymers such as hydroxypropyl methylcellulose (HPMC), sodium carboxymethyl cellulose (NaCMC), and polyvinyl alcohol (PVA), combined with suitable plasticizers to enhance flexibility and mucoadhesion. The prepared films were evaluated for physicochemical properties, including thickness, weight variation, surface pH, folding endurance, drug content uniformity, and moisture absorption. In vitro drug release and ex vivo mucoadhesion studies were conducted to evaluate the release profile and adhesive strength of the formulations. The optimized formulation exhibited satisfactory mechanical properties, prolonged adhesion time, and sustained drug release, indicating its potential for systemic delivery via the buccal route while avoiding hepatic first-pass metabolism. The results suggest that mucoadhesive buccal films can be an effective and patient-friendly alternative to conventional oral dosage forms for improved therapeutic efficacy.

**Keywords**: Mucoadhesive buccal films, controlled drug delivery, HPMC, NaCMC, PVA, plasticizers, sustained release.

Department of Pharmaceutics, Kamla Nehru College of Pharamcy, Nagpur – 440033

ISBN: 978-81-980623-8-3

This research explores the creation and evaluation of a piroxicam matrix-based transdermal patch aimed at treating dysmenorrhea, a common condition that causes painful menstruation and impacts women's quality of life. Traditional treatments typically involve oral non-steroidal anti-inflammatory drugs (NSAIDs) like piroxicam, which can lead to adverse side effects. The study focuses on developing a transdermal drug delivery system (TDDS) to allow piroxicam to enter systemic circulation directly, enhancing its bioavailability and effects by avoiding first-pass metabolism. Various formulations were prepared using a solvent casting technique, incorporating HPMC E5LV as the polymer, PEG 400 as the plasticizer, and Capsicum oleoresin to enhance skin penetration. The formulations underwent several evaluations, including assessments of physical appearance, thickness, weight uniformity, folding endurance, moisture content, moisture uptake, and drug content. The optimized formulation, F3, contained 600 mg of HPMC E5LV, 0.7 ml of Capsicum oleoresin, and 1 ml of PEG 400, exhibiting excellent folding endurance, favorable moisture properties, and a high drug content of 99 ± 0.19%. In-vitro diffusion tests indicated that F3 achieved a cumulative drug release of 98.87% over 2 hours, while ex-vivo studies with goat skin confirmed 97.04% drug permeation within the same timeframe. The findings suggest that the piroxicam transdermal patch may serve as an effective, non-invasive alternative for the management of dysmenorrhea, providing sustained drug release.

**Keywords**: Dysmenorrhea, Transdermal drug delivery, Piroxicam, Transdermal patch Penetration enhancer

## DEVELOPMENT OF COLON TARGETED DRUG DELIVERY SYSTEM FOR MOLSIDOMINE

M. Hema Naga Durga
Malla Reddy College of Pharmacy, Maisammaguda, Secunderabad, India – 500100
mylabathulah@gmail.com

The objective of the study was to develop colon systems for molsidomine using ethyl cellulose, Eudragit S100, Eudragit L100 as polymers. Matrix tablets were prepared by compression coating containing various proportions of polymers. These were prepared by half quantity of powder compressed as core tablet and it was placed exactly in the middle of die cavity and remaining quantity of powder was placed over the core tablet so that powder blend should cover all the sides of core tablet uniformly. The tablets were evaluated for drug content uniformity and were subjected to in vitro drug release studies. The precompression blend of all formulations was subjected to various flow property tests and all the formulations were passed the test. The amount of molsidomine released from the matrix tablets at different time intervals was estimated by a UV method at 270nm. Matrix tablets prepared with Eudragit S100 released less than 3% of the molsidomine in the physiological environment of stomach and small intestine depending on the proportion of polymer used in the formulation. When the dissolution study was continued in simulated colonic fluids the matrix tablets remaining amount was released within 12hr and showed 97.57% drug release.

**Keywords**: Colon targeted drug delivery, Eudragit, coating tablets.

**PC-1015**

## DEVELOPMENT AND IN VITRO EVALUATION OF FLUCONAZOLE GEL USING DIFFERENT GELLING AGENTS

Marampudi Kamili Jyothi, Sadhu Venkateswara Rao
Department of Pharmaceutics, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, Andhra Pradesh, India – 521108
jyothimarampudi923@gmail.com

The present study was undertaken to develop and evaluate topical gel formulations of fluconazole using different gelling agents and their combinations, with emphasis on physicochemical characterization and in vitro drug release performance. Gels were prepared employing carbopol 940, hydroxypropyl methylcellulose (HPMC), carboxymethyl cellulose (CMC), sodium alginate, gelatin, and a carbopol–HPMC mixture at varying ratios. The formulations were evaluated for pH, viscosity, drug content, and in vitro release behavior. The pH of all formulations was within the range of 6.5–6.8, suitable for skin application. Viscosity was strongly influenced by the type of gelling agent, with carbopol 940 and carbopol–HPMC combination gels demonstrating the highest viscosity. Drug content analysis confirmed uniformity across formulations, ranging between 90% and 101%. In vitro diffusion studies indicated a controlled and gradual release of fluconazole up to 150 minutes, with carbopol 940 and its combination-based gels exhibiting the slowest release profile, suggesting potential for prolonged drug retention at the application site. Overall, the study demonstrated successful formulation of fluconazole gels with desirable physicochemical characteristics and sustained release potential. These findings support the feasibility of fluconazole gel as a promising topical drug delivery system for the effective treatment of fungal infections, although further in vivo studies are required to establish clinical efficacy and safety.

**Keywords**: Fluconazole, Topical gel, Gelling agents, In vitro drug release and Fungal infections.

## TO FORMULATE AND EVALUATE A HERBAL TOPICAL PREPARATION FOR THE EFFECTIVE TREATMENT OF VITILIGO.

Mayuri Gajanan Zore
Gawande College of Pharmacy, Sakakerkherda, Buldhana, Maharashtra-443202
mgzore204@gmail.com

Vitiligois depigmentation disorder, and it causes loss of melanocytes. Denaturation of melanocytes caused by oxidative stress, genetics, auto immune response and then synthesis of inflammatory mediators. Vitiligo is classified into two types segmental and non-segmental. There is various treatment to cure vitiligo and some treatment causes side effects. So, through herbal plants we can cure the diseases the herbal plants are Ginkgo biloba, Nigella sativa, Psoralea corylifolia there are plants which has antioxidant properties, anti-inflammatory, these antioxidant helps to neutralizes free radicals and reduce oxidative damage in the skin. Psoralea corylifolia it has ability to stimulate melanin production in the skin through this repigmentaion occurs in the skin. In the pursuit of developing effective treatments for vitiligo, understanding the chemical composition and molecular structure of a topical formulation is essential. GC-MS analysis is used to identify the compound present in polyherbal lotion, FT-IR spectroscopy is used to analzye the functional group present in the lotion, HPLC quantitative analysis is used to determine exact amount of active ingredients present in the polyherbal lotion. The lotion formulation has enriched activity against occident stress and inflammation.

**Keywords**: Vitiligo, Antioxidant, Anti-inflammatory, Polyherbal lotion

## FORMULATION AND EVALUATION OF AN HERBAL GUTIKA OF CLITORIA TERNATEA FOR POLYCYSTIC OVARIAN DISEASE (PCOD)

Meghna Pande1, Sachin Jagdale1, Babita Agarwal1, Shivkanya Mhaske1
1Marathwada Mitra Mandal's College of Pharmacy, Thergaon, Pune, Maharashtra, India- 411033
1Sitabai Thite College of Pharmacy Shirur, Pune, Maharashtra, India-412210
meghnapande77@gmail.com

The present study focuses on the formulation and evaluation of an herbal Gutika containing Clitoria ternatea for the management of Polycystic Ovarian Disease (PCOD). The aim was to assess the therapeutic potential of the polyherbal formulation and to evaluate its physicochemical characteristics as per Ayurvedic and pharmacognostical standards. The Gutika was prepared using Clitoria ternatea, Ashwagandha, Shatavari, Ashoka, Liquorice, and Ginger, herbs traditionally known for supporting hormonal balance and reproductive health. The raw herbal ingredients were assessed for quality parameters. Total ash values ranged from 3.7% to 9.3% w/w, acid-insoluble ash from 0.23% to 2.1% w/w, and water-soluble ash from 1.13% to 35.7% w/w. Alcohol-soluble extractive values varied between 4% and 46.5% w/w, indicating the presence of active constituents. Loss on drying (1.6%–12.2%) confirmed acceptable moisture content. The prepared Gutika showed a hardness of 6 kg/cm², within the standard range, and negligible friability. The disintegration time was 10 minutes, meeting the requirement of not more than 15 minutes. pH, drug content, and organoleptic properties such as colour, taste, and odour were found to be uniform and acceptable. The developed Gutika showed satisfactory

ISBN: 978-81-980623-8-3

quality attributes and offers potential as a supportive Ayurvedic formulation for PCOD management.

Keywords: Clitoria ternatea, Gutika, PCOD, Ayurvedic formulation.

**PATCHES WITH DISSOLVABLE MICRONEEDLE CONTAINING HERBAL EXTRACT OF CALENDULA OFFICINALIS**

Poonam Lal, Monika Prakash Jivtode
Datta Meghe College of Pharmacy, (DMIHER), Sawangi Meghe, Wardha Maharashtra 442001

Dissolvable microneedle (MN) technology represents a transformative advancement in transdermal drug delivery, overcoming the limitations of conventional topical and systemic routes by enabling precise, painless, and minimally invasive administration. In this study, we report the development of polymeric dissolvable microneedle patches encapsulating Calendula officinalis extract, a phytopharmaceutical rich in triterpenoids, flavonoids, and saponins with well-documented anti-inflammatory, antioxidant, and wound-healing activities. The microneedles were fabricated using biocompatible, water-soluble polymers via a micro-moulding technique, yielding arrays with optimal mechanical strength for efficient stratum corneum penetration while ensuring rapid dissolution upon insertion. Advanced characterization confirmed uniform distribution of phytoconstituents, structural integrity, and stability of the loaded extract. In vitro permeation studies demonstrated enhanced dermal delivery and sustained release kinetics compared to conventional topical formulations, suggesting superior bioavailability. Antimicrobial assays revealed significant inhibitory activity against Staphylococcus aureus and Candida albicans, validating the therapeutic potential in infected wounds. Furthermore, cytocompatibility evaluations confirmed the non-toxic nature of the formulation toward human dermal fibroblasts. The synergistic integration of phytotherapy with next-generation MN technology highlights a paradigm shift toward natural, patient-compliant, and sustainable dermatological therapeutics. The Calendula-loaded dissolvable microneedle platform demonstrates promise for clinical translation in the management of inflammatory skin conditions, chronic wounds, and post-surgical healing. Future investigations will focus on in vivo efficacy, pharmacokinetics, and large-scale manufacturability to establish its role as a viable alternative to conventional transdermal and oral herbal therapies.

**Keywords**: Dissolvable microneedles, Calendula officinalis, transdermal delivery, wound healing, phytopharmaceuticals, sustained release, dermal therapeutics.

**IMMEDIATE RELEASE OF LABETALOL HYDROCHLORIDE USING FAST-DISSOLVING SUBLINGUAL FILMS**

Bhavya Shree T, Lavith Kumar H, Ramakrishna Shabaraya A
Department of Pharmaceutics, Srinivas College of Pharmacy, Valchil, Farangipete Post, Mangalore. Dakshina Kannada-574143. India
bhavyashreebhat91@gmail.com

Fast dissolving sublingual films are advanced oral drug delivery systems designed to rapidly disintegrate or dissolve upon contact with saliva. This dosage form offers improved bioavailability and a faster onset of action compared to conventional oral solid forms. Labetalol hydrochloride, a dual α- and β-adrenoceptor blocker used in the management of angina pectoris and hypertension, was selected for developing an immediate-release sublingual formulation. This study focused on the development and evaluation of fast dissolving sublingual films of Labetalol hydrochloride to enhance patient convenience and compliance, particularly among elderly and paediatric populations. The films were prepared by the solvent casting method using varying concentrations of HPMC K4M, HPMC, and NaCMC as film-forming polymers, with PEG 400 as a plasticizer. Six formulations were assessed for physicochemical properties, including weight variation, thickness, surface pH, tensile strength, swelling index, drug content, disintegration time, in vitro dissolution, and stability. All formulations complied with the required quality parameters. Among them, formulation F3 (3% w/v HPMC) exhibited optimal performance, showing a maximum drug release of 97.71±1.18% at the end of 300 seconds and a disintegration time of 19±1.24 seconds. These results confirm that fast dissolving sublingual films of Labetalol hydrochloride constitute a promising immediate-release dosage form for achieving rapid therapeutic action.

**Keywords**: Fast dissolving sublingual films, Labetalol hydrochloride, Immediate release, Solvent casting method.

**PERSONALIZED DRUG DELIVERY SYSTEM**

Mrunal Khare, Ankita Dhopte, Atul Hemke
S.K.B. College of Pharmacy,Gada, Kamptee, Nagpur, Maharashtra, India – 441002
m07khare@gmail.com

Personalized medicine requires advanced drug delivery systems, and 3D printing (3DP) plays a crucial role in achieving this. 3DP enables the creation of complex drug combinations, personalized dosages, and flexible shapes and structures of dosage forms (DFs), offering an efficient alternative to traditional pharmaceutical manufacturing. These innovations may replace conventional drug administration approaches, leading to improved therapeutic outcomes. The technology allows production of dosage forms with intricate geometries tailored to individual patient needs. Personalized drug delivery systems (PDDS) are emerging, incorporating customized doses, dosage forms, drug release profiles, and timing of administration, supported by digital health platforms for diagnosis, treatment monitoring, adherence, and traceability. Integrating PDDS with digital tools creates a dynamic feedback loop between patient requirements and drug products. As a promising digitized technology, 3DP can advance personalized dosage forms, regenerative medicine, and implantable medical devices. Its unique capabilities address formulation challenges, especially for poorly soluble drugs. It also shows potential from pre-clinical testing to first-in-human studies and enables on-site production of customized formulations at the point of care, offering exceptional dose flexibility. Overall, 3D printing is a transformative technology that supports personalized, efficient solutions for drug delivery and future innovations in patient care.

**FORMULATION, CHARACTERIZATION AND EVALUATION OF TRANSETHOSOMES WITH AZATHIOPRINE TO TREAT SYSTEMIC LUPUS ERYTHEMATOSUS (SLE)**

Naga Chandrika Pallam
Department of Pharmaceutics, Geethanjali College of Pharmacy, Cheeryal, Hyderabad, Telangana 501301.
Sri Padmavati Mahila Viswa Vidyalaya, Tirupati, Andhra Pradesh.
chandrikapallam@gmail.com

Azathioprine, a purine analog immunosuppressant, has been widely used as a steroid-sparing agent in the management of SLE. The objective of the study was to formulate, characterize and evaluate transethosomes of azathioprine. Transethosomes are prepared by using mechanical dispersion method on basis of edge activator and ethanol concentration and responses like particle size, entrapment efficiency, and zeta potential were observed and also characterized by particle size analyzer, SEM analysis, zeta potential, drug-excipient compatibility by FTIR, XRD, and further evaluated by using in-vitro diffusion studies and drug release studies. AZA-TE formulation was observed particle size of 172.6 nm , Entrament efficiency 82.3% , and Zeta potential -29.0 mV, with poly dispersability index of 0.313. AZA-TE formulation was further characterized by SEM, XRD and FTIR. With SEM analysis were observed spherical, smooth, shiny and discrete vesicles were found. With XRD analysis gel was characterized as a amorphous nature. With FT-IR analysis observed that there is no interaction with polymer and excipient that indicates there is a compatibility between polymer and excipients. AZA-TE formulation subjected to drug release studies and 95.46% of drug was released. To conclude the study on Azathioprine transethosomes for SLE, positively conclude that the developed Azathioprine () transethosome formulation shows significant potential for improved transdermal delivery and treatment of SLE, emphasizing the increased efficacy due to deeper skin penetration.

**Keywords**: Azathioprine, Transethosomes, SLE, controlled release, and Entrapment efficiency.

**DEVELOPMENT AND CHARACTERIZATION OF SESAMOL-LOADED SNEDDS FOR BREAST CANCER THERAPY**

Namrata Singha, Karuna Shankar Shuklab
Institute of Pharmaceutical Sciences, University of Lucknow, Lucknow, Uttar Pradesh, India.
Goel Institute of Pharmaceutical Sciences, Lucknow, Uttar Pradesh, India
namrata05singh@gmail.com

Globally breast cancer remains a leading cause of cancer-related mortality among women. Sesamol, a natural phenolic compound derived from Sesamum indicum seeds and sesame oil, has demonstrated potent antioxidant and anticancer properties, including induction of growth arrest and apoptosis in malignant cells. However, its clinical application is hindered by poor bioavailability. Hence, lipid-based drug delivery systems (LBDDS), particularly self-nanoemulsifying drug delivery systems (SNEDDS), offer a promising strategy to enhance solubility and absorption of lipophilic bioactives. In this study, Sesamol-loaded SNEDDS were formulated using oils (Isopropyl myristate, Isopropyl palmitate, Caprylic capric triglycerides, Sesame oil), surfactants (Span 80, Tween 80), and co-solvent (PEG-400) based on Sesamol's solubility profile. The formulations were prepared via aqueous titration method and characterized for thermodynamic stability, emulsification efficiency, droplet size, polydispersity index, zeta potential, surface morphology, refractive index, transmittance, and drug release profile. The optimized SNEDDS significantly improved the in-vitro dissolution rate of Sesamol compared to the pure drug. Furthermore, the anticancer efficacy of the optimized formulation was evaluated using MTT assay on MCF-7 human breast cancer cells, revealing superior cytotoxicity compared to the marketed preparation. These findings suggest that SNEDDS is a viable carrier for enhancing the therapeutic potential of Sesamol in breast cancer treatment.

**Keywords**: Seasamol, Breast cancer, Aqueous titration method, SNEDDS.

**DEVELOPMENT AND CHARACTERIZATION OF METHOTREXATE LOADED SPANLASTIC GEL FOR THE MANAGEMENT OF RHEUMATOID ARTHRITIS**

Navami R Alva, Vineetha K, A R Shabaraya
Department of Pharmaceutics, Srinivas College of Pharmacy, valachil, Mangalore, Karnataka-574143
alvanavami182@gmail.com

Methotrexate is an Anti-rheumatic drug used to treat rheumatoid arthritis, suffers from limited skin permeability, solubility and significant systemic adverse effects upon administering orally or via injections. To overcome these challenges, a novel methotrexate loaded spanlastic gel was developed for enhanced transdermal delivery. Spanlastic was formulated by thin film hydration technique with five different formulation containing varied concentrations of Span 60 and Tween 80. The preparations were analyzed for different parameters including particle size, zeta potential, surface morphology, percentage entrapment efficiency and in vitro drug release study. The best formulation (F3) was chosen based on their highest percentage entrapment efficiency i.e., 88.01±0.36% and in vitro drug release i.e., 85.96±0.82% in 8 hours which was added into the carbopol 934 gel. The prepared gel was then evaluated for its parameters like physical appearance, pH, drug content, spreadability, viscosity, in vitro diffusion studies and kinetic studies. The in vitro drug release of the spanlastic gel was 81.29±0.23% in 8 hours and showed the zero order release kinetics. The developed spanlastic gel demonstrated was found to be stable and the obtained results showed that methotrexate loaded spanlastic gel could be an effective strategy in the management of rheumatoid arthritis.

**Keywords**: Methotrexate, Anti rheumatic, Rheumatoid arthritis, Spanlastic, Span 60, Tween 80, transdermal.

nicky2203g@gmail.com

Ethyl gallate, a derivative of gallic acid, having significant characteristics including anti-inflammatory, antioxidant & antiviral, positioning it as potential candidate for therapeutic applications across several different illnesses, such as inflammatory condition, cancer, and viral illnesses like influenza, herpes simplex. Preclinical studies have shown that it has the capacity to modulate inflammation and oxidative stress, both of them plays significant roles in a variety of pathological diseases. The versatility of ethyl gallate in addressing a lot of disease pathways demonstrates its promise in integrated therapeutic methods. However, despite promising in vitro and animal model results, its clinical use remains unknown. The lack of human clinical studies leaves a significant vacuum in our findings, particularly of its safety, efficacy, and comprehensive pharmacological mechanisms. Future study is required to close this gap and establish the therapeutic value of ethyl gallate.

**FORMULATION AND EVALUATION OF SERUM CONTAINING SALICYLIC ACID, CHITOSAN AND MARJORAM OIL FOR MANAGEMENT OF ACNE**

Nikitha S, Kirthana, Manav Doshi, Asleetha Srija, Lokesh P G, Divyasree, Tanmoy Ghosh, B V Basavaraj

The study aims to formulate a novel serum containing salicylic acid, chitosan, and marjoram oil for management of acne vulgaris. The formulation sought to utilize the synergistic antibacterial, anti-inflammatory, and wound-healing properties of these components to enhance skin penetration and efficacy. Methodology involved synthesizing salicylic acid–chitosan and marjoram oil–chitosan nanoparticles using the ionic gelation method. These nanoparticles were incorporated into a serum using sodium alginate as a gelling agent. The serum was evaluated for its physicochemical properties (pH, viscosity, spreadability), particle size, in vitro drug release profile, and antibacterial efficacy against Cutibacterium acnes. Additionally, cytocompatibility was assessed using MTT assay, and wound-healing potential was examined via scratch assay on human dermal fibroblast cell lines. The optimized formulation (M2) exhibited desirable particle size, stable pH, good spreadability and viscosity, and sustained drug release. It demonstrated significant antibacterial activity with clear zones of inhibition, high cell viability in MTT assay, and effective wound closure in scratch assays. FTIR spectra confirmed compatibility between the ingredients used in the serum preparation. Overall, the findings suggest that this serum holds strong potential as a topical treatment for acne, offering both antibacterial and skin-repairing benefits.

**Keywords**: Acne vulgaris, Cutibacterium acnes, Marjoram oil -chitosan nanoparticles, Salicylic acid-chitosan nanoparticles

DPP-4 inhibitors play a vital role in the long-term management of Type 2 diabetes, yet many of these drugs face a fundamental challenge: poor oral bioavailability. This limitation often reduces their therapeutic efficiency and may contribute to inconsistent patient outcomes. To address this gap, the present study investigates a nanoformulations-based approach designed to enhance the delivery and performance of a selected DPP-4 inhibitor, with the broader aim of improving real-world glycemic control. A novel Nanoparticulate system was developed with an emphasis on improving solubility, shielding the drug from premature gastrointestinal degradation, and promoting a more predictable absorption profile. Then it subjected to evaluation parameters like particle size analysis, zeta potential measurements, entrapment efficiency, and in-vitro release kinetics—were performed to evaluate

ISBN: 978-81-980623-8-3

formulation performance. The optimized nanoparticle batches exhibited a narrow particle size distribution within the nanometer range, favorable surface charge for stability, and high encapsulation efficiency. In-vitro release data demonstrated a sustained and controlled release pattern, indicative of improved drug availability over an extended period. Overall, the findings suggest that nanoformulations can meaningfully enhance the therapeutic efficiency of DPP-4 inhibitors by ensuring better absorption and more stable plasma concentrations. Beyond the laboratory, this approach holds promise for reducing dose variability, improving patient adherence, and offering a more dependable therapeutic option for individuals living with Type 2 diabetes.

The study focuses on the formulation and evaluation of a Moringa oleifera effervescent tablet aimed at enhancing patient compliance and improving nutritional effectiveness. Moringa oleifera leaves are known for their rich content of vitamins, minerals, and antioxidants, yet their traditional dosage forms often suffer from poor taste, limited solubility, and reduced bioavailability. To overcome these challenges, a palatable effervescent tablet was developed using standardized Moringa leaf extract as the primary active ingredient, with a balanced combination of citric acid and sodium bicarbonate as the effervescent base. Additional nutrients such as vitamin C, zinc, and magnesium were incorporated to enhance overall nutritional potency and improve the absorption of Moringa's bioactive compounds. Natural flavors and sweeteners were included to mask the earthy taste of the extract and improve acceptability. The formulated tablets were assessed for effervescence time, pH, uniformity, moisture content, and stability. Results demonstrated rapid disintegration within three minutes, acceptable pH, and good stability under storage conditions. The developed formulation provides a convenient, fast-dissolving, and nutritionally enriched supplement that enhances bioavailability and palatability, thereby improving patient compliance and encouraging regular consumption of Moringa-based nutritional products.

**SMART AND STIMULI-RESPONSIVE NANOCARRIERS: DEVELOPING ACCURATE DRUG DELIVERY METHODS TO IMPROVE THERAPEUTIC INDEX AND PATIENT ADHERENCE**

Prajakta Raju Milmile, Monali R. Dakhole, Krishna R. Gupta, Milind J. Umekar
Department Of Pharmaceutical Chemistry
Smt. Kishoritai Bhoyar College of Pharmacy, Nagpur, Maharashra 441002
prajaktamilmile18@gmail.com

A significant breakthrough in precision drug delivery, smart and stimuli-responsive nanocarriers solve long-standing issues with traditional dosage forms like low patient compliance, off-target toxicity, and poor bioavailability. These clever nanosystems are designed to respond to internal or external stimuli by releasing medications in a regulated fashion. Selective activation within diseased tissues is made possible by internal triggers, such as changes in pH, redox potential, hypoxic conditions, enzyme overexpression, or elevated reactive oxygen species. Temperature, light, magnetic fields, ultrasound, electrical signals, and other external stimuli all improve site-specific drug release and enable real-time therapy modification. A variety of materials, including polymeric nanoparticles, liposomes, dendrimers, inorganic nanoparticles Surface functionalization, ligand-based targeting, and nano-bio interface interaction optimization are all part of their design. A lot of platforms also use imaging agents for both therapeutic and diagnostic purposes. By boosting drug accumulation at target sites, decreasing systemic toxicity, and improving patient adherence through sustained or on-demand release, these characteristics work together to improve the therapeutic index. The main classes of stimuli-responsive nanocarriers are highlighted in this review along with their mechanisms, design approaches, characterization techniques, and preclinical or clinical developments.

**Keywords**: Stimuli-responsive nanocarriers, smart drug delivery, controlled release, targeted delivery, pH-sensitive systems.

**PC-1029**

**BRIMONIDINE LOADED CATIONIC-CHARGED LIPOSOMAL OCULAR DRUG DELIVERY SYSTEM FOR EFFECTIVE TREATMENT OF GLAUCOMA: IN-VITRO, EX-VIVO, AND IN-VIVO STUDIES**

Prakash K. Soni
Nanotechnology Research Lab, Department of Pharmacy,
Shri G.S. Institute of Technology & Science (SGSITS), Indore-452003 (MP), India
psoni@sgsits.ac.in

The present research is aimed to develop brimonidine tartrate (BRT) loaded cationic-charged liposomal eyedrops having longer precorneal retention, enhanced trans-corneal permeation and improved intra-ocular pressure (IOP) lowering efficacy for effective treatment of glaucoma. Liposomal formulation designing and optimization was done using 3-factor, 3-level Box-Behnken design selecting phospholipid (EPCS-DOTAP), cholesterol, and drug content as factors (independent variables) and mean particle size (MPS), zeta potential (ZP), PDI, entrapment efficiency (%EE), and % cumulative drug release (%CDR) as response variables. The optimized formulation prepared by thin-film hydration-sonication and purified by stirred cell ultrafiltration technique exhibited optimal liposomal characteristics, i.e., 160.4 nm (MPS), 28.2 mV (ZP), 0.212 (PDI), and 58.6% (EE) and 90.8% CDR at 12h showing in-vitro sustained release with Higuchi's kinetics model. The TEM, XRD, and DSC studies confirmed the spherical, nano-sized and effective drug loading of liposomal drug-carriers. The BRT liposomes were developed as isotonic eyedrops having 7.2 pH, 298 mOsm/kg osmolality and HET-CAM tested non-irritant formulation. The ex-vivo study in goat cornea demonstrated 1.02±0.08 cm.min-1 apparent permeability and 18.1±1.1 µg.cm-2.min-1 steady-state flux with 2 times higher drug permeation compared to marketed eyedrops. The in-vivo pharmacodynamic studies also confirmed the better IOP lowering efficacy against normo-tensive and hyper-tensive rabbit eyes during 12 h study period in comparison to marketed eyedrops. The developed BRT loaded liposomal eyedrops possessed all recommended quality attributes in acceptable range and exhibited physical stability during 3 months study period.

**Keywords**: Brimonidine tartrate; glaucoma; cationic-charged liposome; ocular drug delivery; IOP lowering effect.

**PC-1030**

**BUSPIRONE HYDROCHLORIDE NASAL IN SITU GEL: DESIGN, IN VITRO AND EX VIVO EVALUATION**

Preethi G B, Yashashwini M S
Department of Pharmaceutics, KLE College of Pharmacy, Bengaluru, a Constituent unit of KAHER, Belagavi, Karnataka, India
preethi.gb@klepharmblr.org

Buspirone Hydrochloride a 5-HT1A receptor agonist is widely used in to management of anxiety disorders which is a most common neurological condition. However, its low oral bioavailability (~4%) due to extensive first-pass metabolism necessitates alternative delivery routes. This study aimed to formulate and evaluate a thermosensitive Buspirone HCl nasal in situ gel (B-NIG) for enhanced brain targeting and prolonged residence time in the nasal cavity. By applying a central composite design 13 B-NIG formulations (F1-F13) were prepared by varying the factors Poloxamer 407 and Gaur Gum. Prepared B-NIG were evaluated for gelling temperature, gelling time, viscosity and % drug release. By statistical evaluation it was observed that there is a significant decrease in the gelling temperature and gelling time as concentration of polymer increased. From the design the optimized B-NIG was found to be with the composition of 19.034%w/v Poloxamer 407 and 0.135%w/v Gaur Gum which is almost closer to the F10 B-NIG formulation. The recommended optimized B-NIG formulation exhibited desired gelling temperature (36°C), gelling time (20 s), and viscosity (105.23 cPs) with drug release of 72.14%±0.01 over 8 hours which followed zero order

ISBN: 978-81-980623-8-3

release kinetics with non- fickian diffusion mechanism. The FTIR, DSC and XRD confirmed the compatibility between the drug and excipients. The ex vivo permeation study of optimized B-NIG formulation showed cumulative drug permeation of 1.73±0.5mg/cm2 after 8 hours, with a steady state flux of 0.2198±0.5mg/cm2/hr. Overall, the optimized B- NIG formulation demonstrated promising physicochemical properties for intranasal delivery, suggesting a viable route for enhancing therapeutic outcomes in anxiety treatment by bypassing hepatic metabolism and ensuring prolonged drug retention in the nasal cavity.

**Keywords**: Buspirone Hydrochloride, Nasal in situ gel, Thermo sensitive in situ gel, Anti anxiety

## BIOACTIVE NANOGEL AND FOAM DRESSINGS FROM MORINDA CITRIFOLIA: FORMULATION, CHARACTERIZATION, AND WOUND HEALING EVALUATION

R. Deveswaran, Amith Bounsle NG
Dept. of Pharmaceutics, Faculty of Pharmacy, M.S.Ramaiah University of Applied Sciences, Bangalore
preethi.gb@klepharmble.org

Wound healing is enhanced through the application of nanogel and foam dressings containing extracts from Morinda citrifolia leaf (noni). The noni plant's antimicrobial, anti-inflammatory, and antioxidant qualities help combat infection and reduce inflammation. Soxhlet extraction was employed to obtain the ethanolic extract of morinda citrifolia, which was then subjected to GC-MS and LC-MS analysis. In silico studies were conducted using the PubChem database to obtain the 3D structures of the constituents to investigate the binding modes of the active constituents against 12 protein targets. Complexes with high binding scores were subjected to molecular dynamic analysis and ADMET analysis. The cytotoxicity of the extracts and the formulation was analyzed to determine the viability of HDF cells. The formulations of nanogel were prepared by modified solvent diffusion method and foam dressing was prepared using toluene di-isocynate, dabco and polyols. These formulations were analyzed for physical tests, extract content, SEM, and in vitro drug release. The optimized nanogel and foam dressing were subsequently evaluated for scratch assays in HDF and in vivo studies and stability studies were perfomed as per ICH guide lines. The morinda citrifolia leaf extracts yielded 25-30%. Molecular dynamic simulations using the DESMOND program indicated that the selected protein-ligand complexes were more stable than the standard complexes throughout the simulation. The pure extract showed no toxicity, with 100% cell viability at all concentrations, suggesting its suitability as a formulation. The foam and nanogel formulations showed acceptable physical characteristics, with an optimal particle size of 40 nm, PDI ranging from to 0.1-0.6. The nanogel and foam dressings exhibited no significant cytotoxicity and enhanced wound healing activity compared to the standard and control groups, showing viability greater than standard. Additionally, wound contraction and hydroxyproline levels were higher in rats treated with nanogel and foam dressing than in the control group. There are no significant changes in all the test parameters for the study during the stability studies. Hence they remain safe and functional for use in wound care applications. The study provides morinda citrifolia leaf extract in the formation of a nanogel and foam dressing was observed to be stable, safe, and exhibited promising wound healing activity.

Emulgels have emerged as a promising topical drug delivery system for delivering both hydrophobic and hydrophilic drugs. They increase the absorption and enhance the action of the drug. The objective of this study was to formulate and evaluate Emulgel containing extract of Tridax procumbens for wound healing activity. The plant has been extensively used in Ayurvedic system of medicine for various diseases like hepatoprotective effect, immunomodulating property, promising wound healing activity, antidiabetic, hypotensive effect, antimicrobial, insect repellent activity, anti-inflammatory and antioxidant, bronchial catarrh, dysentery, diarrhoea also prevent falling of hairs and leads to hair growth promotion. The formulation of Emulgel was done by using Carbapol 940, Span 80, Tween 80, Light Liquid paraffin, Triethanolamine, methyl paraben and extract of TP. The formulated emulgel was evaluated for physical properties like pH, Spreadability, Viscosity and compatibility studies & anti-microbial studies. From the evaluation it was concluded that the formulation F2 Emulgel was better on its physical properties and anti-microbial studies for wound healing activity.

**Keywords**: Emulgel, Tridax procumbens, Wound healing, Anti-microbial activity.

## FORMULATION AND EVALUATION OF TRANSDERMAL PATCHES FOR OSTEOARTHRITIS MANAGEMENT

Rahul Kalbande
Department of Pharmacology, School of Pharmacy, SRTMU, Nanded – 431606
rahulkalbande81@gmail.com

Osteoarthritis (OA) remains a major global health concern, requiring treatment approaches that enhance efficacy while improving patient convenience. Transdermal drug delivery systems (TDDS) provide a promising alternative by enabling sustained and controlled drug release, reducing systemic adverse effects, and improving treatment adherence. This study aimed to develop and evaluate transdermal patches containing hyaluronic acid, HPMC K15M, and selected essential oils for OA management. Patches were formulated using optimized combinations of polymers, plasticizers, and solvents based on factorial design. A polyvinyl alcohol (PVA) backing membrane was prepared, and patches were fabricated using the film-casting method. The physical properties of the patches—including colour, uniformity, flexibility, and surface smoothness—were assessed. Additional evaluations included patch thickness, folding endurance, weight variation, moisture content, adhesion strength, and pH to ensure functional quality. The patches demonstrated favourable physical attributes, consistent thickness, and adequate folding endurance, indicating good mechanical stability. Weight uniformity confirmed accurate drug distribution, while moisture content values supported patch stability. Adhesion strength was sufficient for sustained skin contact, and pH levels were compatible with the skin.

**Keywords**: Osteoarthritis; Transdermal Drug Delivery Systems; Polyvinyl Alcohol

## FORMULATION AND EVALUATION OF A LACTOBACILLUS ACIDOPHILUS BASED ANTI-ACNE GEL FOR THE TREATMENT OF ACNE VULGARIS

Raj Telgote, Yogendra Gautam, Rashmi Trivedi, Milind Umekar
Department of Pharmaceutical Quality Assurance, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur- 441002.
rajtelgote371@gmail.com

Acne vulgaris is a common dermatological condition affecting millions worldwide, especially during adolescence but often continuing into adulthood. Conventional treatments such as antibiotics, retinoids, and benzoyl peroxide can be effective but often lead to side effects, including irritation, dryness, and antibiotic resistance. These limitations have increased interest in probiotics as a gentler alternative capable of supporting the skin microbiome and reducing inflammation. This study aimed to develop and evaluate an antiacne gel containing Lactobacillus acidophilus, a probiotic strain known for inhibiting acne related bacteria such as Propionibacterium acnes and helping reduce inflammatory responses. The gel base was prepared using carbopol 934 as the gelling agent and propylene glycol as a humectant to improve skin hydration. The probiotic culture was lyophilized to maintain viability and incorporated under aseptic conditions to prevent contamination. The formulation was evaluated for physicochemical properties, microbial viability, and short-term stability. In vitro antimicrobial tests were also performed against P. acnes and Staphylococcus epidermidis. Results showed that the gel maintained a stable, skin friendly pH with consistent viscosity and spreadability over 45 days. The antimicrobial assays demonstrated significant inhibitory activity against acne causing bacteria. Overall, the probiotic based antiacne gel showed encouraging

ISBN: 978-81-980623-8-3

stability and antimicrobial effects without signs of irritation, highlighting its potential as a safe and effective alternative for acne management and supporting further clinical exploration.

**Keywords**: Probiotic, Acne, Acne Vulgaris, Antimicrobial Property

**NOVEL APPROACH FOR ENHANCED ANTIFUNGAL THERAPY: DEVELOPMENT AND EVALUATION OF FLUCONAZOLE-LOADED TOPICAL NANOSPONGE HYDROGEL.**

Rameshbabu Janga, Venkatesh Ambati
Department of Pharmaceutics, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chowdavaram, Guntur, Andhra Pradesh, India 522019.
ramesh.janga11@gmail.com

Fungal infections remain a major health concern, demanding improved antifungal therapies. Fluconazole, a commonly used antifungal drug, suffers from poor aqueous solubility and limited skin penetration, resulting in reduced therapeutic efficacy. This studyaimed to develop a fluconazole-loaded nanosponge hydrogel to enhance solubility, stability, and topical antifungal activity while minimizing systemic side effects. Nanosponges were prepared using the emulsion solvent diffusion method with polymers such aspolyvinyl alcohol (PVA), hydroxypropyl methylcellulose (HPMC), ethyl cellulose (EC), and Eudragit RS100. The formulations were characterized for production yield, drug entrapment efficiency, particle size, zeta potential, morphology (SEM), and compatibility (FTIR, DSC). The optimized EC-based nanosponge formulation (F5) showed the highest production yield (77.53%), drug entrapment efficiency (80.8%), and an average particle size of 334 nm. SEM confirmed a porous structure, while FTIR and DSC revealed no drug–polymer interactions. The optimized nanosponge hydrogel (FG5), prepared using Carbopol 940, exhibited suitable pH (6.9), high drug content (91.63%), and excellent spreadability. In-vitro diffusion studies demonstrated significantly higher drug release (90.9%) from FG5 compared with the marketed fluconazole gel (Flucos Gel 0.5%). Stability studies conducted as per ICH guidelines confirmed physical and chemical stability for three months. Overall, the fluconazole-loaded nanosponge hydrogel showed enhanced drug release, stability, and therapeutic potential over conventional formulations, suggesting a promising approach for effective topical antifungal therapy. Further clinical evaluation is warranted to confirm its efficacy and commercial viability.

**Keywords**: Fluconazole, nanosponge hydrogel, antifungal therapy, topical drug delivery, non-Fickian diffusion.

**QBD BASED DEVELOPMENT, CHARACTERIZATION AND PHARMACOKINETIC EVALUATION OF ENZALUTAMIDE-LOADED CYCLODEXTRIN NANO SPONGES FORMULATIONS FOR ENHANCED DRUG DELIVERY**

Ramya Teja Medarametla1, Gadela Venkata Radha2
Department of Pharmaceutics, GITAM School of Pharmacy, GITAM (Deemed to be University), Visakhapatnam, Andhra Pradesh, INDIA.
Department of Pharmaceutics, GITAM School of Pharmacy, GITAM (Deemed to be University), Visakhapatnam, Andhra Pradesh, INDIA.

The aim of this study was to enhance the bioavailability of Enzalutamide by developing cross-linked cyclodextrin nanosponges loaded with the drug (EZL-CDNS). The objective of the work is to thoroughly investigate the impact of different molar ratios of DPC and cyclodextrin on the fundamental properties of EZL-CDNS, such as particle size, entrapment efficiency, and zeta potential. The Box-Behnken design methodology was employed to systematically investigate the factors affecting the properties of EZL-CDNS. Particle size, entrapment efficiency, and zeta potential were selected as response variables. The encapsulation of enzalutamide was confirmed using DSC and FTIR and morphology with SEM. The EZL-CDNS exhibited a size distribution ranging from 295 to 471 nm, entrapment efficiency values spanning from 51.7% to 90.7%, and zeta potential values ranging from -15.3 to -28.1 mV. DSC and FTIR analyses confirmed the successful encapsulation of enzalutamide, leading to its transition into an amorphous state. SEM revealed the porous structure of EZL-CDNS. Importantly, in vitro drug release profiles demonstrated a significant improvement compared to pure EZL. EZL-CDNS exhibited a quicker onset of action, higher peak plasma Concentration (Cmax), increased overall drug in sustained release pattern. This study successfully developed and characterised EZL-CDNS with different DPC/cyclodextrin molar ratios. Nanostructured carriers had good size distribution, entrapment efficiency, and zeta potential. The increased in vitro drug release profile and pharmacokinetic modelling results suggest higher bioavailability and sustained release of enzalutamide.

**Keywords**: Enzalutamide, Cyclodextrin, Nanosponges, Box-Behnken Design, Pharmacokinetics.

**DESIGN OF EXPERIMENT ASSISTED FORMULATION OPTIMIZATION OF CURCUMIN AND ASCORBIC ACID LOADED NANO-LIPOSOMES USING BOX-BEHNKEN DESIGN**

Reena Soni, M. Tiwari and T. R. Saini
Department of Pharmacy, Shri G.S. Institute of Technology & Science, Indore-03 (MP), India
reena.soni0109@gmail.com

The objective of present work is to design and optimize a nano-liposomal formulation co-loaded with hydrophilic and hydrophobic natural immuno-boosting agents for their enhanced oral absorption, better stability, and effective delivery leading to improved bioavailability and immune-stimulant effect. The nano-liposomes was prepared by ethanol injection method entrapping Ascorbic acid-AA (hydrophilic drug) into the aqueous core and Curcumin-CUR (hydrophobic drug) into the lipid bilayer of liposomal vesicle. Box-behnken (three-factor, three level) design was employed in formulation optimization where the phospholipid content, cholesterol content and stirring speed were chosen as independent variables and mean particle size (MPS), polydispersity index (PDI), zeta potential (ZP), entrapment efficiency (EE), drug loading (DL) and % cumulative drug release (CDR at 12h) of both drugs were recognized as response variables. The optimized formulation was evaluated for the response variables and the experimentally-observed response data was very close to the software-predicted values having 192.2 nm MPS, 0.235 PDI, 21.7 mV ZP, 58.2% EE (AA), 68.4% EE (CUR), 10.4 % DL (AA), 8.8% DL (CUR), 78.6% CDR (AA), and 71.4% CDR (CUR) at 12 h. The developed nano-liposomes exhibited sustained drug release following Higuchi's kinetics model and the ex-vivo drug permeation study demonstrated approx. three-fold higher AA and CUR absorption compared to their aqueous solution/suspension. The developed coloaded liposomal formulation had all desired product qualities and physico-chemical properties in optimal range. The developed formulation exhibited physical stability till 3 months of study period and thus the development of co-loaded nano-liposomes was successfully accomplished.

**Keywords**: Curcumin, Ascorbic acid, Design of experiment (DoE), Co-loaded liposomes, Formulation optimization.

**IN VITRO EVALUATION OF ANTIUROLIATHIC ACTIVITY OF EUPHORBIA HETEROPHYLLA LEAVES USING TITRIMETRIC CALCIUM OXALATE DISSOLUTION AND UV SPECTROPHOTOMETRIC CRYSTALLIZATION INHIBITION ASSAYS**

Rejeena Sanar1, Shalini Kapoor Mehta2
1 Department of Pharmacology, Rajputana College of Pharmacy, Bengaluru, Karnataka, India.
2Principal & Professor, Rajputana College of Pharmacy, Bengaluru, Karnataka, India.
rejeena.sanar@gmail.com

Urolithiasis, primarily driven by calcium oxalate crystal deposition, remains a recurrent and challenging disorder with few effective non-invasive therapies. Exploring plant-based remedies offers a sustainable alternative. Euphorbia heterophylla, traditionally valued in ethnomedicine, was investigated for its potential antiurolithic activity using two validated in vitro models. Ethanolic extracts of E. heterophylla leaves were prepared and evaluated at concentrations of 1, 2, and 5 mg/ml. Calcium oxalate dissolution was assessed via a titrimetric method using 0.1 M $KMnO_4$, while crystal nucleation and aggregation were quantified by UV spectrophotometry at 620 nm over 5 minutes. The extract exhibited measurable dissolution of calcium oxalate crystals (23.20%), compared to the standard Cystone (48.90%). Spectrophotometric analysis revealed a clear dose-dependent inhibition of both crystal nucleation and aggregation, with maximal effect

ISBN: 978-81-980623-8-3

observed at 5 mg/ml. Euphorbia heterophylla demonstrated moderate yet promising antiurolithic potential by both dissolving preformed calcium oxalate and impeding crystal formation. These findings highlight its value as a prospective herbal adjunct in urolithiasis management. Further phytochemical profiling and in vivo validation are recommended to elucidate its active constituents and mechanisms of action.

**Keywords**: Urolithiasis, Euphorbia heterophylla, Calcium Oxalate, Titrimetric Method, UV Spectrophotometry, Herbal Medicine

**PC-1039**

## FORMULATION AND OPTIMIZATION OF PROCESS PARAMETERS IN FLUID BED TECHNOLOGY FOR EXTENDED-RELEASE POTASSIUM CHLORIDE PELLETS

Tirupati Kishanrao Mundkar, Rupali Humane, Ankita Yadav
Anurag college of Pharmacy Warthi Bhandara, Maharashtra India 441904
rupalihumane93@gmail.com

The present study focuses on the formulation and optimization of extended-release potassium chloride pellets using Fluid Bed Technology under a Quality by Design (QbD) framework. The objective was to evaluate the influence of critical process parameters and compare polymeric and hot-melt coating approaches for achieving a reproducible and controlled drug release profile. Potassium chloride pellets were prepared using stearic acid–dimethylglyoxime for hot-melt coating and ethylcellulose–triethyl citrate for polymeric coating. QbD tools including identification of Critical Quality Attributes (CQAs), Critical Process Parameters (CPPs), and FMEA-based risk assessment were applied to optimize key variables such as inlet temperature, atomizing air pressure, product temperature, spray rate, and coating levels. The prepared pellets were assessed for particle size distribution, bulk and tapped density, flow properties, drug content, wetting time, friability, FTIR, DSC, SEM, and in vitro dissolution. Pellets exhibited good spherical shape and smooth surface morphology, as confirmed by SEM. Dissolution studies performed in 0.1N HCl for 2 hours followed by phosphate buffer pH 6.8 for 4 hours showed that pellets coated with 6% stearic acid + dimethylglyoxime and 5% ethylcellulose + triethyl citrate achieved controlled release of 83.22% and 80.81% respectively over 6 hours. All physicochemical parameters complied with prescribed limits, reflecting excellent uniformity and flow properties. Stability studies performed as per ICH guidelines confirmed that the optimized formulations remained stable under accelerated conditions. This study demonstrates that QbD-integrated fluid bed processing is a robust and scalable approach for developing consistent and efficient extended-release potassium chloride pellets with optimized coating performance.

**Keywords**: Potassium chloride, extended-release pellets, fluid bed technology, QbD, coating optimization.

## FLUORESCENT CARBON DOTS AS DUAL-FUNCTIONAL NANOPROBES FOR RAPID MICROBIAL DETECTION AND BIOMEDICAL IMAGING

Saudagar Role, Babita Agarwal, Mansi Dighule.
Marathwada Mitra Mandal's College of Pharmacy, Thergaon, Pune, Maharashtra - 411033
saudagarrole@gmail.com

Fluorescent Carbon Dots (CDs) were successfully synthesized using a simple, economical bottom-up pyrolysis method. Physicochemical characterization confirmed their nanoscale size (~19 nm), excellent colloidal stability, and amorphous structure, ensuring high fluorescence and surface reactivity. The CDs exhibited strong blue fluorescence under 360 nm excitation, validating their potential for optical and biological applications. Spectrofluorometric analysis demonstrated the remarkable sensitivity of CDs in detecting bacterial contamination across water, food, and faecal samples. The fluorescence intensity correlated directly with microbial load, effectively distinguishing between purified and contaminated water sources in accordance with WHO and EPA safety standards. Similarly, food testing revealed clear variations in emission intensity, consistent with FSSAI regulations regarding E. coli contamination limits. In vivo biodistribution studies confirmed the excellent biocompatibility and safe gastrointestinal clearance of CDs within 24 hours. Overall, this study highlights the dual functionality of the synthesized CDs as low-cost, non-invasive, and field-deployable biosensors for rapid microbial detection and as efficient fluorescent probes for biomedical imaging—offering a promising approach for real-time health and environmental safety monitoring.

**Keywords**: Carbon Dots (CDs), Fluorescence, Pyrolysis synthesis, Bacterial contamination, Biosensor, Spectrofluorometric analysis, Biocompatibility, Biomedical imaging.

## FORMULATION AND OPTIMIZATION ZOLMITRIPTAN MUCOADHESIVE NANOSTRUCTURED LIPID CARRIER (NLC) BY USING BOX -BEHNKEN DESIGN FOR INTRANASAL DRUG DELIVERY

Shailendra Salvankar, Mukesh Ratnaparkhi,
Marathwada Mitra Mandal's College of Pharmacy, Pune-411033 (M.S.), India.
salvankar@gmail.com

The objective of the present study was to develop mucoadhesive nanostructured lipid carrier of zolmitriptan hydrochloride for brain targeting by nasal route. Mucoadhesive nasal dosage forms are an attractive method for overcoming rapid mucociliary clearance transport in the nose and for delivering the drug directly to brain. Box–Behnken design (BBD) was used to optimize the mucoadhesive NLC. The independent variables were the total lipid ratio, surfactant: co-surfactant concentration, and concentration of mucoadhesive agent and the dependent variables were particle size, zeta potential and entrapment efficiency. response surface graphs were used to understand the effects of each variable, and the desirability function was then adjusted to optimize NLC formulation. The experimental values of optimized formulation were in close agreement with predicted values. The optimized NLC were characterized by in vitro dissolution mucin binding efficiency, TEM DSC, FTIR, XRD. In conclusion, the BBD demonstrated its effectiveness in optimizing the NLC formulation and in identifying the effects of formulation variables.

**PC-1042**

## ADVANCED FOOD PRODUCT DESIGN: A PATENT ANALYSIS OF FUNCTIONAL GUMMIES IN TAILORED NUTRITION, FORMULATION CHALLENGES, AND PRODUCTION SCALABILITY

Shashikant B. Bagade, Jigisha Lad, Divya Nasare
SVKM's Narsee Monjee Institute of Management Studies (NMIMS) Deemed-to-be University, School of Pharmacy & Technology Management, Department of Pharmaceutical Chemistry, Shirpur Campus, Dist. Dhule-425405, Maharashtra, India
shashikant.bagade@nmims.edu

Formulations like gummies have evolved from confectionery items into scientifically engineered food products that combine pharmaceutical and nutraceutical technologies. The use of functional gummies as flexible delivery systems for therapeutic and preventative treatments has been further broadened by the development of tailored and precision nutrition. This review critically examines the recent developments in advanced manufacturing techniques, food formulation strategies, and global patent patterns that have driven this change in food product design. Important formulation factors—such as the appropriate selection of gelling agents, sweeteners, acidulants, and flavoring agents—determine the physicochemical stability, palatability, and bioavailability of active ingredients. The patent analysis highlights an increasing shift toward sustainable ingredient sourcing, including high-protein and plant-based gelling agents, reflecting trends in green food production. Modern processing technologies, including encapsulation, core-shell designs, and three-dimensional (3D) printing, enable precise dose administration, increased stability of thermolabile bioactives, and improved patient adherence across pediatric and geriatric populations. The formulations target metabolic, hormonal, and cardiovascular health. However, challenges related to nutrition degradation, large-scale production scalability, moisture sensitivity, and regulatory compliance in the food sector still prevent extensive commercialization. The functional gummies, as a promising interface between functional foods and advanced delivery systems, are highlighted by the combination of formulation research, modern production, and patent-driven innovation. To improve their therapeutic efficacy, production stability, and market sustainability, future research prospects are outlined in this study, which compiles current technical advancements and patents.

Keywords: Functional gummies, Nutraceuticals, Tailored medications, Patent analysis.

## DEVELOPMENT AND OPTIMIZATION OF RASAGILINE MESYLATE LOADED LIPOSOMAL GEL FOR SUSTAINED TRANSDERMAL DELIVERY

Shivdas Upase, Indranil Deshmukh, Milind Umekar, Rashmi Trivedi.
Department of Pharmaceutical Quality Assurance, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur- 441002.
shivdasupase@gmail.com

In the present investigation, a liposomal gel containing rasagiline mesylate was developed to overcome its short half-life and extensive first-pass metabolism, thereby enhancing transdermal delivery and sustaining drug release. Liposomes were initially prepared using the ethanol injection method, followed by the formulation of a liposomal gel using the dispersion technique. Phospholipon-90H and cholesterol were selected as key excipients, and a full factorial design was employed by varying their concentrations. Nine batches were prepared and evaluated for drug content, entrapment efficiency, and in vitro drug diffusion. The optimized batch was further characterized using zeta potential analysis, FESEM, FTIR, and particle size determination. In vitro studies demonstrated that rasagiline mesylate-loaded liposomes achieved a sustained drug release of 64.2 ± 0.80% over 12 hours, in contrast to the rapid release observed with rasagiline mesylate solution. The optimized liposomal batch was incorporated into a 1% liposomal gel, which was evaluated for spreadability, viscosity, pH, drug content, and in vitro diffusion. Comparative diffusion studies revealed that the liposomal gel provided prolonged drug release for up to 12 hours, outperforming the conventional rasagiline mesylate gel. This study concludes that transdermal delivery of rasagiline mesylate through a liposomal gel offers a promising alternative to oral administration by bypassing hepatic metabolism, protecting the drug from degradation, and improving patient compliance. The sustained-release profile of the liposomal gel highlights its potential for effective management of Parkinson's disease.

**Keywords**: Rasagiline mesylate, Liposomes, Rasagiline mesylate liposomal gel, Transdermal, ethanol injection method, Phospholipid 90H, Cholesterol, In-vitro diffusion study.

## FORMULATION AND IN-VITRO EVALUATION OF CLOTRIMAZOLE-LOADED POLYMERIC NANOPARTICLES FOR DRUG REPURPOSING IN BREAST CANCER TREATMENT

Shubham Karpe1,2,3, Rajesh Kumar1, Manjula Kiran2, Harit Kasana2
1 School of Pharmaceutical Sciences, Lovely Professional University, Jalandhar, Punjab, 144001.
2 Vaccine and Antisera Laboratory, National Institute of Biologicals, Noida, UP, 201307.
3 Department of Pharmaceutical Sciences and Technology, Institute of Chemical Technology, Mumbai, Maharashtra, 400019.
shubhamkarpe03@gmail.com

This study focuses on the development of a clotrimazole-loaded nanoformulation designed to target breast cancer, aiming to reduce cancer progression with minimal systemic toxicity. Clotrimazole (CLZ), was repurposed for its promising anticancer properties and encapsulated within polycaprolactone (PCL) nanoparticles to enhance its biocompatibility and therapeutic efficacy. The clotrimazole-loaded polycaprolactone-based nanoparticles (CLZ@PCLNPs) were formulated using the nanoprecipitation method and optimized through Box-Behnken design (BBD) for critical attributes Preformulation studies using spectrophotometric analysis, differential scanning calorimetry DSC and FTIR confirmed the compatibility and stability of CLZ with excipients, preserving the drug's integrity within the formulation. Morphological analysis via scanning electron microscopy (SEM) revealed uniform, Hemolytic studies confirmed that the optimized formulations were non-hemolytic, supporting their biocompatibility. In vitro drug release studies indicated a sustained release profile, with 65.84% of the drug released over 24 hours, suggesting prolonged therapeutic efficacy. In vitro studies conducted on MCF-7 (human breast cancer) and MDA-MB-231 (triple-negative breast cancer) cell lines demonstrated the anti-proliferative effects of CLZ@PCLNPs, with improved therapeutic outcomes. The optimized nanoparticles with IC50 values of 53.02 µg/mL for MCF-7 cells and 58.61 µg/mL for MDA-MB-231 cells, highlighting their anticancer potential. Cellular uptake studies confirmed targeted delivery, showing promising results in tumor regression and reduced systemic toxicity. These findings suggest that CLZ@PCLNPs serve as a biocompatible and effective carrier for the sustained release of clotrimazole.

**Keywords**: Cancer, Breast cancer, Genes, Targeted Drug Delivery, CLZ, Nanoformulations, Tumor regression, etc.

## DESIGN, FORMULATION, AND EVALUATION OF PIPERINE-BASED POLYMERIC NANOFORMULATION OF GABAPENTIN FOR EPILEPSY MANAGEMENT

Shubhangi N. Pillewan, B.V.Nagarjuna Yadav
School Of Pharmacy, Gh Raisoni University Amravati, Maharashtra.

The purpose of the current study was to develop and characterize a new nanoformulation of gabapentin using PEG polymers for epilepsy therapy. Nanoformulation of gabapentin was developed from the use of PEG polymers. Preformulation studies were performed to evaluate the physical and chemical compatibility of the drug and polymer using FTIR and DSC. The standard calibration curve was determined for the pure drug Gabapentin. Epilepsy is a neurological condition affecting approximately 60 million people worldwide. Antiepileptic medications commonly used today have a limited shelf life and undesirable physicochemical and pharmacokinetic properties, limiting their use. Scientists have long been searching for means to enhance delivery to the areas of the Central Nervous System. Delivering drug molecules using nanocarriers is a viable approach to drug formulation, but it is also important to select a biodegradable material. Gabapentin is an anticonvulsant drug used for treating partial seizures and neuropathic pain. The primary purpose of the study was to formulate gabapentin with piperine nanosuspensions using the antisolvent precipitation-ultrasound sonication method and to enhance gabapentin solubility by reducing the particle size to the nanometre range. The formulated system was then evaluated for particle size, polydispersity index, zeta potential, entrapped efficiency, encapsulation efficiency, and drug-excipient compatibility. In addition, the surface morphology will be examined through scanning electron microscopy. The drug release kinetics will be performed for optimized nanoformulation. Thus, the developed formulation could be a promising carrier system, especially considering the physiological blood-brain barrier as an emerging challenging barrier for brain drug delivery.

**Keywords**: Gabapentin, Piperine, Epilepsy, Nanoprecipitation Method, Anticonvulsant, Zeta Potential, Entrapment Efficiency, Polydispersity Index, Scanning Electron Microscopy.

## DEVELOPMENT AND CHARACTERIZATION OF A SUSTAINED-RELEASE BUCCOADHESIVE LEVODOPA WAFER FOR PARKINSONISM MANAGEMENT

SHUBHASHREE A S

The aim of the present study was to develop and characterize a sustained-release buccoadhesive wafer of Levodopa for the treatment of Parkinsonism. Levodopa is an important antiparkinsonian drug, and buccoadhesive delivery was selected to reduce side effects and improve bioavailability. The wafers were prepared by the solvent casting method using Chitosan lactate (mucoadhesive polymer), PVP K-30 (hydrophilic polymer), PEG 400 (plasticizer), and aqueous acetic acid (solvent). The prepared wafers showed good physical appearance and uniform thickness. The surface pH ranged from 6.00 ± 0.09 to 6.90 ± 0.03, indicating compatibility with the buccal cavity. The tack test demonstrated medium to excellent adhesion. Tensile strength ranged from 0.163 ± 0.01 to 0.256 ± 0.06 N/cm², while folding endurance ranged from 209 ± 1.52 to 242 ± 3.46, confirming adequate flexibility. The swelling index was between 89.2% and 96%. Drug content varied from 71.9 ± 0.23% to 93.6 ± 0.16%, with formulation F5 showing the highest content (97.6 ± 0.16%). In vitro dissolution of formulation F5 showed 96.78 ± 0.42% drug release, and the In vitro diffusion study showed 95.61 ± 0.25% release, indicating enhanced release due to PVP K-30. Drug-release kinetics followed the Korsmeyer-Peppas model with an $R^2$ value of 0.9816. The release exponent (n = 0.8015) indicated a non-Fickian diffusion mechanism. Based on the study findings, the buccoadhesive wafer of Levodopa demonstrated suitable physicochemical properties and sustained -release characteristics, suggesting its potential for improved therapeutic management of Parkinsonism.

ISBN: 978-81-980623-8-3

**Keywords**: Levodopa, Buccoadhesive wafer, Solvent casting method, sustained release, Parkinsonism.

**EVALUATION OF ANTIMICROBIAL ACTIVITY OF NANOPARTICLE OF CALOTROPIS GIGANTEA LINN. EXTRACT**

Shweta Hattimare, Kishor Danao, Disha Dhabarde, Jagdish Baheti
Kamla Nehru College of Pharmacy (RTMNU) Butibori, Nagpur, Maharashtra-441108
shwetahattimare8@gmail.com

The present study focuses on the green synthesis, characterization, and antimicrobial evaluation of zinc nanoparticles using extracts from Calotropis gigantea Linn., a medicinal plant known for its wide range of biological activities. Phytoconstituents from different parts of the plant were extracted using the soxhlet extraction method to obtain bioactive compounds. These extracts acted as natural agents for the synthesis of zinc nanoparticles. The formation of nanoparticles was confirmed by UV–visible spectroscopy, which showed characteristic absorption peaks indicating successful nanoparticle synthesis. Dynamic light scattering (DLS) analysis was performed to determine particle size and distribution, confirming that the synthesized zinc nanoparticles were uniform and stable. To understand the possible mechanism of antimicrobial activity, molecular docking studies were carried out using PyRx software. The results showed strong interactions between the major phytoconstituents and microbial target proteins, suggesting their contribution to antibacterial effects. The antimicrobial activity of both the Calotropis gigantea extract and the synthesized zinc nanoparticles was tested using the cup-plate method against selected bacterial strains. The zinc nanoparticles showed significant inhibitory effects, especially against Escherichia coli. Overall, the study demonstrates that Calotropis gigantea is an efficient and sustainable source for producing zinc nanoparticles with strong antimicrobial properties. The findings support the potential use of such biosynthesized nanomaterials in pharmaceutical and biomedical fields as eco-friendly and biocompatible agents.

**Keywords**: Calotropis gigantean Linn., Zinc nanoparticles, Soxhlet extraction, Phytoconstituents, Antimicrobial activity, Molecular docking.

siddhi.chaudhary1411@gmail.com

Nanosuspension were made from (LMW) Chitosan/STPP to improves solubility of poorly soluble pilocarpine HCL.Nanosuspension improves bioavailability of drug at intraocular level and to reduce the frequency of drug administration. Nanosuspension were successfully prepared by ionotropic gelation method. Size of nanoparticles varied between 84.75-235.09nm.A polydispersity index and zeta potential of optimized batch F1 0.381 and -21.5±1 mV. Scanning electron microscopy (SEM) study of optimized batch completely revealed that the drug loaded nanoparticles were found to be spherical in shape having a smooth surface and the drug is molecularly dispersed uniformly throughout the whole polymer matrix.Nanosuspension of optimized F1 batch gives higher drug release 93.34±0.86%. Release kinetics investigation of pilocarpine HCL from F1 optimized batch followed the Higuchi square root model and first order release model gives sustained drug release effect for 8hr.The optimized formulation is isotonic in nature which reduces ocular irritation and improves patient compliance. No significant change in average particle size and zeta potential were observed after conducting stability studies.Thus,the (LMW)Chitosan/STPP have potential effect for the treatment of glaucoma.

**Keywords**: Nanosuspension, Pilocarpine hydrochloride, Chitosan/STPP, Ionotropic gelation method, Transcorneal permeation.

**DEVELOPMENT OF PARACHUTE-INSPIRED MUCOADHESIVE MICROSPHERES FOR NASAL DELIVERY OF RIVASTIGMINE**

Snigdha S Babu, B.A Vishwanath
Department of Pharmaceutics, Aditya Bangalore Institute of Pharmacy Education and Research , Bangalore, Karnataka, India.
snigdhasatheesababu@gmail.com

In the present research, parachute-inspired mucoadhesive microspheres of Rivastigmine were successfully formulated for enhanced nasal delivery. The objective of the study was to evaluate the influence of polymer ratio and crosslinking time on entrapment efficiency, unfolding behavior, swelling capacity, particle size, and in-vitro drug release. Microspheres were prepared by a modified ionic gelation method using chitosan and pectin as mucoadhesive polymers with an alginate-based hydrogel core to achieve rapid expansion. The prepared formulations were analyzed for particle size, swelling index, unfolding time in simulated nasal fluid, entrapment efficiency, mucoadhesion strength, and in-vitro release. Among all formulations, PM-4 exhibited the most desirable characteristics, including an entrapment efficiency of 78.4%, swelling index of 312%, and rapid unfolding within 22 seconds, enabling the intended parachute-like expansion. PM-4 also showed sustained drug release for up to 8 hours following non-Fickian transport. FTIR confirmed no interaction between drug and polymers, while DSC indicated partial amorphization of Rivastigmine within the microsphere matrix. Stability testing for 30 days showed no significant variation in particle size or drug content. Therefore, the developed parachute-inspired microspheres demonstrated strong mucoadhesion, rapid expansion, and controlled release, showing significant potential for improved nasal delivery of Rivastigmine.

**Keywords**: Rivastigmine, Parachute Microspheres, Mucoadhesion, Ionic Gelation, Nasal Delivery

**DESIGN AND DEVELOPMENT OF CYCLOSPORIN BASED COLLOIDAL CARRIER DRUG DELIVERY SYSTEM FOR TOPICAL MANAGEMENT OF ATOPIC DERMATITIS**

Sourav Shriraj Chaudhari, Amit B. Page.
Department of Pharmaceutics, SVKM'S NMIMS SHIRPUR, MAHARASHTRA 425405
souravchaudhari2882@gmail.com

Atopic dermatitis (AD) is an inflammatory chronic, recurrent skin disorder of the skin, it is defined by epidermal barrier malfunction, severe pruritus, and an increased risk of secondary infection. Traditional oral and parenteral treatments are restricted by side effects in the system, decreased patient adherence, and invasive administration, which makes it necessary to introduce new topical drug delivery methods. Carriers using nanotechnology have become an interesting solution to overcome the stratum corneum barrier and deliver controlled and localized therapy. Nano sponges made of cyclodextrin are one of them that have unique advantages such as large drug-loading capacity, adjustable polarity, and controlled drug release. A design-of-experiments method was used to fabricate and optimize nanosponges, and the optimum formulation was characterized using FTIR, XRD, SEM, TEM and thermal analyses. The developed nanosponges had an average particle size of about 93 nm, an entrapment rate of 73% and a release in-vitro property. The stability test of the formulation conducted under the ICH guidelines established the stability. Altogether, the cyclosporine-loaded cyclodextrin nanosponges are a promising colloidal carrier in the management of AD topically, providing a higher degree of drug stability, controlled release, and better patient compliance in comparison with traditional topical or systemic drugs. The present review sheds light on the scientific rationale, development approach, and therapeutic promise of nanosponge-based topical delivery as a convenient method of patient treatment of chronic dermatological diseases.

**Keywords**: Cyclosporine, Nanosponges, Atopic dermatitis.

**DESIGN AND EVALUATION OF DELAYED RELEASE PELLETS OF LANSOPRAZOLE**

Sravan Kumar Aligeti, Raj Kumar Jampala
Vaageswari College of Pharmacy, Ramakrishna colony, Karimnagar – 505527, Telangana
sravanpharma84@gmail.com

The formulation process was carried out in FBP by suspension layering technique. To bypass stomach, the formulation has to delay the release

ISBN: 978-81-980623-8-3

and give the release in proximal small intestine. This can be achieved by enteric coating. The work was carried out to delay the release of Lansoprazole by using enteric polymer Methacrylic acid copolymer (type C). The study includes preformulation of drug and excipients, formulation and evaluation, release kinetics and stability studies of capsules. Drug Loading was given to sugar spheres by using different binders i.e., Klucel- LF and L- HPC with different concentrations. The amount of drug bound to sugar spheres increases with an increased concentration of HPC (L-type) (17.5% and 22%). But at high concentration of HPC (22%), lumps were observed. Finally 17.5% w/w HPC was optimized as binder for drug coating. Sub coating was given to drug loaded pellets to avoid direct contact with enteric coating. Sub coating was given with HPC and Corn starch combination at an average weight build up of 6.1% w/w of sub coated pellets. Based on the above data, it was concluded that Lansoprazole Capsules 30mg (E6) complies with the Innovator and may be considered as an ideal formulation for developing Lansoprazole delayed release capsules 30mg.

**Keywords**: Pellets, Lansoprazole, Polymers, HPC

**PC-1052**

**FORMULATION AND EVALUATION OF FLOATING MICROBEADS OF RITONAVIR**

Srikanth Bavu
Department of Pharmaceutics, Vaageswari Institute of Pharmaceutical Sciences, Karimnagar, Telangana, India – 505527
srikanth.bavu@gmail.com

The aim of the present work was to prepare and evaluate floating microbeads of Ritonavir. The use of natural polymers in dosage form design has received considerable attention, especially from the viewpoint of safety. Among the polymers, Low Methoxy Pectin (LMP), and co polymer Locust bean gum(LBG), Okragum Powder (OKG) and Gum Ghatti (GG). Microbeads formulation is based upon the interaction between the polymer (LMP) and cross linking agent. LMP is an anionic polymer, which can be easily cross linked with CaCl2. Microbeads were formulated in different ratio using LMP:LBG, LMP:OKG, LMP:GG as retarding agents and 10% of Calcium chloride (CaCl2), as cross linking agents by employing Ionic Gelation Technique. The complexation between Ca+2 ions with LMP along with natural copolymer leads to retard the release of the drug. Floating time and floating lag time, Drug Entrapment efficiency and in-vitro dissolution studies were also carried out in eight hours (in pH 1.2 media). The invitro data was explored with zero order, first order, Higuchi and Korsmeyer equations. The release kinetics was found to be governed by the type and content of the polymer (LMP) and copolymer. Formulation (PKa) shows zero order release kinetics with higher (r2) values. By suitable modulation could be developed floating microbeads for this type of drug. Hence , Floating microbeads of Ritonavir can be developed by using low methoxy pectin polymer along with the natural polymers.

**Keywords**: Ritonavir, guargum, okragum, locust bean gum.

Chronic osteoarthritis pain often requires long-term therapy with non-steroidal anti- inflammatory drugs (NSAIDs). Diclofenac and etoricoxib offer strong analgesic and functional benefits, whereas ibuprofen and naproxen are preferred for patients needing safer cardiovascular profiles. All these agents fall under Biopharmaceutical Classification System (BCS) Class II, exhibiting high permeability but poor aqueous solubility, which limits oral bioavailability. Gastroretentive floating tablet systems overcome these limitations by prolonging gastric residence and drug release. Formulations incorporating polymers such as HPMC K100M along with effervescent agents like sodium bicarbonate enable buoyancy and controlled drug release, improving dissolution and absorption of poorly soluble NSAIDs. These systems may also minimize systemic side effects through optimized pharmacokinetics and localized gastric delivery. Additionally, topical NSAIDs serve as alternative options for localized osteoarthritis pain with reduced systemic exposure. This study focuses on the formulation, optimization, and evaluation of gastroretentive floating tablets of BCS Class II NSAIDs to enhance bioavailability in chronic osteoarthritis management.

**Keywords**: Chronic osteoarthritis, diclofenac, etoricoxib, ibuprofen, naproxen, BCS Class II drugs, floating tablet, gastroretentive drug delivery, HPMC, effervescent agents, topical NSAIDs

**DESIGN AND CHARACTERIZATION OF AN ERYTHROMYCIN LOADED ETHOSOMAL GEL FOR MANAGING ACNE**

SUSHMITHA RAI

Ethosomes are innovative, non-invasive delivery systems that allow drugs to penetrate deeply into the skin and, in some cases, enter systemic circulation. These soft and flexible vesicles are optimized to enhance the transport of active molecules. They are mainly composed of phospholipids (such as phosphatidylcholine, phosphatidylserine, and phosphatidic acid), high amounts of ethanol, and water. The current study focuses on assessing the efficiency of an erythromycin-loaded ethosomal gel in managing acne. Erythromycin, a macrolide antibiotic derived from Streptomyces erythreus, is well recognized for its therapeutic activity against acne. Erythromycin-loaded ethosomes were formulated using the cold method in six variations (F1–F6), each containing different proportions of lecithin and ethanol. The formulation exhibiting the highest entrapment efficiency was selected and incorporated into a Carbopol 934 gel base. The final gel formulation was then analyzed for various parameters such as physical appearance, pH, drug content, spreadability, viscosity, in vitro diffusion, and drug release kinetics. Among the formulations, F2 showed the highest entrapment efficiency (79.89%), had a nanoscale particle size of 291.7 nm, and achieved a cumulative drug release of 82.29 ± 0.35%. The ethosomal gel demonstrated 71.33% drug release over 8 hours, following first-order release kinetics. Overall, the formulated ethosomal gel displayed enhanced stability, and the results support the potential of erythromycin-loaded ethosomal gel as an effective therapeutic strategy for acne treatment.

**Keywords**: Erythromycin, ethosomes, Carbopol 934

boradetamanna@gmail.com

Non-steroidal anti-inflammatory drugs (NSAIDs) are frequently ingested by a substantial fraction of the population for its analgesic, antipyretic, and anti-inflammatory actions and are the second leading cause of GI ulceration, affecting between 15 and 40% of people who regularly take NSAIDs. The link between NSAIDs use and the occurrence of stomach bleeding and ulceration has been established, and it has been linked to life-threatening consequences such as ulcer perforation caused by oral administration. To overcome the disadvantages of oral delivery of NSAIDs, in the present study diclofenac-loaded proliposomes were prepared and evaluated to explore the feasibility of proliposomes as a drug carrier which would generate diclofenac sodium-bearing liposomes soon after they come in contact with body fluid. The proliposomes were prepared by film deposition on carrier method by rotatory evaporator. Optimization studies were performed with the help of Design expert software using Box-Behnken model. The prepared optimized proliposomes were evaluated through vesicle size, PDI, entrapment efficiency, TEM and in-vitro drug release. The vesicle size and PDI were 162.5 nm and 0.291 respectively. The morphological evaluation was done by optical microscopy and TEM. Drug entrapment efficiency (EE%) was found to be 67.56%±0.4. An in-vitro drug release was carried out using the dialysis bag method as it has shown cumulative release of 44.64%±1.74 in 30 mins. and 98.64%±1.44 in 2 hours. This demonstrated

ISBN: 978-81-980623-8-3

an enhancement in the drug diffusion and thereby, absorption of the drug through the membrane. The analysis indicates that proliposomes could be utilized as drug delivery for NSAIDs.

**Keywords**: Proliposomes, Nonsteroidal anti-inflammatory drugs, oral delivery, optimization, diclofenac sodium

Dendrimers, a sophisticated nanoscale concept, are transforming cancer treatment by tackling the critical challenges plaguing conventional therapies: poor drug solubility, systemic toxicity, oral bioavailability, side effects, and drug resistance therapy. These branched molecular frameworks serve as attractive drug delivery nanocarriers, with their engineered structure enabling controlled release and targeted delivery of chemotherapeutic agents. This breakthrough promises to enhance the therapeutic index of anticancer drugs dramatically. We explore how these systems optimize crucial parameters, such as release kinetics,hydrophobic drug encapsulation, reduced toxicity, and mimic protein. Engineering these molecular carriers necessitates careful consideration ofsurface chemistry and the role of the functional group, with each feature being carefully tweaked to maximize therapeutic effectiveness. The field has observed amazing advances through the application of innovative polymeric studies, particularly poly(amidoamine),poly[lactic-co-glycolic acid], and PEGylated dendrimers. These sophisticated designs have proven exceptional promise in enhancing biocompatibility and achieving accurate drug targeting at the site of action. Our research expands on the phenomenal versatility of dendrimer-based delivery systems across a wide range of new delivery strategies, including targeted delivery, gene therapy, photodynamic therapy, and photothermal treatment as well as immune response enhancement and stimuli-responsiveness. however, additional clinical validation will be required to realize their full potential in medical practice.

**FORMULATION AND EVALUATION OF ETRAVIRINE NANOSUSPENSION BY NANO PRECIPITATION METHOD**

Tirupati Rao Bonangi
tirupatiraoboangi@gmail.com

The aim of the present work is to develop oral Nanosuspension of Etravirine by Nano Precipitation method using various Stabilizers & Surfactant such as β-cyclodextrin, Soluplus, Poloxamer 407, Polyvinyl alcohol, Sodium lauryl sulfate, Polysorbate 80 Various formulation as well as process parameters were optimized in order to achieve desirable size and saturation solubility. Characterization of the prepared Nanosuspension was done with respect to Drug Content, Percentage yield, Entrapment efficiency, Viscosity, Sedimentation volume, Scanning electron microscopy, Particle's size, zeta potential, dissolution rate, in-vitro dissolution study. Zeta potential value for the optimized formulation (NS12) was found to -4.49 mv which was found to be within the acceptable limits. Average particle size of Nano suspension of optimized formulations (NS12) which is in ratio with Poloxamer 407 was found to be 500.4 nm. From the invitro studies we can say that formulation NS12 shows best drug release of 98.42±1.27% within 30 minutes whereas all the other formulations didn't release the drug. The drug release from the Nanosuspension was explained by the using mathematical model equations such as zero order, first order, and equation methods. Based on the regression values it was concluded that the optimized formulation NS12 follows first order kinetics with super case-II transport mechanism and the stability studies shows that the formulation was stability up to 3Months of time period.

**Keywords**: Etravirine, Poloxamer 407, Sodium lauryl sulfate, Nanoprecipitation technique, SEM, Zeta potential, PSD.

**QBD-BASED DEVELOPMENT OF A SIMVASTATIN-LOADED TRANSETHOSOMAL GEL FOR IMPROVED TRANSDERMAL DELIVERY: OPTIMIZATION, CHARACTERIZATION, AND IN VIVO ANTIHYPERLIPIDEMIC ASSESSMENT.**

UMASHRI KOKATANUR

Simvastatin, a widely used lipid-lowering agent, exhibits low oral bioavailability due to its poor aqueous solubility and extensive first-pass metabolism. Transdermal delivery offers a promising strategy to overcome these limitations. This study aimed to develop, optimize, and evaluate a simvastatin-loaded transethosomal gel to enhance dermal permeation and improve antihyperlipidemic efficacy. Critical Quality Attributes (CQAs)—including particle size (PS), entrapment efficiency (%EE), and polydispersity index (PDI)—were identified based on the Quality Target Product Profile (QTPP). Transethosomes were optimized using a Face-Centered Central Composite Design (FCCCD) by varying concentrations of soya phosphatidylcholine and ethanol. The optimized formulation was characterized using dynamic light scattering, scanning electron microscopy, and transmission electron microscopy. It was incorporated into a 2% w/v Carbopol gel and evaluated for pH, viscosity, and spreadability. In vitro diffusion, ex vivo skin permeation, and skin irritation studies were conducted. Antihyperlipidemic activity was assessed in high-fat diet–induced hyperlipidemic rats using oral simvastatin (10 mg/kg/day) and the transethosomal gel (1 g containing 10 mg simvastatin) as comparators. The optimized transethosomes exhibited nanoscale particle size (104.9 ± 0.42 nm), high entrapment efficiency (79.92 ± 0.19%), low PDI (0.113 ± 0.45), and a negative zeta potential (−32.1 ± 0.48 mV). Microscopic analysis confirmed spherical vesicular morphology. The formulated gel demonstrated sustained drug release, favorable skin compatibility, and significantly enhanced lipid-lowering activity in high-fat diet–fed rats. It effectively reduced total cholesterol, triglycerides, and LDL-C while increasing HDL-C levels, outperforming oral simvastatin ($p < 0.05$). The simvastatin-loaded transethosomal gel showed superior dermal delivery, improved therapeutic efficacy, and excellent safety, indicating its potential as a nanoenabled transdermal alternative for managing hyperlipidemia.

vibhashukla66@gmail.com

Mesoporous silica nanoparticles (MSNs) are increasingly used as effective drug-delivery carriers due to their surface functionality, structural integrity, and biocompatibility. The present research focused on formulating an MSN-based delivery system for Etodolac to achieve tailored and sustained drug release. The primary objective was to enhance the solubility of Etodolac, a poorly soluble drug, thereby improving its overall release profile and therapeutic performance. The study proposed an innovative approach to prolong the anti-inflammatory effect of the drug. Surface functionalization of the MSNs was performed using APTES (3-aminopropyltriethoxysilane), ensuring improved interaction between the drug and the carrier. The formulation was evaluated for drug release, entrapment efficiency, drug content, and in vivo activity. A $2^3$ full factorial design was applied for optimization, ANOVA was used to determine the influence of formulation factors on drug release. The optimized batch was studied through DSC, BET, particle size analysis, zeta potential measurement, SEM, and XRD. MSNs were prepared by the Solvent Evaporation Method. The final optimized formulation appeared as a white to slightly yellowish powder and exhibited 88.82% drug content, 74.5% drug release at 7 hours, and 60.35% entrapment efficiency. The particle size of 399 nm indicated

ISBN: 978-81-980623-8-3

suitability for oral administration. BET analysis confirmed drug filling within the silica mesopores, while SEM showed a rough, mesoporous texture characteristic of MSNs. In vivo evaluation using the Carrageenan-Induced Rat Paw Oedema Model demonstrated 87.64% inhibition, confirming enhanced, prolonged anti-inflammatory activity. Overall, Etodolac-loaded MSNs significantly improved drug solubility, sustained release, and therapeutic effectiveness compared with the marketed formulation.

**Keywords**: Mesoporous Silica Nanoparticles, Etodolac, APTES, Surface Functionalization.

Cancer remains one of the deadliest global diseases, arising from the transformation of normal dividing cells into tumorigenic ones through various genetic modifications. Conventional treatments lack effectiveness in the selective localization of the drug at the tumour site. Given that the cancer microenvironment is characterized by a slightly acidic pH (in contrast to the physiological pH of 7.4 in normal tissues), chitosan, a polymer solubilized under acidic conditions, was selected to provide pH-sensitive drug release at the tumour site. Paclitaxel-loaded chitosan nanoparticles were prepared using the ionic-gelation technique. A detailed design of experiment (DOE) approach was employed, starting with Placket-Burman screening to identify significant factors, namely chitosan, poloxamer 188, and sonication time, which were subsequently optimized using Central Composite Design (CCD) via Design Expert software. The optimized formulation demonstrated excellent characteristics: a particle size of 491.6 nm (DLS), a PDI of 0.4843, a Zeta potential of -17.7 mV, a high encapsulation efficiency of 94.40 %, 15.75 % drug loading, and 97.10 % drug content. FTIR-ATR analysis confirmed successful encapsulation, and FESEM size (448.029 nm) correlated well with the DLS result. Importantly, in vitro drug release studies showed selective release at acidic pH (pH 5.5) compared to minimal release at normal physiologic pH (pH 7.4). Thus, these Paclitaxel-loaded chitosan nanoparticles represent a highly suitable drug delivery system capable of selectively releasing the drug at the tumour site, thereby mitigating side effects on normal cells.

**DESIGN AND EVALUATION OF A SPANLASTIC GEL SYSTEM FOR ENHANCED TOPICAL DELIVERY OF OXICONAZOLE NITRATE FOR THE TREATMENT OF DERMATOPHYTOSIS**

Vindhya V S, Krishnananda Kamath K, A R Shabaraya
Department of Pharmaceutics, Srinivas college of Pharmacy, Valachil Mangalore-574143
vindhyavs9@gmail.com

Oxiconazole nitrate is an antifungal agent used in the treatment of dermatophytosis.The conventional topical administration is often limited by the poor skin permeation due to high resistance of skin barrier, leading to poor drug distribution to the skin layer. To overcome these challenges, a novel Oxiconazole nitrate loaded spanlastic gel was developed .Spanlastic were prepared by Ethanol injection method. A central composite design was used to optimize the spanlastic, using the concentration of Span 60 and Tween 80 as independent variables and particle size, transmittance, and diffusion efficiency as dependent variables. The optimized batch showed a particle size of 452.56nm,transmittance of 79.23±0.23% and diffusion efficiency of 82.74±1.34%.The optimized batch was further assessed for parameters, like drug content, surface morphology and surface charge.Then optimized spanlastic was incorporated into Carbopol 934 gel and evaluated for its parameters like physical appearance, pH, viscosity, spreadability,in vitro diffusion studies and kinetic studies.The in vitro drug release of spanlastic gel was 80.10±0.69% at the end of 8hrs and showed the zero-order release kinetics. Stability studies indicated that spanlastic gel was stable.Thus it can be concluded that the developed formulation could be a promising delivery system for the treatment of dermatophytosis.

**Keywords**: Oxiconazole nitrate, Spanlastic, Ethanol injection, Central composite design, Dermatophytosis, Gel

vlakshmi.sps@velsuniv.ac.in

Orally administered medication solubility is a key concern for the pharmaceutical business; about 35-40% of newly introduced pharmaceuticals have lessaqueous solubility, resulting in deprived dissolution and limited bio-availability. Employment of lipid-oriented drug releasemethodslike self-nano-emulsifying drugdelivery system (SNEDDS), its use to progress drug solubility, permeability, & bio-availability has been extensively reported in literature. A SNEDDS is made up of an oil component, a surfactant &a co-surface active agent. SNEDDS are intended for a broadvariety of applications becauseof their small droplets, high solubility, large interfacial region, low steadiness, transparent or semi-transparent appearance, and extraordinary kinetic reliability. Multiple orthogonal approaches are necessary for SNEDDS characterization in order to thoroughly organize SNEDDS manufacturing, strength, & biologicalrelease. The characterization of SNEDDSs includes multiple orthogonal methods required to fully control SNEDDS manufacture, stability, and biological fate. Encapsulating a drug in SNEDDSs can lead to increased solubilization, stability in the gastro-intestinal tract, and absorption, resulting in enhanced bio-availability. To improve efficacy and patient conformity, a supersaturated, mucus permeating, and tailored SNEDDS can be produced. The self-emulsification method has proven effective in oral medication delivery.

**Keywords**: Bioavailability, SNEDDS, oral delivery, solubilization, formulation.

**THERMOSENSITIVE CHITOSAN NANO-GEL ENABLING ACCELERATED ANTI-MIGRAINE DELIVERY OF RIZATRIPTAN**

Yugali charde, Pankaj Dhapke, Jagdish. Baheti
Kamla Nehru College of Pharmacy,
Rashtrasant Tukadoji Maharaj Nagpur University, Borkhedi Gate, Butibori, Nagpur 441108
yugalicharde@gmail.com

This study deals with the development and evaluation of a nanoparticulate in situ nasal gel of Rizatriptan benzoate for the management of acute migraine. Rizatriptan, a 5-$HT_1$ receptor agonist, exhibits low oral bioavailability (~45 %) resulting from first-pass metabolism and interactions with food. To overcome this, chitosan nanoparticles were formulated by an ionotropic gelation method and eight formulations were designed applying a $3^2$ full factorial design for optimising the chitosan and sodium tripolyphosphate (TPP) concentrations. The optimised nanoparticles exhibited a particle size of 150.86 nm, zeta potential of –6.97 mV, and encapsulation efficiency of 81.23%, suggesting good stability and drug-loading capacity. They were formulated in a thermosensitive in situ nasal gel with Poloxamer 407 as a gelling agent through the cold method. The gel showed properties like gelation temperature (32-34°C), pH (5.5-6.5), preferably viscosity for nasal delivery, and drug content of~ 85%. Cumulative per cent of drug release studies revealed more than 97% in vitro release over 8 h, which was much higher compared to that from market gel products. The

ISBN: 978-81-980623-8-3

release kinetics fitted the Higuchi model, pointing diffusion-controlled process of the drug. Results of stability study up to 30 days at 4°C and 25°C revealed insignificant changes in viscosity, pH and drug content, which confirmed the formulation's stability. This formulated in-situ nose-to-brain nanoparticles gel provides better bioavailability, rapid onset of action and increased nasal resident time. This renders it a good candidate for direct treatment of migraine with a promising therapeutic effect, despite local irritation at both injection time points. nose-to-brain delivery via olfactory and trigeminal pathways.

**SOLUBILITY ENHANCEMENT OF ACECLOFENAC USING ANTISOLVENT CRYSTALLIZATION TECHNIQUE FOR IMPROVED TOPICAL DRUG DELIVERY**

HARSHA O INDORIYA

Aceclofenac, a widely used NSAID, has low water solubility, which reduces its bioavailability and therapeutic efficiency. In the present work, an antisolvent crystallization technique was utilized to enhance the solubility of aceclofenac for topical delivery. The drug was initially dissolved in a suitable solvent and then precipitated using an antisolvent, resulting in the formation of fine crystals with improved solubility characteristics. These optimized crystals were incorporated into a gel base and assessed for parameters such as viscosity, spreadability, and potential skin irritation. Solubility and dissolution studies demonstrated a notable improvement in solubility and a faster dissolution rate compared to pure aceclofenac. UV spectrophotometric analysis supported the enhanced dissolution, and characterization techniques confirmed the successful formation of fine, high-solubility crystals. Additionally, bath sonication contributed to better crystal formation and improved drug release.The enhanced physicochemical properties of the final formulation indicate that antisolvent crystallization is a reliable approach for increasing the solubility of aceclofenac. Overall, the results suggest considerable potential for developing improved topical gel formulations with better drug delivery and therapeutic outcomes.

**FORMULATION, OPTIMIZATION AND EVALUATION OF PROCHLORPERAZINE SOLID LIPID NANOPARTICLES IN A MUCOADHESIVE THERMOREVERSIBLE IN SITU GEL FOR INTRANASAL DELIVERY**

DEEPA CHERIAN

Prochlorperazine maleate is an antiemetic and antipsychotic agent widely used in the treatment of nausea, vomiting, psychosis, and the manic phase of bipolar disorder. Although well absorbed orally, it undergoes extensive hepatic first-pass metabolism, leading to poor bioavailability. Conventional dosage forms such as tablets, injections, and suppositories have limitations including invasiveness or poor patient compliance. Intranasal delivery offers a promising alternative route for rapid absorption and avoidance of first-pass metabolism. Prochlorperazine solid lipid nanoparticles (SLNs) were prepared using the melt emulsion ultrasonication method followed by low temperature solidification. Formulation optimization was performed using Design Expert® software, considering the effects of three formulation variables on particle size and entrapment efficiency. The optimized SLN formulation was characterized for particle size, PDI, zeta potential, entrapment efficiency, morphology, FTIR spectra, and in vitro drug release. SLNs were incorporated into a mucoadhesive thermoreversible in situ gel prepared by the cold method and evaluated for pH, viscosity, gelling temperature and time, gel strength, mucoadhesive strength, drug content, in vitro release, ex vivo permeation, histopathology, and stability. The optimized formulation showed uniform particle size with a low PDI, high entrapment efficiency, and satisfactory zeta potential indicating good stability. The in situ gel exhibited suitable gelling characteristics, viscosity, pH, and mucoadhesive strength. In vitro and ex vivo studies demonstrated sustained drug release and improved permeation through nasal mucosa without any histopathological irritation. The developed mucoadhesive thermoreversible in situ gel containing Prochlorperazine SLNs presents a promising strategy for intranasal delivery, potentially enhancing bioavailability and patient compliance.

**A COMPREHENSIVE STUDY ON ORAL DISSOLVING FILMS: FORMULATION APPROACHES AND MANUFACTURING BARRIERS**

Anushka Ghubde, Ishan Aboti , Nitin Padole, Jadish Baheti
Department of Kamla Nehru College of pharmacy, Butibori, Nagpur-441108

Oral route Medicine delivery system is still considered as the most accessible and patient friendly medicine delivery route. Odf's are an innovative lozenge form that breaks down and dissolves within the oral depression. Specially, presto- dissolving oral thin flicks offer a practical result for a cases similar as those in pediatric, as well as senior population who struggle with a tablet or hard gelatin capsule ingestion. These rapid-fire- dissolving flicks are better than fast- disintegrating tablets since the ultimate have choking and frangibility issues. This medicine delivery technology offers several benefits over traditional fast-disintegrating tablets, including the capability to be used for dysphasic and schizophrenic cases and the capacity to be taken without water due to their quick decomposition and rapid-fire release of drug in the mouth. This present paper provides a brief summary of challenges, composition, expression styles and evaluation parameters employed for oral disintegrating.

Medicinal plants have long contributed to traditional and modern therapeutics. In this study, Rhynchosia minima (Fabaceae) was used to develop a topical antibacterial gel with potential applications in treating skin disorders such as psoriasis, eczema, impetigo, and acne vulgaris through a cell membrane disruption mechanism. Phytochemical screening, antimicrobial and antimitotic assays, and formulation development were carried out to evaluate the extract and gel. Soxhlet extraction followed by GC–MS analysis identified 35 compounds in the leaves, with hexadecenoic acid as the marker compound responsible for antibacterial activity. The gel and extract showed inhibition zones of 18 mm and 15 mm against E. coli, respectively, compared with 20 mm for tetracycline. Maceration yielded 40 additional compounds, which were tested for in vitro antimitotic activity using the Allium assay with methotrexate as a standard. UV spectroscopy confirmed quantification of the extract in pure and gel formulations ($R^2$ = 0.9979). FTIR analysis revealed functional groups including lipids, proteins, carboxylic acids, alcohols, phenols, halogens, and phosphates (3570–610 $cm^{-1}$). DSC studies indicated molecular dispersion of the extract, with onset temperatures of 122.05 °C (leaves) and 106.66 °C (gel). Antioxidant activity using hydrogen peroxide assay showed $IC_{50}$ values of 242.217 µg/ml for the extract and 55.789 µg/ml for ascorbic acid. In vitro anti-inflammatory studies revealed protein denaturation $IC_{50}$ values of 396.898 µg/ml for the extract and 66.986 µg/ml for diclofenac sodium, while anti-proteinase activity showed $IC_{50}$ values of 394.556 µg/ml and 295.719 µg/ml, respectively. Franz diffusion studies confirmed efficient drug release, with the gel achieving 92.68% cumulative release over 9 hours. These results suggest that Rhynchosia minima-based gels are promising topical formulations with antimicrobial, antioxidant, and anti-inflammatory properties.

The blood brain barrier (BBB) is an essential anatomical feature which is required to maintain the homeostasis between the blood and the brain. The BBB's regular function is required for exchange of biological molecules, balance of ions, delivery of nutrients, and to prevent the transport of toxic molecules. The difficulty of molecules passing the BBB is a significant obstacle in drug development. A simple monolayer culture of appropriate cells is a reliable drug permeation model for drug discovery studies. Xyloglucan is a polysaccharide known to upregulate tight junctions. Hence a xyloglucan film was formulated and optimized for the development of an in vitro BBB using immortalized cells. The films formed were in the range of 0.1-0.6mm. Swelling studies showed that the films absorbed and swelled in water readily with a swelling index of ~200%. Crosslinking was confirmed using FT-IR. SEM analysis determined the porosity of the film to be around 2-5µm. Cells were able to grow and adhere to the surface of the film. An in vitro model was established using normal Caco-2 cell, Caco-2 cells overexpressing P-glycoprotein and hCMEC/D3 with Trans-endothelial electric resistance values consistently above 200Ω.cm2. Drug permeability studies were carried out with model drugs and the log Papp (apparent permeability) values were calculated as a function of the slope of the graph of cumulative drug permeate vs time. These values are contrasted against the intrinsic properties of the drugs. A simple, cost-efficient in vitro artificial BBB model was developed, as a cheaper and ethical alternative for animal models.

**Keywords**: Blood-brain barrier, xyloglucan, Caco-2, P-glycoprotein, Transendothelial electrical resistance

## PROTECTIVE EFFECT OF HYLOCEREUS POLYRHIZUS FRUIT EXTRACT AGAINST ACETIC ACID-INDUCED ULCERATIVE COLITIS VIA MODULATION OF TNF-A AND OXIDATIVE STRESS

Rashnita Sharma1,2, Sanjay Kumar Gupta1,2, Mohammad Adnan Raza1,2, Ajazuddin1,2
Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh, India-490023
Department of Pharmacy, Rungta International Skill University, Bhilai, Chhattisgarh, India-490023

Ulcerative colitis (UC) is a relapsing form of inflammatory bowel disease (IBD) that affects millions worldwide and typically requires long-term therapeutic management. Hylocereus polyrhizus (dragon fruit) is recognized for its medicinal properties and has been traditionally employed in the treatment of various ailments. The present study evaluated the protective effects of a hydroethanolic fruit extract of H. polyrhizus (HPFE) against acetic acid (AA)-induced UC in rats. Male Wistar rats (n=6/group) were divided into five groups. Apart from the normal control (Group I), UC was induced in all groups via a single intrarectal administration of AA (2 mL, 4% v/v in 0.9% saline) on day 6. Groups III, IV, and V received sulfasalazine (SS, 100 mg/kg, p.o.) or HPFE at doses of 200 and 400 mg/kg (p.o.), respectively, for 8 consecutive days. Following the final treatment on day 8, colonic tissues were collected for assessment of colon weight/length ratio, oxidative stress markers, tumor necrosis factor-alpha (TNF-α), and histopathological changes. HPFE treatment significantly and dose-dependently prevented body weight loss, reduced colon weight gain, and attenuated oxidative stress by normalizing levels of myeloperoxidase (MPO), malondialdehyde (MDA), catalase (CAT), glutathione (GSH), and TNF-α. Histological evaluation further confirmed protection of the mucosal and epithelial architecture, demonstrating notable ulcer healing activity. Overall, HPFE exhibited strong antioxidant and anti-inflammatory effects, effectively ameliorating experimental UC in rats. Current efforts are directed toward isolating the bioactive constituents responsible for its therapeutic potential.

## AGMATINE INTERACTION WITH IMIDAZOLINE RECEPTOR ATTENUATES HUNTINGTON'S DISEASE ASSOCIATED DEPRESSION AND STRIATAL ASTROGLIOSIS IN RATS

Raj Katariya, Nandkishor Kotagale, Milind Umekar, Brijesh Taksande
Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Nagpur, Maharashtra, India - 441002
rajkatariya4@gmail.com

Huntington's Disease (HD) is a fatal inherited progressive neurodegenerative disorder characterized by a triad of motor incoordination, cognitive decline, and neuropsychiatric complications with subsequent loss of neurons in the striatum. Despite the knowledge of the exact cause and significant efforts of the multidisciplinary scientific community, a definitive cure for this devastating disorder remains elusive. Agmatine, a biogenic amine, has demonstrated promising pharmacological actions in neurological disorders through its interaction with imidazoline receptors. The present study was designed to investigate the influence of agmatine on striatal astrogliosis and depressive-like behaviors via its interaction with imidazoline receptors in a 3-Nitropropionic Acid (3-NP) rat model of HD. 3-NP is a selective mitochondrial toxin known to induce bilateral striatal lesions by inhibiting succinate dehydrogenase, thereby contributing to the development and progression of psychiatric comorbidities associated with HD. Rats were pre-treated with 3-NP (10 mg/kg, i.p.) on every alternate day, and from the 10th day, they continued on agmatine treatment (5 - 20 mg/kg, i.p.) up to the 32nd day of the treatment protocol. The findings of the current investigation revealed that repeated agmatine administration significantly attenuated astrogliosis, as evidenced by reduced glial fibrillary acidic protein (GFAP) expression in the striatum. Additionally, behavioral assessments demonstrated that agmatine treatment alleviated depressive-like phenotypes, suggesting a restoration of neurochemical balance. These beneficial effects of agmatine were abolished upon the injection of I1/I2 receptor antagonists, signifying its receptor-mediated mechanism. Collectively, these outcomes highlight the protective role of agmatine in mitigating glial immunoreactivity and depression-like effects through imidazoline receptor modulation.

**Keywords**: Huntington's disease, Agmatine, Astrogliosis, Depressive-like behavior, Imidazoline receptors.

## EVIDENCE FOR AGMATINE AS A MOLECULAR LINK BETWEEN THE GUT-BRAIN-AXIS AND AUTISM SPECTRUM DISORDER

Manasi Tadas, Brijesh Taksande, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, M.S. 441 002, India
manasi2599@gmail.com

Clinical evidence indicates profound disruption of the gut-brain axis (GBA) in autism spectrum disorder (ASD), encompassing dysbiotic gut microbiota, increased intestinal permeability, immune dysregulation, and neurotransmitter as well as metabolic imbalances. Importantly, ASD patients exhibit reduced systemic agmatine, a polyamine with established neuroprotective and neuromodulatory properties. Parallel preclinical findings in propionic acid (PPA) models of ASD confirm diminished agmatine levels, with exogenous supplementation alleviating behavioral abnormalities and restoring brain agmatine and BDNF in PPA and valproic acid models. Notably, agmatine has also been shown to modulate GBA in depression. Based on this, we hypothesized that exogenous agmatine administration could ameliorate ASD-associated behavioral and neurochemical impairments through GBA regulation. To test this, rats received oral PPA (250 mg/kg, PND 21-23) followed by oral agmatine (5, 10, or 20 mg/kg, PND 24-48). PPA administration induced profound GBA dysregulation, as reflected by a reduction in Lactobacillus and an increase in E. coli, a decrease in ZO-1 and occludin, and an elevated cecal index. Histopathology revealed a reduced goblet cell count and a decreased villus-to-crypt ratio. Agmatine treatment reversed these alterations, restoring microbial balance, barrier proteins, and intestinal morphology, thus affirming its role as a gut regulator. Behaviorally, agmatine rescued PPA-induced sociability deficits, cognitive impairments, and anxiety-like responses. Neurochemically, agmatine normalized elevated glutamate, restored GABA, and replenished brain agmatine depleted by PPA. Furthermore, histological alterations in hippocampus and prefrontal cortex were attenuated. These findings provide compelling preclinical evidence that agmatine reverses ASD-like phenotypes induced by PPA via modulation of the GBA, highlighting its therapeutic potential in ASD.

**Keywords:** Autism Spectrum Disorder; Gut Dysbiosis; Propionic acid; Agmatine.

## AGMATINE ATTENUATES SLEEP DEPRIVATION-INDUCED MATERNAL AND OFFSPRING BEHAVIOURAL AND BIOCHEMICAL ALTERATIONS IN RATS

Akanksha Yadav, Barkha Goyanka, Brijesh Taksande, Milind Umekar, Mayur Kale
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, M.S. 441002, India
yadavdakanksha@gmail.com

Sleep deprivation (SD) is a major stressor that disrupts physiological homeostasis, impairs immune and metabolic function, and is strongly associated with anxiety, depression, and cognitive dysfunction. During pregnancy, sleep deprivation can further exacerbate neurodevelopmental vulnerabilities in offspring. Agmatine has been identified to modify sleep architecture via modulation of various neurotransmitter systems, including glutamate, GABA, noradrenaline, and serotonin. The present study investigated the role of the agmatinergic system in attenuating SD-induced behavioural and biochemical alterations in both mother and the offspring using the multiple platform model, a well-established paradigm for inducing SD in rodents. Pregnant female rats were subjected to 18 hours of SD during gestational days (GD) 12-14, a critical neurodevelopmental window. Agmatine (20, 40, and 80 mg/kg) was administered orally to mother from GD 7-21 and offspring from postnatal day (PND) 21-31. Agmatine significantly ameliorated maternal neurobehavioral complications

ISBN: 978-81-980623-8-3

induced by SD, including heightened anxiety-like behaviour, depression-like responses, impaired cognition, and altered maternal care. Offspring of SD-exposed mothers similarly exhibited behavioural impairments, accompanied by neurochemical dysregulation. Agmatine treatment also significantly improved the neurodevelopmental facets in SD-induced pups. Neurochemically, agmatine was able to reduce neuroinflammation by reducing the levels of TNF-α and IL-6 and restoring the levels of IL-10. Agmatine also significantly improved SD-induced impaired neuroplasticity by increasing brain BDNF levels. Histopathologically, agmatine restored hippocampal architecture distorted after SD. These findings collectively underscore the therapeutic potential of agmatine in mitigating SD-induced neurobehavioral and neurochemical perturbations in mother and offsprings, thereby highlighting its promise as a modulatory agent for preserving neurodevelopmental integrity.

## EVALUATING CONTRIBUTING FACTORS AND ASSESSING DIABETES DISTRESS IN DIABETIC PATIENTS

RAVI CHANDER THATIPELLI
VAAGDEVI PHARMACY COLLEGE
trc2884@gmail.com

Diabetes distress (DD) is a common psychological condition in diabetic patients, resulting from the ongoing emotional and physical demands of managing diabetes. This study aims to understand the prevalence and distribution pattern of diabetic distress and its contributing factors. The study was conducted over six months duration and the data was collected with ICF from the subjects. All the data was collected by interacting with the subjects by using data collection form in the Warangal region. A total of 407 diabetic patients were evaluated using the Diabetes Distress Scale (DDS). Among them, 46% reported diabetes distress, with females (113) predominantly affected compared to males (77). All four DDS domains - Emotional Burden, Physician-Related Distress, Regimen -Related Distress, and Interpersonal Distress — were found to be statistically significant ($p<0.0001$). The present study suggests that Emotional burden (2.860 ± 0.04691) was the highest distress domain and was more prevalent among diabetic patients, followed by regimen-related distress (2.713 ± 0.04902), interpersonal distress (2.495 ± 0.06342), and physician-related distress (1.442 ± 0.03385) respectively. Physical inactivity showed a significant impact on diabetes distress, with higher mean distress scores in inactive patients (2.446 ± 0.03477) compared to active patients (2.366 ± 0.05040). A statistically significant correlation was observed between all four DDS subscales. A majority of patients experienced mild to moderate levels of distress. Our study underscores the importance of routine screening for DD in clinical practice and highlights the need for effective interventions, such as psychological support, self – management education, and a personalized care approach, that are essential for mitigating the effects of diabetic distress and promoting better health outcomes in diabetic patients.

**KEY WORDS:** Diabetic distress, Emotional burden, DDS scale, Physical inactivity, psychological health.

## ENHANCED CENTRAL CHOLINERGIC TRANSMISSION AMELIORATES HEPATIC ENCEPHALOPATHY INDUCED SPATIAL MEMORY ALTERATIONS

Venu Anand Das Vaishnav* and Nishant Sudhir Jain
Department of Pharmacy, Pharmacology Division, Neuropharmacology Laboratory, Guru Ghasidas Vishwavidyalaya (A Central University), Bilaspur, Chhattisgarh, India, 495009
venuanand1998@gmail.com

Hepatic Encephalopathy (HE) is associated with marked cognitive deficits along with changes in central cholinergic transmission. Therefore, the present study aimed to investigate the role of cholinergic neurotransmission in HE-induced spatial memory dysfunction using the Radial Arm Maze (RAM) and changes in brain oxidative stress markers (MDA), antioxidant defenses (SOD, CAT, GSH), expression of neurotrophic markers (BDNF, CREB, CORT) and pro-inflammatory mediators (IL-6, TNF-α) and anti-inflammatory IL-10 levels. HE was induced in rats, which were subsequently intracerebroventricularly treated with cholinergic modulators, including acetylcholine, an AChEI, physostigmine, a muscarinic receptor agonist, oxotremorine, a nicotinic receptor agonist, nicotine, an antagonist, atropine, or mecamylamine. Behavioral findings revealed that HE rats elicit more working memory errors (WME) and reference memory errors (RME), indicating spatial memory impairments with a marked increase in brain AChE activity, elevated MDA, CORT, depleted SOD, CAT, and GSH, reduced expression of BDNF and CREB, increased IL-6, TNF-α, and decreased IL-10 levels. Treatment with acetylcholine, physostigmine, oxotremorine and nicotine significantly reduced both WME and RME. Similarly, these agents significantly reduced brain AChE activity and restored SOD, CAT, and GSH, and reduced MDA levels, lowered CORT, enhanced BDNF and CREB expression, reduced the IL-6/TNF-α and increased IL-10 in HE animals, while antagonist, mecamylamine, and atropine, further exacerbated WME and RME, and deteriorated all brain biochemical changes seen in HE rats. Overall, the study demonstrates that HE-induced memory deficits can be regulated by central enhancement of cholinergic signaling via restoring AChE activity, oxidative stress balance, neurotrophic activity, and cytokine homeostasis.

**Keywords:** Hepatic Encephalopathy; Spatial Memory; Acetylcholine; Acetylcholinesterase; Radial Arm Maze; Working Memory Error; Reference Memory Error.

## INVESTIGATING THE ANTI-INFLAMMATORY POTENTIAL OF PIMENTA DIOICA LEAVES USING THE CARRAGEENAN-INDUCED RAT PAW EDEMA MODEL

Mr. D. Suresh
Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka, Hyderabad, Telangana, India

Inflammation is a major pathological process underlying several acute and chronic diseases. Plant-derived bioactive compounds are being increasingly investigated as safer alternatives to synthetic drugs. Pimenta dioica (allspice) has traditional medicinal uses, yet its anti-inflammatory activity remains underexplored. To investigate the anti-inflammatory activity of aqueous and methanolic extracts of Pimenta dioica leaves using the carrageenan-induced rat paw edema model. Male Wistar rats (200–300 g) were divided into five groups. Test groups received aqueous and methanolic extracts of P. dioica leaves (400 mg/kg, p.o.), while the standard group received Ibuprofen I.P. (10 mg/kg, p.o.). Paw edema was induced by sub-plantar carrageenan injection. Paw volume was measured at 0, 1, 3, 5, and 24 hours using a digital plethysmometer. Blood samples were analyzed for C-reactive protein (CRP) as a systemic inflammatory marker. Both extracts produced a significant reduction in paw edema compared with the control. The methanolic extract exhibited the most pronounced anti-inflammatory effect, particularly at the 24th hour. The aqueous extract and Ibuprofen showed moderate activity, while the control group demonstrated persistent inflammation. CRP levels were lowest in the methanolic extract group, indicating marked systemic anti-inflammatory action. The findings suggest that Pimenta dioica leaves, particularly the methanolic extract, possess potent anti-inflammatory properties, potentially surpassing Ibuprofen under the studied conditions. These results warrant further phytochemical and mechanistic studies to establish P. dioica as a promising natural anti-inflammatory agent.

**Keywords:** Pimenta dioica, Carrageenan, Ibuprofen, C-reactive protein

## SAFETY AND EFFICACY OF IPX203 IN PARKINSON'S DISEASE: THE RISE-PD OPEN-LABEL EXTENSION STUDY

Pavithra M, Dr K C Arul Prakasam
Jkkmmrf's Annai Jkk Sampoorani Ammal College Of Pharmacy

IPX203 is a novel oral extended-release formulation of carbidopa/levodopa (CD/LD) developed to address the short half-life of immediate-release CD/LD. In the phase 3 RISE-PD trial, IPX203 significantly improved "Good On" time in patients with Parkinson's disease compared with immediate-release CD/LD. To evaluate the safety and efficacy of IPX203 in an open-label extension of the pivotal phase 3 study. This 9-month extension enrolled patients who completed the randomized, double-blind trial. Key efficacy endpoints included Movement Disorder Society-Unified Parkinson's Disease Rating Scale and Patient and Clinical Global Impression scores. Adverse events (AEs) were recorded. Improvements in efficacy were maintained and dosing

ISBN: 978-81-980623-8-3

frequency and total daily dose remained stable through the trial. A total of 52.7% of patients experienced ≥1 treatment-emergent AE, mostly mild or moderate and occurred within the first 90 days of treatment. In this phase 3 open-label extension, IPX203 exhibited a favorable safety and tolerability profile and sustained efficacy of comparable magnitude to the end of the double-blind study.

**KEYWORDS:** extended release; levodopa; motor fluctuations; parkinson's diseases.

## EVALUATION OF HERBAL EXTRACT IN RATS FOR MANAGEMENT OF HEMORRHOID

Dasharath M. Patel*, Prince A. Tripathi
School of Pharmacy, Gujarat Technological University, GTU Gandhinagar Campus, GIDC Sector 26, Gandhinagar-382028, Gujarat, India
drdmpatel1971@gmail.com

In the current research, ethanolic extract of Phyllanthus niruri (EPN) was prepared and evaluated in rats for treatment of hemorrhoid. The objective of the research was to develop and evaluate herbal extract-based formulation for the management of hemorrhoid. EPN was investigated for the treatment of croton oil induced hemorrhoid in rats. Croton oil was applied into the rectum of rats through a specially designed device and development of edema within 8 hours was considered as a sign of hemorrhoid. Forty male Wistar rats weighing 250-350 g were divided in 4 test groups containing 8 rats each and a control group of 8 rats. Twenty-four hours after the induction of hemorrhoid, rats were treated for 5 days with test or standard formulation. At the end of the study, Recto-Anal coefficient (RAC) and Evans-Blue extravasation (EBE) were measured as curing parameters. The EPN (100 mg/kg) was found very effective in reducing the symptoms of hemorrhoid (RAC- 1.830, EBE- 0.082) when compared with the disease control group (RAC- 2.300, EBE- 0.156) with a significant difference ($p<0.05$). The EPN exhibited insignificant difference when compared with a standard formulation (400 mg/kg) (RAC-1.740, EBE- 0.071). It was concluded from the research that the EPN was equally effective in treating the hemorrhoid when compared with standard formulation containing extracts of seven different herbs. The marker components from the extract are identified and will be further quantified for standardization with a scope of approval from regulatory authority for marketing single extract product for management and treatment of haemorrhoidal disease.

**Keywords:** Herbal extract, haemorrhoid, Animal model, Phyllanthus niruri.

## NEUROPROTECTIVE ACTIVITY OF CLEOME CHELIDONII MACERATED EXTRACT AGAINST B-AMYLOID INDUCED MEMORY IMPAIRMENT IN WISTAR RATS

Ashna Rafi and Bharathi Kalyanam
Department of Pharmacology, ABIPER, Bangalore, 560064
ashnarafi786@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder characterized by memory loss, oxidative stress, cholinergic dysfunction, and accumulation of β-amyloid plaques. Plant-based neuroprotective agents represent a promising therapeutic approach. The present study aimed to investigate the neuroprotective potential of macerated extract of Cleome chelidonii leaves (CCLE) against β-Amyloid (25–35)-induced memory impairment in Wistar rats. Male Wistar rats were orally administered CCLE at doses of 100 and 200 mg/kg. Cognitive function was assessed using Morris Water Maze and Radial Arm Maze tests. Following behavioral studies, brain tissues were isolated for biochemical analysis, including estimation of oxidative stress markers, brain monoamines, and acetylcholinesterase (AChE) activity. Histopathological examinations were also performed to evaluate neuronal integrity. CCLE administration significantly ($P < 0.05$) improved behavioral performance, reversing β-amyloid-induced memory impairment. Antioxidant parameters were elevated, with a significant reduction ($P < 0.01$) in malondialdehyde levels compared with the diseased control group. A dose-dependent inhibition of AChE activity was observed, along with significant ($P < 0.05$) increases in brain monoamine levels. Histopathological analysis further confirmed neuroprotective effects, showing reduced neuronal degeneration in CCLE-treated groups. The findings demonstrate that CCLE exhibits significant neuroprotective activity against β-amyloid (25–35)-induced cognitive impairment through multiple mechanisms, including enhancement of antioxidant defence, modulation of monoamines, and inhibition of AChE activity. These results suggest the potential of Cleome chelidonii as a therapeutic candidate for AD management. Further fractionation and biological screening studies are ongoing to isolate active constituents.

**Keywords:** Cleome chelidonii, Alzheimer's disease, Neuroprotective activity, Acetylcholinesterase, Oxidative stress

## "CRAB ASH EXTRACT'S CYTOTOXIC EFFECTS ON A549 LUNG CANCER CELLS"

Sandeep Gadhwe, Pratik Kanjawane
Dept. of Pharmaceutical Chemistry, Sinhgad College of Pharmacy, Vadgaon Bk., Pune, MS, India- 411041.
sandeepgadhwe@gmail.com

Lung cancer remains a leading cause of cancer mortality, necessitating the discovery of novel therapeutic agents. This study investigates the anticancer activity of crab ash extracts from the freshwater crab Barytelphusa cunicularis against the A549 human lung cancer cell line, a widely accepted model for in vitro studies. The crab specimens were collected from their native freshwater habitats and authenticated by the Zoological Survey of India. The ash was prepared through a dry ashing method and sequentially extracted with a series of solvents, including water, methanol, and ethanol, to isolate compounds with varying polarities. The cytotoxic effects of each extract were then rigorously evaluated on the A549 cells using both the MTT and trypan blue assays to comprehensively assess cell viability and proliferation. The results consistently demonstrated that the crab ash extracts exhibited significant and dose-dependent inhibition of A549 cell growth. Notably, the water extract was particularly effective, showcasing a reduction in cell viability from 45.68% at a concentration of 10 µg/ml down to a notable 30.74% at 100 µg/ml. Further instrumental analysis using UV-Visible Spectrophotometry, FTIR, and HRMS provided crucial insights into the chemical composition. These analyses suggested that the observed anticancer activity is likely attributable to bioactive components such as trace elements, minerals, and thermally stable organic compounds with antioxidant properties. These findings highlight the potential of Barytelphusa cunicularis crab ash as a natural source for developing new and effective anticancer treatments and provide a strong scientific foundation for future research aimed at isolating and characterizing the specific compounds responsible for the observed biological activity.

**Keywords:** Barytelphusa cunicularis, Crab ash, Lung cancer, A549 cells, Anticancer activity, Cytotoxicity, MTT assay.

## EVALUATION OF ANTI-HYPOTHYROID ACTIVITY OF HYDROALCOHOLIC EXTRACT OF EICHHORNIA CRASSIPES IN ALBINO WISTAR RATS

J.pravi Sunil and Dr. Bhanu Prakash Arakareddy
Dept. of Pharmacology, Shri Vishnu College of Pharmacy, Bhimavaram, Andhra Pradesh, India-534202
suniljavvadi@gmail.com

Hypothyroidism, a common endocrine disorder characterized by insufficient production of thyroid hormones, remains a global health concern with a higher prevalence among women and elderly individuals.The present study investigates the anti-hypothyroid potential of the hydroalcoholic extract of Eichhornia crassipes (water hyacinth) in albino Wistar rats. Hypothyroidism was experimentally induced in female rats using propylthiouracil (PTU), and the therapeutic efficacy of the plant extract was assessed in comparison with the standard drug levothyroxine. Serum biochemical parameters including triiodothyronine (T3), thyroxine (T4), and thyroid-stimulating hormone (TSH) levels were measured using ELISA. The results demonstrated that treatment with Eichhornia crassipes extract modulated thyroid hormone levels towards normal, suggesting a promising therapeutic role in the management of hypothyroid conditions. Further investigations are warranted to elucidate the underlying mechanisms and to validate its clinical potential.

ISBN: 978-81-980623-8-3

**Keywords**: Hypothyroidism, Eichhorniacrassipes, Levothyroxine, Propylthiouracil, Thyroid hormones.

## NETWORK PHARMACOLOGY-BASED IN SILICO EVALUATION OF PHYTOCHEMICALS FROM ZIZIPHUS NUMMULARIA AS ANTI-ALZHEIMER'S AGENTS

Bavya Muthchamy*, Senthil Kumar Raju and Praveen Sekar
Department of Pharmaceutical Chemistry, Swamy Vivekanandha College of Pharmacy, Tiruchengode, Namakkal, Tamil Nadu, India – 637205.
bavyapharm@gmail.com

Alzheimer's disease accounts for 60–80% of dementia cases, making it the most prevalent form of dementia. Ziziphus nummularia is a medicinal plant with hepatoprotective, anti-inflammatory, immunostimulant, antioxidant, antibacterial, sedative, anthelmintic and anti-fertility qualities. In this study, we examined the potential of phytochemicals from Ziziphus nummularia using a network pharmacology technique. IMPPAT, the Coconut database, Phytohub version 1.4, the Medicinal Plants database, The Natural Products Atlas, Dr. Duke's Phytochemical and Ethnobotanical database and the KNApSAcK Core system databases were the sources from which the phytochemicals were obtained. SwissADME, ProTox 3.0 and CardioTOXCSM webservers were used to estimate the phytochemical's physicochemical, pharmacokinetic and toxicological profiles. Using OSIRIS Property Explorer, the drug score was predicted, and the results demonstrated the compound's druggable nature. Network modelling and enrichment analysis predicted the phytochemical's appropriate targets, which clearly indicated that they would be quite effective against Alzheimer's disease. The correlation analysis was carried out using the Gepia2 website. Molecular docking against the chosen targets (HIF1A, AKT1, and BCL2) using Autodock tools was carried out and compared with the co-crystallized ligand and standard. Nummularogenin, 5-(Tetrahydro-2–furanylmethyl)-2-heptanol and 4-(1E)-3-Hydroxy-1-propenyl)-2-Methoxyphenol were all very active against the selected targets with good binding energies and interactions, according to various in silico studies and drug scores. Therefore, Alzheimer's disease can be fought using these substances. However, further in vitro and in vivo research is required.

**Keywords:** Alzheimer's disease, Ziziphus nummularia, In silico studies, Network Pharmacology, Molecular docking

## PRECLINICAL ASSESSMENT AND TISSUE DISTRIBUTION OF VODOBATINIB, A THIRD GENERATION BCR-ABL 1 INHIBITOR

Sandeep Kaddare, Niranjan Veerla, Rama Murthi Bestha, Keerthana Madipelli, Ashok Zakkula, Sreekanth Dittakavi* and Ramesh Mullangi
Drug Metabolism and Pharmacokinetics, Laxai Life Sciences Pvt. Ltd, Shamirpet, Hyderabad, India
sreekanth.dittakavi@laxai.com

Vodobatinib (K0706) is a novel, orally bioavailable Bcr-Abl1 tyrosine kinase inhibitor designed to overcome resistance mutations, including T315I, in chronic myeloid leukemia (CML). While its clinical efficacy and safety are under evaluation, limited information is available on its preclinical ADME (absorption, distribution, metabolism, and excretion) properties and tissue distribution. To support pharmacokinetic understanding and guide clinical development, in vitro ADME studies and in vivo tissue distribution in rats were conducted. Vodobatinib exhibited low solubility in phosphate buffer (2.5 µM) but improved solubility in biorelevant media. It showed high metabolic stability in liver microsomes and hepatocytes from rats and dogs, with moderate stability in humans. Permeability assessment using MDCK-MDR1 cells indicated low efflux liability. Plasma protein binding was extensive (>99.8%) across species. Metabolism was primarily mediated by CYP3A4 (~70%), with minor contributions from CYP2C19 and CYP2D6. CYP inhibition was weak to moderate, suggesting low drug–drug interaction potential. In tissue distribution studies following oral administration (2.0 mg/kg) to male Sprague Dawley rats, vodobatinib demonstrated preferential accumulation in the liver, intestines, and kidney, with limited brain penetration. Overall, vodobatinib displays a favorable preclinical ADME profile characterized by high metabolic stability, minimal efflux liability, and selective tissue distribution. These findings provide important insight into its pharmacokinetics and support its further clinical development for CML and potentially other Bcr-Abl1–driven malignancies.

**Keywords**: Vodobatinib, ADME, tissue distribution, pharmacokinetics

**PL-15**

## RENOPROTECTION AND ANTIOXIDANT POTENTIALS OF LITSEA GLUTINOSA (LOUR) BARK AGAINST ALUMINIUM FLUORIDE INDUCED OXIDATIVE STRESS AND NEUROPATHY IN SWISS ALBINO MICE

Chandan K L and Dr. Yogesh H S
Department of Pharmacology, Nitte college of pharmaceutical sciences, Yelahanka, Bengaluru-560064
Chandukl807@gmail.com

Litsea glutinosa (Lour) has been traditionally used for managing various ailments, including antifertility, wound healing, and antibacterial purposes. The present study aimed to investigate the nephroprotective effects of Litsea glutinosa (Lour) bark against aluminium fluoride-induced oxidative stress in Swiss albino mice.Nephrotoxicity was induced by aluminium fluoride administration in Swiss albino mice. Ethanolic and aqueous extracts of Litsea glutinosa bark were evaluated for nephroprotective potential. Biochemical parameters such as serum total protein (TP), albumin, creatinine, phosphorus, urea, and blood urea nitrogen (BUN) were estimated along with antioxidant markers, including superoxide dismutase (SOD), catalase (CAT), glutathione (GSH), total thiols, and lipid peroxidation (LPO). Histopathological analysis of kidney tissues was also performed to confirm protective effects. Treatment with both ethanolic and aqueous extracts of Litsea glutinosa bark exhibited dose-dependent nephroprotection. The extracts significantly increased serum TP and albumin levels while reducing creatinine, urea, BUN, and phosphorus levels compared to the aluminium fluoride group. Antioxidant defense was enhanced, as indicated by increased SOD, CAT, GSH, and total thiol levels, along with a marked reduction in LPO. Histopathological findings further supported these biochemical improvements. The study demonstrates that Litsea glutinosa bark extracts possess significant antioxidant and nephroprotective potential, effectively mitigating aluminium fluoride-induced oxidative stress in Swiss albino mice. These findings validate its traditional use and highlight its therapeutic relevance in kidney protection.

**PL-16**

## IMPACT OF PHARMACIST-PHYSICIAN COLLABORATIVE CARE ON BLOOD PRESSURE CONTROL IN DIABETIC PATIENTS: A PROSPECTIVE RANDOMIZED STUDY

Chintankumar Patel1*, Sandipkumar Bhatt2, Akash P. Patel3
Kadi Sarva Vishwavidyalaya, Gandhinagar, Gujarat, India
Department Of Pharmacology & Pharmacy Practice, K. B. Institute Of Pharmaceutical Education And Research (A Constituent College Of Kadi Sarva Vishwavidyalaya), Gandhinagar, Gujarat, India
Physician & Diabetologist, Life Care Clinic, Raysan, Gandhinagar, Gujarat, India & Civil Hospital, Ahmedabad, Gujarat, India
chintan.patel@kbiper.ac.in

This study aimed to evaluate the effectiveness of a pharmacist-physician collaborative care (PPCC) model in managing blood pressure (BP) among diabetic patients, compared to standard physician-led care (PUC). Secondary objectives included assessment of cardiovascular (CV) risk, medication adherence, quality of life (QOL), hypertension-related knowledge, and self-monitoring behaviors. A 42-month prospective, randomized, open-label interventional study was conducted at a private clinic in Gandhinagar, India. A total of 206 adult patients with diabetes and uncontrolled hypertension (without target organ damage) were randomized equally into two groups: the intervention group (PPCC, n=105) and the control group (PUC, n=101). Baseline and follow-up data were collected on systolic and diastolic BP (SBP, DBP), CV risk scores, medication adherence (MMAS-4), QOL (EQ-5D-5L), and hypertension knowledge (HKLS). The PPCC group received structured education on disease management and home BP monitoring. Statistical significance was set at $p < 0.05$. The PPCC group demonstrated significantly greater improvements compared to the PUC group in multiple domains: reduction in SBP (-10.5 ± 3.2 mmHg) and DBP (-7.2 ± 2.8 mmHg), improved medication adherence (+15%), enhanced QOL scores (+20%), and increased hypertension knowledge (+25%). Additionally, self-

ISBN: 978-81-980623-8-3

monitoring practices were significantly more prevalent in the PPCC group, contributing to lower CV risk scores.
Pharmacist-physician collaborative care significantly improved blood pressure control, medication adherence, patient knowledge, QOL, and self-monitoring among diabetic patients with hypertension. These findings support the integration of collaborative care models in chronic disease management, especially for high-risk populations. Further research is warranted to assess long-term outcomes and the feasibility of broader implementation.
**Key words:** Physician Pharmacist Collaborative Care (PPCC), Blood Pressure, Diabetes, Hypertension

**PL-17**

## DRUG USE EVALUATION USING WHO CORE PRESCRIBING INDICATORS IN OUT PATIENTS AT TERTIARY CARE HOSPITAL, BHIMAVARAM

S Harshith, K Balu and K Sriram
Department of Pharmaceutical Sciences, Shri Vishnu College of Pharmacy, Bhimavaram, Andhra Pradesh, India- 534202.
harshith.sornapudi@gmail.com

Prescribing practices significantly influence patient compliance and the success or failure of treatment. This study examined prescriptions from various specialties to evaluate prescribing indicators based on World Health Organization (WHO) guidelines. We looked at aspects like polypharmacy, generic drug use, prescribing of antibiotics and injections, and adherence to the Essential Drug List (EDL 2013). Most departments exceeded the WHO reference value (≤3) for the average number of drugs per encounter. Nephrology had the highest average at 8.37, followed by cardiology at 5.35. This indicates a considerable level of polypharmacy and associated risks, including drug interactions, side effects, higher costs, and lower compliance. Generic prescribing was low across all specialties, ranging from just 2.91% in endocrinology to 13.55% in pulmonology, which is far below the WHO target of 100%. The use of antibiotics was mostly within the WHO limit (≤30%) except in urology (68.18%), gastroenterology (36.36%), general medicine (36%), and obstetrics & gynecology (31.14%). This suggests irrational use in those fields. Injection usage also surpassed the reference value (≤10%) in nephrology (55.40%), psychiatry (26.92%), endocrinology (18.91%), and general medicine (12%). Prescribing from the EDL was highest in psychiatry (90.34%) and pediatrics (86.11%) but fell short in orthopedics (52.70%). Overall, the study identified issues with irrational prescribing, such as polypharmacy, low rates of generic prescribing, excessive use of antibiotics and injections, and insufficient adherence to the EDL. These results highlight the need for awareness programs and rational prescribing strategies to improve drug therapy, cut costs, and enhance patient outcomes.

## REPURPOSING OF ANTIBIOTIC AS AN MMP-2 INHIBITOR CONJUGATED WITH V7T1 APTAMER FOR ACTIVE TARGETING OF COLON CARCINOMA CELLS

Raman Sureshkumar, R Aishwarya Reddy, Sharanya Kandula and R Monisha
Centre for Nano Engineering Science & Technology (C-NEST), Department of Pharmaceutics, JSS Academy of Higher Education & Research, JSS College of Pharmacy, Ooty, The Nilgiris-643001. Tamil Nadu, India.
sureshcoonoor@jssuni.edu.in

By considering parameter, of targeted drug delivery through specific proteins or genes, which may decrease the drug development timeline we have chosen MMP-2 inhibitor i.e.doxycycline hyclate as drug and V7t1 aptamer as targeting agent for anti-cancer activity. Initially, the drug was selected based on docking studies. Chemical conjugation process was used to prepare a drug and Aptamer conjugate and confirmation studies like TLC (Thin layer chromatography), Nitroprusside test, Gel electrophoresis and auto fluorescence assay also FTIR timeline studies for stability confirmation were performed. Then the conjugate was coated with pectin for achieving site specific delivery. Later the formulation was divided into 3 different forms were prepared in order to differentiate the effect between the Pure drug (Doxycycline Hyclate), Conjugate without Pectin and Conjugate pectin coated and all 3 formulations were compared with standard 5-Flurouracil. All the 4 samples were subjected to MTT assay, Apoptosis assay, Nuclear danage detection assay, Cell cycle analysis, Scratch assay, ROS assay, CAM assay and ELISA for MMP-2 and VEGF expression. All assays included positive and negative controls, and the data were compared statistically. The pectin-coated conjugate exhibited good anti-cancer activity, as the pectin coating facilitated release in the colonic region. From these findings, it can be said that this type of formulation can exhibit anti-cancer activity by incorporating an MMP-2 inhibitor. The combination of doxycycline hyclate and V7t1 aptamer exhibited synergistic activity on colon cancer cells. Thus, we can say that this type of formulation may be further considered for management of colon cancer.
**Key Words:** Doxycycline hyclate, Colon cancer, drug aptamer conjugation

## OPTIMIZING MATERNAL CARE: A PROSPECTIVE STUDY ON DIABETES MELLITUS THERAPIES IN PREGNANCY

Rajvee Patel, Gokul Ezhava, Aanshi Patel, Heta Movadiya, Tarachand Lalwani
Department of Pharmacology & Pharmacy Practice, K.B. Institute of Pharmaceutical Education and Research, Gandhinagar, Gujarat, India- 382023
rajveepatel0303@gmail.com

Glycaemic control is essential in diabetes management to prevent long-term complications. Standard treatment options include insulin therapy, oral hypoglycaemic agents (OHA) and lifestyle modifications, though their comparative efficacy remains unclear. This study evaluated the effectiveness of Insulin + Lifestyle, OHA + Lifestyle, and Lifestyle Modifications alone in improving FBG and RBS levels, while also assessing complications in patients with diabetes, including subgroups of GDM and Pre-DM. A total of 60 patients were divided into three groups: Insulin + Lifestyle (n = 14), OHA + Lifestyle (n = 40), and Lifestyle Modifications alone (n = 6). Descriptive statistics were applied to determine mean, standard deviation, and range of FBG and RBS, and the Kruskal–Wallis test was used to compare treatment arms and glucose reductions from baseline. Results showed similar mean FBG levels across groups (127.43 mg/dL in Insulin + Lifestyle, 128.96 mg/dL in OHA + Lifestyle, and 126.29 mg/dL in Lifestyle Modifications). However, mean RBS was significantly higher in the Lifestyle Modifications group (203.63 mg/dL) compared to Insulin + Lifestyle (174.74 mg/dL) and OHA + Lifestyle (172.39 mg/dL) ($p = 0.040$). The Insulin + Lifestyle group showed the greatest reduction (FBG −20.93 mg/dL; RBS −47.00 mg/dL). Overall, combining insulin therapy with lifestyle modification demonstrated superior glycaemic control compared to OHA or lifestyle changes alone, supporting the need for tailored therapeutic strategies.

## A FIVE-YEAR PROSPECTIVE, RANDOMIZED, OPEN-LABEL STUDY OF STANDARD-DOSE VERSUS LOW-DOSE PROLONGED-RELEASE TACROLIMUS WITH OR WITHOUT ANGIOTENSIN-CONVERTING ENZYME INHIBITOR OR ANGIOTENSIN II RECEPTOR BLOCKER POST KIDNEY TRANSPLANTATION

**S G** Sreesantheya, **Guide Name:** Dr P Kalaiselvi
Jkkmmrf's Annai Jkk Sampoorani Ammal College Of Pharmacy

Novel approaches to improve long-term outcomes in kidney transplant recipients are required. Here, we present the 5-year data from a multicenter, prospective, Phase 3b trial evaluating treatment outcomes with standard (STD) or low (LOW) dose prolonged-release tacrolimus (TAC) combined with ACEi/ARB or other antihypertensive therapy (OAHT) in Canadian kidney transplant recipients. Adult de novo kidney transplant recipients were randomized 2 × 2 to STD or LOW dose TAC and ACEi/ARB or OAHT. Patients had received a first or second transplant from a living or deceased donor and had ≥ 1 human leukocyte antigen mismatch with their donor. There were 281 patients from 13 sites across Canada. Overall patient survival was 95.7% and was comparable between groups. Graft survival at study end was 89.7% in the LOW+OAHT group and 94.4%-97.1% in the other groups and BPAR, and Class II de novo donor-specific antibodies (dnDSA) were higher in the LOW+OAHT group than in the other groups. However, these differences were not statistically significant. Graft function, blood pressure (BP), and

ISBN: 978-81-980623-8-3

proteinuria were similar between the groups; however, between 2 and 5 years there was a 2-fold or greater increase in the use of ACEi/ARB in patients randomized initially to OAHT, mostly because of hypertension and proteinuria. There were no unexpected safety findings. Patients randomized to LOW TAC with renin-angiotensin system (RAS) blockade had similar outcomes at 5 years as patients treated with STD TAC with or without RAS blockade, whereas those randomized to LOW TAC without RAS blockade showed a non-significant trend towards more rejections and dnDSA TRIAL REGISTRATION: ClinicalTrials.gov identifier:

**OPTIMIZATION AND APPROACHES FOR THE TREATMENT OF GASTROESOPHAGEAL REFLUX DISEASE**

Shubham Bairagi, Mukul Sharma
Sri Aurobindo Institute of Pharmacy, Indore (Madhya Pradesh)-453555
Shubhambairagi420@gmail.com

Gastroesophageal Reflux Disease (GERD) is one of the most prevalent gastrointestinal disorders worldwide, caused by the reflux of gastric contents into the oesophagus due to dysfunction of the lower oesophageal sphincter. It is associated with symptoms such as heartburn, regurgitation, chest discomfort, and, in severe cases, mucosal damage. Although proton pump inhibitors (PPIs) and surgical interventions such as fundoplication are widely used, they are often limited by incomplete symptom control, high recurrence rates, long-term side effects, and complications, highlighting the need for improved therapeutic strategies. The present study focuses on the optimization of a novel method for the treatment of GERD that combines design innovation and targeted therapeutic mechanisms to restore physiological function and reduce reflux episodes. The approach emphasizes minimally invasive techniques aimed at enhancing oesophageal sphincter competency, reducing oesophageal acid exposure, and improving patient compliance. Preliminary evaluations demonstrate significant reduction in symptom severity, decreased reliance on chronic pharmacological therapy, and improved quality of life. Importantly, the optimized method offers advantages such as reduced risk of adverse events, faster recovery, and sustainability in long-term management compared to conventional options**.** These promising results suggest that this optimized therapeutic method may provide a safe, effective, and patient-friendly alternative for GERD management.

**Keywords**: Gastroesophageal reflux disease, novel, optimization, invasive therapy, reflux management.

**PL-22**

**INTEGRATIVE HERBAL FORMULATION FOR RHEUMATOID ARTHRITIS: IN VIVO, NETWORK PHARMACOLOGY, AND DOCKING INSIGHTS.**

Gayatri Patil, Ashish Kulkarni, Niraj Vyawahare
Department of Pharmacology, Dr.D.Y.Patil College of Pharmacy, Akurdi, Pune-411044.

To formulate and evaluate an herbal bioactive preparation for the management of Rheumatoid Arthritis (RA), with emphasis on identifying molecular targets and mechanisms through network pharmacology and molecular docking approaches. An integrative methodology was adopted wherein network pharmacology was utilized to systematically identify the putative targets and pathways modulated by selected phytoconstituents. The involvement of these compounds in key signaling cascades such as NF-κB, MAPK, and JAK/STAT was analyzed. Furthermore, molecular docking studies were performed to validate binding affinities of major bioactives with pro-inflammatory mediators and cytokine receptors. Network pharmacology revealed that the bioactive compounds interact with multiple targets central to inflammation and immune regulation. Docking studies demonstrated strong binding affinities of phytoconstituents with cytokine receptors and inflammatory mediators, supporting their potential inhibitory roles. These findings provide computational evidence for the therapeutic promise of the formulation. The integrative approach combining in vivo evaluation with network pharmacology and molecular docking provides a mechanistic rationale for the therapeutic efficacy of herbal formulations in RA management. This strengthens the translational relevance of herbal bioactive compounds as safe and effective alternatives for RA treatment.

**PL-23**

**EFFECT OF WITHANIA SOMNIFERA ON ETHANOL AND NICOTINE CROSS-TOLERANCE.**

Sankalp Verma*, Dishant Bhadnag, Milind Umekar, Manish Aglawe.
Division of Neuroscience, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, MS, 441002
vermasankalp280@gmail.com

Adaptogens are phyto medicines that can be used as a potential therapeutic target for drug addiction. Withania somnifera (Ashwagandha) have shown significant adaptogenic effects in anxiety and stress, also in many clinically proven neuronal conditions. Thus, in the present study, we investigated the effects of Withania somnifera extract on alcohol and nicotine cross-tolerance in the Swiss albino mice model. Exposure of mice to 4-days daily treatment with ethanol or nicotine and on the 5th day, assessment of tolerance with the same dose of alcohol or nicotine followed by a withdrawal period of 30 days and then assessment of cross-tolerance with a single dose of nicotine to ethanol treated mice and ethanol to nicotine treated mice. It was assessed by testing behavioral paradigms including EPM, OFT, and body temperature measurement. Furthermore, assessment of ACTH, corticosterone and CRF was evaluated in the brain homogenates. We observed that a group of animals receiving 4 days of daily alcohol, on the 5th day showed development of tolerance to anxiety-like behavior, but locomotor parameters were not affected significantly. The development of cross-tolerance was observed in a group of mice receiving a single anxiogenic dose of nicotine followed by ethanol consumption and withdrawal in EPM. The pre-treatment of WSE and its phytoconstituents before the nicotine challenge was also found to attenuates the anxiogenic effect of nicotine as revealed by an increase in OA entries in EPM. Also, a significant decrease in ACTH, CORT and CRF level was observed in the brain homogenate of mice with WSE pre-treatments. These results suggest that WSE may serve as an effective adaptogen in arresting ethanol and nicotine mediated tolerance to cross-tolerance effects and attenuating anxiety and stress levels.

**EVALUATION OF IN-VITRO SYNERGISTIC ANTIDIABETIC ACTIVITY OF DALFAMPRIDINE AND NESIRITIDE.**

Thanushree R and Mrs. Lakshmi Vivek
Department of Pharmacology, Nitte college of pharmaceutical sciences, Yelahanka, Bengaluru -560064
09thanushree08@gmail.com

The present study investigates the in-vitro synergistic antidiabetic activity of two synthetic compounds, Dalfampridine and Nesiritide, through assessment of glucose uptake, enzymatic inhibition, and cell viability. Both agents were evaluated for their ability to inhibit key carbohydrate-metabolizing enzymes, including α-amylase, α-glucosidase, and dipeptidyl peptidase-IV (DPP-IV), as well as pancreatic lipase. Results demonstrated a concentration-dependent inhibition of α-amylase and α-glucosidase by both drugs, suggesting their potential to attenuate postprandial hyperglycemia. Mild inhibition of DPP-IV was observed, although the effect was markedly lower than that of the reference inhibitor diprotin A. Pancreatic lipase inhibition was minimal in both test compounds, with PP-4 showing moderate activity at higher concentrations, though less effective than the standard drug Orlistat. Importantly, both Dalfampridine and Nesiritide significantly enhanced glucose uptake in HPG-2 cells, with the most pronounced effect observed at 100 mg/mL. At this concentration, glucose utilization was comparable to that of the standard antidiabetic drug metformin and substantially greater than baseline activity. These findings indicate that Dalfampridine and Nesiritide exhibit promising synergistic antidiabetic potential, primarily via enhancement of cellular glucose uptake and inhibition of carbohydrate-hydrolyzing enzymes. Although their DPP-IV and lipase inhibitory effects were less pronounced, the combined pharmacological profile supports further exploration of these

ISBN: 978-81-980623-8-3

compounds as potential adjuncts in the management of type 2 diabetes mellitus.

**Keywords:** Dalfampridine, Nesiritide, antidiabetic activity, α-amylase, α-glucosidase, glucose.

## STUDY OF IN VIVO IMMUNOMODULATORY AND IN VITRO ANTICANCER EFFECTS IN CONVOLVULUS PLURICAULIS, MICHELIA CHAMPACA AND CHROMOLAENA ODORATA AND IN VIVO NEPHROPROTECTIVE ACTIVITY IN PITHECELLOBIUM DULCE

Dr. Manjushree Pawar1*, Dr. Preeti Kulkarni2, Dr. Surekha Salgar3, Dr. Jayesh Dwivedi4, Dr. Udichi Kataria5
*1Department of Pharmaceutical Chemistry, LSHGCT's Gahlot Institute of Pharmacy, University of Mumbai, Koparkhairane, Navi Mumbai, India-400709
manjushree.gip@gmail.com

Background: Evaluation of preclinical immunomodulatory anticancer models are very crucial in the process of drug discovery and development. Dysfunctional immune system is linked with disorders like autoimmune diseases, inflammatory diseases, cancer and as a treatment immunosuppressive or immunostimulant drugs are prescribed aiming at immune system disease. Synthetic drug treatments can lead to drug induced kidney failure or nephrotoxicity which is a widespread issue and its prevalence is around 66% among older adults. Globally nephrotoxicity has become a major concern due to frequent use of drugs that are nephrotoxic and continuous intake/exposure to such drugs can cause acute and chronic kidney disease. Objective: 1. To screen the ethanolic extracts of selected three medicinal plants – CP, MC, CO and combination (COMB) of above three plants (CP+MC+CO) for in-vivo and in-vitro immunomodulatory anticancer activity to cause a total effect of extracts (combination) higher than the sum of single effect of each extract. 2. To evaluate nephroprotective activity of phytocompounds which were isolated from the methanol fractions of the bark of Pithecellobium dulce in rat model. Methodology: The extracts of CO, MC and CO were subjected for 1. In-vivo immunomodulatory models - Carbon clearance test, Delayed Type Hypersensitivity test and Haemagglutination antibody titre in albino wistar rats based on acute oral toxicity tests. 2. In-vitro anticancer potential using Sulforhodamine B (SRB) assay against breast and colon cancer cell lines at concentrations of 10, 20, 40 and 80 µg/ml. 3. Methanolic fractions of PD were subjected for cisplatin induced nephrotoxicity, gentamicin induced nephrotoxicity, and paracetamol induced nephrotoxicity. Results: The extracts of CP, MC and CO have shown effects on cellular and humoral mediated immunity thus confirming its immunomodulatory potential and inhibited percent control growth in dose dependent manner for both breast and colon cancer cell line. Pithecellobium dulce was found to exhibit nephroprotective activity. Conclusion: Considering the positive outcome in all selected models, the selected medicinal plants could be further explored for future studies. Optimization in experimental conditions or turning extracts into novel drug delivery systems can enhance the medicinal effects of the plants.

## ANTI-ARTHRITIC POTENTIAL OF SONCHUS ARVENESIS L. ETHANOLIC EXTRACT ON COMPLETE FREUND'S ADJUVANT INDUCED ARTHRITIS IN WISTAR RAT

Suraj G. Budhawat. Sachin P. Borikar, Shirish P. Jain
Department of Pharmacology, Rajarshi Shahu College of Pharmacy, Buldana 443001, Maharashtra, India.
surajbudhawat@gmail.com

Rheumatoid arthritis (RA) is a chronic autoimmune disorder characterized by joint inflammation, with limited treatment options for complete recovery. This study evaluated the anti-arthritic potential of ethanolic extract of Sonchus arvenesis L. (EESA) in Complete Freund's Adjuvant (CFA)-induced arthritis in Wistar rats. Animals were divided into control, disorder control, standard (Indomethacin 2.5 mg/kg), and test groups (EESA 50 and 100 mg/kg, p.o.). Treatments were given from day 1–29. Behavioral assessments (body weight, arthritic index, rotarod, hot plate, actophotometer, plethysmometer), hematological parameters (RF, CRP, ESR, CBC), and histopathology of tibiotarsal joints were performed. EESA significantly improved locomotor activity, body weight, fall-off time, and paw withdrawal latency while reducing paw volume and arthritic score. Hematological findings showed reduced RF, ESR, CRP, WBC and increased Hb, RBC, and platelet count. Histology confirmed reduced joint damage. Findings suggest that Sonchus arvenesis L. possesses promising anti-arthritic activity, supporting its potential as a complementary therapeutic approach in RA.

**Keyword-** Rheumatoid arthritis, Complete freunds adjuvant, EESA, Plethsmometer, ESR, CRP level, RF.

**PL-27**

## ANTIBIOGRAM: STUDY TO IMPROVE DRUG RESISTANCE, INFECTION CONTROL AND THE RATIONAL ANTIBIOTIC PRESCRIPTION AT TERTIARY CARE HOSPITAL, NAMAKKAL

Naveen R, Arunachalam G, Gokul P & Vigneshwaran R
Department of Pharmacy Practice and Pharmacognosy, PGP College of Pharmaceutical Science and Research Institute, Namakkal.
naveen1992003@gmail.com

Antimicrobial resistance (AMR) poses a serious threat to effective treatment of infections, largely due to irrational antibiotic use and inadequate infection control. This study at a Tertiary Care Hospital, Namakkal, aimed to develop an antibiogram to identify local resistance patterns and guide rational prescribing. A total of 1,775 clinical specimens collected over one year were processed using standard microbiological methods, and antibiotic susceptibility testing was performed according to CLSI guidelines. The results showed that Escherichia coli was the predominant isolate (about 38%), followed by Klebsiella species (27%), Staphylococcus aureus (15%), and Pseudomonas aeruginosa (8%). Among Gram-negative isolates, E. coli and Klebsiella exhibited high resistance to third-generation cephalosporins (65% and 72%, respectively) and fluoroquinolones (58% and 63%), whereas carbapenems retained better sensitivity (82% and 79%). For Gram-positive organisms, methicillin-resistant Staphylococcus aureus (MRSA) accounted for 41% of S. aureus isolates, though most remained susceptible to vancomycin and linezolid. The findings also revealed frequent empirical use of broad-spectrum antibiotics, contributing to rising resistance rates. The study concludes that establishing an antibiogram is an effective tool to monitor resistance trends, improve rational antibiotic selection, and strengthen infection control practices. Regular updates and integration with hospital antibiotic stewardship programs are strongly recommended to slow the spread of resistance and ensure optimal patient care.

**Keywords:** Antimicrobial resistance, Escherichia coli, Klebsiella, Cephalosporins.

## INTEGRATIVE THERAPEUTIC APPROACHES IN PARKINSON'S DISEASE: PROTEIN AGGREGATION, IMMUNE PATHWAYS, AND FERROPTOTIC CELL DEATH

Prasanth B1, Vigneshwaran R1, Jennifar E1 and Shivani K1
1 Department of Pharmacy Practice, PGP College of Pharmaceutical Science and Research Institute, Namakkal.
prasanth19804@gmail.com

Parkinson's disease (PD) is a complex neurodegenerative disorder characterized by progressive dopaminergic neuronal loss and pathological alpha-synuclein (α-syn) aggregation. Current therapies, such as levodopa and dopamine agonists, provide symptomatic relief but fail to modify disease progression. Thus, novel therapeutic strategies are urgently needed. Targeting α-syn aggregation remains a major focus, with monoclonal antibodies (prasinezumab, cinpanemab) and small molecules (anle138b) demonstrating potential to reduce aggregates and slow progression, though challenges such as blood–brain barrier penetration and patient heterogeneity persist. Beyond α-syn, dysregulation of leucine-rich repeat kinase 2 (LRRK2) and triggering receptor expressed on myeloid cells 2 (TREM2) implicates neuroinflammation and innate immunity in PD pathogenesis, offering additional therapeutic targets. Recently, ferroptosis, an iron-dependent cell death pathway driven by lipid peroxidation, has emerged as a critical mechanism underlying dopaminergic neuron vulnerability. Preclinical studies highlight the therapeutic potential of ferroptosis inhibitors

ISBN: 978-81-980623-8-3

(ferrostatin-1, liproxstatin-1) and iron chelators (deferiprone) in rescuing neuronal survival and mitigating motor deficits. Together, these insights underscore the need for integrative approaches that address protein aggregation, neuroinflammation, and ferroptosis vulnerability. Future efforts should prioritize biomarker-driven patient stratification, precision medicine, and combinatorial strategies capable of delivering true disease modification. Advancing such therapies offers hope for transforming PD management and improving long-term outcomes.

**Keywords**: Parkinson's disease, alpha-synuclein, LRRK2, TREM2 and ferroptosis.

**PL-29**

## IMPACT OF MDR-TB CASES ON MORTALITY RATES IN BANGALORE DISTRICT

Abhishek Yadav A
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India – 560064
abhiyadav4664@gmail.com

Tuberculosis (TB) continues to be a major global health concern, with multidrug-resistant tuberculosis (MDR-TB) emerging as a challenge to control. This study analyzed the impact of MDR-TB on mortality in Bangalore district using hospital-based data from 2019–2021. A retrospective review showed 17 MDR-TB cases out of 323 in 2019, 23 of 213 in 2020, and 117 of 258 in 2021. Deaths recorded were 51, 37, and 36, respectively. MDR-TB showed an increasing trend, though mortality remained stable, suggesting effective hospital-based management.The retrospective cross-sectional study was conducted in government hospitals across urban and rural Bangalore. Records of confirmed TB patients were classified into MDR-TB, rifampicin-resistant TB (RR-TB), and drug-sensitive TB. Data were extracted from hospital registers and patient files. Patients with incomplete details or lost to follow-up were excluded. Demographics, TB type, and treatment outcomes (cured, ongoing, default, death) were analyzed. Mortality was compared between MDR-TB and non-MDR TB cases using descriptive statistics, with subgroup analysis by age and gender.Hearby, the study concluds that the MDR-TB prevalence has shown an alarming increase in Bangalore district, though mortality has not risen proportionally. Strengthening surveillance, early detection, and timely treatment are essential to curb drug-resistant TB.

**Keywords:** Tuberculosis, MDR-TB, Mortality, Drug Resistance, Public Health

## EXPLORING THE POTENT ACTION OF FERULIC ACID ALONG WITH METFORMIN IN DEHYDROEPIANDROSTERONE INDUCED PCOS IN FEMALE WISTAR RATS

Bhagyashree Ramchiary , Jyothi Y and Meerakh Subba
Department of Pharmacology, Krupanidhi College of Pharmacy (RGUHS), Bengaluru, Karnataka, 560035
bhagyashreeramchiary269@gmail.com

In the present study, the potent action of ferulic acid along with metformin in dehydroepiandrosterone induced PCOS in female Wistar rats was evaluated. The objective of the study was to evaluate the effects of ferulic acid, metformin and their combination in a dehydroepiandrosterone (DHEA)-induced Polycystic Ovarian Syndrome (PCOS) model in female Wistar rats. PCOS was induced by administering DHEA (6 mg/kg, subcutaneously) for 21 days. Treatments included metformin (300 mg/kg, orally), ferulic acid (100 mg/kg, orally), and their combination (300 mg/kg + 100 mg/kg) for 14 days. Parameters such as body weight, oestrous cycle, glucose tolerance, testosterone levels, and ovarian histopathology were assessed. DHEA significantly affected body weight and disrupted the oestrous cycle. Preventive therapy improved insulin sensitivity and glucose metabolism, leading to hormonal balance and mitigating PCOS symptoms. Combination treatment regulated the oestrous cycle more effectively than individual therapies, improved reproductive health, and reduced elevated testosterone levels, addressing hyperandrogenism. It also helped to manage blood glucose levels and prediabetic conditions. Ovarian tissue in the combination group showed increased folliculogenesis and enhanced vascularity, indicating improved ovarian health. Thus, it can be concluded that the ferulic acid metformin combination effectively ameliorates dehydroepiandrosterone (DHEA)-induced polycystic ovarian syndrome (PCOS) model.

**Keywords:** Polycystic Ovarian Syndrome, Ferulic acid, Metformin, Dehydroepiandrosterone, Oestrous cycle.

## A COMPARATIVE STUDY ON COST AND EFFECTIVENESS OF CLOPIDOGREL AND TICAGRELOR IN ACUTE CORONARY SYNDROME PATIENTS

R SARANYA, Dr P KALAISELVI
JKKMMRF'S ANNAI JKK SAMPOORANI AMMAL COLLEGE OF PHARMACY
saranyasrksr@gmail.com

Coronary artery disease (CAD) involves atherosclerotic plaque buildup in coronary arteries, restricting blood and oxygen flow to the heart, potentially leading to acute coronary syndrome (ACS). ACS encompasses conditions like ST-elevation myocardial infarction (STEMI), non-ST-elevation myocardial infarction (NSTEMI), and unstable angina (UA). This prospective observational study at a tertiary care cardiology center in Erode analyzed the cost and effectiveness of clopidogrel and ticagrelor in 188 inpatient ACS patients (above 18 years). The study aimed to identify the more cost-effective drug and measure quality of life using the Nottingham Health Profile. The cohort included 92 patients on clopidogrel (72 male, 20 female) and 96 on ticagrelor (76 male, 20 female). Age distribution showed clopidogrel use at 10.9% for 18-45 years, 63% for 45-65 years, and 26.1% for >65 years. Ticagrelor use was 23% for 18-45 years, 62.5% for 45-65 years, and 14.5% for >65 years. Cost analysis revealed clopidogrel (clopilet) averaged Rs. 7.75 per tablet, while ticagrelor (Brilinta) averaged Rs. 60 per tablet. The study concluded that ticagrelor is more effective but also more costly than clopidogrel.

**Keywords**: Coronary artery disease, acute coronary syndrome (ACS), Nottingham Health Profile, clopidogrel, Ticagrelor.

## CROSS-SECTIONAL ASSESSMENT OF SLEEP QUALITY, COMORBIDITIES, AND DRUG UTILIZATION PATTERNS AMONG ADULTS

Dr.Aravind Jesuraj, Ayisha.k.m, Alwy Jose, Malavika p.u
Department of pharmacy practice, Nirmala college of health science, chalakudy, thrissur, Kerala, India -680311
Ayishaass03@gmail.com

Sleep disorders are common but underdiagnosed, contributing to poor quality of life and increased risk of cardiometabolic diseases. Screening with validated tools such as the Epworth Sleepiness Scale may help in early detection. To assess the prevalence of poor sleep quality and excessive daytime sleepiness among adults, and to explore their associations with comorbidities, lifestyle habits, and drug utilisation. A cross-sectional observational study will be conducted among approximately 200 adults (≥18 years) recruited from outpatient clinics and community health programs. After obtaining informed consent, baseline demographic, clinical, and medication data will be collected. Participants will complete a structured Sleep Questionnaire, including the Epworth Sleepiness Scale. Clinical parameters such as BMI, neck circumference, and blood pressure will also be recorded. Data will be analysed using descriptive and inferential statistics with a significance level of $p<0.05$. The prevalence of poor sleep quality is estimated at around 30%. Abnormal sleep patterns and excessive daytime sleepiness are anticipated to correlate with hypertension, diabetes, obesity, and depression. Lifestyle factors such as alcohol use, caffeine intake, smoking, and irregular sleep schedules are expected to emerge as significant predictors of sleep disturbance. This study is expected to highlight the burden of sleep disorders in adults and identify modifiable lifestyle and drug-related factors. Findings support the integration of routine sleep screening into clinical practice for early diagnosis and improved management.

**Keywords:** Sleep disorders, Epworth Sleepiness Scale, cross-sectional study, comorbidities, lifestyle factors.

## NEUROPROTECTIVE POTENTIAL OF SELECTED PHYTO MOLECULES FOR THERAPEUTIC IMPLICATIONS IN ALZHEIMER'S DISEASE.

Swapna Reddy Kasireddy1, Ram Mohan Manda 2
School of Pharmacy, Anurag University, Hyderabad.

ISBN: 978-81-980623-8-3

A significant target in the treatment of Alzheimer's disease (AD) is the inhibition of acetylcholinesterase (AChE). The need for inventive therapeutic agents has been emphasized by the limited efficacy and numerous adverse effects of common anti-acetylcholinesterase medications. Natural products have grown into a major source of potential neuroprotective agents, particularly those that come from medicinal plants. Through molecular docking, this study aimed to find out the anti-Alzheimer's potential of certain bioactive compounds, such as DSN BCN, DMC, DXN-A, and IRN, against human acetylcholinesterase (PDMB ID: 2ACE); and HDAC (PDB ID: 2ODC), which provide promising avenues for AD therapy. Using Auto Dock Vina software, molecular docking was utilized for analyzing ADMET, Lipinski's rule, and molecular docking with the goal to predict potentially selected bioactive antagonists. The significant binding affinities of all ligands that target specific amino acid residues within AChE and HDAC have been highlighted by the study's docking outcomes. Furthermore, while compared to the reference standard, BCN, DMC, and DSN revealed greater binding affinity. Good gastrointestinal absorption was shown by the positions of BCN, DMC, and DSN inside the white region among the investigated compounds.

**Keywords:** Alzheimer's disease, ADMET analysis, molecular docking, and inhibitors of AChE and HDAC.

**PL-34**

## TRACKING AND REDUCING ANTIBIOTIC OVERUSE: A 6-MONTH AUDIT AND FEEDBACK INTERVENTION IN HIGH-BURDEN DEPARTMENTS

Dhanushya K, Sutheeswaran G, Vigneshwaran R, Gokul P
Department of Pharmacy Practice, PGP College of Pharmaceutical Science and Research Institute, Namakkal, Tamil Nadu, India-637 207
dhanushyak123@gmail.com

Antimicrobial resistance remains a critical global challenge, particularly in hospital settings where inappropriate prescribing practices contribute to the rise of antimicrobial resistance (AMR), treatment failures and increased healthcare costs. This study, conducted at Namakkal, India aimed to evaluate bacterial resistance patterns and assess the impact of a 6-month audit and feedback intervention on antibiotic prescribing and patient outcomes. A total of 153 patients were included between August 2024 and February 2025, with clinical specimens obtained from urine (35.9%), pus (28.7%), wound swabs (11.1%), and blood (7.2%). E. coli (65 isolates) emerged as the predominant pathogen, followed by Klebsiella pneumoniae (20), Staphylococcus aureus (19) and Pseudomonas aeruginosa (12). Antibiotic susceptibility testing revealed high resistance to Ampicillin (90%), Amoxicillin-Clavulanate (85%), and Ciprofloxacin (70%). Conversely, high sensitivity was observed for Meropenem (95% in E. coli, 90% in K. pneumoniae), Amikacin (90% in E. coli, 85% in K. pneumoniae), and for Gram-positive isolates, Vancomycin and Linezolid (95%). Clinical effectiveness was highest in urinary tract infections (90% day 5), followed by wound (85% day 10) and other infections (80% day 7). These highlights the crucial role of antimicrobial stewardship strategies, particularly audit and feedback thus enhancing treatment outcomes, reducing resistance emergence, and achieving cost savings in high burden hospital settings.

**Keywords:** Antibiotic resistance, Audit and feedback, antimicrobial stewardship, Escherichia coli, Broad-spectrum antibiotics

## INVESTIGATING IMPACT OF CALCIUM CHANNEL BLOCKERS ON PHARMACOKINETICS OF LAPATINIB: POSSIBLE ROLE OF CYTOCHROME P450 ENZYMES AND P-GLYCOPROTEIN EFFLUX TRANSPORTERS

Jagadish P C, Mrunal Pradeep Desai, and Prajakta Harish Patil
Department of Pharmaceutical Chemistry, Manipal College of Pharmaceutical Sciences, Manipal Academy of Higher Education, Manipal, Karnataka, India, 576104
jagadish.pc@manipal.edu

Lapatinib, an oral tyrosine kinase inhibitor used to treat breast cancer, is associated with cardiotoxicity. As a result, cardioprotective agents, including calcium channel blockers, are often co-prescribed, creating a potential for pharmacokinetic interactions that need to be evaluated. This study assessed the effects of calcium channel blockers on P-glycoprotein-mediated efflux, cytochrome 3A4-regulated metabolism, and overall pharmacokinetics of lapatinib using an ex vivo everted gut sac model, an in vitro metabolic stability assay, and in vivo pharmacokinetic interaction studies in rats. Calcium channel blockers such as verapamil and nicardipine increased the apparent permeability of lapatinib by 1.92 and 1.68 folds, respectively. Further, lapatinib's metabolic clearance in human liver microsomes was decreased by 15.78 and 9.47 folds in the presence of nicardipine and diltiazem, respectively at the concentration of 100µM. In vivo, the Cmax of lapatinib was observed to be increased by 29.30% with diltiazem (25 mg/kg) and 36.76 % with nicardipine (4 mg/kg) pretreatment. However, verapamil (20 mg/kg) reduced its Cmax by 30.44%. Pre-treatment with diltiazem and nicardipine increased lapatinib exposure, while verapamil reduced it. These findings emphasize the need for careful monitoring when calcium channel blockers are co-administered with lapatinib to ensure safe and effective therapy.

**Keywords:** Lapatinib, Calcium channel blockers, CYP3A4, P-glycoprotein, Pharmacokinetic drug-drug interactions.

**PL-36**

## EVALUATION OF INSULIN INJECTION PRACTICES AND IMPACT OF EDUCATION ON INSULIN USAGE AMONG TYPE 2 DIABETES PATIENTS IN NILGIRIS

Afreen Fyros PK and Sanya Z
JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty, Tamil Nadu, India-643001

Proper insulin injection techniques are essential for optimal insulin absorption, prevention of lipodystrophy, and avoidance of complications in patients with Type 2 Diabetes Mellitus (T2DM). However, limited data exists on injection practices among the South Indian population. This study aimed to assess insulin administration knowledge and practices among T2DM patients, identify errors, and evaluate the impact of an educational intervention. A prospective, open-label study was conducted at Government Medical College Hospital, Nilgiris, Tamil Nadu (IRB No: IRBGMC0029) among 269 T2DM patients on insulin therapy for six months. Baseline knowledge and practice were assessed using a prevalidated questionnaire. Patients received education on correct insulin administration and disposal techniques through pamphlets and pictorial aids. Post-intervention assessment showed a significant improvement in knowledge scores (Pre: 6.73 ± 1.898; Post: 9.19 ± 1.789; $t = -18.505$, $p < 0.05$). Safe needle disposal practices improved markedly, with the number of patients discarding needles in sharp containers increasing from 24% (n=66) to 57.6% (n=155) after a single educational session. The findings highlight substantial gaps in knowledge and practices regarding insulin injection techniques among T2DM patients. Educational interventions were effective in enhancing both knowledge and safe disposal behavior, emphasizing the crucial role of clinical pharmacists in diabetes education. Implementing structured insulin stewardship programs could significantly improve patient safety and glycemic control in the community, and there is a pressing need to establish such programs across India to standardize safe insulin use.

**Keywords:** Type 2 Diabetes Mellitus, Insulin Injection, Patient Education, Insulin Therapy, Safe Disposal

## "PHARMACIST-LED COUNSELLING FOR DYSLIPIDAEMIA: A KNOWLEDGE, ATTITUDE, AND PRACTICES (KAP) STUDY."

Blessy Babu, Aravinth Vijay Jeysuraj S, Damodar H Menon and Vijeesh T S
Department of Pharmacy Practice, Nirmala college of health science, Kerala University of Health Science, Thrissur, Kerala, India – 680311
bb.blessybabu05@gmail.com

Dyslipidaemia is a significant public health issue in India and a key risk factor for heart disease. This cross-sectional study was conducted among 50 Dyslipidaemia participants from adults in Thrissur district over 2 months using a self-developed, structured questionnaire validated by subject matter experts. The instrument was developed based on a thorough review of existing literature to assess sociodemographic, the three KAP domains, and key principles of medication adherence. The study showed moderate knowledge; 52% scored adequately. Awareness about muscle pain related to statin use stood at 48%. Although the overall attitude was positive (average score: 3.85 out of 5), this did not reflect in actual practice. Only 48% of eligible respondents reported perfect medication adherence, and just 48% would seek help upon

ISBN: 978-81-980623-8-3

experiencing a potential side effect. The data were analysed using Anova ($p<0.05$) This study reveals a considerable gap between patients' positive attitudes and their real knowledge and practices. It highlights the urgent need for pharmacist-led initiatives, especially in educating patients about medication adherence and the right steps for handling adverse drug reactions. Targeted counselling from pharmacists is crucial for enhancing patient safety and improving heart health.

**Keywords**: Adverse drug reactions, Medication adherence, Patient education, Pharmacy practice

**PL-38**

**A CROSS-SECTIONAL MUAH-16 ANALYSIS OF MEDICATION ADHERENCE OF HYPERTENSIVE PATIENTS**

Damodar H Menon*, Aravinth Vijay Jeysuraj S, Blessy Babu, Mohammed Shahil
Department of Pharmacy Practice, Nirmala college of health science, Kerala University of Health Science, Thrissur, Kerala, India – 680311
hmenondamodar1@gmail.com

Hypertension is a prevalent chronic condition where non-adherence to medication can significantly increases the risk of cardiovascular events, compromise treatment efficacy and can even increase the risk of cardiovascular mortality. No studies have been conducted so far in Thrissur on assessment of medication adherence of hypertensive patients using 16-item Medication Usage Adherence Helper (MUAH-16). This cross-sectional study was conducted among 37 hypertensive patients in a community setting over a three-month period using a structured Google Form survey. Adherence was measured using MUAH-16 scale assessing patient behaviours, routines, and self-reported barriers to taking medication, including forgetfulness, treatment complexity, and lifestyle disruptions. The study population had a mean age of 53.9 years, with a majority being female (66.7%). Results showed that forgetfulness (32%) and having a busy schedule (27%) were the most commonly cited reasons for missing medication. A significant portion of respondents (43%) reported having coexisting conditions such as diabetes, high cholesterol, or heart disease, which can complicate treatment regimens($P<0.05$). The most effective adherence strategy reported was linking medication intake with a daily routine like meals (49%). Other common aids included using a pillbox (22%) and receiving reminders from family members (14%). Despite these aids, over half of the participants (51%) admitted to sometimes forgetting to take their medication. The study demonstrates that practical barriers are significant, highlighting the need for patient education focused on simple, routine-based strategies and memory aids to improve medication adherence in the community.

**Keywords:** Barriers, Cross-Sectional Study, Hypertension, Medication Adherence, Patient Education.

**PL-39**

**POTENTIAL OF TRICHOSANTHES CUCUMERINA L. FOR MANAGING METABOLIC RELATED DISORDERS:AN INSIGHT OF IN-VITRO STUDIES**

Rounak Adhikary, Seha Singha*
Department of Pharmaceutical Technology, School of Health and Medical Sciences, Adamas University, Kolkata-700126
rounakadhikary2002@gmail.com

The Cucurbitaceae plant family's Trichosanthes cucumerina L. is a crop rich in nutritional and medicinal qualities. In numerous folkloric remedies, fruits are utilized to address various metabolic disorders such as hyperglycemia, hyperlipidemia, diabetes, and obesity. Additionally, they are traditionally employed to alleviate fever, skin disorders,bleding disorder, and hypertension, and are also employed for cardioprotective, hepatoprotective, analgesic purposes. This research aims to investigate the therapeutic potential of Trichosanthes cucumerina L. using in-vitro and method for addressing hyperlipidemia,hyperglycemia,and associated metabolic disorders, while also conducting its phytochemical profiling for quality assessment and validation of traditional claims. The hydroalcohol extract of dried Trichosanthes cucumerina L. fruit was used in this investigation. In addition to the in vitro enzyme inhibitory capability against the enzymes α-amylase, α-glucosidase,Carbonic, anhydrase and pancreatic lipase, the in vitro antioxidant capacity was investigated utilizing the DPPH and hydroxyl scavenging assay. The findings demonstrated that the fruit extract exhibits greater antioxidant activity and significant enzyme inhibition potential. Several identified metabolites in Trichosanthes cucumerina L. fruits could be responsible for the therapeutic potential linked to metabolic disorders. The results of this investigation demonstrated the potential of the traditionally significant plant Trichosanthes cucumerina L. to treat illnesses connected to metabolism. The fruit extract's phytocomponents may be in charge of the enzymes' inhibitory and antioxidant properties. Therefore, Trichosanthes cucumerina L. fruits will be helpful as alternate treatments for hyperglycemia, hyperlipidemia, and associated metabolic diseases.

**Keywords:** Trichosanthes cucumerina L., Metabolic disorders, Antioxidant activity, Enzyme inhibition, Phytochemical profiling.

**PL-40**

**IMPROVING PSYCHIATRIC CARE: PHARMACIST'S ROLE IN MEDICATION ADHERENCE"**

Kanyakumari
Department Of Pharmacy Practice, Rajiv Memorial Education Society's College of Pharmacy Kalaburagi, Karnataka, India- 585102
Kanyakumari1611@gmail.com

This prospective interventional study was conducted over six months in the psychiatry outpatient department to evaluate the impact of clinical pharmacist interventions on prescribing patterns, follow-up trends, drug-related problems, and medication adherence among psychiatric patients. A total of 102 patients aged ≥18 years with psychiatric disorders, with or without comorbidities, were included. Among them, 59 were males and 43 were females, with the majority falling within the 31–45 years age group (37.25%). The most common psychiatric condition observed was psychosis (39.21%), followed by insomnia (13.72%), schizophrenia (12.74%), anxiety disorder (11.76%), bipolar disorder (6.86%), anger disorder (4.90%), depression (4.90%), and other psychiatric conditions (5.88%). Risperidone emerged as the most commonly prescribed antipsychotic drug, frequently combined with Trihexyphenidyl to manage extrapyramidal side effects. The pharmacist-led educational intervention focused on improving patient awareness, medication counselling, and adherence monitoring. Findings revealed that pharmacist involvement not only optimized prescribing practices but also contributed to the identification and prevention of drug-related problems, ultimately enhancing medication adherence. This emphasizes the crucial role of clinical pharmacists in bridging the gap between prescribers and patients, ensuring rational drug use, and improving therapeutic outcomes in psychiatric care. The study highlights that structured pharmacist-led interventions can significantly strengthen psychiatric management by enhancing patient safety and adherence.

**Keywords:** Psychiatric disorders, Pharmacist intervention, Antipsychotic drugs, Medication adherence

**PL-41**

**FORMULATION AND CHARACTERIZATION OF ARROWROOT STARCH–SODIUM ALGINATE MUCOADHESIVE BUCCAL FILMS OF ZOLMITRIPTAN FOR TARGETED MIGRAINE THERAPY**

SUJATHA
Visveswarapura Institute of Pharmaceutical Sciences
sujathapharmacy92@gmail.com

Mucoadhesive buccal films have emerged as a promising alternative to conventional oral dosage forms, especially for antimigraine therapy where rapid onset and avoidance of first-pass metabolism are critical. Plant-based polymers such as arrowroot starch (AR) and sodium alginate (SA) offer biocompatibility, cost-effectiveness, and film-forming potential.This study aimed to formulate zolmitriptan-loaded buccal films using AR starch and SA, evaluate their physicochemical and mechanical properties, and optimize polymer ratios for uniform drug release and mucoadhesion. Films were prepared by solvent casting with varying AR:SA ratios (100:0, 0:100, 50:50, 70:30, 30:70). Citric acid was incorporated to reduce starch retrogradation and glycerol as a plasticizer. Drug–excipient compatibility was confirmed through FTIR, DSC, and XRD. Films were characterized for thickness, weight variation, folding endurance, tensile strength, moisture content, surface pH, mucoadhesive strength, SEM morphology, drug content uniformity, and in-vitro drug release in phosphate buffer (pH 6.8). All formulations produced flexible, transparent, non-sticky films with acceptable mechanical strength. FTIR, DSC, and XRD confirmed no major drug–excipient interactions. AR starch films showed burst release within 10

ISBN: 978-81-980623-8-3

minutes, while SA films exhibited sustained release. The 50:50 AR:SA blend (F3) demonstrated optimal balance—uniform thickness (0.20 mm), high folding endurance (385), suitable tensile strength (2.4 kg), uniform drug content (~100%), and consistent drug release with smooth SEM surface morphology. Mucoadhesive strength improved with SA incorporation, confirming its synergistic role with starch. AR starch–SA composite buccal films present a sustainable, plant-based platform for zolmitriptan delivery in migraine therapy. The optimized 50:50 formulation achieved desirable mucoadhesion, mechanical integrity, and controlled drug release, supporting its potential for clinical translation. Future work will focus on permeability and stability studies.

**Keywords**: Arrowroot starch, Sodium alginate, Zolmitriptan, Buccal films, Mucoadhesion, Migraine therapy

**PL-42**

## EMPOWERING SAFE OTC MEDICATION USE: IMPACT OF PHARMACIST COUNSELLING AND EDUCATIONAL ZINES

Bridgit Neyyan, Akashkumar P. Mathuria and Sandipkumar P. Bhatt
K.B. Institute of Pharmaceutical Education and Research, Gandhinagar, Gujarat, India - 382023.
Bridgit2712@gmail.com

Over-the-counter medications are widely used for self-medication, providing an accessible and cost-effective way to manage minor ailments. Many patients lack proper knowledge about drug administration techniques and precautions while using OTC products such as eye-drops, topical-agents, and syrups. This reduces therapeutic effectiveness and can lead to avoidable complications. Hence, structured educational materials such as PILs, pictorial aids and zines can be crucial in improving patient knowledge and minimizing administration errors. A prospective-interventional study was conducted over 6 months, with total sample enrolment of 210 participants. Participants were randomly assigned to one of three groups: counselling only; counselling & zine; or zine only. A KAP questionnaire was filled before and after intervention. A follow-up was conducted after 1 week of the intervention to measure change in KAP. Statistical-analysis was done using MS-Excel and SPSS. The study demonstrated improvement in KAP score for all the intervention groups. Mean-difference was highest in the Counselling & Zine group (7.30), followed by the Counselling group (6.86) and the Zine group (4.11). Welch's ANOVA showed significant difference between the intervention groups (Statistic = 14.458, $p < 0.05$). The study demonstrates counselling plays a vital role in OTC medication safety through education but zines prove effective at reinforcing deep-learning and real-world practice. Participants, considered zines to be a helpful educational tool with clear visuals that made the content easy to understand thus indicating their potential for patient-education. The combination of verbal counselling with zines appeared to create the most optimal method for patient-education and responsible medication use.

**Keywords:** Over-the-counter (OTC) medications, Self-medication, counselling, education, Knowledge, Zines.

## KNOWLEDGE, PRACTICE, ADHERENCE, AND RISK FACTORS OF FOOT CARE AMONG TYPE 2 DIABETES MELLITUS PATIENTS IN NILGIRIS

Mohsina Hyder K and Sabarinathan S
Department of Pharmacy Practice, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty-643001, The Nilgiris, India
mohsinahyder@gmail.com

Diabetic foot complications remain a leading cause of morbidity, disability, and amputations among individuals with diabetes. Poor knowledge and inadequate adherence to foot care practices significantly contribute to these adverse outcomes. This study aimed to assess the knowledge, practice, and adherence to foot care, identify risk factors for foot ulcers, and evaluate the impact of an educational intervention using a foot care pamphlet. A prospective interventional study was conducted among 383 male and female Type 2 diabetes patients aged above 30 years attending Government Medical College and Hospital, Udhagamandalam, Nilgiris, from October 2024 to March 2025. Patients with severe infections, previous history of foot ulcers, or incomplete questionnaires were excluded. Ethical clearance was obtained (IRB No: IRBGMC0070). Baseline knowledge, practice, and adherence were assessed using a validated questionnaire, followed by distribution of an educational pamphlet and reassessment after two weeks. Findings revealed that 64.3% had inadequate foot care practices, 37.8% had poor glycemic control, 31.5% were smokers, and 8.2% had peripheral vascular disease. Only 12% performed regular foot examinations, 28% dried between toes, and 26% moisturized their feet. Knowledge scores significantly improved from baseline ($M = 3.84$, $SD = 1.21$) to follow-up ($M = 7.02$, $SD = 1.60$) ($p < 0.001$). The study concludes that simple educational strategies, particularly clinical pharmacist-led counseling supported by educational materials, can effectively improve patient knowledge, encourage healthy practices, and potentially prevent diabetic foot complications, thereby reducing the risk of ulceration and subsequent amputations.

**Keywords:** Diabetic foot care, Knowledge, Practice, Adherence, Risk factors, Type 2 Diabetes mellitus, Nilgiris

**PL-44**

## PHARMACIST-LED INTERVENTIONS TO ADDRESS VACCINE HESITANCY AND IMPROVE CONFIDENCE: A COMMUNITY-BASED STUDY

Syed Mansoor and Ruhana
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore.560041
msyed6522@gmail.com

Vaccine hesitancy and low confidence in immunization services remain major barriers to coverage. This study evaluated the effectiveness of pharmacist-led counselling in reducing vaccine hesitancy and improving confidence. A pre–post interventional design was employed among 101 community participants. Baseline data on vaccine hesitancy and confidence were collected using a structured questionnaire, followed by pharmacist-led educational and counselling sessions. Post-intervention outcomes were analyzed using paired t-tests and chi-square tests. At baseline, 39.6% of participants expressed hesitancy, while only 58.4% reported confidence in vaccine safety and effectiveness. Following intervention, hesitancy decreased significantly to 17.8% ($p<0.001$), while confidence rose to 81.2% ($p=0.002$). Willingness to recommend vaccination to family increased from 52.4% to 76.2% ($p=0.004$). These findings demonstrate that pharmacist-led interventions are effective in reducing vaccine hesitancy and enhancing community confidence. Integrating pharmacists into vaccination awareness programs may be a key strategy to strengthen immunization services.

**Keywords:** Vaccination, interventional study, vaccine hesitancy, vaccine confidence, pharmacist-led counselling.

**PL-45**

## EFFECT OF ITRACONAZOLE EMULGEL ENRICHED WITH PAPAIN AND BROMELAIN HERBAL EXTRACTS TO ENHANCED DERMATOPHYTOSIS MANAGEMENT

Ritika Arora and Kumud Upadhyaya
Department of Pharmaceutical Sciences, Faculty of Technology, Sir J.C. Bose Technical Campus, Bhimtal, Kumaun University, Nainital, Uttarakhand, India (263136)
ritikaa155@gmail.com

The risk of dermatophytosis is heightened by the growing resistance to conventional antifungal drugs, raising concerns about treatment failures and emphasizing the need for innovative therapeutic approaches. To address these challenges, Emulgel is being used which acts as dual control release system. The aim of this study is to prepare and evaluate the Itraconazole emulgel using herbal extracts named bromelain and papain represents a novel and effective approach in combating dermatophytosis. This synergistic blend not only enhances therapeutic efficacy but also increases drug permeability and to minimize potential drug resistance for the management of fungal infections. Different concentration of bromelain, papain and their combinations were used. Carbapol 934 was used as gelling agent. Neem oil and Tulsi oil were used as penetration enhancers. The herbal emulgel was prepared in three steps by formation of emulsion and gel and then obtained emulsion was mixed with the gel stage to the extent of 1:1 with gentle stirring. All the excipients were tested for compatibility studies by FTIR Spectroscopy, which revealed that there were no physical and chemical interaction occured. All the prepared emulgels showed satisfactory physicochemical properties like color, homogeneity, consistency, extrudability, spreadability and pH value. The drug release was found to be higher for

ISBN: 978-81-980623-8-3

formulations F4 (88.44 ± 0.44%) and F5 (94.59 ± 0.42%). In-vitro antifungal activities against T. rubrum, T.mentagrophytes, M. gypseum were determined by well diffusion method. The observed stability data indicated that the formulations remained stable under accelerated storage conditions. It was concluded that integrated emulgel could be a promising formulation for effective treatment of dermatophytosis after clinical studies in future. Ongoing research continues to explore its efficacy and safety.

**Keywords:** Emulgel, Itraconazole, Bromelain, Papain, Dermatophytosis.

**PL-46**

**UNDERSTANDING KNOWLEDGE, ATTITUDES, AND PRACTICE ON ALCOHOLIC LIVER DISEASE IN THE GENERAL POPULATION**

Shruthi G L and Dr Ruhana
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore. 560041.
shruthishruthi0702@gmail.com

Alcoholic liver disease (ALD) is a progressive spectrum of alcohol-induced liver injury, ranging from fatty liver to cirrhosis, and is among the most preventable causes of liver-related morbidity and mortality. Public awareness of ALD risk factors, complications, and preventive measures plays a vital role in reducing its burden. However, general population knowledge and perceptions remain underexplored. The aim of this study was to evaluate the knowledge, attitudes, and practices (KAP) related to ALD among the general population, with particular focus on awareness of risk factors, perceptions of disease seriousness, and preventive behaviors. A cross-sectional KAP survey was conducted among 107 adults over one month (05 July to 05 August) using a structured online questionnaire. The form collected demographic information along with responses on knowledge, attitudes, and practices toward ALD. The findings revealed encouraging levels of knowledge: over 80% identified alcohol as a cause of ALD, and 72% recognized its progression to cirrhosis if untreated. Preventive practices were moderately reported, with many participants undergoing liver health check-ups and maintaining healthy lifestyle habits. Attitudinal responses showed that just over half considered ALD a serious health concern, while nearly 90% supported awareness initiatives, including education for both drinkers and non-drinkers and the implementation of community programs. In conclusion, the study highlights positive awareness and favorable attitudes toward ALD in the population, though gaps in perception and preventive behaviors persist. Strengthening education, promoting routine screening, and implementing community-based programs are essential to improve liver health outcomes.

**Keywords:** Alcoholic liver disease, KAP survey, public awareness, preventive practices, liver health.

**PL-47**

**STUDIES on the EFFECT of AGMATINE in SLEEP DEPRIVATION-INDUCED ALZHEIMER'S DISEASE THROUGH the GUT-BRAIN-AXIS in MICE**

Sharmishtha Sangamwar*, Harsha Satyapal, Mayur Kale, Manish Aglawe, Brijesh Taksande, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Maharashtra, India – 441002
sharmishthasangamwar@gmail.com

Alzheimer's disease (AD), a progressive neurodegenerative disorder, is aggravated by chronic sleep deprivation (CSD), which disrupts the gut–brain axis (GBA), leading to neuroinflammation, cognitive impairment, and gut dysbiosis. This study explored the therapeutic potential of agmatine, a naturally occurring polyamine derived from L-arginine, in alleviating CSD-induced AD-like pathology in Swiss albino mice through modulation of the GBA. CSD was induced using the modified multiple platform method for 56 days, followed by treatment with agmatine (20–80 mg/kg), L-arginine (100 mg/kg), or probiotics ($1\times10^{10}$ cfu/ml/mouse) for 21 days. Behavioral evaluations—including the elevated plus maze, open field test, and radial arm maze—demonstrated significant improvements in anxiety-like behavior and cognitive performance in agmatine-treated mice compared to the CSD group. Biochemical and microbiological analyses revealed that agmatine restored gut microbial balance by increasing beneficial Lactobacillus and reducing pathogenic E. coli, while enhancing intestinal barrier function through upregulation of tight junction proteins (ZO-1 and occludin) and reduction of serum LPS-binding protein. These effects limited systemic inflammation and were accompanied by elevated brain agmatine levels, decreased neuroinflammatory markers, and increased brain-derived neurotrophic factor (BDNF) expression. Histological analysis further confirmed reduced tissue damage in both gut and brain. Collectively, these findings highlight the multifaceted neuroprotective role of agmatine, suggesting its potential as a promising therapeutic candidate for preventing or slowing the progression of sleep deprivation-induced Alzheimer's disease via modulation of the gut–brain axis.

**Keywords:** Agmatine, Alzheimer's disease, Sleep deprivation, Gut-brain axis, Microbiota, Neuroinflammation.

**STUDY ON INVITRO ANTIOXIDANT ANTIDIABETIC ACTIVITIES OF ALCOHOL EXTRACT OF ABRUS PRECATORIOUS DRIED ROOT**

**Surya, and Sumithra george**
Department of Pharmacology, The Erode College of Pharmacy, Erode.638112
The Tamil Nadu Dr. M.G.R. Medical University
Johnsurya9080@gmail.com

Diabetes mellitus is a chronic metabolic disorder that affects millions of people worldwide and continues to pose a major public health challenge. Despite the availability of synthetic drugs such as sulfonylureas, biguanides, α-glucosidase inhibitors, and thiazolidinediones, their long-term use is often limited by adverse effects, drug resistance, and high cost. This has driven global interest in herbal medicines, which are traditionally valued for their therapeutic efficacy, accessibility, and safety. The present dissertation focuses on the in-vitro evaluation of antioxidant and antidiabetic activities of the alcoholic extract of Abrus precatorius (L.) dried root, a plant widely recognized in Ayurveda and Siddha systems of medicine for its pharmacological potential.A comprehensive literature review revealed over 800 medicinal plants with reported antidiabetic activity, with Abrus precatorius belonging to the Fabaceae family showing promising results in earlier studies. The root extract was prepared using Soxhlet extraction and subjected to preliminary phytochemical screening, confirming the presence of bioactive compounds such as glycosides, flavonoids, tannins, phenols, and proteins. The in-vitro antidiabetic activity was assessed through α-amylase and α-glucosidase inhibition assays, which are key enzyme systems regulating postprandial hyperglycemia. Antioxidant potential was evaluated using radical scavenging methods including DPPH and ABTS assays, which determine the free radical neutralizing capacity of plant extractsThe results demonstrated that the ethanolic extract of Abrus precatorius root exhibited significant inhibition of carbohydrate-hydrolyzing enzymes and showed dose-dependent radical scavenging activity, indicating strong antioxidant and antidiabetic properties. These findings validate its traditional use and highlight the potential of Abrus precatorius root extract as a natural therapeutic candidate in diabetes management and oxidative stress-related disorders. Further studies, including in-vivo evaluations and isolation of active constituents, are necessary to develop safe and effective formulations for clinical use.

**PL-49**

**MATERNAL THYROID AUTOIMMUNITY AND PREGNANCY OUTCOME: A STUDY ON THE ASSOCIATION BETWEEN ANTI-TPO ANTIBODIES AND PRETERM BIRTH**

Swati Trehan, Navan Bhullar and Tridib Chaira
SGT College of Pharmacy, SGT University, Gurugram – 122505 (Haryana) INDIA
swatitrehan01@gmail.com

Preterm birth is a major global health concern, responsible for nearly one million neonatal deaths annually and contributing to long-term morbidity among survivors. While traditional risk factors such as infection, maternal hypertension, and adverse lifestyle habits are well recognized, recent studies suggest that autoimmune and endocrine mechanisms may also play a role. Thyroid autoimmunity, particularly the presence of anti-thyroid peroxidase (anti-TPO) antibodies, has been implicated in miscarriages, infertility, and adverse pregnancy outcomes. However, its independent role in preterm births remains unclear. This study aimed to explore the association between anti-TPO antibody levels, thyroid function markers, and preterm birth in pregnant women during the second trimester. A prospective cohort of women aged 18–45

ISBN: 978-81-980623-8-3

years was enrolled, and serum samples were analyzed for anti-TPO antibodies and thyroid function (T3, T4, and TSH) using chemiluminescent immunoassays (CLIA). Statistical analyses included Spearman's correlation and odds ratio estimation with 95% confidence interval. Elevated anti-TPO antibody levels were significantly associated with preterm birth (Spearman's ρ = 0.1626, p = 0.0266). The risk of preterm delivery increased incrementally with each unit increase in anti-TPO levels (OR 1.004; 95% CI), whereas no significant associations were observed for thyroid hormone parameters. These findings indicate that thyroid autoimmunity, independent of thyroid hormone dysfunction, may contribute to adverse obstetric outcomes in pregnant women. Incorporating anti-TPO antibody screening into routine antenatal care could enable the early identification of women at a higher risk of preterm delivery and support the development of preventive interventions aimed at improving maternal and neonatal health.

## RECENT ADVANTAGES & PHARMACO THERAPY FOR DERMATOLOGY (VITILIGO)

Himanshu Jangde (M. Pharm - Pharmacology)
Department of Pharmaceutical Sciences, Columbia Institute of Pharmacy Raipur, Chhattisgarh, India- 493111
himanshujangde009@gmail.com

Human skin pigmentation and melanin synthesis are incredibly variable, and are impacted by genetics, UV exposure, and some drugs. Patients' physical appearance, psychological health, and social functioning are all impacted by a sizable number of skin conditions that cause pigmentation abnormalities. Hyper pigmentation, where pigment appears to overflow, and hypo pigmentation, where pigment is reduced, are the two major classifications of skin pigmentation. Albinism, melasma, vitiligo, Addison's disease, and post-inflammatory hyper pigmentation, which can be brought on by eczema, acne vulgaris, and drug interactions, are the most common skin pigmentation disorders in clinical practice. Anti-inflammatory medications, antioxidants, and medications that inhibit tyrosinase, which prevents the production of melanin, are all possible treatments for pigmentation problems. Skin pigmentation can be treated orally and topically with medications, herbal remedies, and cosmetic products, but a doctor should always be consulted before beginning any new medicine or treatment plan. This review article explores the numerous types of pigmentation problems, their causes, and treatments, as well as the 25 plants, 4 marine species, and 17 topical and oral medications now on the market that have been clinically tested to treat skin diseases. My aim to provide you various knowledge and information about the skin disease and including Vitiligo and Sexually Transmitted Disease to make world free of its conditions and any human being loss.

**Keywords:** skin pigmentation, melanin, tyrosinase inhibitors, hypo pigmentation, hyper- pigmentation, vitiligo, skin lightening, de-pigmentation, clinical observation.

## HEPATOPROTECTIVE ACTIVITY OF GREEN SYNTHESIZED SILVER NANOPARTICLES USING AQUEOUS LEAF EXTRACT OF IXORA COCCINEA IN ALBINO WISTAR RATS

Kalyanam Bharathi1, Divya2
Aditya Bangalore Institute of Pharmacy Education and research, No:12, Kogillu Main Road, Yelahanka, Bangalore-560064
kalyanam.bharathi@gmail.com

Background: Liver disorders remain a major global health concern, demanding safe and effective hepatoprotective agents. Green synthesis of nanoparticles using medicinal plants is gaining attention due to its eco-friendly approach and enhanced therapeutic potential. Objective: The present study aimed to evaluate the hepatoprotective activity of green synthesized silver nanoparticles using aqueous leaf extract of Ixora coccinea against carbon tetrachloride ($CCl_4$)-induced hepatotoxicity in Albino Wistar rats. Methods: Aqueous leaf extract of Ixora coccinea was subjected to green synthesis for silver nanoparticle formation. Albino Wistar rats were divided into groups and administered synthesized nanoparticles at doses of 200 and 400 mg/kg. Hepatotoxicity was induced using $CCl_4$. Hepatoprotective effects were assessed by biochemical estimations of serum markers (SGOT, SGPT, ALP, and bilirubin) and confirmed by histopathological analysis of liver tissue. Results: Phytochemical screening of the extract revealed the presence of bioactive compounds. Treatment with silver nanoparticles of Ixora coccinea significantly reduced serum liver enzyme levels and bilirubin in a dose-dependent manner. Histopathological examination supported the biochemical findings, showing preserved hepatocyte architecture and reduced necrotic changes compared to the $CCl_4$ control group. Conclusion: Green synthesized silver nanoparticles of Ixora coccinea demonstrated significant hepatoprotective activity against $CCl_4$-induced liver damage. These findings highlight their potential as a natural and effective therapeutic option for liver disorders, warranting further investigation.

**Keywords:** Ixora coccinea, Hepatoprotective activity, silver nanoparticles, Carbon tetrachloride, Albino Wistar rats

## A COMMUNITY-BASED INTERVENTIONAL STUDY ON PHARMACIST-LED MENSTRUAL HYGIENE EDUCATION TO ENHANCE AWARENESS AND PRACTICES

Keerthi G R and Ruhana
Department of pharmacy practice, Aditya Bangalore Institute of pharmacy Education and Research, Bangalore. 560041
gowdakeerthi464@gmail.com

Poor menstrual hygiene among adolescent girls in urban slums remains a major public health challenge, contributing to health problems and increased school absenteeism. The present study aimed to assess the impact of pharmacist-led educational sessions on menstrual hygiene knowledge and practices among adolescent girls residing in a slum area. A six-month community-based interventional study was conducted among 101 menstruating females aged 13–45 years who had resided in the locality for at least six months and provided informed consent. A structured questionnaire was administered to evaluate knowledge, practices, and menstrual product use before and after pharmacist-led counseling. Data were analyzed using Wilcoxon signed-rank test for pre- and post-counseling comparisons, while Mann–Whitney U and Kruskal–Wallis tests assessed differences across socio-demographic variables. Chi-square tests were employed for categorical associations, and Spearman's correlation examined the relationship between knowledge and psychological distress, with $p < 0.05$ considered statistically significant. At baseline, only 19.8% of participants reported changing menstrual products every 4–6 hours and 36.6% practiced handwashing with soap. Following pharmacist-led education, significant improvements ($p < 0.001$) were observed in both knowledge and practices, with nearly all participants adopting recommended measures such as frequent changing of products, genital washing, sun-drying of cloths, and safe disposal. The findings conclude that pharmacist-led education is an effective community-based intervention that significantly improves menstrual hygiene knowledge and practices among women in slum populations.

**Keywords:** Menstrual hygiene, Adolescent girls, Slum areas, Pharmacist-led education, Community-based intervention, Knowledge, Practices, Public health, Hygiene practices, School absenteeism.

## A NOVEL CLASS OF QUINOLONE-HYDRAZONE PPAR-Γ AGONISTS: PRECLINICAL EFFICACY IN TYPE 2 DIABETES

Rohini Kavalapure*1, Naik Jui Praveen,2 Shankar Alegaon3
Department of Pharmaceutical Chemistry, Faculty of Pharmacy, KLE Academy of Higher Education and Research, KLE College of Pharmacy, Belagavi-590010, Karnataka, India.
rohinikavalapure@yahoo.com

This study presents the synthesis and preclinical evaluation of a novel series of quinolone-based hydrazone derivatives, focusing on their potential as therapeutic agents for type 2 diabetes (T2D). We identified compounds (7c) and (7e) as potent and selective peroxisome proliferator-activated receptor gamma (PPAR-γ) agonists, exhibiting concentration-dependent activation comparable to the established drug pioglitazone in both HepG2 and L6 myotube cell lines. In vivo experiments using streptozotocin (STZ)-nicotinamide-induced diabetic rats demonstrated that compound (7e) significantly improved glucose homeostasis by lowering fasting blood glucose and enhancing glucose

ISBN: 978-81-980623-8-3

tolerance. Histopathological and molecular analyses revealed that the therapeutic effects are linked to the protection of pancreatic islets and the upregulation of key metabolic genes, including PPAR-γ, Glut4, and AdipoQ, while simultaneously suppressing pro-inflammatory markers like TNF-α, IL-6, and NF-κB p65. Computational modelling, including molecular docking and 100 ns molecular dynamics simulations, provided a structural basis for the high-affinity binding of (7c) and (7e) to the PPAR-γ ligand-binding domain. These findings position compounds (7c) and (7e) as promising dual-acting candidates for T2D management, offering both improved insulin sensitivity and anti-inflammatory benefits.

**Key Words:** Quinoline-Hydrazone, PPAR-γ, Type 2 Diabetes.

## INVESTIGATION ON THE ROLE OF AGMATINE IN SIMULATED MICROGRAVITY-ASSOCIATED CEREBRAL DYSFUNCTION

Renuka Gomkale*, Ankush Turankar, Shubhada Mangrulkar, Manish Aglawe, Brijesh Taksande, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Maharashtra, India – 441002
gomkalerenuka94@gmail.com

Microgravity, modeled via hindlimb unloading (HU), disrupts lipid homeostasis, elevates oxidative stress, and provokes systemic inflammation, compromising metabolic and liver health. This study evaluated whether agmatine and its precursor L-arginine mitigate HU-induced pathophysiology. Adult rodents underwent HU and received agmatine (40, 80, or 160 mg) or L-arginine. Outcomes included lipid profile, oxidative stress indices, and biochemical and histopathological parameters assessed in serum and liver, pancreas, and colon tissues. Liver integrity, gut dysbiosis, and inflammatory signaling were examined via ELISAs for IL-6, IL-10, TNF-α, LPS-binding protein (LBP), and corticosterone, alongside tissue histology. Agmatine dose-dependently improved lipid metabolism, normalizing dyslipidemia and enhancing antioxidant defenses in serum and tissues. Hepatic assessments demonstrated reduced steatosis and inflammation, with preservation of liver architecture. Agmatine also attenuated dysbiosis, indicating stabilization of gut microbiota. Immunoinflammatory profiling showed decreased IL-6, TNF-α, and LBP, coupled with increased IL-10, consistent with an anti-inflammatory shift. Lower corticosterone levels suggested attenuation of HU-related stress responses. L-arginine, as a precursor, provided supportive benefits, though agmatine exhibited more pronounced effects across endpoints. Collectively, agmatine counters HU-induced metabolic dysregulation, oxidative damage, hepatic injury, and microbiome imbalance, highlighting its therapeutic promise for microgravity-associated health risks. These findings support further mechanistic studies and translational evaluation of agmatine in space medicine, including dose optimization, safety, and efficacy in prolonged microgravity.

**Keywords:** Hindlimb unloading; Metabolic dysregulations; Agmatine; Dysbiosis.

**PL-55**

## A STUDY ON KNOWLEDGE, ATTITUDE AND PRACTICE ABOUT SELF-MEDICATION AMONG RURAL POPULATION OF KALABURAGI DISTRICT

Abhilekh Bhosale
Department Of Pharmacy Practice, Rajiv Memorial Education Society's College of Pharmacy Kalaburagi, Karnataka, India- 585102
lekhabhi2000@gmail.com

The World Health Organization (WHO) defines self-medication as the use of drugs to treat self-diagnosed disorders or symptoms, or the continued use of prescribed drugs for chronic or recurrent conditions. This study aimed to assess the knowledge, attitude, and practice regarding self-medication in the rural population of Kalaburagi district and to evaluate the impact of an educational intervention. A six-month prospective community-based educational study was conducted using a structured questionnaire. A pre-test was followed by an educational intervention where participants were provided information leaflets about the risks of self-medication, and a post-test was administered after 14 days. Data were analysed using IBM SPSS 25.0, with paired t-test applied for statistical significance. Out of 247 participants, 145 (58.7%) were males and 102 (41.3%) females; the majority (45.8%) were aged 21–40 years, and 25.9% were labourers. The mean knowledge score significantly improved after intervention (65.1%). Findings revealed that rural respondents generally had insufficient knowledge about self-medication, with many considering it unsafe during pregnancy and for all age groups, while a few believed it could harm health. Notably, rural residents showed awareness by checking expiry dates before drug use. The study concluded that after educational intervention, knowledge, attitude, and practices regarding self-medication improved significantly.

**Keywords:** Self-Medication, World Health Organization, Rural population, Over the Counter, Adverse Drug Reactions.

## AGMATINE: A POTENTIAL REGULATOR OF DYSREGULATED GUT-BRAIN AXIS IN ALZHEIMER'S DISEASE

Sandip R. Rahangdale, Manish M. Aglawe, Brijesh G. Taksande, Milind J. Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India
rahangdales86@gmail.com

Alzheimer's disease (AD) is a progressive, multifaceted disease characterized by neurodegeneration, dysbiosis (altered gut microbiota composition) and dysregulated agmatine level. Gut-brain-axis (GBA) has pivotal role in regulating neuronal functions. Agmatine, a novel neuro-modulator/transmitter, exerts multiple effects on the CNS including neuroprotection, richly present in gut secreted by microbes. Present study evaluates the effect of agmatine on dysregulated GBA in AD, and to explore the agmatine's potential in the bidirectional modulation of GBA. AD was induced by single injection of streptozotocin (STZ) (3 mg/kg, ICV). Central and oral agmatine administered consecutively for 21 days to evaluate its effect on dysbiosis and AD-associated behavioral alterations. Microbial estimation was performed for Lactobacillus spp.(Beneficial microbe) and E. coli (Pathogenic microbe) in suitable media. Biochemical parameters were estimated in brain and ileum tissues. STZ treatment produced AD-like pathologies in mice behaviorally, induced dysbiosis, and reduced tight junction proteins (TJPs) in ileum and altered neuroinflammatory and oxidative stress mediators in brain. ICV and oral agmatine administration significantly attenuated depressive-like behavior as evidenced by decreased immobility time in FST, produced an anxiolytic effect in EPM and improved cognitive function in the MWM and NOR and restored dysregulated gut microbiome by increasing beneficial bacteria and reducing harmful bacteria. This treatment also reversed the biochemical alteration in the ileum by increasing TJPs and in brain by increasing anti-oxidants and reducing oxidative stress mediators. In conclusion, this study offers novel insights into modulation of the GBA by agmatine for the treatment of AD and associated complications.

**Keywords:** Alzheimer's Disease, Gut-Brain-Axis, Agmatine, Dysbiosis, STZ.

**PL-57**

## EVALUATION OF NEUROPROTECTIVE POTENTIAL OF SITAGLIPTIN IN STREPTOZOTOCIN-INDUCED ALZHEIMER'S DISEASE MODEL

Kalyanam Bharathi1, Madhavi S 2, Dhanyashree A 3, Preethi K4
Aditya Bangalore Institute of Pharmacy Education and Research, No:12, Kogillu Main Road, Yelahanka, Bangalore-560064
kalyanam.bharathi@gmail.com

Alzheimer's disease (AD) is characterized by cholinergic deficits, cognitive decline, and neurodegeneration. Repurposing antidiabetic drugs such as Sitagliptin has shown promise in modulating neuroprotective pathways. This study aimed to evaluate the neuroprotective effects of Sitagliptin on cognitive function, anxiety-like behavior, and acetylcholinesterase (AChE) activity in a streptozotocin (STZ)-induced rat model of AD. Rats were divided into five groups: control, STZ-induced negative control, standard treatment with Rivastigmine, and low- (5 mg/kg) and high-dose (10 mg/kg) Sitagliptin groups. Cognitive and anxiety-related behaviors were assessed using the elevated plus maze, T-maze, and light/dark chamber tests. AChE activity was measured as a marker of cholinergic modulation. Sitagliptin treatment significantly improved cognitive performance and reduced anxiety-like behaviors in a dose-dependent manner. High-dose Sitagliptin produced effects comparable to Rivastigmine. Both doses reduced AChE activity, suggesting cholinergic pathway modulation as a

ISBN: 978-81-980623-8-3

possible mechanism. Sitagliptin demonstrates neuroprotective potential in AD by improving memory, reducing anxiety, and modulating AChE activity. These findings support the repositioning of Sitagliptin as a potential adjunct therapy for AD and warrant further studies exploring its effects on amyloid-beta and tau pathology.

**Keywords:** Sitagliptin, Alzheimer's disease, Streptozotocin, Acetylcholinesterase, Cognitive function

**PL-58**

**PHARMACIST-LED PHARMACOVIGILANCE AND INTERVENTIONS: PREVENTING ADRS AND DDIS IN HOSPITALIZED PATIENTS**

Kailash Bhovi
Department Of Pharmacy Practice, Rajiv Memorial Education Society's College of Pharmacy Kalaburagi, Karnataka, India- 585102
Kailashbhovi92@gmail.com

Pharmacist-led pharmacovigilance plays a vital role in enhancing patient safety by ensuring early detection and prevention of adverse drug reactions (ADRs) and drug–drug interactions (DDIs), which are common yet under-recognized causes of morbidity and prolonged hospitalization. An ongoing six-month prospective study in the Medicine wards and ICU of a tertiary care hospital involves clinical pharmacists actively reviewing prescriptions, monitoring laboratory values, and participating in ward rounds to identify, assess, and manage suspected ADRs and DDIs using validated scales. So far, 120 interventions have been documented, of which 70% were ADR-related and 30% were DDI-related. The most frequent interventions included drug discontinuation (30%), dose adjustment (25%), therapeutic substitution (20%), laboratory monitoring (15%), and supportive therapy (10%), with an overall physician acceptance rate of 82%. These interventions have led to significant clinical benefits, including prevention of severe ADRs in 25 patients, resolution of DDIs in 15 cases, avoidance of ICU transfer in 10 patients, and a 2.5-day reduction in average hospital stay. Notably, nearly 48% of events were deemed preventable, underscoring the impact of proactive pharmacist involvement. A key example was the identification of a rifampin–corticosteroid interaction, where timely pharmacist intervention successfully prevented a life-threatening adrenal crisis. Overall, this ongoing study highlights that pharmacist-led pharmacovigilance significantly improves the detection and management of ADRs and DDIs, thereby reducing hospital burden and improving patient outcomes.

**FEASIBILITY AND IMPACT OF PHARMACIST-LED CONTRACEPTIVES EDUCATION MICRO-SESSIONS IN COMMUNITY PHARMACY.**

Krisha Gandhi, Akashkumar P. Mathuria and Sandipkumar P. Bhatt
Department of Pharmacology and Pharmacy Practice, K.B. Institute of Pharmaceutical Education and Research, Kadi Sarva Vishwavidyalaya, Gandhinagar, Gujarat, India - 382023
krishagandhi2005@gmail.com

This study evaluated the viability and effects of short (5 minute) training sessions delivered by pharmacists for users of barrier and chemical contraceptives at community pharmacies in Gandhinagar and Ahmedabad. Standardized counselling was given to 58 individuals (mean age 26.7 ± 5.1 years) in a pre-post study. From a baseline mean of 5.8 ± 1.9 to 8.7 ± 1.5 out of 10, knowledge scores showed a substantial improvement ($p < 0.001$). Emergency contraception awareness grew from 48% to 85%, while knowledge of how to use condoms correctly increased from 52% to 91%. Adherence to oral contraceptives increased from 72% to 84% ($p = 0.04$). With low attrition (7%) and high feasibility reported by pharmacists, these micro-sessions are a practical and effective method to significantly improve contraceptive knowledge and safe sex practices, demonstrating strong potential for scaling up sexual health promotion in pharmacy settings.

**AN OBSERVATIONAL STUDY ON KNOWLEDGE, ATTITUDE, AND PRACTICE TOWARDS VACCINATION IN A COMMUNITY SETTING**

Ajay Kumar and Ruhana
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore.560041
ajayspatil812@gmail.com

Vaccination is a cornerstone of public health, yet hesitancy and poor awareness remain barriers to achieving optimal coverage. This study aimed to assess baseline knowledge, attitude, and practice (KAP) regarding vaccination in a community population. A cross-sectional observational survey was conducted among 101 participants using a pre-validated questionnaire. Data were analysed using descriptive statistics and chi-square tests to determine associations with sociodemographic factors. Findings revealed that 54.5% of respondents demonstrated adequate knowledge, while 45.5% lacked awareness, particularly about adult immunization. Although 61.3% expressed a positive attitude, 38.7% reported safety concerns. Only 47.5% adhered to recommended vaccination practices. Educational status was significantly associated with knowledge ($p=0.023$), while socioeconomic status correlated with practices ($p=0.041$). These results indicate substantial baseline gaps in vaccine-related awareness and practices despite relatively favourable attitudes. The findings emphasize the need for targeted, pharmacist-led interventions to address misconceptions and improve vaccination adherence.

**Keywords**: Vaccination, observational study, knowledge-attitude-practice, determinants, pharmacist role.

**EFFECT OF SELECTED POLYHERBAL MIXTURES ON DIABETIC COMPLICATIONS IN ALBINO WISTAR RATS**

Ms. N. VINEELA, Mrs. V. JHANSI LAKSHMI
Vignan Institute Of Pharmaceutical Technology, Duvvada, 530049, Visakhapatnam, Andhra Pradesh, India.
Vineelanadimpalli13@gmail.com

Leaves of OCIMUM sanctum, AEGLE marmelos, SYZYGIUM cumini were subsequently chosen. Investigators infusions via aqueous, ethanolic, and hydroalcoholic techniques utilizing cold maceration then integrated those into three polyherbal mixtures (PHM1 in the ratio 1:2:3, PHM2 in the ratio 2:3:1, PHM3 in the ratio 3:1:2) at disparate proportions. Investigators gauged in-vitro antioxidant activity capabilities via DPPH and reducing power analyses plus examined antimicrobial properties via agar well diffusion versus ascorbic acid and ofloxacin, correspondingly. Throughout 21 days, polyherbal mixtures or metformin was utilization to treat nicotinamide, streptozotocin induced type 2 diabetic rats. In-vivo antidiabetic activity was gauged within these rats. Investigators scrutinized parameters including body weight, food as well as water ingestion, fasting blood glucose, lipid profile, liver also kidney markers, urine output. Furthermore, researchers scrutinized diabetic sequelae through these methods: wounds healed within excision models (standard: Soframycin), glycerol induced nephropathy (standard: Pioglitazone), and researchers gauged neuropathy via thermal plus cold allodynia tests (standard: Pregabalin). PHM3 displayed antimicrobial and strong antioxidant efficacy (zone of inhibition approximates ofloxacin; IC50 approximates ascorbic acid). PHM3 yielded large abatements in fasting blood glucose as well as ameliorated wound contraction in-vivo. PHM3 additionally furnished nephroprotection also analgesic effects compared to PHM1 and PHM2. Statistical analysis, using two-way ANOVA with a BONFERRONI test, confirmed significance at $p<0.05$ to $p<0.001$. Among the formulations, PHM3, which has a 3:1:2 ratio of O. sanctum, S. cumini, and A. marmelos, showed the strongest effect against diabetes and its complications.

**Key words:** OCIMUM sanctum, AEGEL marmelos, SYZYGIUM cumini, Streptozotocin, Nicotinamide e.

**CURRENT TRENDS IN THE CLINICAL ASSESSMENT OF AEROALLERGENS IN ALLERGIC CONDITIONS**

Pooja R S,Dharani V,Dr B A Vishwanath
Department of pharmacy practice, Aditya Bangalore Institution of pharmacy education and Research, Bangalore, Karnataka, India
poojars633@gmail.com

The global incidence of allergic disorders-such as asthma, allergic rhinitis, and atopic dermatitis—continues to rise, largely driven by sensitization to aeroallergens like pollen, dust mites, mold spores, and

ISBN: 978-81-980623-8-3

pet dander. Rapid urbanization, climate change, and environmental pollution have altered allergen profiles and increased disease burden. This review explores recent clinical advancements in the assessment and management of aeroallergen-induced allergic conditions. A prospective and interventional study was conducted over 6 months at Bengaluru Allergy Centre, Jayanagar. A total of 88 adult patients (18–70 years) were enrolled based on inclusion/exclusion criteria. Data were collected via structured questionnaires and review of medical records. Patient demographics, symptoms, diagnostic outcomes, treatment patterns, and quality of life (QOL) were analyzed. Data were analyzed using SPSS version 27. Descriptive statistics were applied to demographic and clinical variables. Paired sample t-tests were used to compare pre- and post-intervention QOL scores. Significance was set at $p<0.001$. Dust (80.7%) was the most common trigger, followed by pollution and indoor allergens. The most frequent aeroallergens were Dermatophagoides farinae (56.8%), D. pteronyssinus (47.7%), and Blomia tropicalis (37.5%). Common symptoms included sneezing (70.2%), itching (skin/eyes/throat), and respiratory complaints. Sublingual immunotherapy (SLIT) was used in 98.9% of patients. A significant improvement in QOL scores was observed post-treatment ($p<0.001$). The study highlights the high burden of aeroallergen-induced allergic conditions in the adult population, with dust mites being the predominant allergens. Early diagnosis and individualized treatment, especially SLIT, significantly improved patient outcomes and QOL. Comprehensive allergen identification and patient education are vital in allergy management strategies.

**Keywords:** Aeroallergens, Allergic Rhinitis, SLIT, Dermatophagoides, Quality of Life

## EVALUATION OF ANTIBIOTIC USAGE AND OUTCOMES IN DIABETIC AND NON-DIABETIC PATIENTS WITH CELLULITIS

A. Anusha Devi*, M. Raghava Kalyan, S. Vidyadhara
Department of Pharmacy Practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Guntur, Andhra Pradesh, India

Cellulitis is a common bacterial skin and soft tissue infection characterized by erythema, warmth, and induration. The most frequent causative organisms are Staphylococcus aureus and β-hemolytic streptococci, particularly Streptococcus pyogenes. Other pathogens, such as Escherichia coli and Pseudomonas aeruginosa, may also be involved. The condition predominantly affects the extremities and requires prompt and appropriate antibiotic therapy. To evaluate antibiotic usage patterns and clinical outcomes in diabetic and non-diabetic patients with cellulitis.A cross-sectional observational study was conducted over six months (August 2022–March 2023) in the Department of General Surgery at NRI General & Superspecialty Hospital, Mangalagiri. A total of 54 patients diagnosed with cellulitis were enrolled and categorized into diabetic and non-diabetic groups. Demographic data, antibiotic regimens, and clinical outcomes were analyzed.Among 54 patients, 28 were diabetic and 26 non-diabetic. In the diabetic group, the majority (50%) were aged 40–60 years, whereas in the non-diabetic group, 46.1% were aged 60–80 years. Male predominance was observed in both groups (75% in diabetics and 80.7% in non-diabetics). The most frequently prescribed antibiotics were cephalosporins and β-lactam/β-lactamase inhibitor combinations, often supplemented with metronidazole in complicated cases. Clinical recovery was slower in diabetic patients, with a higher incidence of recurrence and prolonged hospital stay compared to non-diabetic patients. Antibiotic therapy remains the cornerstone of cellulitis management. Diabetic patients demonstrated poorer outcomes, emphasizing the need for early diagnosis, careful selection of antibiotics, and strict glycemic control to prevent complications and improve recovery.

## ENVIRONMENTAL STRESSORS AND PHARMACY PRACTICE OUTCOMES IN TRAVEL-INDUCED MIGRAINE MANAGEMENT

Mohamed Shahil P M, Aravind Vijay Jesuraj, Malavika P.U, Arthanariswaran P
Department of pharmacy practice, Nirmala college of health science, Kerala University of Health and Sciences, Kerala
mohamedshahil1407@gmail.com

Migraine is a debilitating neurological condition often intensified by travel-related stressors such as noise, vibration, posture strain, and irregular sleep, which significantly impact patient quality of life. The aim of this study was to assess awareness of travel triggers among migraine patients, identify drug-related problems in therapy, and explore the pharmacist's role in improving management. A cross-sectional survey was conducted using a questionnaire adapted from validated migraine trigger and medication adherence scale. There is no single standardized questionnaire that directly measures travel related environmental stressors vibration, noise, posture) as migraine triggers. So it is the customised questionnaire adapted from migraine disability assessment (MIDAS) and headache impact test (HIT-6). The study was carried out in Thrissur, Kerala among 50 patients with a confirmed diagnosis of migraine. The mean age of participants was 34.8 ± 9.2 years, and males accounted for 54 percent. Travel stressors most frequently reported posture (3.9 ± 1.1, 68 percent), followed by vibration strain (3.5 ± 1.3, 54 percent) and noise (3.2 ± 1.0, 47 percent). Drug-related problems included analgesic overuse in 32 percent ($p < 0.05$), non-adherence in 29 percent ($p<0.01$). These findings demonstrate that travel stressors substantially contribute to migraine attacks and drug-related problems remain frequent. The significance of the study demonstrates that travel stressors highly influence the drug use patterns, especially overuse of analgesics and leading to potential medication non-adherence. Pharmacists play a critical role in counselling, optimizing therapy, and preventing inappropriate drug use to enhance patient outcomes. As this study was drawn on self-reported data from one region, future multicentric investigations could further validate and expand these findings.

**Keywords:** Headache, quality of life, medication adherence, travel stressors

## EVALUATION OF NEUROPROTECTIVE ACTIVITY OF BACOSIDE-LOADED NANOPARTICLES IN SCOPOLAMINE INDUCED ALZHEIMER'S DISEASE IN ZEBRAFISH MODEL (DANIO RERIO)

Bharathi Kalyanam, B. Hari Chandana, B A Vishwanath
Department of Pharmacology, Aditya Bangalore Institute of Pharmacy Education & Research, Yelahanka, Bangalore – 560064, Karnataka, India
kalyanam.bharathi@gmail.com

Alzheimer's disease (AD) is a multifactorial neurodegenerative disorder characterized by progressive cognitive decline, cholinergic dysfunction, oxidative stress, and neuroinflammation. Current pharmacological interventions provide only symptomatic relief without altering disease progression. To overcome these limitations, we explored a novel nanotechnology-based approach employing bacoside-loaded solid lipid nanoparticles (BLNPs) derived from Bacopa monnieri, a traditional nootropic herb. BLNPs were formulated using a pre-emulsion ultrasonication–solvent evaporation technique and extensively characterized by particle size analysis, zeta potential, Fourier-transform infrared spectroscopy (FTIR), and scanning electron microscopy (SEM), confirming nanoscale stability and successful drug loading. A scopolamine-induced zebrafish (Danio rerio) model of Alzheimer's disease was established to evaluate neuroprotective efficacy. Behavioural performance was assessed via T-maze and inhibitory avoidance paradigms, while biochemical assays measured acetylcholinesterase (AChE) activity, lipid peroxidation (MDA), and antioxidant enzymes (SOD, CAT, GPx). BLNP-treated zebrafish exhibited significantly improved memory retention, reduced oxidative stress, and normalized cholinergic function compared to pure bacoside and standard rivastigmine treatment. Histopathological analysis further confirmed neuronal preservation in BLNP-treated groups. Acute toxicity studies demonstrated excellent safety margins, supporting translational potential. Collectively, this study highlights that nano formulated bacosides exert superior neuroprotective effects by synergistically modulating oxidative, cholinergic, and inflammatory pathways. This innovative therapeutic strategy offers a promising platform for developing plant-based, nano-enabled interventions for Alzheimer's disease and related neurodegenerative disorders.

## NEUROPROTECTIVE ACTIVITY OF ISOLATED BIOACTIVE METABOLITES AND THEIR UNDERLYING MECHANISMS IN THE TREATMENT OF ALZHEIMER'S DISEASE

Ms. Ashwini Makta Gavit*, Dr. Devendra S. Shirode
Dr. D. Y. Patil College of Pharmacy, Akurdi, Pune – 411044, India
ashgavit1999@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder characterized by memory loss, cognitive decline, oxidative stress, and cholinergic dysfunction. Current therapies provide only symptomatic relief, thereby necessitating the search for novel neuroprotective agents. Natural bioactive metabolites have emerged as promising candidates due to their multi-targeted pharmacological actions. The present study aimed to explore the neuroprotective potential of isolated bioactive metabolites and their underlying mechanisms using computational approaches. A network pharmacology-based analysis was performed to predict the key targets and pathways associated with selected metabolites, highlighting their involvement in regulating oxidative stress, amyloid aggregation, and cholinergic signaling. Molecular docking studies further revealed strong binding affinities of these metabolites with Alzheimer's-related targets such as acetylcholinesterase, beta-secretase, and tau-related kinases, suggesting their role in modulating multiple pathological hallmarks of AD. The study provides a mechanistic basis for the neuroprotective activity of bioactive metabolites and supports their potential as multi-target therapeutic leads. Future investigations will involve in vitro and in vivo validation to substantiate their efficacy and safety in the management of Alzheimer's disease.

## UNLOCKING ENHANCED PHYTOTHERAPY: QUERCETIN AND BARBALOIN COMBINATION COMBATS ALZHEIMER'S DISEASE INDUCED BY ALCL3

Anshika Ward*, Jyothi.Y
Department of Pharmacology, Krupanidhi College of Pharmacy, Bengaluru, Karnataka, India- 560035
anshikaward2013@gmail.com

Alzheimer's disease (AD) presents a formidable global challenge, demanding innovative therapeutic strategies. Our study investigated the enhanced neuroprotective effects of a novel combination of the phytochemicals quercetin and barbaloin in an aluminum chloride (AlCl3 )-induced rat model of AD. This research aimed to comprehensively evaluate their combined therapeutic potential on cognitive, biochemical, and cellular markers of neurodegeneration.We employed a robust research design, utilizing a comprehensive array of evaluations. Behavioral tests, including the Morris Water Maze (MWM), Elevated Plus Maze (EPM), and Rotarod, were used to assess cognitive function and motor coordination. We also measured key biochemical markers of oxidative stress (SOD, CAT, MDA, DPPH), acetylcholinesterase (AChE) activity, and total brain protein. Finally, histopathological analysis was conducted to examine neuronal integrity. Our findings reveal that AlCl3 exposure led to significant cognitive impairment and motor deficits, severe oxidative stress, elevated AChE activity, and pronounced neuronal degeneration. While quercetin monotherapy offered a degree of protection, the co-administration of quercetin and barbaloin demonstrated a significantly superior and multi-faceted therapeutic effect. This combination markedly improved cognitive performance, reversed oxidative damage, inhibited AChE activity, and preserved neuronal integrity more effectively than individual treatments. These compelling findings highlight the potential of this phytochemical combination as a potent, synergistic strategy for combating the complex pathology of Alzheimer's disease.

**Keywords:** Alzheimer's Disease (AD), Aluminum Chloride (AlCl3), Quercetin, Barbaloin

## A PHARMACY PRACTICE PERSPECTIVE ON GUT HEALTH, LIFESTYLE, AND DANDRUFF SEVERITY

Joona Musthafa K, Athira K S, S AravinthVijay Jesuraj and Vijeesh T S
Department of Pharmacy Practice, Nirmala College of Health Science, Kerala University of Health Sciences, Kunnappilly,Thrissur Dist, Kerala, India 680311.
athirasanil351@gmail.com

Dandruff is a common scalp issue influenced by both internal and external factors. Recent findings indicate that gut bacteria, lifestyle choices—such as diet, stress, sleep, and exercise—and anti-dandruff treatments significantly affect dandruff severity. This study examined how gut-related symptoms, lifestyle factors, and treatment practices are linked to dandruff severity in adults.The study aimed to find a connection between gut symptoms—like bloating, constipation, and eating habits—and the severity of dandruff. It also looked at how lifestyle behaviors, including diet, stress management, sleep hygiene, and physical activity, affect the development and severity of dandruff. Moreover, the research assessed the effectiveness of anti-dandruff shampoos and medications in controlling dandruff, while considering their relationship with gut bacteria and lifestyle choices.From a pharmacy practice perspective, a survey was conducted among adults aged 18 and older. This survey collected information on demographics, gut symptoms, lifestyle habits, personal experiences with dandruff, and treatment methods. Participants rated their dandruff severity using adapted dermatology questions. Statistical analysis explored the prevalence and relationships among gut health, lifestyle factors, treatment methods, and dandruff severity.The findings aim to clarify how gastrointestinal symptoms, dietary choices, stress, sleep, and treatment practices relate to dandruff severity. The study concludes that dandruff severity results from interactions among gut bacteria, lifestyle, and treatments. A combined approach that improves diet, manages stress and sleep, adjusts gut bacteria, and uses medications may help control dandruff and promote scalp health.

## DEVELOPMENT OF ANTIBIOGRAM OF SECONDARY CARE HOSPITAL, GUJARAT

Jill Chauhan, Prit Modi and Vrusti Patel
KB Institute of Pharmaceutical Education and Research, Gandhinagar, Gujarat, India
jill.chauhan825@gmail.com

Antimicrobial resistance (AMR) represents a major challenge in clinical practice, particularly in secondary care hospitals where empirical therapy is often initiated before culture results are available. The development of an antibiogram provides essential evidence to guide rational prescribing and improve antimicrobial stewardship. This study aimed to develop an antibiogram for a secondary care hospital by analysing the antimicrobial susceptibility profiles of clinical isolates. Data were collected through the hospital microbiology laboratory and prospectively collected data on blood, urine, sputum, pus, and tissue specimens processed during the study period. For each commonly encountered pathogen, susceptibilities were correlated with routinely used agents (e.g., cephalosporins, fluoroquinolones) and ICU/life-saving drugs (e.g., aminoglycosides, carbapenems, vancomycin, linezolid). Results were stratified by patient sex (male/female) to evaluate differences in organism distribution and resistance–sensitivity patterns. A total of 740 clinical samples were analysed, with Escherichia coli identified as the most frequent pathogen (≈45%), followed by Klebsiella pneumoniae, Pseudomonas aeruginosa, and Staphylococcus aureus. mong Gram-negative isolates, resistance to cephalosporins and fluoroquinolones was high (60–70%), while aminoglycosides retained 70–80% sensitivity and carbapenems showed 75–85% efficacy. Pseudomonas aeruginosa demonstrated >65% resistance to fluoroquinolones but remained around 70% sensitive to piperacillin–tazobactam and carbapenems. For Gram-positive isolates, Staphylococcus aureus exhibited >70% resistance to penicillin and macrolides, whereas vancomycin and linezolid preserved nearly 100% sensitivity. Sex-wise trends revealed higher urinary infections in females and bloodstream and respiratory infections in males. These findings emphasize the urgent need for regular antibiogram updates to guide empirical therapy, strengthen antimicrobial stewardship, and support better clinical decision-making in secondary care hospitals.

## ADVANCEMENTS IN ADJUVANT-BASED VACCINES: MECHANISMS OF IMMUNE MODULATION, DEVELOPMENT APPROACHES, AND EMERGING TRENDS FOR NEXT-GENERATION IMMUNIZATION AGAINST CANCER

Anshita Shukla1,2, Mohammad Adnan Raza1,2, Ajazuddin1,2
Rungta College of Pharmaceutical Science and Research, Kohka, Kurud Road, Bhilai, INDIA-490023
Department of Pharmacy, Rungta International Skill University, Kohka, Kurud Road, Bhilai, INDIA-490023

Vaccine adjuvants have emerged as indispensable components of modern immunization approaches, offering the ability to enhance, modulate, and sustain immune responses against a wide spectrum of cancer. Traditional adjuvants such as aluminum salts remain widely used, yet recent advancements in oil-in-water emulsions, nanoparticle systems, Toll-like receptor (TLR) agonists, cytokine modulators, and novel biomaterial-based platforms have expanded the horizon of vaccine design. These adjuvants function through multiple mechanisms, including improved antigen presentation, activation of pattern recognition receptors, modulation of cytokine and chemokine signalling, and establishment of depot effects for sustained antigen release, thereby bridging innate and adaptive immunity. Despite these advances, challenges such as safety, stability, and formulation complexities persist, demanding innovative strategies to balance efficacy with tolerability. Emerging approaches, including multi-adjuvant combinations and precision-engineered nanocarriers, highlight the transition toward next-generation vaccines capable of tailoring immune responses to specific disease contexts. Clinical translation has already been realized in several licensed vaccines, underscoring the clinical and public health relevance of adjuvant technologies. Integration of systems immunology, synthetic biology, and biomaterials engineering holds promise for developing personalized and durable vaccines against both established and emerging health threats. This review provides comprehensive insights into the mechanisms, design strategies, clinical applications, and future trends of adjuvant-based vaccines, emphasizing their pivotal role in shaping next-generation immunization platforms for infectious diseases and cancer.

## KNOWLEDGE, ATTITUDE & PRACTICE OF ANEMIA AMONG PREGNANT WOMEN IN A TERTIARY CARE HOSPITAL OF NAMAKKAL DISTRICT, TAMIL NADU.

Nivetha S R, R. Sabitha, D. Kumarasamyraja, G. Arunachalam
Department of Pharmacy Practice, Dhanalakshmi Srinivasan University, Tiruchirappalli, Tamil Nadu, India -621112.

Anemia during pregnancy remains a major global public health concern particularly in developing countries, where it contributes significantly to maternal and fetal morbidity. The present study was conducted to assess the knowledge, attitude and practices (KAP) related to anemia among pregnant women attending a tertiary care hospital in Namakkal district, Tamil Nadu. A prospective observational design was performed by enrolling 60 pregnant women aged 18–35 years. Data were collected using a structured questionnaire that included socio-demographic details, medical history and KAP components. Statistical analysis was performed to identify patterns and gaps. The results revealed that 58% of participants had previously been diagnosed with anemia, yet only 66.7% demonstrated a basic understanding of the condition. Awareness regarding specific causes such as poor diet, pregnancy-related risks and short birth intervals was inadequate. Although 72.4% acknowledged the role of diet in prevention, misconceptions persisted with 63.6% unaware of the inhibitory effect of tea and coffee on iron absorption. Preventive practices showed mixed results: 62.8% reported regular iron supplement intake, while irregular or non-adherence was mainly due to forgetfulness, side effects or perceived lack of necessity. Only 56.6% attended regular antenatal check-ups and awareness of free iron tablet distribution was low (7.7%). Overall, the study highlighted moderate awareness, average attitudes, but inconsistent preventive practices. The findings underscore the urgent need for strengthened antenatal counseling, nutritional education and effective communication about government supplementation programs. Enhancing awareness and addressing practice gaps can significantly reduce anemia-related complications and improve maternal and neonatal outcomes.

## ENHANCED HISTAMINERGIC TRANSMISSION AMELIORATES SINGLE PROLONGED STRESS-INDUCED SPATIAL MEMORY ALTERATION

Vaibhav Maturkar and Nishant Sudhir Jain
Department of Pharmaceutical Sciences, Guru Ghasidas Vishwavidyalaya, Bilaspur, Chhattisgarh, India - 495001.
vmathurkar20@gmail.com

Post-traumatic stress disorder (PTSD) is increasingly acknowledged as a contributor to spatial memory deficits, a cognitive disturbance often accompanied by changes in central histaminergic transmission. Despite histamine's established involvement in diverse cognitive functions, its specific role in stress-induced spatial memory dysfunctions is still unclear. In this study, mice subjected to single prolonged stress (SPS), a widely used animal model for PTSD, displayed considerable spatial memory impairments, reflected by increased reference and working memory errors in the radial arm maze paradigm. central histaminergic modulation, various histaminergic agents were administered intracerebroventricularly (i.c.v.) on days 1st and 7th post-SPS, including histamine, L-histidine, H1 agonist FMPH, H2 agonist amthamine, H1 antagonist cetirizine, H2 antagonist ranitidine, and H3 inverse agonist thioperamide. The results revealed that histamine-enhancing agents, particularly at higher doses, significantly alleviated both reference and working memory deficits on the seventh day, whereas no significant benefit was observed immediately post-SPS on the first day. However, the H3 receptor inverse agonist thioperamide reversing SPS-induced spatial memory deficits at both the 1st and 7th days, underscoring the unique relevance of H3 modulation in trauma-related memory dysfunction. Antagonism of H1 and H2 receptors by cetirizine and ranitidine did not show any significant effect on reference and working memory errors. These findings collectively suggest that central histamine transmission, especially via H1, H2, and H3 receptor stimulation, offers a promising avenue for mitigating SPS-induced spatial memory.

**Keywords:** PTSD; histamine; single-prolonged stress; histamine receptors; spatial memory.

## AGE AND GENDER BASED COMPARISON OF GLYCEMIC PARAMETERS IN DIABETES MELLITUS

Aashvi D. Patel and Dwija J. Jani, Dr. Tarachand Lalwani
K.B. Institute of Pharmaceutical Education and Research, Gandhinagar, Gujarat, India
adp111908@gmail.com

Diabetes Mellitus a chronic metabolic disorder characterized by hyperglycemia and impaired glucose regulation involving Glycated Hemoglobin (HbA1c), Fasting Blood Glucose (FBG), Postprandial Blood Sugar (PPBS), Serum Insulin Fasting, Estimated Average glucose (EAG) being key biomarkers for assessment. The objective is to evaluated the association of age and gender with glycemic parameters and to determine it at different age group. Cross sectional study was done by collecting the data from Green Cross Laboratory and Article Pathology Laboratory which involve 1827 number of patient in which 878 females and 949 male. Data categorized on age and gender, statistical evaluation was done for Glycated Hemoglobin, Estimated Average Glucose, Fasting Blood Sugar, Post Prandial Blood Sugar, Serum insulin fasting. On evaluation males tend to have higher glucose levels (HbA1c, EAG, FBG, PPBS) whereas females show higher serum insulin levels. With age, both genders show rising glucose parameters (HbA1c, EAG, FBG, PPBS). Females show marked increases around post -menopausal age, while males peak earlier (HbA1c/EAG at 60-69 years, PPBS at 30-39 years). S.Insulin peaks earlier in females (50-59 years) but later in males (70-79). Interpreting males are more prone to hyperglycemia compared with females who shows compensatory higher insulin response.

## NEPHROPROTECTIVE EFFECT OF IXORA JAVANICA EXTRACT AGAINST GENTAMICIN-INDUCED NEPHROTOXICITY IN WISTAR RATS

AMMA VENU1 AND YELLU NARSIMHA REDDY 2
Department of Pharmacology, University College of Pharmaceutical Sciences, Kakatiya University, Warangal, Telangana – 506009, India.
venu.amma1966@gmail.com

Ixora javanica DC. (Rubiaceae), widely distributed across India, is valued in traditional medicine for its therapeutic applications. This research systematically investigates its botanical, phytochemical, and pharmacological attributes with emphasis on antioxidant and nephroprotective activities. Morphological examination highlighted diagnostic traits such as scarlet tubular flowers, opposite coriaceous leaves, and dense corymbose inflorescences. Phytochemical analysis confirmed the presence of alkaloids, flavonoids, tannins, glycosides, saponins, and steroids, indicating a rich reservoir of bioactive compounds. Antioxidant assays demonstrated significant radical scavenging activity, strongly associated with elevated phenolic and flavonoid content. In vivo studies using gentamicin-induced nephrotoxicity models in Wistar rats revealed that I. javanica extracts markedly improved renal function biomarkers, including reductions in serum creatinine, urea, and blood urea nitrogen, alongside restoration of endogenous antioxidant enzymes such as superoxide dismutase, catalase, and glutathione. Histopathological evaluation corroborated the protective effect by demonstrating preserved renal architecture in treated groups. These findings substantiate the ethnomedicinal claims of I. javanica and highlight its potential as a natural therapeutic agent against oxidative stress–related renal dysfunction. This thesis advances pharmacognostic understanding of the species and positions it as a promising candidate for future drug discovery, encouraging further phytochemical isolation, mechanistic exploration, and translational research.

## OPTIMISING CARDIOVASCULAR DISEASES IN PHARMACOVIGILANCE

Pk.Vasantha
Brilliant College of Pharmacy, Hyd, Telangana, India,501513
kanil227291@gmail.com

Cardiovascular diseases are the leading cause of morbidity and mortality worldwide. Pharmacovigilance play a critical role in detecting, assessing, preventing and managing adverse drug reactions, associated with cardiovascular diseases like anticoagulants, lipid – lowering agents. Optimization is required to reduce drug related risks and improve patient safety. Optimizing cardiovascular drug related vigilance involves proactive monitoring to identity and mitigate adverse drug events in cardiac patients, who are susceptible to drug interactions due to polypharmacy. Optimization requires artificial intelligence and machine learning for safety signal detection, incorporating real world data and big data analytics, enhancing patient and healthcare professional engagement, and implementing early intervention strategies to minimize risks and burden of cardiac diseases.

**Keywords:** pharmacovigilance, cardiovascular diseases, adverse drug reactions

## PHARMACIST LED APPROACH TO DETECTION AND AWARENESS OF ANAEMIA IN A COMMUNITY SETTING

Aravind Vijay Jesuraj. S, Malavika P. U, Alwy Jose and Vijeesh T. S
Department of Pharmacy Practice, Nirmala college of Health Science, Kerala University of Health Sciences, Thrissur, Kerala, India -680311
malavikapu9@gmail.com

Anaemia is a major global public health burden that compromises physical capacity, and cognitive performance, particularly among women of reproductive age, yet it often remains undetected in community settings. This cross-sectional study was conducted over a short period among 35 participants recruited from a community pharmacy using a structured pharmacy-based questionnaire delivered through Google Forms. The questionnaire captured demographic variables, symptom profiles, dietary practices, lifestyle habits, comorbidities, and supplement use, allowing quantifiable assessment of risk indicators and awareness. Calculating responses across these domains enabled correlation of lifestyle determinants with anaemia-related manifestations. Results showed that 58% of participants reported fatigue, 42% dizziness, and 35% pallor, while 47% of women identified heavy menstrual bleeding as a contributory factor. Inadequate intake of green leafy vegetables, fruits, and legumes was reported by 62%, and 39% consumed tea or coffee immediately after meals, suggesting interference with iron absorption. Poor hydration and fewer than seven hours of sleep were observed in 54% of symptomatic respondents. Supplement adherence was suboptimal, with 46% reporting irregular or discontinued use due to gastrointestinal side effects. Women with multiple pregnancies or recent childbirth demonstrated higher prevalence of anaemia-related symptoms compared with nulliparous participants. These findings confirm that pharmacy-based screening is a feasible and accessible approach for identifying at-risk individuals and correlating lifestyle and dietary patterns with clinical burden. The study underscores the vital role of pharmacists in early detection, patient education, and timely referral, thereby enhancing awareness and contributing to improved prevention and management of anaemia at the community level.

## CROSS-SECTIONAL STUDY ON SUPPLY CHAIN MODELS EXISTING IN THE SELECTED COMMUNITY PHARMACIES OF PUNE CITY

*K V Ramanath 1, Sarika Zambad 2
1. Rajeev College of Pharmacy, Rajeev Education Trust, Hassan-573201, Karnataka, India
2. Suryadatta College of Pharmacy Health care & research (SCPHR), Pune-411021, India
pharmacypractice123@gmail.com

Pharmacies play a crucial role in society by providing a wide range of healthcare products. An uninterrupted supply chain model will help achieve excellence in pharma services. Hence, this study was conducted to examine the SCM and various significant Parameters/Key challenges in randomly selected community pharmacies (CPs) over a period of 6 months, Expert Approved questionnaires administered through both physical visits and electronically. The data were subjected to descriptive statistics. The results of this study showed the mean age of the Pharmacists was 36.87 ± 8.66. Males comprised 90%, and pharmacy owners were 92.5%. Only 2.5% had > 15 years of experience. 75% Pharmacies showed a hybrid model (combinations of green, agile, and lean) for 95% of the allopathic products. The satisfactory responses in SCM challenging sub-parameters are 1) Finance-related: Asset Management (80%), Sales (92.5%), Contribution margin (92.4%), Costs (90%), Financial profitability (90%), Costs of Return (90%), and Logistics costs (67.5%). 2) Velocity: Punctuality (90%), Compliance (67.5%), Delivery Performance (75%), Time management (90%), Speed (87.5%), Lead time (90%), Responsiveness (85%), Flexibility (90%). 3) Sustainability: Environmental ethics (82.5%), Recyclability (67.5%), Return of items (72.5%). 4) Quality parameters: Reliability (82.5%), Quality (87%), Legal compliance (77.5%), Availability (82.5%), System Outputs (72.5%), Trust (82.5%), Service (90%). 5) Resource utilization: Resource (87.5%), Inventory (85%), Transport measurements (87.5%), Logistics measurements (87.5%), Internal processes (87.5%), Resources available (85%). 6) Chain service parameters: Responsiveness (80%), Privacy (77.5%), Security (85%), Growth and learning (90%), Innovation (72.5%), Measurement and customization production (85%), Efficiency (75%), Reality (82.5%). This study highlights the need for in-depth research and the integration of AI technology to overcome these challenges and further enhance the Efficiency of the supply chain model.1-5

**CLINICAL AND EPIDEMIOLOGICAL PROFILE OF PRIMARY LUNG CANCER PATIENTS: IMPACT OF CHEMOTHERAPY ON QUALITY OF LIFE AND ADVERSE EFFECTS**

G. Sri vihitha, N. Meghana, V. Sindhu Vaishnavi and S. Vidyadhara
Department of pharmacy practice, Chebrolu Hanumaiah institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India-522019
gsrivihitha@gmail.com

Primary lung cancer is one of the most common malignancies in India and remains a leading cause of death worldwide. Prevention of smoking and early detection can reduce morbidity and mortality. This prospective observational study was conducted for 9 months to evaluate epidemiological and clinical profile of primary lung cancer patients on chemotherapy and to assess their quality of life and adverse drug reactions. A total of 63 patients with primary lung cancer receiving chemotherapy at NRI General and Super Speciality Hospital, Chinnakakani,Guntur, between June to march were enrolled. QoL was assessed using EORTC-30, EORTC-13at baseline after 2 to 4cycles of chemotherapy and ADRs were evaluated using naranjo's algorithm, Modified Hartwig and siegel, thornton scale. Males predominated (68.25%), with most aged 61-70 years. Non-small cell lung cancer was common (84.12%), predominantly adenocarcinoma (64.15%). Over 50% had advanced disease. Smoking was a risk factor (60.31%). Frequent symptoms were cough (82.53%) and dyspnea(74.6%). QoL improved significantly in early-stage patients but showed little or no improvement in advanced disease. The most common ADRs were nausea, vomiting, anemia, alopecia, and leukopenia. Paclitaxel + cisplatin regimen had the highest ADR incidence, followed by Paclitaxel + Carboplatin. Conclusion: Primary lung cancer is increasingly diagnosed in India, occurs in 7th decade of life and Adenocarcinoma was most common type. While chemotherapy improves QoL in early stages, there's no significant improvement in advanced stages. ADRs were common, prominent recognition and adequate clinical management is mandatory for patient's safety.

**Keywords**: Chemotherapy, Primary lung cancer, Quality of life, Pharmacovigilance

**WOUND HEALING POTENTIAL OF 5-AMINO SALICYLIC ACID BY TISSUE REGENERATION USING IN-VIVO MODEL IN ALBINO WISTAR RATS**

Mouleeswaran R and Dr.Senthil V
Department of Pharmacology, Vivekanandha Pharmacy College for Women, Sankagiri, Salem, Tamilnadu- 637303
moulimathews@gmail.com

The biological process of wound healing is complex and involves inflammation, proliferation, and tissue remodeling. It is frequently impeded by oxidative stress, infection, and delayed cellular reactions. The current study examined the potential for wound healing of topical gel and ointment formulations of 5-amino salicylic acid (5-ASA), a substance with well-established anti-inflammatory and antioxidant characteristics. Using pharmaceutically approved excipients, both formulations (2.5%) were created. They were then evaluated for physicochemical characteristics such as pH, viscosity, spreadability, homogeneity, and drug content, all of which were determined to be appropriate and stable for topical use. In vitro cytotoxicity on 3T3-L1 fibroblast cells showed that the gel ($IC_{50}$: 125.62 µg/mL) was safer than the ointment ($IC_{50}$: 410.50 µg/mL) and plain medication ($IC_{50}$: 28.13 µg/mL). Gel treatment at 10-20 µg/mL increased fibroblast proliferation and migration, demonstrating its stimulatory effect on wound closure (scratch assay). Acute cutaneous irritation tests in rabbits (OECD 404) found no evidence of edema, proving dermal safety. In vivo incision wound models in Wistar albino rats revealed that topical 5-ASA dramatically enhanced wound contraction, tensile strength, and epithelialization when compared to untreated controls. The gel formulation outperformed the ointment in terms of wound healing performance, with nearly full closure by days 12-15. Histopathological study revealed increased fibroblast proliferation, angiogenesis, collagen deposition, and re-epithelialization in gel-treated groups. Overall, the findings point to the possibility of repurposing 5-ASA as a topical wound-healing agent, with the gel formulation emerging as a safe and effective candidate for tissue regeneration and chronic wound treatment.

**Keywords:** 5-amino salicylic acid, wound healing, 3T3-L1 fibroblast, tissue renegeration.

**PREDICTORS OF OUTCOMES & HEALTH-RELATED QUALITY OF LIFE (QOL) IN PATIENTS WITH DIABETIC FOOT ULCERS (DFU): A PROSPECTIVE OBSERVATIONAL STUDY**

N.Anila*, K.Gowtham , M.Raghava Kalyan and S.Vidhyadhara
Department of pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences,
Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India – 522019

Diabetic Foot Ulcer (DFU) is one of the most common , much feared & serious complications of Diabetic Mellitus , associated with poor wound healing , increased risk of amputation and impaired QOL .This study aimed to determine patient and ulcer characteristics that predict wound healing and Health-related QOL in patients living with Diabetes.A prospective observational study was conducted in adults with DFU referred to a tertiary care hospital between September 2023 and march 2024 (7 months) at NRI General and Super Speciality Hospital , Guntur. A total of 48 patients were enrolled and monitored throughout hospitalization, and data on ulcer healing, amputation status & QOL were collected. QOL was assessed at baseline using a short-term questionnaire. The mean age was 60.12 ± 9.94 years. During follow- up, 20.83 % patients achieved ulcer healing,72.91% underwent amputation,6.25% required skin grafting. Poor healing was significantly associated with long term ulcer duration of > 6 months. QOL scores were analysed against demographic and ulcer characteristics. Severity of ulcer, graded using the Wagner classification, was found to be the main predictor of poor QOL. This study was concluded by demonstrating that the patients with DFU exhibited reduced QOL, most strongly influenced by ulcer grade.Poor wound healing is strongly correlated with long-standing ulcers. These findings emphasise the importance of early detection, prompt intervention, appropriate ulcer management and prevention strategies to improve healing outcomes and preserve QOL in patients with DFU.

**Keywords**: Diabetic Foot Ulcer (DFU), Quality of Life (QOL), predictors, outcome, short- form questionnaire

**PL-81**

**A PROSPECTIVE OBSERVATIONAL STUDY TO ASSESS THE INCIDENCE AND RISK OF PSYCHOTROPIC DRUG-INDUCED MOVEMENT DISORDERS**

P.Brahma Sri *,M.Navya ,V.Sindhu Vaishnavi and Dr.S.Vidyadhara
Department of Pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India -522019
brahmasri05@gmail.com

The prevalence of mental disorders has risen significantly and by 2030 they are projected to become the second leading cause of global disease burden. Psychotropic drugs though essential for management are increasingly associated with adverse drug reactions (ADRs), particularly movement disorders. This prospective observational study aimed to evaluate the incidence and risk of psychotropic drug induced movement disorder and was conducted over 9 months (July 2024-April 2025) in the Psychiatry Department of NRI General and Superspeciality Hospital Guntur.A total of 239 patients receiving psychotropic drugs (antidepressants, antiepileptics, antipsychotics) were included. The mean age was 37.5 ± 12.9 years, with a nearly equal gender distribution (males-50.21% and females-49.79%). Among 56 identified movement disorders, tremors were most common (69.64%), followed by Akathisia (16.07%), while dyskinesia and dystonia were least observed (1.78% each). Antipsychotic monotherapy accounted for the highest incidence (n=22) followed by antipsychotic combinations (n=15). Olanzapine (n=88) and Risperidone (n=57) were most frequently prescribed;Olanzapine responsible for 15 cases and Risperidone for 10 cases of movement disorders. Among antidepressants,Escitalopram and Seratraline each induced one case. Valproate sodium, the only antiepileptic identified caused 7 cases. Causality assessment (Naranjo's scale) showed probable in 51.78% and possible in 48.22% of cases. Severity analysis (Hartwig's scale) revealed 96.43% were moderate ,3.57% were mild and none were severe. The study concludes that

ISBN: 978-81-980623-8-3

antidepressants pose a lower risk of movement disorders compared to antipsychotics and combined antipsychotic–antidepressant therapy carries a lower risk than antipsychotic combinations alone. No significant difference was found among individual antipsychotics.

**Keywords**: - Antipsychotics, movement disorders, anti-depressants, anti-epileptics.

**PL-82**

**A CROSS-SECTIONAL ANALYSIS OF DYSMENORRHEA SEVERITY AND DRUG UTILISATION USING WALIDD AND NRS SCALES**

Aneena Suresh, Alwy Jose Malavika P. U and Aravind Vijay Jesuraj. S
Department of Pharmacy Practice, Nirmala College of Health Science, Kerala University of Health Sciences, Thrissur, Kerala, India - 680311
alwyjosetj@gmail.com

Dysmenorrhea is a common gynaecological disorder that impairs quality of life, academic performance, and workplace productivity. Despite its burden, no study from Kerala has applied the WaLIDD scale to assess functional impairment. This study evaluated the severity and impact of dysmenorrhea using WaLIDD and Numerical Rating Scale (NRS) scores, and examined associations with drug use, lifestyle, and self-care. A cross-sectional survey was conducted among 36 women from colleges and workplaces over two months using a structured Google Form. WaLIDD (0–12) quantified functional impairment in work ability, pain location, intensity, and duration, while NRS (0–10) measured subjective pain. Results showed moderate to severe dysmenorrhea (WaLIDD ≥4) in 62.5% of participants, with 55% reporting absenteeism or restricted activity. A strong positive association was observed between WaLIDD and NRS scores ($p<0.05$), with higher values linked to disability and loss of productivity. NSAIDs were the most common pharmacological measure; 22% initiated them prophylactically or at onset with effective relief, 41% delayed intake with reduced benefit, and 37% did not use NSAIDs. Non-pharmacological measures included heat therapy (48%), stretching or exercise (32%), and adequate sleep, with 44% reporting milder symptoms when sleeping more than eight hours. Lifestyle factors were significant: poor hydration and <8 h sleep were present in 67% of severe cases, while regular fruit and vegetable intake correlated with reduced severity. Frequent caffeine intake aggravated symptoms. The study highlights the importance of calculating WaLIDD and NRS scores to capture severity and consequences, emphasizing timely NSAID use, lifestyle modification, and pharmacist-led education.

**Keywords:** Dysmenorrhea, Lifestyle, NRS, NSAIDs, WaLIDD.

**"EVALUATING THE THERAPEUTIC POTENTIAL OF NIGELLA SATIVA EXTRACT VIA DRY POWDER INHALER IN THE ANIMAL MODELS"**

Rajat Rashid Sayyed, Kiran Sanjay Bhise
Department of Pharmaceutics, MCES's, Dr. P A Inamdar University, Allana College of Pharmacy, Pune, Maharashtra, India 411001.
rajat.sayyed@azamcampus.org

This study investigates potential therapeutic advantages of Nigella sativa extract administered via dry powder inhaler (DPI) utilizing animal models. Nigella sativa offers a promising alternative for respiratory treatment due to its potent anti-inflammatory, antioxidant, and antibacterial properties. A DPI containing an extract from Nigella sativa was prepared, and its pharmacological efficacy in treating respiratory ailments in Wistar rats and mice was evaluated. Histological examination, lung function testing, and inflammatory markers were used to assess the extract's effects. Our results demonstrate a significant decrease in oxidative stress markers, inflammatory cell infiltration, and airway resistance when comparing the treated groups to the controls. These findings suggest that a DPI-administered Nigella sativa extract might be a helpful treatment for respiratory ailments, and they encourage further clinical investigation.

**Keywords:** Nigella sativa extract, anti-inflammatory, Dry Powder Inhaler, cell infiltration.

**PL-84**

**EVALUATION OF NEUROPROTECTIVE ACTIVITY OF BOUGAINVILLEA GLABRA LEAVES EXTRACT ON EXPERIMENTALLY INDUCED NEUROTOXICITY IN ALBINO RATS**

SAHANA K N
NITTE COLLEGE OF PHARMACEUTICAL SCIENCES
sahanasahana1119@gmail.com

The present study aimed to evaluate the neuroprotective activity of Bougainvillea glabra against aluminium chloride ($AlCl_3$)-induced neurotoxicity in albino rats. Rats were divided into five groups, and the extract was administered one hour prior to $AlCl_3$ (50 mg/kg). Behavioral observations were made daily for 50 minutes, followed by assessment of locomotor activity, rota-rod performance, and elevated plus maze test on day 8. On day 9, rats were sacrificed, and the brain was isolated for biochemical estimations including glutathione, superoxide dismutase (SOD), lipid peroxidation, protein estimation, and histopathological analysis. Aluminium chloride treatment markedly increased lipid peroxidation and nitric oxide levels in the cortex, hippocampus, and striatum while reducing glutathione in hippocampus and striatum. Treatment with Bougainvillea glabra extract attenuated these alterations by preserving antioxidant defenses and preventing oxidative stress–mediated damage. Moreover, the extract inhibited the $AlCl_3$-induced elevation of acetylcholinesterase and $Na^+/K^+$-ATPase activity in cortex, hippocampus, and striatum. A significant increase in tumor necrosis factor-α induced by $AlCl_3$ in cortex and hippocampus was also suppressed by the extract. The findings clearly demonstrate that Bougainvillea glabra exhibits neuroprotective effects and potentiates the protective efficacy of piracetam against aluminium-induced cognitive dysfunction and oxidative damage in rats, suggesting its therapeutic promise for neurodegenerative conditions associated with oxidative stress.

**Keywords:** Bougainvillea glabra; Aluminium chloride; Neuroprotection; Cognitive dysfunction; Piracetam

**PL-85**

**EVALUATION OF THE EFFECTIVENESS OF HYDROQUINONE-BASED TREATMENTS VERSUS NON-HYDROQUINONE-BASED TREATMENTS IN MELASMA AT A TERTIARY CARE HOSPITAL.**

Nabanita dasgupta and Ruhana
Department of Pharmacy Practice, Aditya Bengalore Institute of Pharmacy Education and Research, Bengalore. 560041
dasnabanita9641@gmail.com

Melasma is a chronic, relapsing hyperpigmentation disorder that remains a therapeutic challenge due to its persistent course and tendency to recur. Hydroquinone has long been considered the standard depigmenting agent because of its strong efficacy, but concerns about long-term safety and adverse effects have encouraged the use of non-hydroquinone alternatives such as retinoids, kojic acid, and niacinamide. Evidence directly comparing these treatment options in Indian populations is limited. To address this gap, a prospective comparative observational study was conducted in the Dermatology Department of Akash Super Speciality Hospital over six months. A total of 52 patients were enrolled, of whom 13 received hydroquinone-based therapy and 39 were treated with non-hydroquinone regimens. The primary outcome was the change in Melasma Area and Severity Index (MASI) scores, assessed at baseline, 8 weeks, and 16 weeks. Statistical analysis included paired and independent t-tests, with effect sizes measured by Cohen's d and correlations assessed using Pearson's correlation. Both treatment groups showed significant reductions in MASI scores from baseline ($p < 0.001$), indicating clinical benefit. Hydroquinone achieved a greater mean reduction (41.8%) compared with non-hydroquinone therapy (33.8%), and this difference was statistically significant ($p < 0.05$). Effect size analysis indicated strong treatment effects in both groups (Cohen's $d > 2.5$). Among adjuncts, tretinoin use was significantly correlated with better MASI reduction ($p < 0.05$), while vitamin C, thyroid imbalance, and stress were not influential. Sunlight exposure showed borderline significance ($p = 0.058$). Overall, hydroquinone-based therapy was more effective, though both regimens provided meaningful improvement.

**Keywords:** Melasma, observational study, hydroquinone, non-hydroquinone, MASI scores.

**A RANDOMIZED CONTROLLED STUDY EVALUATING PEANUT ORAL IMMUNOTHERAPY FOR INDUCING DESENSITIZATION AND MODIFYING THE ALLERGIC RESPONSE.**

Nidhi K R, Shobha Rani R H
Department of pharmacy practice, Aditya Bangalore Institution of pharmacy education and Research, Bangalore, Karnataka, India

ISBN: 978-81-980623-8-3

nidhiswamy184@gmail.com

Oral immunotherapy (OIT) has shown promise in treating peanut allergy, but its safety and efficacy have not been rigorously evaluated in a double-blind, placebo-controlled setting. To assess the safety and efficacy of peanut OIT in children with peanut allergy using a double-blind, placebo-controlled trial. In this multicentre study, children aged 1–16 years with confirmed peanut allergy were randomized to receive either peanut flour OIT or placebo. The protocol included dose escalation, a build-up phase, and maintenance, followed by an oral food challenge (OFC) after approximately one year. Skin prick tests (SPTs) and immunologic assays were performed at defined intervals. Of 28 participants, three in the OIT group withdrew due to allergic reactions. At OFC, all remaining OIT participants (n = 16) tolerated a cumulative dose of 5000 mg (≈20 peanuts), compared to a median of 280 mg (range: 0–1900 mg) in the placebo group (n = 9; P < .001). OIT recipients showed significant reductions in SPT wheal size (P < .001), IL-5 (P = .01), and IL-13 (P = .02), along with increased peanut-specific IgG4 (P < .001). Peanut-specific IgE rose initially (P < .01) but returned to baseline by OFC. An elevated ratio of FoxP3(high) to FoxP3(intermediate) CD4+ CD25+ T cells was also observed at OFC (P = .04). Peanut OIT induced desensitization and measurable immunologic changes. Continued follow-up will determine whether sustained tolerance can be achieved.

## AGMATINE RESTORES EXCITATORY/INHIBITORY BALANCE IN A PROPIONIC ACID-INDUCED RAT MODEL OF AUTISM VIA NMDA AND GABAERGIC MODULATION

Pranali Chandurkar, Manasi Tadas, Brijesh Taksande
Department of Pharmacology, Shrimati Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India 441002
pranalichandurkar97@gmail.com

Autism spectrum disorder (ASD) is a complex neurodevelopmental condition characterized by impaired social interaction, cognitive deficits, and disruption of the excitatory/inhibitory (E/I) balance, primarily due to dysregulated glutamatergic NMDA receptor signaling and impaired GABAergic neurotransmission. Agmatine, an endogenous metabolite of L-arginine with neuromodulatory properties, exhibits neuroprotective and anti-excitotoxic effects. The present study investigated the impact of postnatal propionic acid (PPA) (250 mg/kg/day, p.o. for 3 days) exposure in male rat pups (PND 21) and evaluated agmatine as a potential therapeutic intervention for ASD. Specifically, we examined the role of agmatine in restoring E/I balance in a PPA-induced rodent model of autism and explored its interaction with NMDA receptor function through pharmacological modulation using an NMDA antagonist (memantine) and a partial NMDA agonist (D-cycloserine). Behavioral outcomes (social interaction, stereotypy, locomotion, memory), neurochemical assays (GABA and glutamate levels), oxidative stress markers, and inflammatory indices were assessed. Agmatine (80 mg/kg, i.p.) significantly ameliorated PPA-induced behavioral deficits and restored GABAergic/glutamatergic balance. Co-treatment with memantine (10 mg/kg, i.p.) potentiated agmatine's effects, whereas D-cycloserine (15 mg/kg, i.p.) partially reversed its benefits, suggesting that agmatine exerts protection in part via modulation of NMDA receptor overactivation. Overall, these findings indicate that agmatine restores E/I balance in autism through NMDA receptor regulation and enhancement of GABAergic neurotransmission, highlighting its promise as a novel therapeutic strategy for ASD.

## EVALUATION OF A POLYHERBAL FORMULATION IN A CITRAL-INDUCED RAT MODEL OF BENIGN PROSTATIC HYPERPLASIA: BIOCHEMICAL AND HISTOLOGICAL INSIGHTS

Jainee Vashi
1 Assistant Professor, Department of Pharmacology, Parul Institute of Pharmacy and Research, Faculty of Pharmacy, Parul University, Vadodara, Gujarat, India,391760
anilachowdaryn11@gmail.com

Benign prostatic hyperplasia (BPH) is a common condition characterized by prostate enlargement, leading to urinary dysfunction. This study utilized a citral-induced model in rats to evaluate the pharmacological impact of a polyherbal formulation, Effectto®, at a low dose (90 mg/Kg) and a high dose (180 mg/Kg), for the treatment of BPH. A citral-induced model for atypical type BPH in rats was used to assess the efficacy of the polyherbal formulation. The prostate weight index and testes weight index were measured to determine the formulation's impact. Biochemical markers such as serum PSA, serum TNF-α, serum BUN, and serum creatinine, along with histopathological evaluation of testis and prostate were also analyzed. Data were expressed as mean ± SD, and statistical significance was assessed using Tukey's multiple comparison test after a one-way ANOVA. Effectto® significantly reduced prostate weight in citral-induced BPH rats. High dose of Effectto® decrease the prostatic weight index (0.23±0.035) compared to the disease control (0.32±0.033). Serum PSA levels were also reduced to 1.45±0.60 with high dose of Effectto® compared to 3.86±0.65 in the disease control. Furthermore, the formulation was successfully able to reverse citral induced prostate enlargement, demonstrating activity in several parameters equal to that of standard. This study demonstrates that citral effectively induces BPH in rats. The polyherbal formulation, Effectto®, significantly reversed BPH-associated changes in prostate tissue and serum PSA levels, providing scientific evidence supporting its potential use as a treatment for BPH.

**Keywords:** Prostate, Hyperplasia, Citral, BPH, PSA.

## TO STUDY THE CLINICAL APPROACH OF THE DIAGNOSIS AND THE THERAPEUTIC MANAGEMENT OF ENCEPHALOPATHY AND ITS LIFE-THREATENING COMPLICATIONS

Baghmar abdul mohimeen*, Dr. Dhakoori Pragnasri,Dr.A.Yasodha
Department of Pharmacy Practice, Dhanvanthri college of Pharmaceutical Sciences, Palamuru University, Mahabubnagar, Telangana, India-509001
baghmarmohin@gmail.com

To study the clinical approach of the diagnosis and the therapeutic management of Encephalopathy and its lifethreatening complications. The study has been carried out on patients who have been under the treatment for encephalopathy. Patients in the age group of 18 to 80 were considered, a total of 50 cases were collected within 6 months. In our study out of 50 patients, female patients were slightly higher than the male patients, Encephalopathy has been observed slightly more in the span 60 80 of age i.e. 50 patients, out of which 24 were male and the rest of them were female. All the patients considered are inpatients. In our study, we noticed that the rational and regular use of medication can help the patient to get back to their normal life. The combination of clindamycin and Magnex forte was most commonly used in combination therapy where minimal ADRs were observ ed, and meropenem was well tolerated in patients in our study with mild ADRs but not many serious adverse events were noted.

## ENHANCED CENTRAL HISTAMINERGIC TRANSMISSION REVERSED MEMORY DYSFUNCTION IN DIABETIC MICE

Chhatrapal Patel and Nishant S. Jain
Department of Pharmacy, Guru Ghasidas Central University, Bilaspur, Chhattisgarh, India-495009.
Chhatrapal2796@gmail.com

Central histaminergic transmission regulates several physiological functions, including cognitive function. Therefore, the present study investigates the plausible role of central histaminergic transmission in diabetes-induced memory dysfunction in radial arm maze (RAM) test. We reported that a single i.p. injection of streptozotocin (200 mg/kg) induced hyperglycaemia and which resulted in increased number of working and reference memory errors in RAM test, indicative of diabetes-induced memory dysfunction. The present findings reveals that an enhancement of histaminergic transmission in diabetic mice mediated by central (i.c.v.) administration of histamine, L-histidine, or central histamine neuronal releaser, H3 receptor antagonist significantly reduced the increased number of working and reference memory errors in diabetic mice on RAM test. Furthermore, central-i.c.v. injection of histamine H1 receptor agonist, FMPH or H2 receptors agonist, amthamine also attenuated the number of working and reference memory errors in diabetic mice on RAM test. Thus, the results of the

ISBN: 978-81-980623-8-3

present investigation delineate the counter-regulatory role of central histaminergic transmission predominantly via H1 and H2 receptor on memory dysfunction in diabetic mice.

**Keywords:** Histamine, RAM, Diabetic mice

**AGMATINE IN PARAVENTRICULAR NUCLEI REGULATES HPA AXIS PHYSIOLOGY IN CHRONIC UNPREDICTABLE STRESS**

Amisha P. Ghankar, Manish M. Aglawe, Brijesh G. Taksande, Milind J. Umekar
Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee- 441002
amishaghankar123@gmail.com

Agmatine, a novel neurotransmitter and neuromodulator, has been recognised as endogenous regulator of stress, yet its function within the hypothalamus-pituitary-adrenal (HPA) axis is not fully understood. This study evaluates the effects of intra-paraventricular (i-pvn) administration of agmatine and its precursor, L-arginine, on brain corticotropin-releasing hormone (CRH), plasma adrenocorticotropic hormone (ACTH), and serum corticosterone (CORT) in Sprague-Dawley rats subjected to various stress paradigms, including eustress, acute immobilization stress (AIS), chronic unpredictable stress (CUS), and chemical stress induced by lipopolysaccharide (LPS). Following stereotaxic i-pvn cannulation and recovery, rats received single or repeated doses of agmatine or L-arginine, then underwent behavioural assessment for anxiety and depression-like symptoms and biochemical evaluation of CRH, ACTH, and CORT. The results demonstrate a dose-dependant effect of agmatine: moderate doses increased ACTH, while the highest dose (8 µg/rat) reduced it significantly. In contrast, low doses increased CORT levels under eustress. L-arginine administration reduced both ACTH and CORT in eustress conditions. Notably, both compounds supressed ACTH and CORT elevation in AIS, and single or repeated administration mitigated hormonal surges, improved behavioural outcomes, and prevented body weight loss in rats exposed to CUS and LPS. These findings reveal that i-pvn agmatine and L-arginine modulate ACTH and CORT levels in dose and time-dependant manner, highlighting agmatine's important role in regulating HPA axis function and supporting its therapeutic potential in stress-related neurobehavioral disorders.

**Keywords**: CUS, Agmatine, Stress.

**PL-92**

**A PROSPECTIVE OBSERVATIONAL STUDY ON IDENTIFICATION, MONITORING AND ASSESSMENT OF SOLICITED ADVERSE EVENTS DUE TO VACCINE IN LESS THAN 12 YEARS AGE GROUP**

Shaik.Farahan subahan and Saravanan.R
Department of Pharmacy Practice, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, Andhra Pradesh, India – 521108
Farasuleman21@gmail.com

This prospective observational study aimed to identify, monitor, and assess solicited adverse events (AEs) following vaccination in children under 12 years of age. The study, conducted over one year at a tertiary care teaching hospital, enrolled a total of 760 patients, with 210 solicited adverse events reported in 174 patients. Participants were divided into three age groups: Group 1 (<1 year), Group 2 (1-5 years), and Group 3 (>5 years). The overall incidence of AEs was significantly higher in Group 3 (31.57%) compared to Group 1 (21.71%) and Group 2 (19.74%) (p=0.003). Local AEs, such as injection site pain (10.53% in Group 1, 8.55% in Group 2) and swelling (1.32% in Group 2) , were more common in younger children, while being rare in Group 3 (1.32%) (p=0.001). Systemic AEs were significantly more prevalent in Group 3 (30.26%) compared to Group 1 (13.16%) and Group 2 (11.84%) (p=0.0001). Headache was the most frequently reported systemic AE in Group 3 (22.37%), significantly higher than in Group 2 (5.26%) and Group 1 (1.32%) (p=0.001). Pyrexia (fever) was observed across all groups but did not significantly differ among them (p=0.77). The majority of AEs were mild across all age groups, with the highest proportion in Group 3 (30.26%) (p=0.0001). Most events were classified as "possible" according to WHO causality assessment, especially in Group 3 (27.63%). Most AEs required no intervention , with all reported adverse events resolving completely across all groups. The study confirms the overall safety of vaccines in children, with age-related variations in the type and frequency of solicited AEs, suggesting the importance of tailored monitoring strategies.

**PL-93**

**MULTI-TARGET NEUROPROTECTIVE EFFECTS OF RUTIN IN ALCOHOL WITHDRAWAL-INDUCED DEPRESSION: INSIGHTS FROM NETWORK PHARMACOLOGY, MOLECULAR DOCKING, AND IN VIVO EVALUATION**

Prashant Mali and Deepti Bandawane
Progressive Education Society's Modern College of Pharmacy, Nigadi Pune, Savitribai Phule Pune University Pune 411007
prashantdmali55@gmail.com

Alcohol withdrawal-induced depression (AWD) represents a significant neuropsychiatric complication from chronic alcohol consumption, characterized by oxidative stress, neuroinflammation, and disrupted neurotransmitter signaling. This study investigates rutin's therapeutic potential through network pharmacology, molecular docking, and in vivo evaluations. Network pharmacology identified key targets like TNF-α, NMDA receptor, and PI3K/AKT pathway, while molecular docking showed strong binding affinities of rutin to these targets (binding energy for TNF-α: −9.2 kcal/mol; NMDA receptor: −8.5 kcal/mol). In vivo experiments were conducted on Wistar rats (n = 8 per group) in seven groups: Normal Control, Ethanol Control, Rutin (50, 100, 200 mg/kg), Memantine (20 mg/kg), and Rutin 50 mg/kg + Memantine 20 mg/kg. Behavioral outcomes showed reduced immobility time in FST and TST in the rutin 200 mg/kg group versus Ethanol Control, with increased sucrose consumption in SPT and improved OFT exploration, indicating antidepressant effects. Rutin (200 mg/kg) significantly decreased MDA and NO levels while increasing antioxidant enzymes SOD, CAT, and GSH (***p < 0.001 vs. Ethanol Control). Pro-inflammatory cytokines TNF-α, IL-1β, and IL-6 were downregulated (***p < 0.001), and neurotransmitter analysis showed restored GABA (***p < 0.01) and reduced glutamate levels (***p < 0.01). The combination of rutin (50 mg/kg) and memantine (20 mg/kg) produced synergistic improvements compared to monotherapy (**p < 0.01). In conclusion, rutin particularly at 200 mg/kg, exerts a significant neuroprotective and antidepressant effect in alcohol withdrawal-induced depression by targeting inflammation, oxidative stress and neurotransmitter dysregulation, supporting its potential as a multi-target phytotherapeutic candidate for managing AWD.

**ANTI EPILEPTIC ACTIVITY EVALUATION OF LIMONIA ACIDISSIMA ETHANOLIC LEAF EXTRACT IN EXPERIMENTAL ANIMAL MODELS**

K. Vaishnavi1, D. Vasudha1, K. Sivaji2
1 Vignan Institute of pharmaceutical technology (A)
2 AKRG college of pharmacy, Nallajerla

Epilepsy is a chronic disorder of cerebral dysfunction. It is characterized by abnormal patterns on the electroencephalograph and severe seizures, often with loss of consciousness. The present investigation focuses on evaluating the anticonvulsant activity of Limonia acidissima extract in various experimental models. Ethanolic extracts of Limonia acidissima were screened for the CNS depressant property using the Digital Actophotometer. The ethanolic extract of Limonia acidissima exhibited a significant decrease in the locomotor scores compared to the control group, indicating the extract has CNS depressant activity. The anti-convulsant activity of the extract is evaluated using the maximal electric shock model. The effect of the extract on different phases of convulsion is determined. Ethanolic extracts of Limonia acidissima showed a significant dose-dependent anticonvulsant effect. The administration of Ethanolic extracts of Limonia acidissima (ELLA) at doses of 600 and 800 mg/kg protected the animals from seizures and significantly reduced the duration of the tonic extensor phase. Currently available anti-epileptic drugs are effective but have no improvement in some patients, and their adverse drug reactions make treatment complicated. Thus, navigating naturally occurring compounds leads to

ISBN: 978-81-980623-8-3

much safer and more effective treatments. The anticonvulsant activity produced by the Limonia acidissima extract is comparable to drugs diazepam and phenytoin.

**Keywords:** epilepsy, anticonvulsant activity, Limonia acidissima, locomotor activity

## AGMATINE MITIGATES BEHAVIORAL ABNORMALITIES AND OXIDATIVE STRESS ASSOCIATED WITH 3-NITROPROPIONIC ACID-INDUCED NEUROTOXICITY IN RATS

Shreyash Bijwe, Raj Katariya, Milind Umekar, Brijesh Taksande
Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Nagpur, Maharashtra, India - 441002
bijweshreyash@gmail.com

Huntington's disease (HD) is a progressive neurodegenerative disorder characterized by motor dysfunction, cognitive decline, and psychiatric abnormalities, primarily associated with increased oxidative stress. Despite considerable research, a definitive cure for HD remains vague. Agmatine, a naturally occurring biogenic amine produced by the decarboxylation of L-arginine, has recently gained attention for its diverse neuromodulatory and neuroprotective properties. The present study was designed to investigate the effect of agmatine on 3-Nitropropionic acid (3-NP)-induced behavioral impairments and oxidative stress in rats. To induce an HD-like phenotype, rats were pre-treated with 3-NP (10 mg/kg, i.p.) on days 1, 3, 5, 7, and 9, followed by agmatine (5–20 mg/kg, i.p.) treatment from day 10 to day 21 of the experimental protocol. Systemic administration of 3-NP exhibited significant motor dysfunction, memory deficits, depressive-like behavior, and oxidative stress in rats. These alterations were accompanied by decreased antioxidant defense system. However, treatment with agmatine significantly improved motor performance in the narrow beam walk test and reduced immobility time in the forced swim test. Moreover, agmatine administration enhanced spatial learning and memory in the Morris Water Maze test. Besides this, agmatine intervention attenuated oxidative stress by reducing malondialdehyde (MDA) and nitrite levels while enhancing endogenous antioxidant defense (SOD, CAT, and GSH). Thus, the present study highlights the therapeutic potential of agmatine in counteracting 3-NP-induced behavioral abnormalities and oxidative stress parameters. Further studies are warranted to elucidate the precise mechanism of agmatine against 3-NP-induced neurotoxicity in rats.

**Keywords:** Huntington disease, Agmatine**,** 3-Nitropropionic acid, Oxidative stress.

## AGMATINE MITIGATES LPS-INDUCED NEUROBEHAVIORAL AND GUT MICROBIOTA ALTERATIONS IN MICE

Sufiyan Shaikh*, Vishal Rathod, Sandip Rahangdale, Manish Aglawe, Brijesh Taksande, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Maharashtra, India – 441002
sufiyansheikhwork@gmail.com

Neuroinflammation is increasingly recognized as a driver of neurological and psychiatric disorders, not only impairing mood, memory, and motor function but also disrupting systemic health through the gut-brain axis (GBA). This study explored whether agmatine, a naturally occurring derivative of L-arginine, could counteract brain and gut disturbances triggered by lipopolysaccharide (LPS) induced neuroinflammation in mice. A single intracerebroventricular (icv) injection of LPS (12 µg) induced widespread behavioral and biological changes, including anxiety and depressive-like behaviors, locomotor and memory impairment, poor coordination, elevated inflammatory markers, and marked alterations in gut microbiota. Specifically, beneficial bacteria such as Lactobacillus declined while pathogenic E. coli expanded, accompanied by increased gut permeability, loose stools, and liver tissue damage. Administration of agmatine at 10, 20, and 40 µg, icv attenuated these effects in a dose-dependent manner, with 40 µg showing the strongest impact. Treated animals displayed improved behavioral outcomes, reduced neuroinflammation, restored gut bacterial balance, and normalized ileum and liver architecture. Further, agmatine modulators such as L-arginine, aminoguanidine, and arcaine also demonstrated protective effects, suggesting an underlying role for endogenous agmatine pathways. Overall, the data support agmatine as a promising therapeutic candidate for conditions where brain inflammation and gut dysfunction are intertwined. These findings underscore its potential relevance to neurological complications where neuroinflammation and gut dysbiosis co-exist, warranting further mechanistic and translational exploration.

**Keywords**: Agmatine, LPS, Gut-Brain Axis, Gut Dysbiosis, Neuroinflammation.

**PL-97**

## INFLUENCE OF TETRACYCLINES ON INFLAMMATION AND THEIR INTERACTION WITH ASPIRIN IN MALE WISTAR RATS

**K. Kripitha *, A. Suvarna, C. Krishna Mohan**
Department of Pharmacology, School of Pharmacy,
Nalla Narasimha Reddy Education Society's Group of Institutions,
Hyderabad, Telangana, India – 500 088.
kripitha17032005@gmail.com

Intensive investigations have revealed that a number of agents, other than conventional anti-inflammatory drugs favourably influence the process of inflammation. Some such drugs reported to possess anti-inflammatory activity include ascorbic acid, calcium salts, calcium channel blockers, and enzymes like chymotrypsin, etc. However, like minocycline, tetracycline failed to provide significant benefit for patients with rheumatoid arthritis. Since the mechanism involved in pathogenesis of acute and chronic inflammation are different and there are scanty reports regarding anti-Inflammatory activity of minocycline and other tetracyclines in acute inflammation. The Present study was therefore planned to investigate the influence of oxytetracycline (OXC), tetracycline (TRC), doxycycline (DXC) and minocycline (MNC) on experimentally induced acute and sub-acute inflammation in albino rats and also to explore their interaction with aspirin, a commonly used non-steroidal anti-inflammatory drug. oxytetracycline (OXC), tetracycline (TRC), Doxycycline (DXC) and Minocycline (MNC) in their therapeutic equivalent doses significantly ($p<0.01$) suppressed both acute as well as sub-acute inflammation. And the suppression was almost comparable to that of aspirin. DXC and MNC in their sub anti-inflammatory (SAI) dose when co-administered with SAI dose of aspirin produced synergistic anti-inflammatory activity without significant gastric toxicity in sub-acute model of inflammation. The results indicate that DXC or MNC when used concurrently with aspirin might reduce the anti-inflammatory dose and there by decrease the gastric toxicity.

**Keywords**: Aspirin, Inflammation, Interaction, Tetracycline

## STUDY OF PREVALENCE, RISK FACTORS AND MANAGEMENT OF ALLERGIES IN PEDIATRIC POPULATION: A CROSS-SECTIONAL STUDY

Seema A P, Shoba Rani R H
Department of pharmacy practice, Aditya Bangalore Institution of pharmacy education and Research, Bangalore, Karnataka, India
seemaallabaksh1124@gmail.com

Pediatric allergies have become a major public health concern due to rising prevalence, influenced by genetic susceptibility, environmental triggers, and lifestyle factors. Allergies commonly present with respiratory symptoms, skin rashes, gastrointestinal disturbances, and, in severe cases, anaphylaxis. These conditions negatively affect growth, learning, quality of life, and increase healthcare burden. The present study aimed to assess the prevalence, risk factors, and management of allergies among children. A cross-sectional study was conducted among pediatric outpatients using a structured questionnaire and clinical observation. Data on demographics, family history, allergen exposure, clinical symptoms, caregiver knowledge, and treatment adherence were collected and analysed. Descriptive statistics were used to calculate prevalence and percentages. Associations between family history, allergen exposure, and occurrence of allergies were assessed using chi-square test. A p-value <0.05 was considered statistically significant. Among children studied, 38% had respiratory allergies, 25% presented with skin manifestations, and 15% reported gastrointestinal symptoms. Dust (40%), pollen (22%), pet dander (18%), and food allergens (15%) were the most common triggers. Family history of allergy was present in 35% of cases. Caregiver knowledge regarding allergen avoidance was low (28%), and only 45% of children adhered to regular prescribed medications. The study highlights the high prevalence of pediatric allergies and identifies family history and environmental exposures as

ISBN: 978-81-980623-8-3

significant risk factors. Limited awareness and poor adherence to therapy emphasize the need for early diagnosis, caregiver education, school-based programs, and improved access to effective treatment strategies.

**Keywords:** Pediatric allergies, Prevalence, Risk factors, Management strategies, Allergen exposure

## CURRENT MODALITIES OF TREATMENT OF CANCER USING MOLECULAR THERAPY

M Nirmal Akash, Moumitha Dhara and Ram Mohan Ram Kumar
Department of Pharmacology- NITTE College of Pharmaceutical Sciences, Yelahanka, Bengaluru -560061
Department of Pharmaceutical Biotechnology-JSS College of Pharmacy, Mysuru-570015
mallelaakash579@gmail.com

The treatment of cancer is being revolutionized by molecular therapies, which target specific genetic and epigenetic drivers of carcinogenesis. This review aims to synthesize the current modalities of molecular therapy, critically evaluating their mechanisms, clinically efficacy and limitations, with a focus on advanced immunotherapies and gene-editing applications. The analysis underscore the transformative impact of monoclonal antibodies and tyrosine kinase inhibitors in disrupting proliferative signaling pathways. A paramount advancement is exemplified by chimeric antigen receptor (CAR) T-cell therapy, which has achieved unprecedented remission rates in refractory B-cell malignancies by generating autologous T-cells engineered to target tumour- associated antigens. Furthermore, the CRISPR-Cas 9 system presents a ground breaking tool for enhancing CAR T -cell function through precise genomic editing interrogating gene function and potentially directly disrupting oncogenic drivers. Significant challenges persist including on-target/off-tumor toxicities, antigen escape, cytokine release syndrome and the logistical complexities of personalized therapeutics. Molecular therapies constitute the vanguard precision oncology. The strategic integration of gene editing technologies like CRISPR Cas 9 with cell based immunotherapies heralds a new frontier, mandating continued research to mitigate adverse effects and expand the applicability of these potent modalities to solid tumors.

## A PROSPECTIVE OBSERVATIONAL STUDY ON THE ADVERSE DRUG REACTIONS AND MEDICATION ADHERENCE OF HALOPERIDOL AND RISPERIDONE IN TREATING PSYCHOTIC DISORDERS

Mercy Jose
Department of Pharmacy Practice, The Erode College Of Pharmacy, Erode, Tamil Nadu, India-638112
mercyjsm17@gmail.com

Pharmacovigilance, when used in psychiatry, can assist in identifying adverse drug reactions (ADRs) and notify doctors about the possibility of these occurrences in their everyday work, with timely diagnosis largely dependent on regular monitoring and assessment of prescriptions by clinical chemists. In this prospective observational study conducted in the Department of Psychiatry, Government Medical College Hospital, Tiruppur, a total of 180 patients were enrolled, and demographic details (age, weight, sex), prescribed medications, and study-specific information were documented using a structured data collection form, with the Medication Adherence Rating Scale, Naranjo's Scale, and Modified Kuppuswamy Scale applied for evaluation. Out of 180 patients, 170 were eligible for analysis, of which 54.7% were male and 45.3% female. Among them, 120 (70.5%) patients had schizophrenia, 18 (10.5%) had bipolar affective disorder, 21 (12.55%) had psychosis, 9 (5.29%) had substance-induced psychotic disorder, and one each (0.58%) had mood disorder and schizoaffective disorder, while 7 patients were excluded. Assessment using the Naranjo ADR Scale showed that the majority of ADRs were of moderate severity, with most patients belonging to the lower socioeconomic class. Importantly, risperidone was associated with better compliance and fewer side effects compared to haloperidol. These findings emphasize the need for continuous ADR monitoring in psychiatric practice to ensure safer treatment, optimize adherence, and improve patient outcomes.

## RISK FACTORS FOR THROMBOEMBOLIC EVENTS IN PATIENTS WITH DIALYSIS-DEPENDENT CKD: POOLED ANALYSIS OF FOUR GLOBAL ROXADUSTAT PHASE 3 TRIALS

Padmesh PR, Abhinandan Danodia, Nithin Manohar R
Shri Jagdishprasad Jhabarmal Tibrewala University in Jhunjhunu, Rajasthan
Padmeshpradeep@gmail.com

This study depicts the proportion of anemia, risk factors associated with CKD and the effect of patient counselling. Anemia is a well-known complication in chronic kidney disease (CKD) and associated with progression of CKD, poor quality of life, and increase in morbidity and mortality. Anemia in CKD is due to erythropoietin deficiency from reduced renal mass, iron and nutritional deficiencies, elevation of pro inflammatory mediators in CKD may affect the erythropoiesis in CKD. It was observed that common risk factors were diabetes mellitus, hypertension, and dyslipidemia. CKD is a complex, progressive condition that develops slowly in some individuals, but rapidly in others. In addition to the underlying cause of renal failure, the rate of disease progression may be observed by the presence of CKD risk factors. The risk factors may increase progression of CKD to the end stage. Knowledge, Attitude and Practice of the patients were assessed using KAP questionnaire before and after counselling using a suitable patient information leaflet. The counselling provided was effective in improving the knowledge, attitude and practice of patients with chronic kidney disease. Pharmacists are in an ideal position to provide patient education and optimize patient care. Greater understanding about the illness and a change of attitude and practice would in turn results in a better therapeutic outcome. For future research the study should be done in a large sample and for long duration of period as a multicenter study.

**Keywords:** Anemia, Erythropoitin deficiency, Dyslipidemia, Chronic kidney disease

## EVALUATION OF NEUROPROTECTIVE EFFECT OF EMBLICA OFFICINALIS FRUIT EXTRACT ON ACRYLAMIDE INDUCED NEUROTOXICITY IN RATS

Sarika Joga
Department of Pharmacology, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, India --- 500007.
sarikajoga950@gmail.com

The study investigates the neuroprotective effects of Emblica officinalis (Indian gooseberry) against acrylamide-induced neurotoxicity in Wistar rats. Acrylamide, a chemical formed during high-temperature cooking, poses significant health risks, particularly neurotoxicity. It leads to oxidative stress, axonal damage, and behavioral deficits such as impaired grip strength, hyperalgesia, and locomotor dysfunction. Emblica officinalis, rich in bioactive compounds and antioxidants, is evaluated for its protective effects. Rats were divided into control, standard and experimental groups receiving acrylamide(50mg/kg) alone or combined with low/high (250mg/kg and 500mg/kg) doses of E. officinalis extract and standard Vitamin C (100mg/kg). Behavioral tests including locomotor activity, grip strength, narrow beam (hind limb impairment), and thermal hyperalgesia indicated that E. officinalis, especially at 500 mg/kg, significantly reversed acrylamide-induced deficits.The findings suggest that E. officinalis mitigates neurotoxicity by enhancing antioxidant defenses and possibly improving neuronal function. The study supports further exploration of E. officinalis as a therapeutic agent against chemically induced neurotoxicity and reinforces its traditional medicinal value.

**Keywords:** Emblica officinalis, Acrylamide, Neurotoxicity, Oxidative stress, Antioxidants, Wistar rats, Grip strength, Hyperalgesia, Locomotor dysfunction, Vitamin C, Neuronal function

The growing demand for safer, plant-based anesthetic agents has directed attention toward medicinal plants such as Thymus vulgaris (thyme) and Syzygium aromaticum (clove), both recognized for their antimicrobial, analgesic, and sedative properties. This study evaluated their anesthetic activities in zebrafish (Danio rerio), a widely accepted experimental model due to its genetic similarity to humans and high sensitivity to anesthetic agents. Essential oils of thyme and clove were tested at concentrations ranging from [e.g., 25–100 mg/L], and anesthetic efficacy was assessed by recording induction time (loss of equilibrium and responsiveness) and recovery time (return to normal swimming). Behavioral changes were also noted. Results demonstrated a clear dose-dependent effect for both extracts. Clove oil, at 50 mg/L, achieved induction in approximately [e.g., 120 ± 10 seconds] with recovery in [e.g., 90 ± 8 seconds], whereas thyme oil at the same concentration required [e.g., 210 ± 15 seconds] for induction and [e.g., 160 ± 12 seconds] for recovery. Higher concentrations of thyme oil improved efficacy but remained less effective than clove oil. The superior activity of clove oil is attributed to its high eugenol content, known for strong sedative and anesthetic properties. These findings suggest that clove oil can serve as a cost-effective, accessible, and eco-friendly alternative to synthetic anesthetics, particularly in aquaculture and veterinary practices, while thyme oil may act as a supportive anesthetic at higher doses. Overall, the study concludes that clove oil demonstrates greater promise as a natural anesthetic agent.

**Keywords:** Zebra fish,Thymus vulgaris, Syzygium aromaticum, Anesthesia, Eugenol

## PHARMACOLOGICAL EVALUATION OF LIMONENE ON LETROZOLE AND HIGH FAT DIET INDUCED POLYCYSTIC OVARIAN SYNDROME (PCOS) IN RATS

Sarika Joga and Kandavalli Manipriya
Department of Pharmacology, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, India --- 500007.
sarikajoga950@gmail.com

Polycystic ovarian syndrome (PCOS) is a prevalent endocrine disorder affecting 5%–10% of women of reproductive age. Although its etiology is multifactorial, oxidative stress, insulin resistance, obesity, hypothyroidism, hyperprolactinemia, and dyslipidaemia are key contributors. Limonene, a naturally occurring monoterpene, exhibits antioxidant, anti-inflammatory, anxiolytic, and metabolic regulatory properties. The objective behind the research was to evaluate the pharmacological effect of limonene on Letrozole and high-fat diet (HFD)-induced PCOS in rats. Female Wistar rats were divided into five groups (n=6): Group I (Normal Control) received sodium CMC and control diet; Group II (PCOS Control) received Letrozole (0.5 mg/kg, p.o.) for 42 days and HFD for 84 days; Group III and IV received Letrozole + HFD along with limonene (50 mg/kg and 100 mg/kg, respectively) from days 43–84; Group V received Metformin (100 mg/kg) as a standard treatment. Body weight, oestrous cycle, behavioural parameters, oral glucose tolerance test (OGTT), insulin tolerance test (ITT), biochemical markers, and ovarian histology were assessed. PCOS induction disrupted estrous cyclicity, increased body and ovarian weights, glucose intolerance, testosterone, triglycerides, oxidative stress markers, and pro-inflammatory cytokines, while reducing antioxidant enzymes, estradiol, progesterone, and behavioural activity. Limonene treatment dose-dependently reversed these alterations, showing comparable efficacy to Metformin. Limonene effectively ameliorated endocrine, metabolic, oxidative, and behavioural disturbances in a Letrozole and HFD-induced PCOS model, suggesting its potential as a therapeutic agent for PCOS management.

**Keywords:** PCOS, Limonene, insulin resistance, oxidative stress, estrous cycle.

## DENGUE: AN EMERGING PUBLIC HEALTH CONCERN

Suparna Sarkar, Dr. Sowjanya Battu, Dr. B. A Vishwanath
Department of Pharmaceutics, Aditya Bangalore Institute of Pharmacy Education and Research,
Bengaluru, India -560064
sarkarsuparna084@gmail.com

Dengue fever is an arboviral disease caused by dengue virus. Symptomatic dengue infection causes a wide range of clinical manifestations, from mild dengue fever (DF) to potentially fatal disease, such as dengue hemorrhagic fever (DHF) or dengue shock syndrome (DSS). The global burden of the disease is not well known, but its epidemiological patterns are alarming for both human health and the global economy. According to the WHO, dengue control is technically feasible with coordinated international technical and financial support for national programs.The references were selected from PubMed, Web of Science and Google Scholar database using search strings containing a combination of terms that included dengue fever, pathogenesis, epidemiology, diagnosis, prevention and control. Dengue fever is common in tropical areas. Texas has the highest number of cases of dengue fever in the United States. If left untreated, dengue fever can develop into the fatal dengue hemorrhagic fever. The disease is quite severe in young children as compared to adults.

**Keywords:** Dengue Fever, Dengue Hemorrhagic Fever, Dengue Shock Syndrome, Pathophysiology, Dengue transmission, Mosquito life cycle, Epidemiology, Detection, management and prevention and control of dengue fever.

## PRECLINICAL PHARMACOKINETIC EVALUATION OF METHOTREXATE AND PROTON PUMP INHIBITOR INTERACTIONS: INSIGHTS FROM RAT AND RABBIT ARTHRITIS MODELS

Harmya Nekkanti, Dr. S. Ramachandran and Dr. M.D. Dhanaraju
Department of Pharmacology, School of Pharmacy, Godavari Global University, Rajamahendravaram, Andhra Pradesh -533296
nharmya@gmail.com

Pharmacological interactions significantly impact therapeutic effectiveness and patient safety during pharmacotherapy. This study investigates the pharmacokinetic interaction between methotrexate (MTX), a conventional treatment option for rheumatoid arthritis, and proton pump inhibitors (PPIs), commonly utilized for the treatment of gastric acid-related disorders. Utilizing rat and rabbit models of arthritis induced by Freund's adjuvant, this research assessed the effects of the concurrent administration of pantoprazole and omeprazole on the pharmacokinetics of MTX and its anti-inflammatory effectiveness. Inflammation was meticulously quantified through precise measurements of paw edema using vernier calipers, along with biochemical markers of inflammation. The combination of MTX and pantoprazole significantly reduced inflammation and enhanced gastrointestinal tolerance compared to MTX administered with omeprazole, which demonstrated relatively lower efficacy and increased adverse reactions. These findings highlight a clinically relevant pharmacokinetic drug interaction that is essential for optimizing MTX therapy in patients requiring acid suppression. This preclinical evidence emphasizes the necessity for careful PPI selection to maximize therapeutic benefits while minimizing toxicity, thereby promoting safer and more effective management of rheumatoid arthritis. While artificial intelligence (AI) was not employed in this research, its application could have significantly enhanced the research methodology. AI-driven algorithms are capable of more effectively analyzing complex pharmacokinetic datasets, facilitating the prediction of drug-drug interactions. Furthermore, AI could optimize dosing regimens by incorporating a variety of chemical and biological variables, potentially reducing the experimental burden. These technological advancements hold the promise to improve the precision of pharmacokinetic evaluations and strengthen personalized treatment approaches.

**Keywords:** Methotrexate, Pantoprazole, Omeprazole, Pharmacokinetic Interaction, Rheumatoid Arthritis

## 7-HYDROXY FLAVONE BIOFLAVONOID AMELIORATES LETROZOLE-INDUCED POLYCYSTIC OVARIAN SYNDROME VIA INHIBITION OF OXIDATIVE STRESS AND INFLAMMATORY MARKERS

PRAMOD PANDURANG GIRAM
Rajarshri Shahu College of Pharmacy, Buldhana
pramodgiram123@gmail.com

ISBN: 978-81-980623-8-3

Background: Polycystic ovarian syndrome (PCOS) is a common gynaecological and endocrinological disorder causes anovulatory infertility that affecting 4-10% in women of reproductive age. Although current therapeutic options exist, many are accompanied by adverse effects, underscoring the need for safer and more effective alternatives. 7-Hydroxyflavone (7-HF), a natural flavonoid, has demonstrated notable biological properties; however, its therapeutic potential in PCOS remains unexplored. The current study aimed to explore the possible role of 7-HFin treating letrozole induced PCOS in rats. Methods: PCOS was induced in Female Wistar Rats by the administered of letrozole (1 mg/kg, , p.o.) for 21 days. After induction, rats were treated with 7-Hydroxyflavone at various doses (5, 10 and 15 mg/kg) and metformin (300 mg/kg) for 14 consecutive days. Result: Letrozole-induced PCOS was characterized by disrupted estrous cycle, increased body and ovarian weights, cystic ovarian follicles, altered metabolic and hormonal level, enhanced oxidative stress (elevated LPO, SOD; reduced GSH), and elevated inflammatory markers (TNF-alpha and IL-6). Treatment with 7-Hydroxyflavone significantly mitigated these alterations, restored normal estrous cycles and hormonal balance, reduced oxidative stress and inflammation, and improved ovarian histology in a dose-dependent manner.Conclusion: This study provides the first evidence that 7-Hydroxyflavone effectively mitigates letrozole-induced PCOS manifestations in rats, likely through its antioxidant, anti-inflammatory, and endocrine-modulating effects. These findings support the therapeutic potential of 7-HF as a novel candidate for PCOS management.

**KEY WORDS:** Polycystic Ovarian Syndrome (PCOS), 7- Hydroxyflavone (7-HF), Letrozole, Estrus Cycle (EC),

## EFFECTIVENESS OF MONO AND DUAL ANTIPLATELET THERAPY IN ACUTE CORONARY SYNDROME IN A TERTIARY CARE HOSPITAL

T Kaviyarasu and Abishek
Dept Of Pharmacy Practice, The Erode College of Pharmacy,638112
The Tamil Nadu Dr. MGR University, Chennai.
Bunchgamers98@gmail.com

Cardiovascular diseases, particularly ischemic heart disease (IHD), remain a leading cause of mortality worldwide, with acute coronary syndrome (ACS) being a major contributor. Antiplatelet therapy plays a pivotal role in reducing morbidity and mortality by preventing thrombotic events in these patients. This study, titled “Effectiveness of Mono and Dual Antiplatelet Therapy in the Management of Acute Coronary Syndrome (ACS)”, was conducted to evaluate and compare the clinical outcomes of patients treated with aspirin monotherapy versus those receiving dual antiplatelet therapy (DAPT) consisting of aspirin and clopidogrel. A prospective observational design was employed, enrolling patients diagnosed with ACS at a tertiary care hospital. Clinical data, treatment modalities, and patient outcomes were systematically collected and analyzed. The study primarily assessed cardiovascular events such as recurrent angina, myocardial infarction, stroke, and mortality. Secondary parameters included hospital stay duration, bleeding complications, and other drug-related adverse effects. The findings demonstrated that dual antiplatelet therapy significantly reduced the incidence of recurrent ischemic events compared to monotherapy, affirming the superior efficacy of combined therapy in ACS management. However, DAPT was also associated with a modest increase in bleeding complications, highlighting the need for individualized patient assessment to balance efficacy and safety. This study reinforces the clinical benefits of dual antiplatelet therapy over monotherapy in reducing adverse cardiovascular outcomes among ACS patients. Nonetheless, the risk of bleeding necessitates cautious patient selection and continuous monitoring. The results underline the importance of evidence-based prescribing practices to optimize therapeutic benefits while minimizing harm. Future research with larger cohorts and longer follow-up is warranted to further validate these findings and refine treatment guidelines.

**Keywords:** Acute Coronary Syndrome, Antiplatelet Therapy, Aspirin, Clopidogrel, Dual Therapy, Cardiovascular Outcomes.

## ESTIMATION OF HORMONAL ACTIVITY AGAINST LEVOTHYROXINE INDUCED HYPERTHYROIDISM IN EXPERIMENTAL ANIMALS USING THE BETA VULGARIS LEAVES EXTRACT

Sashi1, Prabhjeet Kaur Bamrah2
1Department of Pharmacy, Banasthali Vidyapeeth, Rajasthan
2Institute of Pharmaceutical Education and Research, Kurukshetra University, Kurukshetra University, Kurukshetra, Haryana
mauryasashi720@gmail.com

Hormonal imbalance is a major contributor to several disorders, with hyperthyroidism being characterized by excessive synthesis and secretion of thyroid hormones. Conventional treatments such as antithyroid drugs, iodine therapy, and surgery are effective but often associated with side effects including muscle weakness, hair fall, and appetite loss. In recent years, there has been growing interest in herbal remedies due to their affordability, efficacy, and lower adverse effects. Beta vulgaris (beetroot), traditionally used in medicine for its antioxidant and hormone-modulating properties, has limited scientific evidence regarding its role in hyperthyroidism. The present study aimed to evaluate the antithyroid potential of methanolic leaf extract of Beta vulgaris (BVME) against levothyroxine-induced hyperthyroidism in female Wistar rats. Fresh leaves were shade-dried, powdered, and extracted by maceration with methanol. Hyperthyroidism was induced by oral administration of levothyroxine (500 µg/kg/day for 12 days), after which animals were divided into five groups: normal control, hyperthyroid control, standard drug (propylthiouracil), and two treatment groups receiving BVME (250 mg/kg and 500 mg/kg) for 17 days. Biochemical estimation of serum T3, T4, and TSH levels, body weight monitoring, and histopathological studies were carried out. BVME significantly ($p<0.01$) reduced T3 and T4 levels while elevating TSH in a dose-dependent manner, comparable to the standard drug. In addition, BVME attenuated levothyroxine-induced weight loss and restored normal thyroid gland histology with a 35–60% reduction in follicular cell hyperplasia and colloid accumulation. These findings suggest that methanolic leaf extract of Beta vulgaris possesses potent antithyroid activity, supporting its ethnomedicinal relevance and potential as a safer herbal alternative for managing hyperthyroidism. Further investigations are warranted to isolate and characterize the active phytoconstituents responsible for this effect.

**Keywords:** Beta vulgaris, hyperthyroidism, levothyroxine, phytoconstituents, herbal medicine, antithyroid activity, Wistar rats.

## BACTERIOLOGICAL PROFILES AND PREVALENCE OF SEPTICAEMIA IN NEONATES AT A TERTIARY CARE HOSPITAL

V Akash and Yogeschvaran S
Dept Of Pharmacy Practice, The Erode College of Pharmacy,638112
The Tamil Nadu Dr. MGR University, Chennai.
akashvakash64@gmail.com

Neonatal septicaemia describes any systemic bacterial infection in neonates documented by positive blood culture. It is an important cause of morbidity and mortality among neonates. Neonatal sepsis may be classified according to the time of onset of the disease, < 72 hours as early-onset neonatal sepsis (EONS) and >72 hours as late-onset neonatal sepsis (LONS). EONS are caused by organisms prevalent in the maternal genital tract and LONS are caused by environmental factors. To identify the prevalence of septicaemia in neonates along with age and gender wise distribution, common associated factors and clinical signs/symptoms. Venous blood was collected aseptically and inoculated in blood culture bottle. Further isolation and identification was done by Standard Microbiological Guidelines. ESBL was detected according to CLSI guidelines. In present study out of 116 clinically suspected neonatal septicaemia cases, 89 (76.72%) were males and 27 (23.28%) were females. In present study out of 116 cases of neonatal septicaemia, 65 (56.03%) were early onset neonatal septicaemia and 51 (43.97%) were late onset septicaemia. Out of 89 male patients studied, in 31 (34.83%) cases pathogen were isolated. Out of 27 (23.28%) female patients studied, in 10 (37.04%) cases pathogens were isolated. In present study most common was Klebsiella spp. 39.02 %. Prevalence of septicaemia is 35.34% in neonates in present study. Prevalence was higher in males. And most common associated factor was preterm.

**Key words:** Neonatal septicaemia, Causative bacterial pathogens, Predisposing factors

**A CROSS SECTIONAL OBSERVATIONAL STUDY OF LEUCOPENIA AS AN EARLY TOXICITY MARKER FOLLOWING YELLOW PHOSPHOROUS POISONING CASES**

Rubiya Jasrine M
Department of General Medicine, Government Medical College and Hospital, Tirupur-641605.
mdrubiya02@gmail.com

BACKROUND: India's second-most common toxin is yellow phosphorus poisoning. Yellow phosphorus, which is present in rodenticides between 2 and 5%. 1 mg/kg is the dose that is fatal. Vomiting is the first symptom, and multiple organ failure and death are the last outcomes. Leucopenia is assessed for liver injury promptly as feasible in this article. OBJECTIVE: To assess the toxicity in yellow phosphorus poisoning. METHODS: Cross-sectional observational research was conducted. A total of one hundred patients were included in this investigation. The blood investigation was continuously monitored in the patients for any changes in the blood cell counts. RESULTS: For three days, the patient's leukocyte count was monitored. On day two, the mean patients WBC level drastically decreased. Leucopenia only happens in a small number of people. Leucopenia has been recorded in 24% of the study's participants on day 2. On day 3, 41% people were experienced leucopenia. PT/INR value rises steadily over time. On day one PT increased. On the second day, the mean INR value starts to become abnormal. This indicates internal bleeding. CONCLUSION: Leucopenia may not be considered as a toxicity marker; however, a decline in WBC starting on day two indicates further studies required long term study with large number of patients. Furthermore, the elevated PT/INR on first day indicates, it may be used as one of the toxicity markers for earlier diagnosis of yellow phosphorous poisoning.

**EVALUATION OF EXACERBATION CONTROL AMONG COPD PATIENTS RECEIVINGMETHYLXANTHINES, CORTICOSTEROIDS AND ANTIBIOTICS**

Branham Bright A
Department of Pulmonary Medicine, Tirupur Medical College and Hospital, Tirupur-641605.
brightbranham42@gmail.com

Introduction: Chronic Obstructive pulmonary disease is a chronic inflammatory lung disease that causes obstructed air flow from the lungs. The aim of our study is to assess the control of symptom and exacerbation in COPD patients by comparing the CAT questionnaire and mMRC dyspnoea scale before and after treatment with drugs of methylxanthines, corticosteroids and antibiotics. Methods: This was a cross sectional observational study of patients admitted with exacerbation COPD at tertiary care hospital Tirupur. The study was approved by ethical committee and informed consent form provided by patient before inclusion. The study was conducted over the period of six months, totally 120 patients were enrolled and grouped them based on severity by GOLD classification. Result: Majority of the cases are in the age group of 46-60 years(49%) CAT Score before treatment is high in 86% of patients and after treatment Cat score is reduced to medium in 90% of patients. Before treatment mMRC score of grade 3 in majority of patients reduced to mMRC score of grade 2 after treatment. Preceding 1 year history of re-exacerbation occurs in 87% of patients and hospitalization occurs in 82% of patients. By comparing the CAT and mMRC score, the GOLD classification of majority of patients in Group C (severe) before treatment and after treatment it reduced to Group B (Moderate). Conclusion: The present study concludes that symptoms are controlled more by using methylxanthines, corticosteroids and antibiotics while comparing it with exacerbation.

**Keywords:** Chronic Obstructive Pulmonary Disease (COPD); CAT questionnaire; mMRC dyspnea scale; GOLD classification; Exacerbation; Corticosteroids

**ANTI OBESITY EFFECTS OF SENNA AURICULATA EXTRACT: A MECHANISTIC INVESTIGATION OF PPAR γ MODULATION AND INSULIN SENSITIVITY IN EXPERIMENTAL MODELS**

Yogeschvaran, Amudhabharathi and Mohammed musraf
Department of pharmaceutical biotechnology,The erode college of pharmacy, 638112
The tamil nadu Dr. MGR university Chennai.
yogeschdir@gmail.com

Obesity is a multifactorial metabolic disorder and a leading global health challenge associated with insulin resistance, type 2 diabetes, dyslipidemia, cardiovascular disease, and non-alcoholic fatty liver disease. Senna auriculata (L.) Willd, a traditional medicinal plant widely used in South India, has been reported to possess antidiabetic, antioxidant, and hepatoprotective properties. However, its role in adipogenesis and obesity management has not been fully elucidated. The present study aimed to investigate the anti-obesity effects of S. auriculata extracts with particular emphasis on mechanistic pathways involving peroxisome proliferator-activated receptor gamma (PPARγ) modulation and insulin sensitivity. Phytochemical screening revealed the presence of flavonoids, tannins, phenolic compounds, and alkaloids. In vitro assays using 3T3-L1 preadipocytes demonstrated significant inhibition of lipid accumulation as assessed by Oil Red O staining, along with improved antioxidant defense through enhanced superoxide dismutase (SOD), catalase (CAT), and glutathione (GSH) activity. In vivo studies were conducted on high-fat diet (HFD)-induced obese C57BL/6 mice. Oral administration of the extract resulted in a significant reduction in body weight gain, adipose tissue mass, and serum lipid parameters (cholesterol, triglycerides, LDL) while restoring HDL levels. Moreover, biochemical evaluation showed improvement in liver function markers and reduction of inflammatory cytokines (TNF-α, IL-6) along with increased adiponectin and insulin sensitivity. Gene expression analysis confirmed downregulation of PPARγ and leptin, and upregulation of UCP1 and adiponectin, suggesting modulation of adipogenesis and enhancement of energy expenditure. Western blot analysis further indicated activation of the AMPK pathway and regulation of associated metabolic proteins (pAMPK, pACC, CPT1A). Overall, the findings provide strong evidence that S. auriculata exerts multi-targeted anti-obesity effects by regulating adipogenesis, improving insulin sensitivity, and modulating key molecular pathways. This study scientifically validates the traditional use of S. auriculata and highlights its potential as a safe, plant-based therapeutic agent for the management of obesity and associated metabolic disorders.

**Keywords:** Obesity, metabolic disorder, lipid, high fat diet

**PL-114**

**ANTI- ALZHEIMER POTENTIAL OF SILVER NANOPARTICLES FROM PSIDIUM GUAJAVA IN A SCOPOLAMINE-INDUCED ALZHEIMER'S DISEASE.**

Virupanagouda P. Patila*, Usman Killedara, Adesh Tagada, Nanjappaiah H. Ma, Shivakumar Hugara, Rani Ha. B, Kavita N. Ba and Renuka Sa.
BLDEA's Shri Sanganabasava Mahaswamiji College of Pharmacy and Research Centre, Smt. Bangaramma Sajjan Campus, B.M. Patil Road, Vijayapur-586103. Karnataka. India.
patilk183@gmail.com

Psidium guajava (guava) is rich in bioactive phytochemicals such as flavonoids, tannins, and terpenoids, known for their strong antioxidant and anti-inflammatory properties, which may contribute synergistically to the neuroprotective potential of AgNPs synthesized from its extracts. This research investigates the Alzheimer's disease-fighting potential of P. guajava leaves using a silver nanoparticle-based extract. P. guajava extract and silver nanoparticles of extract were used in scopolamine-induced Alzheimer's disease model. It seeks to enhance cognitive function and control Alzheimer's progression, offering promising therapeutic benefits. Additionally, notable improvements were observed in percentage of spontaneous behaviour, step through latency and escape latency, coupled with reduced levels of Lipid Peroxidation (LPO) and elevated Catalase (CAT) levels in biochemical assessments. The current research indicates that the AgNP of P. guajava exhibited highly significant results and it could be a potential as a promising therapeutic intervention for Alzheimer's disease. In conclusion, P. guajava extract and its silver nanoparticle formulation showed significant promising drug as potential treatments for Alzheimer's disease, based on positive results in scopolamine induced model.

**Keyword:** Alzheimer's disease, AgNP, Psidium guajava, scopolamine-induced model, Catalase.

**THERAPEUTIC POTENTIAL OF HERBAL NANOGEL CONTAINING CENTELLA ASIATICA EXTRACT FOR THE AMELIORATION OF DNFB-INDUCED ALLERGIC CONTACT DERMATITIS**

Saurabh Kumar, Deeparani Urolagin
Department of Pharmacology, R R College of Pharmacy, Bengaluru, India. - 560090.
choudharysaurabh957@gmail.com

This study investigated the therapeutic potential of a herbal nanogel containing Centella asiatica extract for the treatment of DNFB-induced allergic contact dermatitis. The extract was prepared using the maceration method and incorporated into a Carbopol 934 gel base. The nanogel formulation was conducted via the solvent diffusion method, wherein the extract was added dropwise under continuous magnetic stirring, followed by homogenization to obtain nanosized nanogel particles. The Box–Behnken Design (BBD) was utilized in a Design of Experiment (DoE) approach to optimize the formulation parameters. The optimized nanogels were characterized using FTIR, SEM, pH measurement, viscosity assessment, spreadability analysis, particle size determination, in vitro drug release studies, skin permeation evaluation, and phytochemical analysis. In vivo efficacy was evaluated using the guinea pig maximization test, complemented by histopathological and biochemical analyses. The results indicated that the optimized Centella asiatica nanogel demonstrated nanoscale stability, improved skin permeation, and significant in vitro anti-inflammatory effects. These findings suggest that the developed formulation has the potential to be a biocompatible and effective herbal nanogel for managing allergic contact dermatitis.

**Keywords:** Centella asiatica extract, Carbopol, BBD, allergic contact dermatitis.

Department of Pharmacology,
Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Secunderabad, Telangana,500017.
pashamuma27@gmail.com

Urolithiasis, or kidney stone disease, is a common and recurrent urological disorder with major global health implications. Worldwide, 12–15% of individuals are affected during their lifetime, and recurrence rates approach 50% within 5–10 years. In India, the prevalence is around 12%, with a higher burden in northern and western regions. Beyond severe pain and urinary complications, urolithiasis can progress to chronic kidney disease and significantly impair quality of life, making it a pressing public health concern. Calcium oxalate crystals constitute the majority of kidney stones and are known to induce oxidative stress, inflammation, and renal tubular injury. While current treatment strategies are effective, their utility is often constrained by cost, side effects, and high recurrence, underscoring the need for safer, natural alternatives. Sinapic Acid, a phenolic compound widely distributed in plant-based foods, possesses potent antioxidant and anti-inflammatory activities, suggesting potential therapeutic value. This study investigated the antiurolithiatic activity of Sinapic Acid in albino Wistar rats. Urolithiasis was induced with 0.75% ethylene glycol in drinking water, and animals were treated orally with graded doses of Sinapic Acid. Results were compared with Cystone, a standard antiurolithiatic drug. Biochemical analyses and kidney histopathology demonstrated that Sinapic Acid significantly reduced calcium oxalate deposition, improved renal function markers, and preserved renal architecture. These findings indicate that Sinapic Acid may serve as a promising natural therapeutic agent for the prevention and management of urolithiasis.

**Keywords:** Sinapic Acid, Urolithiasis, Calcium oxalate, 0.75% Ethylene glycol, Cystone

Shobhaben Pratapbhai Patel School of Pharmacy and Technology Management, SVKM's NMIMS Deemed-to-be-University, Vile Parle (w), Mumbai 400056, Maharashtra, India.
dsawant092@gmail.com

Allergic conditions affect 30% of the population, affecting day-to-day productivity and quality of life. Despite the availability of tablets, capsules, syrups, and nasal sprays, patient dissatisfaction persists due to the delayed onset of action, short duration, and undesired side effects. Patient-driven insights are important for the development of effective therapies. This study aims to understand patient perspectives on existing allergy treatments, highlighting the common challenges, rank expectations for improvement, and understand their willingness to adopt novel therapies. A cross-sectional survey was conducted with >100 participants across diverse age groups. Responses were collected based on demographics, frequency of symptoms, preferred treatment, onset of relief, treatment limitations, desired improvements, and openness to innovation. Data was analysed to identify trends and patient priorities. Most respondents (65%) were between 36-55 years, with episodic allergies, 45% facing rare episodes and 27% seasonal flares. Tablets and capsules were the most used therapies (56%), yet 63% experienced relief only after 30-60 minutes. Patients highlighted concerns like short duration of effect (28%), slow onset (22%), side effects (20%) and missed doses (15%). Rapid relief emerged as the highest priority (83%) from participants, followed by fewer side effects (43%) and long duration of action (23%). Encouragingly, 81% participants expressed readiness to adopt improved alternatives. All the findings reveal that current therapies fall short of patient expectations stating strong opportunity for developing faster, safer and longer-acting delivery systems, particularly intranasal sprays, fast-dissolving tablets and orodispersible films that truly align with patient needs.

**Keywords:** Cross-sectional survey, Allergic rhinitis, Patient insights, Delivery systems

laxmilanjewar11@gmail.com

Accelerated brain aging is a multifactorial condition marked by cognitive decline, neuroinflammation, oxidative stress and gut microbiota dysbiosis, often mediated through the gut-brain axis. This study aimed to evaluate the neuroprotective and gut restorative potential of agmatine in a D-galactose-induced rat model of accelerated brain aging. Rats were administered D-galactose (150 mg/kg) for 56 days to induce aging-related neuropathology and gut dysbiosis. Treatment groups received agmatine (40 and 80 mg/kg), L-arginine (100 mg/kg) and aminoguanidine (25 mg/kg). Cognitive and behavioural performance was assessed using the Morris Water Maze (MWM), Novel Object Recognition (NOR), Forced Swim Test (FST), Open Field Test (OFT) and Elevated Plus Maze (EPM). Biochemical analyses included quantification of neurotransmitters (dopamine, serotonin, glutamate), acetylcholinesterase activity, oxidative stress markers (MDA, nitrite, SOD, GSH) and inflammatory cytokines (TNF-α, IL-6, IL-10). Additionally, gut barrier integrity (ZO-1, occludin) and systemic LPS-binding protein (LBP) levels were measured. Microbial profiling of fecal samples revealed significant reductions in Lactobacillus and increases in E. coli populations in D-galactose-treated rats, which were reversed by agmatine treatment. Histopathological examination of the hippocampus and ileum confirmed structural improvements following agmatine administration. Notably, the 80 mg/kg dose of agmatine showed superior efficacy in restoring cognitive function, reducing neuroinflammation and oxidative stress and normalizing gut microbiota and barrier function. These findings highlight agmatine therapeutic potential in counteracting brain aging and gut dysbiosis through modulation of the gut-brain axis.

**Keywords**: Agmatine, Accelerated brain aging, Gut-brain axis, Neuroinflammation, Oxidative stress, Gut dysbiosis.

**CHROMIUM-AMINO ACID COMPLEXES AS PROMISING ALTERNATIVES TO NSAIDS: EVIDENCE FROM PHARMACOLOGICAL AND COMPUTATIONAL STUDIES**

M. C. Darshan, K. N. Anitha, Sanjana R
Department of Pharmacology, Government College of Pharmacy, Bengaluru, Karnataka – 560027
sanjanaryaduru@gmail.com

This research explored the analgesic and anti-inflammatory potential of novel chromium–amino acid complexes, Chromium-D-Phenylalanine (Cr-Phe) and Chromium-Glycinate (Cr-Gly). The complexes were structurally validated through UV–visible spectroscopy, FTIR, and elemental analysis. Their interactions with key inflammatory enzymes, COX-1(PDB: 1CX2) and COX-2 (PDB: 3KK6), were investigated via molecular docking, revealing strong binding affinity with scores of –8.0 and –8.9 kcal/mol respectively. Pharmacological evaluation was performed using the acetic acid–induced writhing model in mice. Both complexes produced a marked, dose-dependent reduction in abdominal constrictions (writhes) compared to controls. At 56 µg/kg, Cr-Phe inhibited writhing by 48.3%, while Cr-Gly achieved 39.12% inhibition. These effects, although slightly lower than the standard drug diclofenac sodium (55.7%), demonstrated significant analgesic potential. Interestingly, doubling the dose to 112 µg/kg did not further enhance efficacy, indicating the optimal therapeutic window lies at lower concentrations. These findings indicate that chromium–amino acid complexes are promising novel analgesic agents with safer profiles than conventional NSAIDs. Their optimal efficacy at lower doses may reduce side effects, with Cr-Phe showing greater potency than Cr-Gly. Overall, this study highlights the potential of chromium complexes as innovative scaffolds for developing next-generation analgesics with dual anti-inflammatory benefits.

**Keywords:** Acetic acid–induced writhing, Chromium D-Phenylalanine, Chromium Glycinate, Analgesic activity, writhes.

**NEUROPROTECTIVE EFFECTS OF CHROMIUM-HISTIDINATE AGAINST ROTENONE-INDUCED PARKINSON'S DISEASE IN RATS: ATTENUATION OF OXIDATIVE STRESS, NEUROINFLAMMATION, AND MOTOR DEFICITS**

Mohammed Mutahir, K. N. Anitha, Tarun. P
Department of Pharmacology, Government College of Pharmacy, Bengaluru, Karnataka – 560027
smartyspikes@gmail.com

This study investigated the therapeutic potential of chromium-histidinate (Cr-His) against rotenone-induced Parkinson's disease (PD) in rats through in silico and in vivo approaches. Cr-His was synthesized and characterized using UV-Vis, FT-IR, and elemental analysis. In silico docking and molecular dynamics with α-synuclein (PDB:1XQ8) demonstrated stable binding (−9.0 kcal/mol) and robust hydrogen bonding. In vivo, Wistar rats received rotenone (2 mg/kg, s.c., 28 days) to induce PD-like pathology. Behavioral assessments showed dose-dependent effects of Cr-His. At 80 µg/kg, Cr-His improved motor performance (149.16 ± 4.5 vs 59 ± 3.59 in rotenone, Day 28) and locomotor activity (171.66 ± 20.3 vs 59 ± 3.59), comparable to levodopa–carbidopa (181.16 ± 10.3). Catalepsy scores decreased significantly with Cr-His 80 µg/kg (109.12 ± 6.6 vs 142.34 ± 8.9 in rotenone, $p<0.05$). Biochemically, Cr-His restored GSH (1.06 ± 0.03 vs 0.44 ± 0.01 µmol/mg protein in rotenone), catalase (3.76 ± 0.03 vs 2.86 ± 0.05 U/mg protein), and reduced LPO by 28% (2.54 ± 0.02 vs 3.53 ± 0.09 nmol/mg protein). Nitrite levels declined by 40% with Cr-His (15.25 ± 0.17 vs 25.47 ± 0.21 µg/ml in rotenone), and dopamine levels improved by 50% (153.69 ± 3.27 vs 102.46 ± 1.23 ng/mg). TNF-α was reduced to 323.87 ± 11.1 pg/ml vs 622.62 ± 12.5 in rotenone. Histopathology confirmed dose-dependent neuroprotection with preserved neuronal morphology. Overall, Cr-His demonstrated significant neuroprotective potential in PD through antioxidant, anti-inflammatory, and motor-restorative effects, supporting its evaluation as a candidate for adjunct therapy.

**CHROMIUM GLYCINATE COMPLEX: PHARMACOLOGICAL AND COMPUTATIONAL INSIGHTS INTO ANTI-INFLAMMATORY AND ANTIOXIDANT POTENTIAL**

M. C. Darshan, K. N. Anitha, Subhashini S
Department of Pharmacology, Government College of Pharmacy, Bengaluru, Karnataka – 560027
subhashinisk2002@gmail.com

The anti-inflammatory and antioxidant potential of Chromium Glycinate (Cr-Gly), a trace element complex, was evaluated through in vivo and in silico approaches. Anti-inflammatory activity was assessed in carrageenan-induced paw edema in rats using histopathological and biochemical analyses. The synthesized complexes were characterized by spectroscopic and elemental methods. Antioxidant and anti-inflammatory effects were determined through paw volume, grip strength, lipid peroxidation (LPO), glutathione (GSH), tumor necrosis factor-alpha (TNF-α), and histopathological alterations. Cr-Gly at 40 µg/kg produced 28% inhibition of paw edema ($p<0.01$) compared with diclofenac sodium (42.40%). Treatment with Cr-Gly reduced LPO levels (25.1%) (62.1±0.30), while GSH levels increased by 22–35%, with the highest restoration at 40 µg/kg (34.82%) (78.3±0.33). TNF-α levels were reduced by 37.28% (252.62±1.96) at the same dose. A dose-dependent effect was evident, with significant inhibition at 20 and 40 µg/kg versus carrageenan control. Histology confirmed reduced inflammatory infiltration and edema. Molecular docking and dynamics simulations showed strong binding affinity of Cr-Gly with COX-1 and COX-2. Docking revealed binding with PDB ID: 1CX2 (COX-2) and 3KK6 (COX-1), with scores of –8.0 and –8.9 kcal/mol respectively. Molecular dynamics confirmed stable hydrogen bonding. Cr-Gly demonstrated measurable anti-inflammatory and antioxidant effects under experimental conditions, suggesting relevance for further pharmacological evaluation.

**Keywords:** Chromium Glycinate, Anti-inflammatory, Antioxidant, Cyclooxygenase, Carrageenan induced paw edema.

**AN ANTICIPATORY APPROACH ON STATIN-INDUCED RHABDOMYOLYSIS TREATMENT WITH HERBAL EXTRACT**

Suji P H1, Martin C1, Raju A1
Department of Pharmacology, St. Joseph's College of Pharmacy, Cherthala, Kerala, India – 688524
sujiph10232@gmail.com

Oxalis corniculata belonging to the family Oxalidaceae, has been used traditionally for its medicinal benefits. Recent exploration has shown it has strong antioxidant properties, which supports its use in treating various health issues, especially in precluding damage caused by certain specifics. The study aimed to test the hydroalcoholic extract of Oxalis corniculata (HAEOC) to see if it recovers the damage by statin and fibrate rat models. The aim was to check if the extract could reverse the oxidative stress and to assist in preserving kidney function. Thirty Wistar rats were divided into five groups (n=6 per group): normal control group, simvastatin-treated group, simvastatin + gemfibrozil-treated group, simvastatin-treated group with HAEOC, and simvastatin + gemfibrozil-treated group with HAEOC. All treatments were given over 30 days, and also blood and kidney samples were collected testing. The results showed that simvastatin and simvastatin and gemfibrozil combination caused significant muscle breakdown and oxidative stress, as shown by advanced situations of dangerous substances in the blood (nephrotoxicity markers – $p<0.001$) and unstable antioxidant situations ($p<0.05$). Using HAEOC alongside these medicines effectively reduced these changes by correcting serum levels, reducing oxidative stress, and preserving kidney morphology. The study demonstrates that Oxalis corniculata is a promising prophylactic drug to inhibit nephrotoxicity induced by statin and fibrate therapy.

**Keywords:** Antioxidant; Oxalis corniculata; Rhabdomyolysis, Nephroprotective

**PSYCHOPHARMACOLOGICAL EVALUATION OF BIOPHYTUM SENSITIVE IN MICE**

Roselit Mariya1, Ayishu Mansoor1, Surya. A.S1
Department Of Pharmacology, St. Joseph's College of Pharmacy, Cherthala, Kerala, India-688524
roselitmariya@gmail.com

Biophytum sensitivum, a traditional Indian medicine herb, is employed in treating insomnia and convulsions, but scant scientific data exist

ISBN: 978-81-980623-8-3

concerning its psychopharmacological actions. The current research was designed to assess the influence of the ethanolic extract of Biophytum sensitivum (EEBS) on animal behavior. This research was particularly intended to explore the psychopharmacological activities of EEBS against locomotion, depression, anxiety, and muscle relaxation in experimental models. Biophytum sensitivum leaves were extracted with ethanol through a Soxhlet apparatus. EEBS was administered orally to animals in doses of 100 and 200 mg/kg. Locomotion was assessed through an actophotometer, depression through the Forced Swim Test (FST), anxiety using the Elevated Plus Maze (EPM), and muscle relaxation was tested on a rotarod. Statistical analysis was done through ANOVAs ($p < 0.05$). EEBS significantly enhanced locomotion. In the FST, it decreased immobility time, which was an indication of an antidepressant action. Anxiolytic activity was inferred from elevated open-arm entries and open-arm time in the EPM. Moreover, motor coordination was affected on the rotarod, showing muscle relaxation. The research corroborates the psychopharmacological efficacy of Biophytum sensitivum, showing locomotion, depression, anxiety, and muscle relaxation effects deserving further investigation on its therapeutic possibilities in neuropsychiatric disorders.

**Keywords:** Biophytum sensitivum, locomotor activity, anxiolytic activity, skeletal muscle relaxant activity, antidepressant activity.

## ANTIOXIDANT, ANTIINFLAMMATORY AND SPLEEN PROTECTIVE EFFECTS OF Ipomoea digitata L. TUBER

Lakshmi S, Saipriya S, Surya A S
Department of Pharmacology, St. Joseph's College of Pharmacy, Cherthala, Kerala, India-688524
lakshmiminulal999@gmail.com

It was a study formulated to evaluate the antioxidant, anti-inflammatory, and spleen-protective effects of the alcoholic extract of Ipomoea digitata tuber (EEIDT). The main objective was to examine the protective effects of EEDT against aniline-induced spleen injury in male Wistar rats. The study was carried out by inducing spleen injury in Wistar rats with ID extract (200, 400mg/kg/day at 2 doses) administered. Various parameters like invitro antioxidants (DPPH, NO Scavenging), anti-inflammatory (proteinase inhibition) activities and in-vivo effects on splenic hematology, iron, lipid peroxidation, Glutathione (GSH), and NO levels were evaluated. The results showed that IEDT exposure led to significant health problems and hematological disruptions. However, IEDT treatment restored hematological balance, reduced lipid peroxidation, and normalized GSH and NO levels, indicating protective effects. The in-vitro assay determined that IEDT has both antioxidant and anti-inflammatory activities. So, it can be concluded that the IEDT is a potential natural therapeutic compound for oxidative stress-associated spleen disease.

**Keywords:** Antioxidant, Anti-Inflammatory, spleen injury, Ipomoea digitata L. Wistar Rats

## QUALITY OF LIFE ASSESSMENT BEFORE AND AFTER CORONARY ARTERY BYPASS GRAFTING IN CORONARY ARTERY DISEASE PATIENTS: A PROSPECTIVE OBSERVATIONAL STUDY

V. RISHMA, HIMAJA.T, R. GANESH, K SECHANA
Mallareddy Institute of Pharmaceutical Sciences, Malla Reddy Vishwavidyapeeth

Coronary Artery Disease (CAD) results from narrowed or blocked coronary arteries, presenting as angina, myocardial infarction, or silent ischemia. In India, CAD occurs more frequently and at younger ages. Coronary Artery Bypass Grafting (CABG) effectively restores perfusion, and assessing health-related quality of life (HRQoL) post-CABG provides insight into patient recovery. To analyse and compare the quality of life and functional status of patients before and after Coronary Artery Bypass Grafting (CABG). A six-month prospective observational study was conducted at Mult speciality hospitals. Out of 120 CABG patients, 98 completed follow-ups. HRQoL was assessed using SF-36 preoperatively and at three months, with demographics, comorbidities, and risk factors recorded; data were analysed using repeated measures ANOVA. Most patients were 50–60 years (43%) and male (82%). Alcohol use (58%) and smoking (57%) were common risk factors, with triple vessel disease in 70%. CABG significantly improved all HRQoL domains, including physical, mental, and social functioning. CABG substantially improved quality of life across physical, psychological, and social domains within three months. Routine HRQoL assessment may enhance postoperative care and patient counselling.

## INVESTIGATION OF CARDIOTOXIC EFFECTS OF GULMEHENDI LEAF HYDROALCOHOLIC EXTRACT IN ISOLATED RAT HEART MODEL

Ishan Bhunia, Monisankar Pramanik, Sourav Roy, Mrityunjoy Majumdar
Department of Pharmacology, Netaji Subhas Chandra Bose Institute of Pharmacy, Tatla, Chakdaha, Nadia, West Bengal – 741222
bhuniaishan@gmail.com

The present study investigates the hydroalcoholic extract of Gulmehendi (Salvia Rosmarinus) leaves to assess its cardiotoxic and cardiotropic effects on isolated hearts of albino Wistar rats. Gulmehendi, a medicinal plant of the Lamiaceae family, has been widely used for its antioxidant, antimicrobial, and anti-inflammatory properties, yet its influence on cardiac function remains inadequately explored. The extract was prepared using 70% ethanol and subjected to preliminary phytochemical screening, which revealed the presence of alkaloids, carbohydrates, flavonoids, and glycosides phytoconstituents known to possess diverse pharmacological actions. The experimental model employed isolated rat hearts perfused with Krebs-Henseleit solution through the Langendorff's apparatus, a well-established technique for evaluating direct cardiac responses in controlled conditions. The hydroalcoholic extract was administered in incremental doses, and its effects were systematically compared with standard cardioactive agents, adrenaline and acetylcholine. The extract demonstrated a dose dependent positive inotropic effect (enhanced force of contraction) and positive chronotropic effect (increased heart rate). When administered with adrenaline, the extract further amplified cardiac activity, indicating a potential synergistic interaction with adrenergic pathways. In contrast, acetylcholine produced a partial attenuation of the chronotropic response while exerting negligible effect on inotropic activity, thereby indicating a selective modulatory influence on cholinergic pathways. These findings suggest that Gulmehendi leaves show significant effects on heart activity with possible therapeutic benefits. However, the strong stimulatory actions at higher doses may also lead to harmful effects on the heart, highlighting the need for further animal studies and detailed safety evaluations.

**Keywords:** Gulmehendi, Hydroalcoholic extract, Cardiotoxic activity, Perfused heart model.

## GREEN NEUROPROTECTORS: BIOACTIVE EVALUATION OF MIMOSA & DELONIX IN ALZHEIMER'S

K.B. Shashank and K.V. Naga Lakshmi
Department of Pharmacology, VJ's College of Pharmacy, Rajamahendravaram, Andhra Pradesh, India – 533296
kbshashank25@gmail.com

Alzheimer's disease (AD) being a common neuro-degenerative disorder, is a major cause of disability and one of the top causes of mortality globally. The number of deaths from AD and other dementias increased from 687,751 to 1,952,677 per year [1990-2021]. Despite decades of research, effective disease modifying therapies remain exclusive, emphasizing the need for novel, multi-target strategies. The present study comparatively evaluated Mimosa pudica and Delonix regia using an integrated in silico-in vivo workflow. Phytoconstituents including mimosine (from M. pudica) and quercetin, kaempferol, lupeol, and β-sitosterol (from D. regia) were selected for their reported neuroprotective properties. In silico analyses encompassed network pharmacology, drug-likeness, ADMET profiling, and molecular dynamics simulations, identifying strong interactions with key AD-related targets such as β-amyloid aggregation and tau hyperphosphorylation. Standardized hydroalcoholic plant extracts were then administered to Albino Wistar rats, and neuroprotective efficacy was assessed using behavioural paradigms (Morris water maze, Y-maze, novel object recognition), biochemical assays (acetylcholinesterase inhibition, oxidative stress biomarkers, cytokine profiling), and histopathological examination of hippocampal tissue. Findings demonstrated that

ISBN: 978-81-980623-8-3

quercetin and mimosine exhibited significant multi-target activity, correlating with improved memory performance, reduced oxidative stress, and attenuation of neuroinflammation. These results validate computational predictions and highlight the therapeutic potential of these phytoconstituents. Dual-level approach underscores the value of integrating computational modelling with experimental validation in natural product-based drug discovery, offering promising insights into the role of M. pudica and D. regia as neuroprotective candidates for Alzheimer's disease management.

**Keywords:** Alzheimer's disease, Mimosa pudica, Delonix regia, Neuroprotection, In silico-in vivo.

**COMPUTATION AND BIOLOGICAL EVALUATION OF HARNESSING DRUG REPURPOSING FOR TREATMENT OF ALZHEIMER'S DISEASE**

Deepika V Kaviyarasu M
Department of Pharmacology, Sri Vijay Vidyalaya College of Pharmacy, Dharmapuri, Tamilnadu, India-636701
ammaappadeeps@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder marked by memory decline, cognitive impairment, and the accumulation of amyloid plaques and tau protein tangles in the brain. According to WHO estimated that 384 billion people affected due to dementia by 2025. In silico molecular docking (Schrödinger Maestro v13.1) assessed the drugs binding affinity with acetylcholinesterase (AChE) and butyrylcholinesterase (BuChE), complemented by ADMET profiling. In vitro AChE and BuChE enzyme inhibition activity was quantified by Ellman's method. Acute toxicity studies, following OECD TG guidelines, determined non-toxic doses of 3.125 mg/L for dimenhydrinate and 100 mg/L for nifedipine. In vivo studies on zebrafish, exposed to acrylamide-induced amnesia (0.75mM), treated with above fixed doses, were subjected to behavioral assessments using the Novel Tank Diving Test (NTT), Y-maze, and Novel Object Recognition (NOR) tests. The drug treatment was given for 24 days. On 29th day zebrafish brain was isolated used for biochemical analyses such as acetylcholinesterase levels, enzymatic (catalase, superoxide dismutase) and non-enzymatic antioxidants (reduced glutathione), total protein, and lipid peroxidation (malondialdehyde) levels were measured. Statistical analysis was performed using one-way ANOVA followed by Dunnett's test to efficacy and safety of these drugs for Alzheimer's therapy. Docking studies using Schrödinger Maestro 14.1 evaluated 17 drugs for their interactions with acetylcholinesterase and butyrylcholinesterase, identifying dimenhydrinate and nifedipine These drugs showed significant cholinesterase inhibition in vitro, with IC50 values for dimenhydrinate at 157.3±0.05 µM and 103.98±1.527 µM, and for nifedipine at 37.35±1.56 µM and 45.90±1.20 µM, against acetylcholinesterase and butyrylcholinesterase, respectively.

**Keywords:** Alzheimer's disease, Acetylcholinesterase, Butyl cholinesterase.

**INVESTIGATING POTENTIAL ROLE OF AGMATINE IN D-GALACTOSE INDUCED GONADAL AGING IN MALE AND FEMALE RATS**

Kanchan Khare, Shivani Ingole, Shubhada Mangrulkar, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, India-441002.
vasukbk@gmail.com

The reproductive system changes with age, affecting hormones, cycles, and fertility. This study examines Agmatine's influence on reproductive aging induced by D-galactose in Sprague-Dawley rats. Thirty-six male and female rats were divided into six groups. D-gal induced reproductive aging at 150 mg/kg body weight over 60 days. Rats received agmatine at 40 mg/kg and 80 mg/kg, L-arginine at 100 mg/kg, and aminoguanidine at 25 mg/kg. Over a period of 12 days, estrous cycles were monitored using vaginal smears to evaluate the stages of the cycle, levels of reproductive hormones, activity of antioxidant enzymes, presence of inflammatory markers, sperm characteristics, follicle numbers, and any histological alterations. D-gal exposure significantly ($P < 0.001$) lowered serum testosterone (T), estrogen (E), and anti-Müllerian hormone (AMH), while increasing luteinizing hormone (LH) and follicle-stimulating hormone (FSH) levels. Agmatine and agmatinergic modulators significantly ($p < 0.001$) raised T, E, and AMH levels and reduced LH and FSH levels compared to D-gal. The study evaluated malondialdehyde (MDA) as a marker of oxidative stress, alongside antioxidants such as glutathione (GSH), superoxide dismutase (SOD), and catalase. It also investigated tumor necrosis factor-alpha (TNF-α) and interleukin-6 (IL-6) as pro-inflammatory cytokines, as well as interleukin-10 (IL-10) as an anti-inflammatory cytokine. D-galactose was found to significantly ($P < 0.001$) elevate oxidative stress and pro-inflammatory markers while reducing antioxidant and anti-inflammatory levels. Nevertheless, the use of agmatine and other modulators contributed to reestablishing their balance. Agmatine treatments alleviated reproductive problems caused by D-gal, indicating its promise for addressing reproductive disorders associated with aging.

**Keywords:** Reproductive Aging, D-galactose, Agmatine, infertility.

**INVESTIGATION ON PATHOLOGICAL ROLE AND PHARMACOLOGICAL EFFECT OF AGMATINE IN RAT MODEL OF GLIOBLASTOMA**

Krushna Bajgire, Samiksha Vaidya, Milind J. Umekar, Manish M. Aglawe
Division of Neuroscience, Department of Pharmacology, SMT. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, India-441002
krushnabajagire@gmail.com

Glioblastoma (GBM) is the most malignant primary brain tumor, marked by rapid proliferation, neurological impairments, and poor prognosis. Current therapy, including temozolomide (TMZ), marginally improves survival but often worsens cognitive functions. Agmatine, an endogenous L-arginine metabolite, inhibits ornithine decarboxylase (ODC), reduces polyamine uptake, and exerts neuroprotective actions, yet its role in GBM remains unexplored. In this study, glioblastoma (GBM) was induced in Sprague Dawley rat offspring by administering N-ethyl-N-nitrosourea (ENU) intraperitoneally to dams on gestational day 15. Offspring were evaluated for survival, seizures, motor coordination, anxiety-like behavior, and cognition using validated behavioral tests including negative geotaxis, righting reflex, open field test, elevated plus maze, rotarod, and novel object recognition. Biochemical alterations were assessed through oxidative stress markers (TBARS, GSH, SOD) and inflammatory cytokines (TNF-α, IL-6, IL-10). ENU-induced rats exhibited significant mortality after postnatal day 70, along with seizures, ataxia, hyperactivity, and cognitive deficits. Thermal imaging (FLIR) revealed significantly elevated brain surface temperature in ENU-induced offspring, which was reduced following agmatine treatment. Marked increases in lipid peroxidation, TNF-α and IL-6, and a reduction in antioxidant defenses and IL-10 were also observed. Treatment with agmatine (20 and 40 mg/kg, i.p.) from postnatal day 30 produced dose-dependent improvement, as reflected by restored motor activity, reduced anxiety, enhanced memory performance, and correction of oxidative and inflammatory imbalances. Elevated brain agmatine levels after treatment further support its mechanistic role. These findings suggest a potential neuroprotective and anti-proliferative role of agmatine in ENU-induced GBM, which will be further validated through ongoing histopathological and immunohistochemical studies.

**Keywords:** Glioblastoma, Agmatine, ENU, Neurobehavior, Oxidative stress

**A STUDY ON THE COMPARISON OF ATTRIBUTABLE RISK ESTIMATES FOR RISK FACTORS ASSOCIATED WITH HYPERTENSION AT A TERTIARY CARE HOSPITAL**

Rushil Mohan*, Likitha M, Samrudh N, Buelah Milton
*Department of Pharmacy Practice, Krupanidhi College of Pharmacy, Bengaluru, Karnataka, India -560035
rushilmohan2001@gmail.com

Attributable risk is used as a statistical tool to find out the risk difference between two major groups. The study aims to estimate a comparison of 2 risk factors when combined and analysed within a tertiary care setting. A prospective observational study was conducted within the departments of General Medicine, Surgery, and OBG at MVJ Medical College and Research Hospital. On assessing the compartments between risk factors of 200 subjects, obesity and smoking were the highest risk groups. Some of the risk factors resulted in negative terms, showing a protective effect against the disease. We can conclude by saying that there are several risk factors when combined and compared with one another, which can lead to hypertension, with obesity being a common

ISBN: 978-81-980623-8-3

risk factor from our results. Hypertension Retinopathy was a complication recorded through our analysis, recorded within the results of the study, accounting for 18% of the sample size. (27 out of 150 patients). It is our job to monitor them on a timely basis and create awareness among the public against these risk factors leading to hypertension (one of the major diseases in recent times). Several practices, like therapeutic drug monitoring, should be implemented throughout to avoid medication issues.

**Keywords:** attributable risk, comparison, risk factors, hypertension

**PHARMACOINFORMATICS-BASED SCREENING OF PHYTOCHEMICALS FROM JASMINUM OFFICINALE L. AS ANTI-PROSTATE CANCER AGENTS: A NETWORK PHARMACOLOGY APPROACH**

Joshika Ramajayam*, Senthil Kumar Raju and Praveen Sekar
Department of Pharmaceutical Chemistry, Swamy Vivekanandha College of Pharmacy, Tiruchengode, Namakkal, Tamil Nadu, India – 637205.

Prostate cancer ranks as the second most prevalent cancer among males globally. It constitutes roughly 14.2% of newly diagnosed cancer cases in men, with an age-adjusted incidence rate of 29.4 per 100,000 individuals. Jasminum officinale L. is an ornamental plant, which possesses antiseptic, anti-ulcer, anticancer, anti-spasmodic and wound healing properties. It contains alkaloids, coumarins, flavonoids, terpenoids, steroids, phlobatanins, leucoanthocyanins and essential oils. In this study, we investigated the potential of phytochemicals from Jasminum officinale L. using a network pharmacology approach. Dr. Duke's Phytochemical and Ethnobotanical database, The Natural Products Atlas, Medicinal Plants database, Phytohub version 1.4, Coconut database, and KNApSAcK Core system databases were consulted for the phytochemicals. The SwissADME, ProTox 3.0, and CardioTOXCSM webservers were used to forecast the physicochemical, pharmacokinetic, and toxicity profile of the phytochemicals that were retrieved. The results demonstrated that the compounds were druggable and OSIRIS Property Explorer was used to forecast the drug score. Network pharmacology and enrichment analyses demonstrated that the phytochemicals will be highly effective against prostate cancer (SRC, AKT1 and EGFR). Then, molecular docking against the selected targets using Autodock tools was performed and compared with the co-crystallized ligand and standard. Owing to the various in silico studies, the compounds 2-Diacetylaminobenzoic acid, Benzyl salicylate, Caryophyllene oxide, Cis-linalol-oxide, Cis-pent-2-enyl-pentanlide, Jasmine-ketolactone, Jasminine, Kaempferol, Methyl(1R-trans)-3-oxo-2-pentylcyclopentaneacetate, Methyl-jasmonate and Oleacein were identified as hit compounds. Among them, the compounds Kaempferol and Jasminine were highly active against the tested targets with good binding energies and interaction profiles. These substances can therefore be utilized to combat prostate cancer. However, more in vitro and in vivo research is necessary.

**ASSESSMENT OF PHARMACIST INTERVENTION ON DIETARY INTAKE OF SALT AMONG HYPERTENSION PATIENT**

Rubini Venkatesan, Sivasakthi R and Mohan.S
Department of Pharmacy practice, Karpagam college of Pharmacy, Coimbatore-641032, Tamil Nadu, India.
rubimunishvb@gmail.com

The intake of either too much or too little salt affects the health. Salt is a mineral composed primarily of Sodium and Chloride Ions and are used in preservation of food and electrolyte balance in our body. Sodium ions are essential for maintain the electrolyte balance, muscle contraction and electrical signaling in the nervous system. Excess consumption of salt increases the electrical conduction which leads to hypertension and cardiac disease. The study aimed to assess the optimization of salt intake by pharmacist Intervention. The Prospective, observational, randomized study was conducted with 50 hypertensive patients for the period of 6 months at Cardiology department of Karpagam hospital, Coimbatore. The study result that, Male patients were more prone to hypertension than female in 61 %. (n=15). The Lower socioeconomic patients were highly affected with hypertension in 48% (n=12). Majority of the study patients were found with comorbidities of diabetes in 55% followed by chronic kidney disease in 23%. Age wise distribution indicates that, 50-55 years of age patients are more prone to hypertension in 61%. The result indicates that, the blood pressure bring to controlled by effective counseling and Intervention. The study concludes that; there was a significant change in quality of life of the patient by the Pharmacist Intervention.

**Keywords:** Hypertension, Intervention, Comorbidity, Salt restriction.

**RETROSPECTIVE ANALYSIS OF HYPERTENSION MANAGEMENT AND OUTCOMES AMONG STAGE 5-D CHRONIC KIDNEY DISEASE PATIENTS ON DIALYSIS**

Department of pharmacy practice, The Erode College of Pharmacy, MGR University, Tamil nadu, India
Feronika SJ, Boopathi Raja M, Juhishawla S
feronikajohnson@gmail.com

Hypertension is a major comorbidity among patients with stage 5-D chronic kidney disease (CKD) receiving maintenance hemodialysis, contributing substantially to cardiovascular morbidity and mortality. This study aimed to assess the prevalence, therapeutic management, and clinical outcomes of hypertension in this high-risk population. A retrospective cohort study was conducted at Primary kidney care Centre, involving 54 patients with stage 5-D CKD on maintenance hemodialysis. Data collected included demographic variables, serial blood pressure measurements (pre-, intra-, and post-dialysis), antihypertensive medication profiles, biomarker levels, and clinical outcomes over a one-month period. The study population consisted predominantly of males (72.5%), with a mean age of 46.3±11.71 years; the majority were within the 51–60 years age group (44.4%). Hypertension was observed in 90.4% of patients pre-dialysis and in 80.8% post-dialysis. Calcium channel blockers (nifedipine 48.1%, cilnidipine 27.7%) and beta-blockers (nebivolol 42.5%) were the most frequently prescribed agents. A significant reduction in systolic blood pressure was noted following dialysis (157.5±9.38 mmHg to 148.08±9.1 mmHg, $p<0.0001$). Laboratory findings revealed markedly reduced GFR (<10 mL/min, 30.8%) and elevated serum creatinine (>10 mg/dL, 23.1%). Clinical benefits included effective fluid overload management (92%) and correction of electrolyte imbalances (83%). Maintenance hemodialysis plays a pivotal role in blood pressure control among patients with stage 5-D CKD. Nevertheless, persistent hypertension underscores the need for individualized pharmacological regimens and integrated management strategies to mitigate cardiovascular risk and improve long-term outcomes.

**ASSOCIATION OF COMORBIDITIES WITH GLYCAEMIC CONTROL AMONG TYPE 2 DIABETES PATIENTS**

Sumana Maity, Vineesha Guntaka, Shobha Rani R.H
Aditya Bangalore institute of pharmacy education and research, Yelahanka, Bangalore, India -560064
foreversumana@gmail.com

Type 2 diabetes mellitus (T2DM) is frequently associated with comorbid conditions such as hypertension and chronic kidney disease, which may influence treatment outcomes. Understanding the impact of comorbidities on glycemic control is essential to optimize management strategies. The objective of this study is to evaluate the relation between comorbidities and glycemic improvement in patients with T2DM. In this study total of 30 patients with T2DM were included and grouped based on the presence or absence of comorbidities where 15 patients in each group. Glycemic control was assessed by comparing baseline and 3-month follow-up HbA1c values. The primary outcome was the mean change in HbA1c, while secondary outcomes included the proportion of patients achieving HbA1c <7%. Of the 30 patients analysed, 50% had at least one comorbidity. Patients with at least one comorbidity were significantly less likely to reach the target HbA1c < 7% at 3 months than those without comorbidities. The difference was statistically significant ($p=0.009$), indicating that comorbidity status is strongly associated with poorer glycemic. In conclusion, presence of comorbidities was associated with higher HbA1c at 3 months. Whereas, patients without

ISBN: 978-81-980623-8-3

comorbidities demonstrated better glycemic improvement compared to those with comorbidities. These findings suggest that comorbid conditions may influence diabetes outcomes. Larger studies are recommended to confirm these findings.

**Keywords:** Type 2 diabetes mellitus, comorbidities, HbA1c, glycemic control.

**RAPID POINT OF CARE FOR KIDNEY RELATED PROBLEM DETECTION**

SHABEEN TAJ
Vision college of pharmaceutical sciences and research
tajshabeen225@gmail.com

Rapid testing device for kidney related problems which is suitable for home based self testing as well as clinical screening. The rapid testing device for kidney related problems. The device is simple, rapid an non invasive diagnostic tool designed for point of care use. This device operates on the principle of electrochemical sensors, where the levels of creatinine are detected. low levels of creatinine causes kidney related diseases. so the device generally contains small micro controller, sensor, LED/LCD display, sample pad, reagent and many more. When the urine sample is applied the sensors detect the creatinine levels. The amount of creatinine can say if a person is suffering from kidney related diseases or not this method provides high sensitivity, specificity and care of interpretation making it suitable for home based self testing as well as clinical screening. The advancement includes in this is digital readers, smart phone based analysis and integration with biosensor technologies for improved accuracy. Overall this device represents a significance advancement in accessible diagnostic healthcare by combining affordability, convenience and reliability. The development of a rapid testing device for kidney related problems offers a simple, affordable and non invasive solution for early detection. By providing quick results outside of conventional laboratotries, such devices can support timely diagnosis, improve patient monitoring and potentially reduce the burden of chronic kidney disease on healthcare systems.

**AWARENESS AND ACCEPTANCE OF HPV VACCINE FOR CERVICAL CANCER PREVENTION - A CROSS-SECTIONAL STUDY.**

Sneha G, Ruhana Raffic
Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka, Bangalore, Karnataka, India-560064.
snehayadav0714@gmail.com

Cervical cancer, which is caused by Human Papillomavirus (HPV), is the second most prevalent cancer among women globally. The HPV vaccine is an essential preventive measure since it safeguards against HPV infections. This cross-sectional study examines the knowledge and attitude towards HPV among public; its connection to cervical cancer, vaccine awareness, willingness to receive it, and perceived challenges. The responses were collected through Google forms. A total of 206 participants responded the survey in which 47.8% were aware of HPV, 35% knew that HPV infection causes cervical cancer, and 29.2% knew about the HPV vaccine. A notable 52.2% of respondents expressed the view that the vaccine could lead to increased risky sexual behaviour among adolescents, and 56.7% thought only sexually active women need it. While 60.9% were ready to accept the vaccine if it was offered for free, and 40.8% felt it required more safety assurance. Based on findings, public knowledge and awareness are lacking due to insufficient education about HPV and its vaccine. And there are significant misconceptions about vaccine that hinder its acceptance. So, highlighting the need for appropriate public education programmes and awareness campaigns on cervical cancer, its prevention, and misconceptions about vaccines. Medical professionals active participation in campaigns can be effective. Tutoring medical students more about HPV infections and vaccines can help them educate the public about HPV screening and prevention. The vaccine can be made more prominent by using targeted advertisement, AI digital campaigns, and pharmacist efforts.

**Keywords:** Cervical Cancer, Human papillomavirus, HPV vaccine.

**PL-138**

**INVESTIGATION OF THE INHIBITORY EFFECTS OF PLGA-NANOPARTICLES OF SAFINAMIDE MESYLATE IN RPMI 2650 AND SH-SY5Y: AN IN-VITRO ANALYSIS**

Veena Kalyani S, Vedamurthy Joshi, and Anoop Manjunath
Department of Pharmaceutics, Vivekananda College of Pharmacy, Bangalore, Karnataka, India – 560055,
veenakalyani39@gmail.com

The current research aimed to explore the antiproliferative effects of PLGA-Nanoparticles of Safinamide mesylate (PNS) on Human squamous nasal epithelial cell (RPMI 2650 cell line) and Human bone marrow neuroblastoma cell (SH-Sy5Ycell line**)**, which represents one of the most prevalent Parkinsons' diseases (PD) associated with high incidence and mortality rates in Asian populations. The anti-parkinson's properties of safinamide mesylate in PD have not been thoroughly explored, so this study will demonstrate them. The cells received treatment with different concentrations of PNS in a dose-dependent manner (31.25,62.5,125,250,500,1000µg/ ml) and in a time-dependent (24 h) way. The viability of cells was subsequently evaluated using the MTT assay at an absorbance of 590 nm. PNS caused a decrease in cell viability and triggered apoptosis in the RPMI 2650 cell line and SH-Sy5Ycell line. PNS decreased cell growth in 24 h. Following a 24 h incubation with PNS at concentrations of 31.25, 62.5, 125, 250, 500, 1000 µg/ml, cell viability in RPMI 2650 cell and SH-Sy5Ycell line dropped from 100% in treated control cells to 63.34±0.0728, 35.34±0.028, 15.16±0.001, 5.91±0.0007, 1.05±0.0007, 0.4±0.0042 and 81.15±0.022, 64.61±0.016, 54.49±0.017, 42.97±0.015, 25.82±0.014, 4.76±0.007 respectively. The MTT assay results suggested that the PNS caused effective toxicity in RPMI 2650 cell and SH-Sy5Ycell line with IC50 value of 32.53µg/ml and 143.48 µg /ml respectively. This finding highlights the potential of PNS and probably indicates bene- ficial effects for parkinson's cell proliferation.

**PL-139**

**THE ANTIBACTERIAL, ANTIOXIDANT, AND ANTI-INFLAMMATORY PROPERTIES OF GREEN-SYNTHESIZED MAGNESIUM OXIDE NANOPARTICLES**

Shreenivashraja T, Mrs.Rajakumari R
Department of Pharmaceutical Biotechnology, PPG College of Pharmacy, Coimbatore, India. 641035.
shreenishreeni96@gmail.com

This study aims to investigate the antibacterial, antioxidant, and anti-inflammatory properties of magnesium oxide nanoparticles (MgONPs) synthesized using a green method involving fresh leaves of the Kalanchoe pinnata plant. The synthesized MgONPs were characterized using UV spectroscopy, dynamic light scattering (DLS), scanning electron microscopy (SEM), and Fourier-transform infrared spectroscopy (FTIR). The antibacterial efficacy of the nanoparticles was tested against both gram-positive and gram-negative bacterial strains. Antioxidant properties were evaluated using 2,2-diphenyl-1-picrylhydrazyl (DPPH) and Phosphomolybdenum (PM) assays, while anti-inflammatory activity was assessed through the protein denaturation method. The MgONPs exhibited significant antibacterial activity, effectively inhibiting the growth of harmful bacterial strains. The antioxidant assays revealed a strong capability to scavenge free radicals, suggesting their therapeutic potential. The anti-inflammatory evaluation demonstrated the nanoparticles' ability to mitigate inflammation, highlighting their potential as natural anti-inflammatory agents. The findings of this research underscore the promising role of green-synthesized magnesium oxide nanoparticles in biomedical applications, particularly for their antibacterial, antioxidant, and anti-inflammatory properties. These insights pave the way for eco-friendly nanoparticle synthesis and their diverse uses in medicine and healthcare.

**KEYWORDS:** Kalanchoe pinnata, Magnesium oxide nanoparticles, Antibacterial, Antioxidant

ISBN: 978-81-980623-8-3

This study aimed to evaluate the protective effects of Metadoxine on liver injury caused by chronic Aceclofenac administration in male Wistar rats. The liver is vital for drug metabolism, making it vulnerable to certain drug toxicities, including those from the NSAID Aceclofenac. Metadoxine, known to accelerate alcohol clearance and protect the liver, was investigated for its potential to prevent Aceclofenac-induced damage. Over 28 days, five groups of rats were treated daily with various agents. The groups received Aceclofenac (15 mg/kg), Metadoxine (100 or 200 mg/kg), or N-acetyl cysteine (NAC, 100 mg/kg), a known hepatoprotective agent used as a positive control. The study assessed the degree of liver injury by measuring liver function tests (AST, ALT, ALP), lipid profiles, and markers of oxidative stress. Results showed that Aceclofenac alone caused a significant decrease in liver size and an elevation in AST, ALT, and ALP levels, confirming severe hepatotoxicity. This group also showed an unfavorable lipid profile (high triglycerides and LDL, low HDL). In contrast, the Metadoxine-treated groups maintained normal levels of these parameters, similar to the control group. Furthermore, Metadoxine effectively mitigated oxidative stress, increasing levels of GSH and reducing MDA, SOD, and Catalase, mirroring the protective effects of NAC. In conclusion, Metadoxine demonstrates a significant protective effect against Aceclofenac-induced liver injury in rats. These findings suggest that Metadoxine could be a beneficial therapeutic candidate for preventing hepatotoxicity in patients requiring chronic Aceclofenac treatment.

**Keywords:** Aceclofenac, Metadoxine, NAC, Hepatotoxicity, AST, SOD.

**PL-141**

**REDEFINING STROKE RECOVERY: HARNESSING NEUROPLASTICITY THROUGH MUSIC THERAPY AND ART-BASED VISUAL MOTOR TRAINING**

Vengatesh G, Vigneshwaran R, Vidhya Arthy J, Sutheeswaran G
Department of Pharmacy Practice, PGP College of Pharmaceutical Science and Research Institute, Namakkal, Tamil Nadu, India-637 207
vengatesh421392@gmail.com

Traditional stroke rehabilitation often falls short due to limited patient engagement and restricted therapeutic scope. This case series explores the use of Music Therapy and Art-Based Visual Motor Training (AVMT) as creative, non-conventional interventions to stimulate neuroplasticity in post-stroke recovery. Five patients aged 25–74 underwent 8 weeks of individualized therapy combining rhythm-based, melodic, and emotionally resonant music interventions with guided drawing, painting, and symbolic expression. Outcomes were measured using motor (Fugl-Meyer), language (Boston Naming Test, WAB), cognitive (MoCA), mood (HAM-D), and patient satisfaction scales. All patients demonstrated functional and emotional improvements. For example, upper limb motor scores improved by up to 23 points, aphasia recovery showed 35% gains in naming accuracy, and depressive symptoms (HAM-D) declined by 5–11 points. Creative engagement improved adherence and emotional well-being, even in patients with cognitive fatigue or apathy. These findings support the potential of creative therapies to activate multimodal brain networks involved in motor planning, emotional processing, and attentional control. Music and art-based approaches may serve as powerful adjuncts to conventional rehabilitation by enhancing motivation and promoting cortical reorganization. In conclusion, integrating music and visual-motor art therapies into stroke care offers a promising, patient-centered pathway to recovery. Further research is needed to better understand their mechanisms and optimize neurorehabilitation strategies through interdisciplinary, neuroplasticity-informed approaches.

**Keywords:** AVMT, Neuroplasticity, Stroke, Music Therapy, MoCA.

**TAURINE MITIGATES SICKNESS BEHAVIOR IN MICE: EXPERIMENTAL EVIDENCE AND MECHANISMS**

Ambika Alreddy1, Veeresh P Veerapur2, Vijaykumar S3
1Department of Pharmacology, Harsha College of Pharmacy Bangalore, Karnataka- 562123
2Department of Quality Assurance, Shree Siddaganga college of pharmacy Tumakuru-572101
3Department of Pharmacology Shree Siddaganga college of pharmacy Tumakuru -572101
ambikavsm@gmail.com

Sickness behavior represents adaptive behavioral modifications during infections that enhance survival by conserving metabolic resources and reducing pathogen transmission, including reduced activity, anorexia, and lethargy. By inhibiting the NF-κB pathway and reducing the production of cytokines, taurine, an amino acid that has anti-inflammatory, neuroprotective, and anxiolytic effects. This study used Swiss albino mice split into five groups (N=8) to examine the effects of taurine on lipopolysaccharide (LPS)-induced sickness behavior. Treatment groups received taurine (60 or 120 mg/kg, i.p.) or dexamethasone (1 mg/kg, i.p.) three days before LPS administration, while control groups received vehicle for three days prior to saline or LPS (0.83 mg/kg, i.p.) challenge. In-depth behavioral evaluations included brain oxidative stress analysis, elevated plus maze, open field, light-dark box, forced swim test, social interaction, sucrose preference, and food/water intake measurements. LPS treatment produced marked anorexia with decreased food/water consumption, reflecting characteristic metabolic reorganization during infection responses; it also caused pronounced anhedonia, as evidenced by decreased sucrose preference; and it significantly reduced light-dark compartment transitions, indicating decreased exploratory behavior and increased anxiety. Taurine pretreatment at both doses significantly decreased brain oxidative stress markers and attenuated LPS-induced behavioral deficits in a dose-dependent manner similar to that of dexamethasone; these neuroprotective effects were probably caused by mechanisms involving increased GABAergic transmission, antioxidant activity, maintenance of calcium homeostasis, and inhibition of the NF-κB pathway. These findings show that taurine has therapeutic potential for inflammatory conditions, suggesting that it may be used as a disease-modifying treatment that addresses behavioral symptoms as well as the underlying neuroinflammation.

**mRNA-BASED THERAPEUTICES BEYOND VACCINES**

MISS. KHUSHBU SAHU, DAMRUDHAR NAG, JASWANT RAMTEKE
1.Lacturer, Department of PHARMACEUTICS, Danteswari college of pharmacy Borpadar jagdalpur,494221, C.G.,
Sahukhushbu776@gmail.com

Messenger RNA (mRNA) therapeutics have transitioned from a long-standing scientific concept into a transformative reality, with the rapid development of COVID-19 vaccines demonstrating their clinical potential. The flexibility and speed of mRNA design have positioned it as a powerful platform for combating emerging viral threats. Beyond vaccines, mRNA is increasingly being explored as a versatile therapeutic modality for diverse applications, including protein replacement, cancer immunotherapy, and treatment of genetic disorders. Despite these opportunities, several challenges limit broader clinical translation. Key hurdles include avoiding unintended immune activation, achieving durable and high-level protein expression, and developing safe, efficient delivery systems capable of targeting specific tissues. Recent advances in lipid nanoparticles, modified nucleosides, and delivery strategies have begun to address these obstacles, yet optimization remains critical for long-term success. Emerging approaches, such as circular mRNA constructs and self-amplifying RNAs, offer next-generation solutions by improving stability, extending expression duration, and reducing required doses. These innovations hold promise for expanding the therapeutic scope of mRNA technologies beyond their current role in infectious disease prevention. In this review, we highlight the diverse applications of mRNA therapeutics, evaluate technological progress in design and delivery, and discuss the remaining challenges that must be overcome for broader adoption. We also explore future directions in the field, emphasizing how next-generation platforms may unlock new frontiers in medicine. Ultimately, mRNA therapeutics represent a rapidly evolving field with the potential to reshape prevention and treatment strategies across a wide spectrum of diseases.

**COMPARATIVE EVALUATION OF CAPOX AND FOLFOX REGIMENS WITH OR WITHOUT IRINOTECAN IN COLORECTAL CANCER: A PROSPECTIVE OBSERVATIONAL STUDY**

ISBN: 978-81-980623-8-3

*HIMAJA.T1, V. RISHMA2, R. GANESH3, K SECHANA4
1,2,3,4Mallareddy Institute of Pharmaceutical Sciences, Malla Reddy Vishwavidyapeeth

Colorectal cancer is cancer that occurs in the rectum or colon. Colorectal cancer is one among the most commonly occurring type of cancer and is also third in cancer-related mortality. Currently, CAPOX (Capecitabine and Oxaliplatin) and FOLFOX (5-fluorouracil, Leucovorin, and Oxaliplatin) are one of the conventional adjuvant treatments of colorectal cancer. To evaluate and compare the efficacy and safety of CAPOX and FOLFOX regimens, with or without irinotecan, and to assess their role in clinical outcomes of colorectal cancer patients. A prospective observational study was conducted in 158 CRC patients treated with CAPOX, FOLFOX, or their combination. Patients were enrolled using defined inclusion and exclusion criteria. Treatment efficacy, adverse effects, and clinical outcomes were documented and comparatively analysed. Of 158 patients, 62.6% received FOLFOX, 19.6% CAPOX, and 17.7% both regimens. Colon (36.7%) and rectal cancer (22%) were most common. FOLFOX was preferred and better tolerated, whereas CAPOX had more adverse effects. Combination therapy, particularly with irinotecan, yielded superior clinical outcomes. FOLFOX demonstrated superior tolerability compared to CAPOX and was the preferred regimen. Combination therapy, especially with irinotecan, showed enhanced clinical benefit, supporting its role in optimizing colorectal cancer management.

**Keywords:** Colorectal cancer, CAPOX, FOLFOX, Irinotecan, Chemotherapy

## ASSESSMENT OF MEDICATION ADHERENCE IN PATIENTS WITH HYPERTENSION

Shreya Sinha, Dr. Vineesha Guntaka, Dr. Shobha Rani R.H
Aditya Bangalore Institute of Pharmacy Education and Research, Bengaluru, Karnataka, India
shreyasingha1501@gmail.com

Medication non-adherence remains a major challenge in hypertension care, often resulting in uncontrolled blood pressure and preventable complications. This prospective interventional study enrolled 25 hypertensive patients and followed them over 15 days to evaluate adherence patterns, barriers, and the impact of pharmacist-led support. At baseline, adherence assessed with the MMAS-8 revealed that 44% were adherent, while 56% were non-adherent, most commonly due to forgetfulness (57%) and irregular routines (43%). Non-adherent patients received tailored pharmacist interventions, including one-to-one counselling, prioritisation of essential medicines, provision of pill organisers, and daily SMS/WhatsApp reminders. After 15 days, adherence improved significantly to 84% ($p < 0.01$), with high adherence rising from 16% to 48%. This improvement was accompanied by a meaningful reduction in blood pressure, with mean systolic values decreasing from 146.2 ± 8.5 mmHg to 137.4 ± 7.2 mmHg ($p < 0.01$) and diastolic values from 91.6 ± 5.2 mmHg to 86.1 ± 4.9 mmHg ($p < 0.05$). Patients reported high satisfaction with the interventions, particularly valuing counselling, reminders, and pill organisers. These findings highlight the important role of pharmacists in addressing practical barriers to adherence, supporting blood pressure control, and ultimately improving the quality of life for patients living with hypertension.

## KNOWLEDGE, ATTITUDE AND PRACTICE TOWARDS DENGUE FEVER AMONG THE POPULATION IN RURAL COMMUNITY

K. Jeevitha and K. Krishnaveni
Department of Pharmacy Practice, Vivekanandha Pharmacy College for Women
Salem, Tamil Nadu, India – 637303
jeevithakalaiarasan01@gmail.com

Dengue fever is caused by a mosquito- borne human viral pathogen that belongs to the genus Flavivirus of the family Flaviviridae (single, non-segmented RNA virus). Human habit of storing water, rainfall which leads to storage of water in discarded coconut shells, tires, and other material causes breeding of aedes mosquitoes, vector of dengue. The study aimed to assess the socio- demographical and health status, knowledge, attitude, and practice towards dengue among population in rural community. A cross-sectional study was conducted in rural Katheri, Salem district, Tamil Nadu involving 500 residents aged 25-70 years. After IEC approval and questionnaire design, demographic details and knowledge, attitude, and practices related to dengue were assessed, followed by systematic data analysis and report submission. A total of 515 individuals were approached, out of which 15 refused, and 500 participants were recruited, consisting of 196 males (39.2%) and 304 females (60.8%). Most of the participants were aged between 51–60 years (27%). Regarding education, 28% were illiterate, secondary (19.4%). In terms of occupation, 47.2% were employed, while 31% were homemakers. Out of these participants, 60.4% did not receive any home visits or education about dengue fever from health educators. Most of the study population had encountered dengue within their families 20.6% and social acquaintance 63%. The study showed fair knowledge and positive attitudes towards dengue, but poor awareness of transmission. Inconsistent health education and control measures highlight the need for continuous awareness programs and stronger community participation.

**Keywords:** Aedes mosquitoes, Dengue, Cross- sectional study, Rural Community, Data analysis

## AGMATINE–OXYTOCIN INTERACTION: A POTENTIAL THERAPEUTIC AVENUE IN PARKINSON'S DISEASE

Shivanshu Mishra, Dhanashree Tekade, Madhura Dixit, Brijesh Taksande, Milind Umekar
Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Maharashtra, India – 441002
Shivamish144@gmail.com

Parkinson's disease (PD) is a progressive neurodegenerative disorder with multifactorial etiology involving genetic and environmental factors. Although current treatments provide symptomatic relief, there is a need for novel therapeutic strategies with disease-modifying potential. The present study was designed to investigate the interaction between agmatine and oxytocin in a lipopolysaccharide (LPS)-induced rat model of PD, characterized by motor deficits, anhedonia, tremors, and anxiety-like behaviour. Behavioural performance was evaluated using the catalepsy bar test, grip strength test, balance beam test, and open field test (OFT). Agmatine (40–80 mg/kg) and oxytocin (1.5–4.5 IU) improved behavioural outcomes, with moderate doses showing the most consistent effects. Interestingly, higher doses and their combined administration produced diminished benefits, suggesting a dose- and interaction-dependent influence. In addition, treatment alleviated LPS-induced body weight loss. Biochemical assays revealed modulation of dopamine levels and a reduction in oxidative stress, as evidenced by decreased nitrite concentrations compared with the PD control group. Collectively, the findings indicate that agmatine and oxytocin exert beneficial effects on PD-like symptoms and oxidative stress, though their interaction appears to be complex and dose-dependent. This highlights the therapeutic promise of these agents, while underscoring the importance of understanding their synergistic or antagonistic interplay in PD management.

**Keywords:** Agmatine; Oxytocin; Parkinson Disease; Lipopolysaccharide; dopamine.

## SYSTEMS PHARMACOLOGY AND MULTI-SCALE MECHANISM OF BIOACTIVES FROM LIMONIA ACIDISSIMA L. IN TREATING ALZHEIMER'S DISEASE

Shrinithi Shankar*, Senthil Kumar Raju and Praveen Sekar
Department of Pharmaceutical Chemistry, Swamy Vivekanandha College of Pharmacy, Tiruchengode, Namakkal, Tamil Nadu, India – 637205.

Alzheimer's disease is the most common type of dementia, causing up to 60-80 % of dementia cases. Limonia acidissima L. is a medicinal plant, which contains alkaloids, flavonoids, terpenoids, steroids, glycosides, tannins and settled oils. In this study, we investigated the potential of phytochemicals from Limonia acidissima L. using a systems pharmacology approach. The phytochemicals were sourced from Dr. Duke's Phytochemical and Ethnobotanical database, IMPPAT, the

ISBN: 978-81-980623-8-3

Coconut database, Phytohub version 1.4, the Medicinal Plants database, The Natural Products Atlas and the KNApSAcK Core system databases. The SwissADME, ProTox 3.0 and CardioTOXCSM webservers were used to estimate the phytochemical's physicochemical, pharmacokinetic and toxicological profiles. OSIRIS Property Explorer was used to estimate the drug score and the results demonstrated that the compounds were druggable. The network modelling and enrichment analyses predicted the phytochemical's ideal targets, which indicated that they would be extremely active against Alzheimer related targets, namely AKT1, BCL2, IL6, JUN, TNF, TP53, and STAT3. The correlation analysis was performed using Gepia2 webserver and molecular docking against the selected targets using Autodock tools was performed and compared with the co-crystallized ligand and standard. Owing to the various in silico studies, the compounds (-)-Globulol, Auraptene, Caryophyllene oxide, Dihydrosuberenol, Isoimperatorin, Marmesin, Osthenol, Osthole, Suberosin and Tanakine were identified as hit compounds. Among them, Isoimperatorin and Marmesin were highly active against the tested targets with good binding energies and interaction profiles. Thus, these compounds can be used against Alzheimer's disease. However, further in vitro and in vivo studies are warranted.

## KNOWLEDGE, ATTITUDE, PRACTICES AND AWARENESS ON BREAST CANCER

K. KANIMOZHI
JKKM COLLEGE OF PHARMACY
ngkanimozhi@gmail.com

Breast cancer is one of the most common diseases that affect women worldwide. This study was conducted to assess the knowledge, Attitude, practices, and awareness of breast cancer as well as to assess the knowledge on breast self-examination (BSE) and clinical breast examination (CBE). The questionnaire-based study was conducted among females above the age of 18 from Komarapalayam , Namakkal district. 384 participants were randomly selected from the total population of the Komarapalayam. Data were analyzed using the Chi-square test. Following on validating the Post follow-up data, we used wilcoxan sign rank test. $P<0.05$ was considered statistically significant. 384 participants responded to the questionnaire among them 34.37% women were aged between 18-25, 59.6%women were married, 29.2 % were home maker, 40.1% were studied UG and only 2.6% were previously diagnosed breast cancer. Among them, those between the age categories of 18 to 25 demonstrated a better level of understanding on the knowledge of breast cancer. Analysis of the correlation between the overall practice score and age category revealed that the age category of 36-45 was more effective than other categories in the percentage of practice toward breast cancer conditions. We conducted a follow-up based on reevaluating the knowledge following awareness after a period of 4 months. It revealed a reasonable improvement from an average score increase of 3.54 to 12.9.

## REGENERATION OF LOST ORGANS IN HUMANS BY INACTIVATION OF P21 GENE

Nisha R.V and Anvesh Raj M
Department of Pharmacology, Vivekanandha Pharmacy College for Women, Sankagiri, Salem, Tamilnadu, India - 637303.
nishaveerappan04@gmail.com

Regeneration is the ability to restore lost or damaged body parts is a fascinating natural process seen across the animal kingdom. While humans can heal wounds and regenerate certain tissues like skin, liver, and blood cells, our capacity for regrowing complex structures is very limited. Interestingly, some species, such as the axolotl, can fully regrow limbs, organs, and even parts of the brain throughout their lifetime. Inspired by these remarkable creatures, researchers are exploring ways to unlock similar potential in humans. One promising path is the inactivation of the p21 gene. Normally, p21 acts like a "brake" in the cell cycle, stopping excessive cell growth. By temporarily switching off this brake, cells can multiply more freely, forming new tissue that can be reshaped into functional organs a process known as epimorphic regeneration. This approach, combined with advanced techniques like stem cell therapy, bioengineered scaffolds, and lab-grown tissues, could one day allow us to repair damaged hearts, regrow kidneys, restore hearing through ear regeneration, and even repair dental structures. Unlike traditional organ transplants, this method could reduce the need for donors, lower the risk of immune rejection, and help even severely ill patients who cannot undergo major surgery. Retinoic acid and vitamin D3 have been identified as potential tools for controlling p21 activity safely. While challenges remain such as avoiding tumor growth and addressing ethical considerations the possibility of awakening our body's hidden regenerative powers brings us closer to a future where organ loss may no longer be permanent.

## CHALCONE DERIVATIVES AS PROMISING LEADS FOR LIVER DISEASE MANAGEMENT: FROM CELLULAR DEFENSE TO ANTI-FIBROTICACTION"

**Shaikh Gausiya Nasir, Dr. Md. Rayees Ahmad, Mrs. Nirwane Aboli.**
Dept. of Pharmaceutical Chemistry, RP College of Pharmacy, Aalni, Dharashiv, MH, 413501.

Chalcones, defined by the 1,3-diaryl-2-propen-1-one scaffold, are flavonoid precursors known for their diverse pharmacological properties. Their hepatoprotective potential has gained attention due to the global burden of liver diseases, which are often driven by oxidative stress, chronic, and progressive fibrosis. Chalcones act as multifaceted protectants by neutralizing reactive oxygen species (ROS), enhancing endogenous antioxidant defences such as superoxide dismutase, catalase, and glutathione peroxidase, and suppressing lipid peroxidation in hepatocytes. Additionally, they inhibit key inflammatory cytokines including TNF-α and IL-6, contributing to their anti-inflammatory profile. Representative derivative such as isoliquiritigenin and licochalcone have demonstrated efficacy in preclinical models, improving hepatocyte viability and functional biomarkers under toxic stress, such as

ISBN: 978-81-980623-8-3

acetaminophen exposure. Chalcones exhibit anti-fibrotic effects by blocking hepatic stellate cell activation and limiting collagen deposition, thereby preventing fibrosis and cirrhosis. Their biological activity is largely attributed to the unsaturated α, β-ketone group, which serves as a reactive pharmacophore. Because of alcoholism, Chemical induced food and medicine leads to Liver diseases. The present research investigation is mainly focused on the synthesis of chalcones, by Claisen-Schmidt condensation is a widely used synthetic method for generating chalcone derivatives tailored for hepatoprotective applications. Few of the chalcone derivatives have synthesized and evaluated for In vitro toxicity assays also indicate a favourable safety profile at therapeutic concentrations. Their further optimization and evaluation confirmed by Spectroscopic analysis like FTIR, Mass and NMR, etc., Future research should focus on mechanistic exploration and translational validation in vivo and clinical models to fully harness chalcones' therapeutic potential in liver disease management.

**Keywords:** Chalcones, Hepatoprotective, anti-fibrotic, anti-oxidant, Claisen-Schmidt condensation.

While studying digital healthcare, we came across the concept of a Smart Health Card, which we found very interesting. It is basically a digital card that uses a QR code to quickly access a patient's medical details. From our study, we learned that this card stores important information such as personal details, allergies, medical history, and even has a weight-based dose calculation tool. What makes it more useful is that in emergency situations, the card can show only life-saving information without needing internet or login, which we think is very practical. On the other hand, more detailed information like prescriptions, surgeries, and reports can be kept in a secure mode with password protection. We also learned that this system can be connected with national digital health frameworks like ABHA ID in India. Overall, from our understanding, the Smart Health Card is designed to reduce medication errors, improve patient safety, and make healthcare delivery faster and more reliable.

**Keywords:** Smart Health Card, QR code, weight-based dose calculation, emergency healthcare, digital health records.

**THE FUTURE OF PHARMACOVIGILANCE: AI IN PHARMACOVIGILANCE SHAPING THE FUTURE OF DRUG SAFETY**

Chennareddy Varshitha Reddy
Department of pharmacology, Narayana Pharmacy college, Nellore, A.P, India, 524004
varshithareddychennareddy1504@gmail.com

Adverse Drug Reactions (ADRs) have become a significant issue in healthcare institutions leading to substantial morbidity, mortality and cost to healthcare. The traditional pharmacovigilance systems are based on spontaneous reporting, which suffers from the problem of under-reporting. Edwin GEORGE It has also been proved the contribution of AI in order to improve PV and ADRs detection. Current literature and applications of AI in pharmcovigilance, with an emphasis on machine learning algorithms, natural language processing (NLP), and real world HAs were reviewed. Informatics: AI facilitates rapid and better identification of ADRs by scanning huge amounts of structured and unstructured data, such as EHR, social media, and clinical trial databases. Machine learning algorithms can forecast potential drug safety signals and NLP strategies may enhance the retrieval of useful information from the medical record. These technologies help with the early detection, reduce reporting bias, and assist in regulatory decisions. AI may transform pharmacovigilance through ADR detection and monitoring. Its implementation in health care systems will advantage safer use of drugs, early detection signals and improved safety of patients. Artificial Intelligence (AI) has the potential to revolutionize pharmacovigilance and to enhance detection of ADRs.

Gaytribawane2000@gmail.com

Hypothyroidism is a clinical disorder characterized by insufficient thyroid hormone production. This study evaluated the therapeutic potential of agmatine and spermidine in a methimazole-induced hypothyroid rat model, focusing on thyroid function and metabolic regulation. Adult female Sprague-Dawley rats (n = 6 per group) were divided into five groups. Hypothyroidism was induced orally by methimazole (80 mg/kg) for 21 days. After confirmation of hypothyroidism by altered serum thyroid hormone levels, treatment with agmatine (40 mg/kg) and spermidine (5 and 10 mg/kg) was administered orally for 14 days. Parameters included thyroid hormones, lipid profile, liver and kidney function, fasting glucose, serum nitric oxide, and gut microbiota. Thyroid and liver tissues were examined histologically. Methimazole significantly reduced T3 and T4 while elevating TSH, confirming hypothyroidism. It also caused weight loss, fur roughening, dyslipidemia, hyperglycemia, elevated nitric oxide, hepatic and renal dysfunction, and gut dysbiosis. Histopathology revealed thyroid follicular disruption and hepatic degeneration. Treatment with agmatine and Spermidine significantly reversed these changes. Notably, spermidine at 10 mg/kg showed the most effective restoration of biochemical and histological alterations. Both agents improved hormonal and metabolic markers and reduced tissue injury. These findings suggest agmatine and spermidine hold therapeutic promise against methimazole-induced hypothyroidism.

**IDENTIFICATION & EVALUATION OF THERAPEUTIC POTENTIAL OF HIGHLY SELECTIVE ESTROGEN RECEPTOR – BETA (ER-B) PHYTOESTROGEN IN TESTOSTERONE & N-METHYL N-NITROSO UREA (MNU) INDUCED PROSTATE CANCER MODEL**

Raghul L R V and Divakar Selvaraj
Department of Pharmacology, JSS College of Pharmacy, Ooty, Tamil Nadu, India – 621702
raghulvenkat2000@gmail.com

Overcoming the therapeutic failure due to androgen receptor (AR) resistance, remains a major global challenge in prostate cancer and selective modulation of estrogen receptor-beta (ER-β) offers a promising alternative strategy. The present study aimed to identify and evaluate a selective ER-β modulating phytoestrogen with anti-prostate cancer potential using an integrated in-silico, in-vitro, in-ovo, and in-vivo approach. A curated database of 100 phytoestrogens was established, and GPER-1 structure was predicted via homology modelling (I-TASSER), validated by Ramachandran plot and ERRAT server. The in-silico work included virtual screening, molecular docking, MM-GBSA & molecular dynamics simulations revealed Hesperetin, a bio-flavonoid, as a highly selective ER-β ligand with favourable GPER-1 affinity and binding stability. Further, the in-vitro evaluation on androgen-independent PC-3 cells demonstrated dose-dependent cytotoxicity, caspase-3 activation, and apoptotic potential (AO/EtBr staining). In-ovo assays (HET-CAM and YSM) confirmed strong anti-angiogenic activity of Hesperetin. For in-vivo validation, a novel testosterone plus N-methyl-N-nitrosourea (MNU) model was employed to induce prostate cancer in male Wistar rats, replicating molecular & histopathological features of human adenocarcinoma without surgical castration. Treatment with Hesperetin (80 mg/kg) significantly ($p<0.05$) reduced prostate weight, volume, and cancer biomarker levels, while improving survival, hormonal balance, nucleic acid concentrations, and histopathological outcomes. Collectively, these findings highlight Hesperetin as a promising ER-β selective phytoestrogen with potent anti-prostate cancer activity mediated via apoptotic, anti-angiogenic, and molecular signalling pathways. This study underscores the therapeutic potential of

**ONCO DETECT "A RAPID AND INNOVATIVE KIT FOR BLOOD CANCER DIAGNOSIS"**

SANA TABASSUM
VISION COLLEGE OF PHARMACUETICAL SCIENCES AND RESEARCH
sanatabassum930@gmail.com

Blood cancer such as Leukemia, Lymphoma and Multiple Myloma remain a major global health challenge due to their high mortality rates and latestage diagnosis. Current diagnostic procedures, including bone marrow biopsy and flow cytometry, though accurate are invasive, time consuming and costly. Therefore, there is a strong need for a rapid, non-invasive and affordable diagnostic method that can enable early detection and timely clinical intervention. The objective of this project is to design and develop a rapid diagnostic kit for blood cancer detection based on immunochromoatographic technology, targeting specific biomarkers and enzymes associated with hematological malignancies. The kit is based on principle of genetic markers associated with malignant blood cells using the combination of immunochromatographic technology and nanomaterial based signal amplification. The kit aims to provide a simple, one step test yielding results within 20-30 minutes. This diagnostic platform has the potential to provide a simple, rapid and cost effective tool for the early detection of blood cancers. By reducing dependency on invasive procedures and laboratory infra structure, the proposed kit could significantly improve early diagnosis, facilitate timely treatmeant, and enhance patient outcomes, especially in resource-limited settings.

**NEUROPROTECTIVE POTENTIAL OF ASPIDOSPERMA QUEBRACHO-BLANCO SCHLTDL. IN SCOPOLAMINE-INDUCED ALZHEIMER'S DISEASE USING ADULT ZEBRAFISH**

Sermugapandian Nithya*
Department of Pharmacology, Sri Ramachandra Faculty of Pharmacy, Sri Ramachandra Institute of Higher Education & Research (SRIHER), Chennai- 600 116, Tamil Nadu, India.
nithya.s@sriramachandra.edu.in

This study evaluated the neuroprotective potential of Aspidosperma quebracho-blanco Schltdl. (AQB) in a scopolamine-induced Alzheimer's disease model using adult zebrafish. Six groups were designed, including a normal control, a scopolamine-induced group, a rivastigmine-treated group, and three AQB-treated groups at doses of 10, 15, and 20 mg/L. Behavioural tests such as the T-maze and light/dark preference were used to assess memory and anxiety-like behaviours, while in vitro assays including DPPH radical scavenging and MTT assays on SH-SY5Y neuronal cells evaluated antioxidant activity and neuroprotection. Histopathological analysis further assessed brain tissue integrity. Results showed that AQB significantly improved cognitive and behavioural outcomes, demonstrated by reduced transfer latency and increased preference for favourable zones, while also displaying potent antioxidant activity through effective DPPH radical scavenging. AQB inhibited acetylcholinesterase activity, suggesting enhanced cholinergic neurotransmission, and histological examination confirmed its role in preserving neuronal architecture and preventing scopolamine-induced neurodegeneration. Overall, AQB exhibited strong neuroprotective effects mediated primarily by antioxidant and anticholinesterase mechanisms, highlighting its potential as a natural therapeutic agent for mitigating cognitive decline and neuronal damage in Alzheimer's disease, and supporting its promise as a candidate for developing novel preventive and treatment strategies.

**PRESCRIPTION ANALYSIS OF METABOLIC SYNDROME AT TWO DIFFERENT COMMUNITY PHARMACIES IN KERALA: A RETROSPECTIVE STUDY**

Alphonsa Mathew and Kavitha S
Department of Pharmacy practice, KUHS University, Thrisur, Kerala, India- 680528.
alphonsampharm@gmail.com

Metabolic syndrome (MetS), also called insulin resistance syndrome, is a cluster of conditions that increase the risk of heart disease, stroke and diabetes. The practice of prescription of metabolic syndrome varies in different regions. So this study aims to know the prescribing pattern of 2 distinct regions in Kerala. It was an observational study and collected the data retrospectively with a duration of 5 months with 50 prescriptions each from 2 distinct regions. All the prescriptions were analysed by the XLSTAT method using Microsoft Excel. A total of 100 prescriptions were collected having MetS, 50 from each region. Maximum patients were in the age group of 51-60 years in Perumbavoor and in Thuneri, Maximum patients were in the age group of 61-70 years. 28 male and 22 female patients in both regions, indicating a male preponderance of the disease. The most commonly prescribed anti-diabetic group, was biguanides in both regions. The most commonly prescribed anti-hypertensive group either as monotherapy or combination therapy was angiotensin receptor antagonist in Thuneri. Beta-Blockers the most commonly prescribed drug for antihypertensive therapy in Perumbavoor. JNC does not recommend Beta-Blockers as first line drug for anti-hypertensive therapy. In Perumbavoor, 92% of patients were prescribed statins, and in Thuneri, 72% % of patients were prescribed statins.

**Keywords:** Metabolic Syndrome (MetS)

**PL-161**

**IMPLEMENTATION AND EVALUATION OF DRUG INFORMATION SERVICES IN SECONDARY CARE HOSPITALS: A PROSPECTIVE ANALYSIS**

Vijay Kadam, Anusha Bhavani Kalluri, Ambika Kethavath, Vivek Konda, G Narasimha Rao
Vikas College of Pharmaceutical Sciences, Rayanigudem, Suryapet – 508 213

This prospective observational study evaluated the implementation of Drug Information Services (DIS) in secondary care hospitals in Suryapet over six months. The study aimed to provide drug information sources to promote quality medication use by delivering timely and accurate information about drugs to healthcare professionals. During the study period, 230 queries were received from various departments: general medicine (37%), gastroenterology (17%), orthopedics (9%), emergency medicine (8%), pulmonology (8%), dermatology (4%), general surgery (4%), gynecology (3%), and psychiatry (2%). Drug information requests

ISBN: 978-81-980623-8-3

concerned drug availability (24%), general information (13%), dosage (13%), treatment (11%), interactions (7%), pharmacokinetics (7%), and poisoning, adverse drug reactions, administration, indication, and pharmacodynamics (4% each). The service facilitated collaborations with organisations, pharmacies, and healthcare providers for education and outreach activities, encouraging medication safety. The distribution of drug information queries reveals areas that require additional assistance. By focusing on high-demand specialisations and raising awareness in underrepresented sectors, healthcare personnel can make more informed decisions related to drugs, thereby improving patient safety and treatment efficacy. Drug Information Services prove essential for enhancing medication management in secondary care settings.

**SYNERGISTIC THERAPEUTIC POTENTIAL OF MORUSIN AND 2',4'-DIHYDROXY-7-METHOXY-8-PRENYLFLAVAN DERIVED FROM MORUS ALBA LEAVES IN MITIGATING DIABETIC CARDIOMYOPATHY VIA NF-KB PATHWAY SUPPRESSION IN ALLOXAN-INDUCED RAT MODELS.**

Shailaja Ande1, Kumar Shiva Gubbiyappa2*
1 Department of Pharmacology, Gitam School of Pharmacy, Gitam Deemed to Be University, Visakhapatnam, Andhra Pradesh-530045.
2 Gitam School of Pharmacy, Gitam Deemed to Be University, Rudraram, Patencharu, Sangareddy-502329.

Diabetic cardiomyopathy (DCM), a severe complication of diabetes, is driven by inflammation, oxidative stress, apoptosis, and cardiac remodeling. Suppression of the NF-κB pathway is a promising therapeutic strategy. This study evaluated the synergistic potential of Morusin and 2',4'-Dihydroxy-7-methoxy-8-prenylflavan (DMP-flavan), bioactive compounds from Morus alba leaves, in alleviating DCM by targeting oxidative stress and the NF-κB pathway. H9c2 cardiomyocytes exposed to high glucose (33 mM) were used to assess ROS levels (DCF-DA fluorescence) and antioxidant enzyme activities (SOD, GPx). In vivo, alloxan-induced diabetic Wistar rats were treated with Morusin (50 mg/kg), DMP-flavan (50 mg/kg), or their combination for six weeks. Metabolic parameters, oxidative stress markers, pro-inflammatory cytokines, and NF-κB markers were analyzed. Combination therapy significantly reduced ROS levels in vitro by 45.6 ± 4.1% compared to high-glucose controls while SOD and GPx activities increased from 1.9 ± 0.3 to 4.8 ± 0.4 U/mg protein and 2.7 ± 0.4 to 5.5 ± 0.3 nmol/min/mg protein, respectively ($p < 0.01$). In vivo, combination treatment decreased FBG from 297.2 ± 12.1 mg/dL to 124.5 ± 9.2 mg/dL, HbA1c from 9.8 ± 0.4% to 6.1 ± 0.3%, and TNF-α levels from 81.4 ± 5.2 pg/mL to 38.6 ± 3.8 pg/mL ($p < 0.01$). IL-6 and IL-1β levels were similarly reduced by 50–60%. Cardiac hypertrophic index improved from 0.57 ± 0.03 to 0.34 ± 0.02 ($p < 0.01$), and histological analysis showed markedly reduced fibrosis with decreased collagen deposition. NF-κB pathway markers, including phosphorylation of IκB-α and nuclear p65 levels, were significantly downregulated, confirming suppression of NF-κB activation. Morusin and DMP-flavan synergistically mitigate DCM through NF-κB pathway suppression, reducing oxidative stress, inflammation, and cardiac remodeling.

**Keywords:** Diabetic cardiomyopathy, Morusin, 2',4'-Dihydroxy-7-methoxy-8-prenylflavan, Morus alba, NF-κB, Oxidative stress.

**EFFECT OF DAPAGLIFLOZIN IN HEART FAILURE PATIENTS WITH DIABETES MELLITUS**

Aan Bhutia1*, Suzuki Subba1, Angila Theengh1
Government Pharmacy College Sajong Rumtek, Department of Pharmacy Practice, Sikkim India

This study explores the effects of dapagliflozin, a medication known as an SGLT2 inhibitor, on patients suffering from heart failure with reduced ejection fraction (HFrEF) who also have type 2 diabetes mellitus (T2DM). Dapagliflozin is currently recommended in medical guidelines for managing HFrEF because it has been shown to reduce the risk of death and illness in these patients. The research took place at Sir Thutob Namgyal Memorial (STNM) Hospital, Gangtok, and included adults aged 20 and older who were newly diagnosed with HFrEF (with a left ventricular ejection fraction of 40% or less) and T2DM. The study enrolled 69 patients divided into three groups: those with HFrEF and T2DM not taking dapagliflozin, those with HFrEF and T2DM taking dapagliflozin, and those with HFrEF but without diabetes who were also on dapagliflozin. After treatment, all groups showed significant improvements in both systolic and diastolic blood pressure, as well as in heart function measured by left ventricular ejection fraction (LVEF). The group on dapagliflozin with diabetes showed the greatest improvement, with a 9% increase in LVEF. Heart rates also normalized across all groups, suggesting better autonomic regulation. Additionally, diabetic patients taking dapagliflozin saw notable reductions in blood sugar levels, underscoring the drug's effectiveness in controlling glucose. Overall, the study confirms that dapagliflozin offers broad benefits, enhancing heart function and blood sugar control in patients with HFrEF, especially those with type 2 diabetes.

**Keywords:** Dapagliflozin, heart failure, reduced ejection fraction, type 2 diabetes, glycemic control

**PL-164**

**TRANSFORMING AMBIGUITY INTO CLARITY THROUGH DATA DRIVEN DECISION MAKING IN RISK BENEFIT ASSESSMENT OF DRUGS**

Surendra Agrawal and Pravina N Gurjar
Datta Meghe College of Pharmacy, DMIHER (DU) Wardha, MS India 442001
sagrawal80@gmail.com

Drug development, regulatory approval, and post-marketing surveillance are all contingent upon risk-benefit analysis (RBA). The RBA is presently being redefined by data-driven decision-making, which was formerly guided by expert opinion and clinical trial results. The integration of artificial intelligence (AI), real-world evidence (RWE), and advanced analytics facilitates a more dynamic, transparent, and objective evaluation of pharmacological safety and efficacy. The data-driven RBA integrates unstructured data, like as electronic health records and patient-reported outcomes, with structured data from pharmacovigilance databases, adverse event reports, and clinical trials. Early detection of safety signals, assessment of therapeutic benefits, and prediction of adverse drug reactions are facilitated by tools including machine learning, Bayesian modeling, and multi-criteria decision analysis (MCDA). These solutions provide continuous monitoring throughout a drug's lifecycle while enhancing regulatory evaluations. By considering clinical, demographic, and genetic subgroups, data-driven methodologies provide customized assessments. This ensures more precise identification of populations whose risks are surpassed by benefits. Despite these advancements, challenges such as interpretability, privacy, standardization, and data heterogeneity remain substantial barriers. These limits are being mitigated through continuous initiatives that integrate harmonized frameworks, explainable AI, and standardized data models.

**Keywords:** Risk-Benefit Assessment, Data Analytics Risk-Benefit Assessment, Real-World Evidence in Risk-Benefit Assessment, Predictive Modeling for Risk assessment,

**PL-165**

**PHARMACOLOGICAL INVESTIGATION ON AGMATINE IN TYPE 2 DIABETES MELLITUS WITH CO-MORBID ALCOHOLISM**

Shweta Dulewale, Sakshi Nalkande, Manish Aglawe, Atul Hemke
S. K. B. College of Pharmacy, Gada, Kamptee, Nagpur, Maharashtra, India – 441002.

Antidiabetic action of agmatine (40,80mg/kg,i.p.) was indicated by lowering elevated blood glucose, cholesterol, and triglyceride levels in diabetic
rats and also in alcohol-induced diabetic rats. It has shown a promising effect on the liver enzyme profile and normalized SGOT, SGPT, ALP, and amylase levels. This study thus establishes the animal model of T2DM with co-existing alcoholism and highlights evidentially the potential of agmatine in managing T2DM in alcoholic subjects. Study establishes animal model for diabetic with co-morbid alcoholism and study the pharmacological effect of agmatine in type 2 diabetes mellitus (T2DM) with co-morbid alcoholism through biochemical evaluation. Chronic alcohol consumption is a risk factor for T2DM, it disturbs glucose homeostasis and associated with the development of insulin resistance, obesity, pancreatitis, and impairment of liver function. Although agmatine has been widely used in the treatment of T2DM and alcoholism precise mechanism of its hypoglycemic action is poorly

ISBN: 978-81-980623-8-3

understood. To establish and assess an animal model for diabetics with co-morbid alcoholism and study the pharmacological effect of agmatine in T2DM with co-morbid alcoholism through biochemical evaluation. The alcohol-induced T2DM group rats were fed with Liquid Modified Diet (LMD) + ethanol (EtOH) over 3 weeks with HFD with a low dose of streptozotocin (35 mg/kg) on day 14. Other groups were fed with respective HFD or LMD or normal diet. All the groups were then evaluated for blood glucose, glucose tolerance, insulin tolerance, lipid profile, amylase, SGOT, SGPT, and alkaline phosphatase. Histopathologically liver and pancreatic morphology comparisons were also performed.

**Keywords:** T2DM. Alcoholism, Agmatine

**PL-166**

**ASSESSMENT OF AWARENESS ON SELF-REPORTING OF ADVERSE DRUG REACTIONS AMONG URBAN AND RURAL POPULATION IN BENGALURU: A COMMUNITY-BASED STUDY**

Dr. Gopinatha K[1], Dr. Shekar H.S.[2]
[1]Department of Pharmacy Practice, Visveswarapura Institute of Pharmaceutical Sciences, Bengaluru, India

Adverse drug reactions (ADRs) are a major public health concern and contribute significantly to preventable morbidity. The Pharmacovigilance Programme of India (PvPI) has facilitated patient-centric ADR reporting, yet community awareness and utilization remain limited. Active participation from the general public is essential to strengthen pharmacovigilance systems and ensure medication safety. To assess knowledge, attitudes, and practices related to ADR self-reporting among urban and rural communities of Bengaluru. A cross-sectional community-based study was conducted among 4,500 participants recruited using stratified random sampling. Data were collected with a pre-validated Knowledge, Attitude, and Practice (KAP) questionnaire. Sociodemographic details, education, occupation, and prior ADR experiences were correlated with awareness levels. Statistical analysis included descriptive measures and chi-square test for associations. Overall ADR self-reporting awareness was 8.3%, with significantly higher awareness among urban participants (12%) compared to rural (5%) ($p<0.05$). Education level and prior ADR experiences emerged as strong predictors of awareness. Despite low baseline knowledge, more than 70% of respondents expressed willingness to self-report ADRs if proper guidance and accessible tools were available. Dropouts accounted for <5% of participants, mainly due to incomplete responses. This large-scale community study highlights a substantial gap in ADR self-reporting awareness, particularly in rural populations. Targeted awareness campaigns and pharmacist-led interventions are warranted to promote public participation and strengthen national pharmacovigilance.

**Keywords:** Adverse drug reactions, Pharmacovigilance, Self-reporting, Community awareness, Bengaluru

**THE USE OF BOTH HERBAL AND ALLOPATHIC DRUG FOR THE TREATMENT OF MALARIA IN AFRICA: A RETROSPECTIVE ANALYSIS.**

Oyitabu Ifunanya Mercy, Malviya Nidhi, Gagana D, Shadindra L. Nargund
Nargund College of Pharmacy, Bangalore, Karnataka, Bharat.
nidhi.malviya7@gmail.com

Malaria remains one of the leading causes of morbidity and mortality in Africa, necessitating a multifaceted approach to treatment and prevention. This study provides a comprehensive analysis of the use of both allopathic (conventional pharmaceutical) and herbal anti-malarial drugs across the African continent. While artemisinin-based combination therapies (ACTs) are the cornerstone of modern malaria treatment recommended by the World Health Organization, access to and consistent use of these drugs vary significantly due to socioeconomic disparities, healthcare infrastructure limitations, and drug stockouts. Countries such as Kenya, Ghana, and Tanzania have made strides in expanding access to ACTs, yet challenges such as counterfeit medications and drug resistance—especially emerging artemisinin resistance in East Africa—undermine these efforts. In parallel, the use of traditional herbal remedies remains widespread, particularly in rural communities where access to formal healthcare is limited. Herbal treatments derived from plants such as Artemisia annua, Azadirachta indica (neem), and Cryptolepis sanguinolenta are commonly used either as standalone therapies or in combination with allopathic drugs. These remedies are often administered based on indigenous knowledge passed down through generations. While some herbal treatments exhibit promising antiplasmodial activity, most lack rigorous clinical validation, standardization, and regulation, raising concerns over safety and efficacy. This analysis highlights the need for integrated approaches that recognize the cultural relevance of traditional medicine while reinforcing the use of evidence-based allopathic treatments. Strengthening regulatory frameworks, promoting pharmacovigilance, and fostering research on herbal therapies can enhance malaria treatment outcomes and bridge the gap between traditional and modern healthcare systems in Africa.

**EFFECT OF NATTOKINASE ON COGNITION AND MEMORY IN D-GALACTOSE-INDUCED ACCELERATED AGING MOUSE MODEL**

Ghoshita Malve, Rushikesh Thanekar, Milind Umekar, Madhura Dixit
Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Nagpur, Maharashtra, India - 441002
mghoshita@gmail.com

Aging is a complex biological process commonly associated with cognitive decline, oxidative stress, and neuronal dysfunction. Despite the clear unmet medical need, few interventions have been tested for their ability to restore memory and cognitive function in preclinical models of aging. Nattokinase, a serine protease extracted from Natto (fermented soybeans), exhibits potential antioxidant, neuroprotective, and vasoprotective effects. The present study was designed to investigate the influence of Nattokinase on cognition and neurochemistry in a D-galactose–induced accelerated aging mouse model. Mice were administered D-galactose (150 mg/kg, s.c.) for eight weeks to simulate features of aging, followed by Nattokinase (50, 100, 200 mg/kg, i.p.) treatment. Cognitive performance was evaluated using the Radial Arm Maze (RAM) and the Open Field Test (OFT). Biochemical markers, including malondialdehyde (MDA), catalase, reduced glutathione (GSH), acetylcholinesterase (AChE), cholesterol, glucose, and calcium, were also measured. D-galactose administration significantly increased MDA, AChE, calcium, and cholesterol, while decreasing catalase and GSH levels, confirming oxidative damage and neurochemical imbalance. Interestingly, Nattokinase treatment reversed these alterations, restoring antioxidant defense, calcium homeostasis, and synaptic function. Behavioral analysis also demonstrated enhanced memory and reduced anxiety-like behavior in D-galactose-treated mice. In conclusion, Nattokinase intervention alleviates cognitive and biochemical deficits associated with accelerated brain aging via its potent antioxidant and neuroprotective properties, warranting further exploration for its therapeutic potential against age-related cognitive decline and memory deficits.

**Keywords:** Aging, Nattokinase, D-galactose, Cognitive impairment, Neuroprotection.

**ANTI-INFLAMMATORY AND ANTIARTHRITIC POTENTIAL OF TOPICAL BOSWELLIC ACID NANOEMULGEL FORMULATION IN AN ANIMAL MODEL**

Yogesh Amgaonkar 1, Nitin Kochar 1, Anil Chandewar 1, and Milind Umekar 2,
1. Department of Pharmaceutics, Pataldhamal Wadhwani College of Pharmacy, Yavatmal, India - 445001.
2. Department of Pharmaceutics, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, India - 441002.
yamgaonkar123@gmail.com

Rheumatoid arthritis (RA) is a chronic, systemic autoimmune illness that primarily affects the elderly globally. Boswellic acid (BA), a bioactive molecule derived from Boswellia serrata (Indian frankincense), has long been used in Ayurveda and modern herbal therapy because of its potent anti-inflammatory properties. It reduces inflammation by acting as a potent 5-lipoxygenase (5-LO) inhibitor. This study examined the anti-inflammatory and anti-arthritic efficacy of BA-loaded nanoemulgel formulations in rats with arthritis caused by formaldehyde and complete Freund's adjuvant (CFA) by topical application. Nanoemulsion (BN11),

ISBN: 978-81-980623-8-3

Nanoemulgel (A10), and Argan oil-based Nanoemulgel (A11) were the three optimised BA formulations that were assessed. The results indicated that A11 had the most pronounced decrease in paw oedema and inflammation in both models relative to BN11 and A10. Daily application of BA formulations for three weeks reduced IL-6 and TNFα, indicating its anti-inflammatory action. Radiographic investigations demonstrated that BA nanoemulgel restored joint space, reduced soft tissue swelling and prevented bone erosion in CFA-induced arthritis. Histological analysis further indicated restoration of synovial hyperplasia, inflammatory infiltration, cartilage destruction and bone resorption, especially following nanoemulgel treatment. Overall, BA nanoemulgel significantly enhanced anti-arthritic efficacy, as evidenced by decreased inflammation, reduced arthritis scores, cytokine suppression, and restoration of radiological and histopathological parameters.

**Keywords:** Boswellic acid, Nanoemulgel, Anti-arthritic, CFA model, Topical Delivery

## EVALUATING THE BURDEN OF ADVERSE DRUG REACTIONS IN THE GERIATRIC POPULATION: A HOSPITAL-BASED OBSERVATIONAL STUDY

Dr. Shashikala Wali
Department of Pharmacy Practice, KLE College of Pharmacy, Belagavi, KLE Academy of Higher Education and Research, Belagavi, Karnataka, India.

Elderly individuals are particularly vulnerable to adverse drug reactions due to factors such as multiple medications, age-related physiological changes, and chronic health conditions. This study aimed to evaluate the severity and causality of Adverse Drug Reactions in geriatric subjects. A prospective observational study was conducted over six months involving 250 patients aged 60 years and above. Data on suspected ADRs were collected through patient interviews, clinical records, and physician inputs. Each ADR was assessed using WHO-UMC Causality Assessment Scale**,** and severity was graded with the Modified Hartwig and Siegel Severity Assessment Scale**.** Among 250 patients, 40.4% were on monotherapy and 59.6% on polytherapy. A total of 62 adverse drug reactions (ADRs) were reported, with most classified as "probable" (67.7%) and mild (69.8%). At the time of assessment, 59.7% were recovering, 37.1% had recovered, and 3.2% had not recovered. ADRs remain a major concern in the elderly due to age-related changes, comorbidities, and polypharmacy. Using tools like the WHO-UMC and Hartwig scales in routine care can enhance ADR detection and management, ensuring safer medication use in geriatric patients.

**Keywords:** Adverse drug reactions, Geriatric population, Polypharmacy, Drug safety, Causality assessment

## GUT MICROBIOTA: A NOVEL APPROACH IN DIABETES MANAGEMENT

Kapil Yuvraj Patle, Sushil S. Burle, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur

Diabetes mellitus is a complex metabolic condition that involves continuous hyperglycemia, insulin resistance, and chronic complications. The intestinal microbiota has enjoyed considerable focus in recent years, as a fundamental controller of host metabolism and immune functionality. A shift in the balance of microbes present in the gut, dysbiosis, is becoming associated with type 2 diabetes development and progression. The lack of beneficial microbes in adequate proportions (Bifidobacterium and Lactobacillus) and the rise in the number of pathogenic species can facilitate the impaired functioning of the intestinal barrier, chronicized low-grade activity and the insulin-insensitivity. Medical maintenance of intestinal microbes is a potential constructive method to enhance glycaemic regulation. Treatment with probiotics, prebiotics, synbiotics and dietary fibers improves diversity of microorganisms, short-chain fatty acid (SCFA) production and glucose homeostasis. Plant-based polyphenols and phytochemicals play an additional role as selective stimulators of good bacteria growth and the alleviation of oxidative stress. More aggressive approaches like fecal microbiota transplantation (FMT), next-generation probiotics are under testing in order to provide sustained metabolic benefits. Also, it is recommended that intestinal microbiota has the capacity to change the pharmacodynamic effect of medications such as metformin, and therefore could be utilized in individualized antidiabetic treatment. Overall, attacking gut microbiota is a new and holistic method of diabetes management. Greater comprehension of the host-microbe relationships would facilitate the creation of safe, natural and patient-specific methods to overcome the increasing global burden of diabetes.

**Keywords**: Diabetes Mellitus, Hyperglycemia, Intestinal microbiota, Dysbiosis, Intestinal barrier, Fecal microbiota transplantation (FMT), Next-generation probiotics.

## TELEMEDICINE: TRANSFORMING HEALTHCARE DELIVERY IN THE DIGITAL AGE

Navuduri Suvarna Jyothi,
Principal Koringa College of Pharmacy, Korangi, Andhra pradesh, India
Suvarnakoringa@gmail.com

Telemedicine, the use of digital technologies to deliver medical services remotely, has emerged as a revolutionary tool in modern healthcare. This review explores the evolution, components, benefits, challenges, and future perspectives of telemedicine, highlighting its potential to improve accessibility, cost-effectiveness, and patient outcomes, especially in underserved regions.

**Keywords:** Telemedicine, Remote Healthcare, Digital Health, E-Consultation, Telehealth, health, Health Access

**PL-173**

## A COMPARATIVE STUDY ON EFFICACY, SAFETY AND COST EFFECTIVENESS ANALYSIS OF CEPHALOSPORINS AND CARBAPENEMS IN THE MANAGEMENT OF URINARY TRACT INFECTIONS

V. Sindhu Vaishnavi1*, S. Vidyadhara2
1Department of Pharmacy Practice, 2Department of Pharmaceutics
Chebrolu Hanumaiah Institute of Pharmaceutical Sciences,
Chowdavaram, Guntur.

Urinary Tract Infection (UTI) is defined as the presence of microorganisms in the urinary tract that cannot be accounted for by contamination. Infections of the urinary tract include urethritis, cystitis, prostatitis, and pyelonephritis. UTI is approximately 30 times higher in females than in males. The incidence of bacteriuria is 1.2% among females and 0.03% among males. To compare the efficacy and safety of Cephalosporins and Carbapenems in UTIs and to analyze cost-effectiveness between the two groups. A prospective observational study was conducted over 7 months in the Department of General Medicine, NRI General Hospital. Clinical outcomes, adverse drug reactions (ADRs), and treatment costs were assessed in patients receiving either Cephalosporins or Carbapenems. A total of 93 patients were enrolled, of whom 69 (74%) had complicated UTI and 24 (26%) had uncomplicated UTI. The relative risk for Cephalosporins versus Carbapenems in complicated UTI was 0.7460 (CI-95%, p=0.05), indicating equal efficacy. In uncomplicated UTI, the relative risk was 1.7500 (CI-95%, p=0.003), showing Cephalosporins were more efficacious than Meropenem. ADRs were reported in 3 of 32 patients treated with Meropenem for complicated UTI. The mean treatment cost of Cephalosporins (Rs. 3147.55 in complicated; Rs. 3130.37 in uncomplicated) was significantly lower than that of Carbapenems (Rs. 3724.62 in complicated; Rs. 55890.5 in uncomplicated). Both Cephalosporins and Carbapenems are efficacious in complicated and uncomplicated UTIs, but Cephalosporins are more cost-effective.

**Keywords:** Cephalosporins, Carbapenems, Urinary tract infections, Cost-effectiveness.

**PL-174**

## EFFICACY ASSESSMENT OF CART-FILL DRUG DISTRIBUTION SYSTEM IN A SOUTH INDIAN TERTIARY CARE TEACHING HOSPITAL

Mahesh Anthati, Ramesh Adepu
Vikas College of Pharmaceutical Sciences, Rayanigudem, Suryapet – 508 213

This study assessed the efficacy of a cart-fill drug distribution system at a South Indian tertiary care teaching hospital. A data collection form and standard operating procedure were developed for implementation. The duty pharmacist verified e-prescriptions for transcribing errors, while the research pharmacist verified prescriptions for drug-related issues and cross-verified filled medications for accuracy. Filled medicines were provided to patients with safety instructions. Clinician and patient satisfaction was assessed using feedback questionnaires. Approximately

ISBN: 978-81-980623-8-3

2000 prescriptions were reviewed, with 502 (25.1%) errors identified and corrected. Most errors were dispensing errors (64.14%) and transcribing errors (17.52%). Significant error reduction ($p<0.01$) was observed. Drug returns decreased and average medication supply time was under 45 minutes. Both clinicians and patients expressed satisfaction. The cart-fill drug distribution system ensured medication accuracy within scheduled timeframes, decreased pharmacy returns, and increased patient satisfaction.

**KEY WORDS** Cart-fill drug distribution, Transcription errors, Dispensing errors, E-prescriptions, Drug returns

**PL-175**

## IMPACT OF PHARMACIST-MEDIATED PATIENT COUNSELLING ON KNOWLEDGE, ATTITUDE, AND PRACTICE OF TYPE 2 DIABETES MELLITUS PATIENTS: A PROSPECTIVE OBSERVATIONAL STUDY

Tejaswini Padmanabhuni, Bhargavi Peruri, Sai Rupa Porendla, Ashish Vasa, Thulasi Sapavath
Vikas College of Pharmaceutical Sciences, Rayanigudem, Suryapet – 508 213

This prospective observational study assessed the impact of pharmacist-mediated patient counselling on knowledge, attitude, and practice (KAP) of Type 2 Diabetes Mellitus (T2DM) patients. The study was conducted in endocrinology departments of secondary care hospitals in Suryapet, Telangana, from August 2024 to February 2025. Eighty T2DM patients were enrolled. A structured 20-item KAP questionnaire was administered at baseline and after 2–3 weeks of counselling. Patients received personalized counselling on disease management, lifestyle modification, and medication adherence. Among participants, 66.25% were male, with majority aged 51–70 years. Post-intervention analysis showed significant improvements in KAP scores: knowledge (343.33 to 616.66), attitude (243.33 to 460), and practice (276.66 to 473.33). Counselling improved awareness of symptoms, dietary guidelines, medication adherence, and lifestyle adjustments. Pharmacist-led patient counselling significantly enhances diabetic patients' knowledge, promotes positive attitude, and improves self-care practices. These improvements support better glycemic control and reduce complications risk. Incorporating structured counselling programs into routine diabetic care is recommended, especially in resource-limited settings.

**KEY WORDS**: Type 2 Diabetes Mellitus, Patient Counselling, Knowledge-Attitude-Practice, Observational Study, Pharmacist Intervention

**PL-176**

## PROSPECTIVE OBSERVATIONAL RESEARCH OF CHRONIC KIDNEY DISEASE PATIENTS WITH PRE-EXISTING COMORBIDITIES INCLUDING, PRESCRIPTION PATTERN AND RISK FACTORS IN PATIENTS IN A TERTIARY CARE HOSPITAL

Prakith Swami Dhas and Boopathi Raja
Department of Pharmacy Practice, The Erode College of Pharmacy, Erode.638112
The Tamil Nadu Dr. M.G.R. Medical University
notprakithpc@gmail.com

Chronic Kidney Disease (CKD) is one of the major health concerns all over the world. Our study provides a clarified view for epidemiology in hospital settings identifies risk factors associated with Pre-existing co-morbidities and studies the prescribing pattern of chronic kidney disease. A prospective observational study was conducted in the inpatient general medicine department of a tertiary care hospital. Total 210 patients were studied over period of 6 months for epidemiological studies of chronic kidney disease (CKD) and existing comorbidities, the prescribing pattern of CKD and risk factors associated with comorbidities. The prescription pattern was assessed using KIDGO guidelines for the treatment of CKD and drugs are classified by ATC classification. The study included 210 patients of chronic kidney disease with comorbidities reported 62% male and 38% female. Socio-epidemiological studies show more prevalence in urban than rural and the most commonly observed risk factors associated were hyper-tension and diabetes. Laboratory reports analyzed showed fluctuation levels throughout the stages. Complications include diabetic nephropathy and hypertensive nephropathy and mostly anemia is a major concern. The total prescription contains 3360 drugs out of which 2308 were from the WHO essential drug list. The average drug prescribed to patients was 16-17 drugs. And antimicrobial drugs per prescription were found to be 3-4. In renal transplantation analysis recurrence of CKD is observed. The study concluded that results were significant and provide a precise view of the prevalence and risk factors associated with chronic kidney disease. Prescriptions pattern quantifies use of the high potential drugs.

**Keywords:** Chronic kidney disease, Complications, Prevalence of CKD, Renal replacement, Risk factors of CKD, Prescription pattern.

**PL-177**

## ESTIMATION OF HORMONE THERAPY IN BREAST CANCER PATIENTS

Surya, Sundarraj Krishnakumar
Department of Pharmacy Practice, The Erode College of Pharmacy, Erode.638112
The Tamil Nadu Dr. M.G.R. Medical University
suryakumar94426@gmail.com

The aim of the study is to evaluate hormone replacement therapy for breast cancer patients. The goals are to analyses the evaluation of progesterone and estrogen level in a breast cancer in patient, to evaluate and management of hormone therapy breast cancer and to evaluate the role of HER 2 receptors in breast cancer. For a six-month period, a prospective observational study was conducted among the patients in the oncology department at the Erode Cancer Center in Thindal. The investigation was not open to patients who were younger than 20 or who refused to participate in the trial. Reports on prescription patterns, co-morbidity, and individual demography were made available. The current study was conducted in the 100-bed inpatient oncology department. All female and male patients with breast cancer who were at least 20 years old and willing to provide consent were included in the study. The study excluded individuals who are not willing to participating in the study, severally ill patients, Patient who are below 20 years of age, Pediatrics patients. To obtain the necessary patient data, a correctly designed data collection form was utilized to gather information from patient interviews and the medical file. Clinical pharmacy services will be expanded in patient care through the use of a validated questionnaire and concluded that 70% of patients with metastatic breast cancer have hormone receptor-positive, HER2-positive illness, our study concluded that the main reason for the metastatic breast cancer is that HER-2-positive hormone levels was found to be increased.

**Keywords**: Breast Cancer, Hormone therapy, Metastatic disease

## COMPARATIVE STUDY OF EFFICACY, SAFETY AND COST EFFECTIVENESS OF IV FERRIC CARBOXYMALTOSE WITH IRON SUCROSE IN ADULT PATIENTS WITH IRON DEFICIENCY ANEMIA

P. Rohitha, J. Supraja, P. Anusha, SK. Faiza, S. Sravya, Dr. V. Sindhu Vaishanvi, Dr. V. Vijay Kumar, Dr. Ch. Aruna Kumar
CHEBROLU HANUMAIAH INSTITUTE OF PHARMACEUTICAL SCIENCES

Iron deficiency anemia (IDA) is a major global health concern, especially in developing countries like India. Oral iron therapy often leads to poor compliance due to gastrointestinal side effects, and blood transfusions carry risks. Intravenous (IV) iron therapy is preferred, with Iron Sucrose (IS) commonly used in multiple small doses. Ferric Carboxymaltose (FCM), a newer IV formulation, allows higher single doses with faster administration. Despite its increasing use, there is limited comparative data on the efficacy, safety, and cost-effectiveness of FCM versus IS in adult IDA patients. This study aims to evaluate and compare these two IV iron therapies. To assess the efficacy, safety and cost effectiveness of Intravenous FCM compared with IS for treating IDA. A prospective observational study was conducted over 6 months on patients over 18 years diagnosed with IDA. Patients with other types of anemia or a history of anaphylactic reactions to IV iron were excluded. Demographic data, medical history, diagnosis, and baseline hematological parameters (Hb, MCV, MCH) were collected. Participants were divided into two groups: one received intravenous IS, and the other received FCM. After 2-4 weeks, hematological parameters were reassessed to evaluate treatment efficacy. Safety was assessed through patient interviews, with adverse drug reactions (ADRs) documented and analyzed using WHO causality assessment scale. Clinical outcomes were compared using Student's t-test, and cost-effectiveness were evaluated using Incremental Cost-Effectiveness Ratio (ICER). In FCM group, Hemoglobin (Hb) increased from baseline 8.1 ± 0.75 to post- intervention 10.74 ± 0.94 g/dL, MCV from 68.68 ± 9.44 to 81.17 ± 9.92 fL, and MCH from 19.67 ±

ISBN: 978-81-980623-8-3

4.21 to 25.56 ± 4.39 pg with a p-value of <0.05. In IS group Hemoglobin (Hb) increased from baseline 8.1 ± 0.83 to post-intervention 10.24 ± 1.39 g/dL, MCV improved from 74.95 ± 10.31 to 80.63 ± 14.49 fL, and MCH also increased from 22.75 ± 5.01 to 26.47 ± 4.33 pg with a p-value of <0.05. Comparing post-intervention values between the two groups, Hb in FCM group: 10.74 ± 0.94 g/dL, IS group 10.24 ± 1.39 g/dL, with a P-value of <0.0001. Similarly, MCV in FCM group 81.17±9.92 fL. In IS: 80.63±14.49 fL with a P-value of 0.854 and MCH in FCM: 25.56±4.39 pg and IS: 26.47±4.33 pg with a P-value of 0.354.

**Keywords:** Iron deficiency anemia, Ferric Carboxymaltose, Iron Sucrose, Cost effectiveness

## PHARMACOECONOMIC ASSESSMENT OF HERBAL ADAPTOGEN THERAPY (WITHANIA SOMNIFERA) COMPARED TO CONVENTIONAL ANXIOLYTICS IN THE MANAGEMENT OF GENERALIZED ANXIETY DISORDER

Neha Desai and Sachin Narkhede
Smt. B.N.B Swaminarayan Pharmacy College, Salvav – Vapi, India - 396191
neha.pharm27@gmail.com

Generalized Anxiety Disorder (GAD) is a psychiatric condition that imposes both clinical and economic burden, affecting nearly 7–8% of the Indian population, contributing to reduced productivity and quality of life. Conventional anxiolytics such as SSRIs and benzodiazepines are effective but associated with adverse events, dependency, and higher long-term costs. Withania somnifera a traditional adaptogen, has demonstrated anxiolytic activity in many clinical studies, yet limited evidence exists on its pharmacoeconomic relevance. The present study was designed to compare the cost-effectiveness of Ashwagandha with conventional anxiolytics. Retail market prices were analysed to estimate average monthly treatment costs: Ashwagandha capsules 500 mg BID (₹600), escitalopram 10 mg OD (₹1,200), and alprazolam 0.5 mg BID (₹900). Clinical effectiveness values were derived and expressed as mean reduction in Hamilton Anxiety Rating Scale (HAM-A) scores over 8 weeks: Ashwagandha 12 points, escitalopram 13 points, alprazolam 11 points. A decision-analytic model was constructed using TreeAge Pro. Incremental Cost-Effectiveness Ratios (ICERs) were calculated, and Monte Carlo simulations were applied for probabilistic sensitivity analysis. Results showed that Ashwagandha produced a comparable reduction in HAM-A scores at nearly 50% lower monthly cost than SSRIs, with ICER analysis indicating a saving of ₹50 per unit reduction. Sensitivity testing confirmed robustness in over 85% of simulations, supporting Ashwagandha as a cost-effective alternative for GAD management.

**Keywords:** Ashwagandha, Withania somnifera, Generalized Anxiety Disorder, Pharmacoeconomics, Cost-Effectiveness, Anxiolytics

## AN OBSERVATIONAL STUDY ON THE OCCURRENCE OF DRUG INTERACTION IN THE DEPARTMENT OF PHARMACY PRACTICE IN A TERTIARY CARE HOSPITAL

Sonu Prasad, Alfet Raju Anthraper, Aysha Faizal, Naeema Thasneem K A
KVM College of Pharmacy (Kerala University of Health Science), Cherthala, Alappuzha, Kerala, India – 688527
sonuprasad.12.2003@gmail.com

Drug interactions occur when one drug alters the effect of another in the body. These interactions can either amplify or diminish the effects of drugs. Drug interactions can occur between prescription medications, OTC drugs and even herbal supplements. To manage drug interactions, it is crucial that patients communicate about medications being taken. Aim of the study was to determine the occurrence of drug interactions in the department of pharmacy practice in a tertiary care hospital. This research determined the percentage, severity, age, gender, polypharmacy, category and major interacting drug pairs. This is an observational study done for 3 months involving 100 patients. The DDIs were identified using Lexicomp. From the 100 cases, 443 DDIs were identified. Based on severity, most interactions were found to be moderate (62.75%). The most prone age group were 41-60 (35%). Males (55%) experienced more DDIs than females. According to the study, DDIs increased with the increase in number of prescribed drugs. Polypharmacy was present in most of the cases (59%), mainly in the age group 41-60 (37%). Out of the 443 DDIs, majority of the drug interactions were in the category GI agents (17.9%) & most identified interaction was Paracetamol with Ondansetron (1.8%).

**Keywords:** Severity, gender, polypharmacy

**PL-181**

## RECENT ADVANCEMENTS AND CUTTING EDGE TECHNOLOGIES FOR LIFE THREATENING DISEASE TREATMENT

Mukul Sharma*, Sunil Dwivedi and Gaurav Kant Saraogi
*Sri Aurobindo Institute of Pharmacy, Indore, Madhya Pradesh 453555, India
mukul.sharma@saip.ac.in

The continuous evolution of pharmaceutical sciences has led to remarkable advancements in novel drug delivery systems and formulation strategies that address the limitations of conventional dosage forms. Cutting-edge patented technologies such as Doxil liposomes, Zoladex impants for prostate cancer, Prostep SR, Gliadel waffle for malignant glicoma, microspheres, Vivagel dendrimers for bacterial vaginosis wide variety of MRI contrasting agents like Gadolinium and Cutanova solid lipid nanoparticles, various lipid based m-RNA vaccines and gene therapies have emerged as versatile platforms for precise drug delivery. Furthermore, the integration of 3D-4D printing in personalized medicine, stimuli-responsive smart biodegradable polymers, and hybrid nanomaterial has redefined the scope of formulation design. Recent innovations focus on improving bioavailability, enhancing therapeutic efficacy, ensuring patient compliance, and achieving targeted or controlled release of drugs. Advances in biopharmaceuticals, including monoclonal antibodies, vaccines, and gene delivery vectors, also highlight the transition toward more sophisticated therapeutic approaches. Regulatory acceptance of novel excipients, the application of artificial intelligence in formulation optimization, and the adoption of green pharmaceutical technologies further accelerate progress in this domain. Collectively, these advancements not only broaden the therapeutic landscape but also pave the way for safer, more effective, and patient-centric pharmaceutical products for life threatening diseases in near future.

**Keywords:** Zoladex, regulatory, nanoparticles, dendrimers, potential

## ADR AS A CONSEQUENCE OF DRUG-DRUG INTERACTION: AN OBSERVATIONAL RETROSPECTIVE STUDY

Silpa Jagadeepan S, Akhila S Arjun, Donamol Antony, Radhika N Ravi
KVM College of Pharmacy (Kerala University of Health Sciences), Cherthala, Alappuzha, Kerala, India - 688527
silpajagadeepan02@gmail.com

Drug-Drug interaction is an important issue in clinical practice as management of co-morbidities necessitates polypharmacy and some of these interactions can transmute into or accentuate Adverse drug reactions. A retrospective observational study was carried out in ADR occurred in SH Medical Centre, a tertiary care hospital in Kottayam district of Kerala for a period of 3 months. The study is to determine the occurrence of Adverse drug reaction as a consequence of Drug-Drug interaction. Reported ADR forms were reviewed and data were analyzed using SPSS software. Statistical analysis was done using MS EXCEL spreadsheet. A total of 151 ADR reports were collected from the Department of Pharmacy Practice which met the inclusion criteria. 185 PDDIs were identified from reported ADRs. Of these 30 matched the description of ADRs. Among 30 DDIs, 24 (80%) were pharmacodynamic and 6 (20%) were pharmacokinetic. The study concluded that DDIs attributed to 19.86% ADRs.

**Keywords:** Adverse Drug Reaction, Drug-Drug interaction, Potential Drug-Drug interaction, Pharmacokinetic interaction, Pharmacodynamic interaction.

**PL-183**

## ASSESSMENT OF EFFICACY AND TOXICITY OF NEOADJUVANT TCHP REGIMEN IN EARLY, LOCALLY ADVANCED HER2-POSITIVE BREAST CANCER

Isbha S[1]*, Dr. Muchukota Sushma*, Dr. Srinivas B J2, Dr. Priyank Tripathi2, Dr. Shobha Rani R.H3
Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Department of Pharmacology, 2HCG Cancer Centre, Bangalore, Karnataka, India.
isbha2002@gmail.com

ISBN: 978-81-980623-8-3

HER2-positive breast cancer is an aggressive subtype where timely neoadjuvant therapy significantly improves surgical outcomes and survival. The TCHP regimen (Docetaxel, Carboplatin, Trastuzumab, Pertuzumab) has shown promise in achieving higher pathological complete response (pCR). Emerging tools such as biomarker-guided monitoring (Ki-67, HER2 copy number) and AI-assisted imaging analytics now enable precise assessment of efficacy and early detection of toxicities, offering a patient-centered approach. To evaluate the efficacy of the neoadjuvant TCHP regimen in achieving clinical and pathological response in early and locally advanced HER2-positive breast cancer. To assess treatment-related toxicities using both conventional grading and AI-supported predictive modelling. A prospective interventional study was conducted on 60 HER2-positive breast cancer patients (early and locally advanced). Patients received 6 cycles of TCHP every 21 days. Efficacy was measured by radiological tumor response (RECIST 1.1), AI-assisted MRI volumetric analysis, and pCR at surgery. Toxicity was assessed by CTCAE v5.0 and validated using an AI-based adverse event monitoring system (OncoPredict AI®). Biomarkers (Ki-67, CRP, HER2 gene amplification) were analyzed pre- and post-treatment. The TCHP regimen achieved an overall clinical response rate of 85%, with pCR in 57% of patients. AI-assisted MRI detected early tumor shrinkage trends with 92% concordance to pathological findings. Patients with high baseline Ki-67 and HER2 amplification showed better pCR rates ($p < 0.05$). The most frequent toxicities were neutropenia (42%), diarrhoea (28%), fatigue (25%), and mucositis (18%). Grade 3/4 toxicities occurred in 20% of cases, primarily neutropenia and diarrhoea, but were mitigated through proactive supportive interventions guided by AI risk alerts. Importantly, AI monitoring reduced ADR detection time by 50% and improved pharmacist intervention efficiency by 40%.

**Key Words:** HER2-positive breast cancer, Neoadjuvant TCHP, Pathological complete response, AI-assisted imaging, Biomarkers, Toxicity prediction.

**PL-184**

## ROSUVASTATIN AMELIORATES DOXORUBICIN-INDUCED CARDIOTOXICITY IN EXPERIMENTAL RATS BY MINIMIZING OXIDATIVE STRESS.

Hawa Mabrura M and Navaneetha Krishnan S
Department of Pharmacology
Dr. Kalam College of Pharmacy, Avanam, Thanjavur Dist. Tamilnadu, India - 614623
hawamabru672@gmail.com

Cardiovascular diseases (CVDs) are a global health problem, with projections suggesting 23.6 million deaths by 2030. This study aimed to examine the protective impact of rosuvastatin (RSS), an oral antihyperlipidemic drug against cardiac damage caused by doxorubicin in rats. On the 20th day of the experiment, the rats were given doxorubicin injections (10 mg/kg, i.p.), resulting in cardiac toxicity. The control group didn't receive doxorubicin, but all other groups did. Cardiac marker enzymes such as Creatine Kinase-MB (CK-MB), Lactate dehydrogenase (LDH) and liver marker enzymes such as aspartate aminotransferase (AST), Alanine aminotransferase (ALT), as well as In vivo antioxidants (superoxide dismutase, catalase), were measured to assess RSS's impact on acute treatment. Myocardial tissue histological changes were examined using haematoxylin and eosin staining. Following doxorubicin dosing, cardiac marker enzymes elevated significantly, indicative of myocardial damage, whereas with RSS (10 mg/kg, p.o.) administration, CK-MB, LDH, AST, and ALT levels all saw prominent decreases ($p<0.05$). The in vivo antioxidant levels were significantly elevated by the RSS administration. The acute administration of RSS led to a significant reduction in cardiac and liver enzymes and enhanced In vivo antioxidant activities, demonstrating its cardioprotective effect. The findings were corroborated through histopathological examinations. The cardioprotective effects of RSS in rats may be attributed to its ability to alleviate oxidative stress damage.

**Key words:** Cardioprotective, Rosuvastatin, Doxorubicin, Cardiotoxicity, Oxidative stress.

**PL-185**

## EVALUATION OF NEUROPROTECTIVE EFFECTS OF ETHANOLIC EXTRACT OF PHYLLANTHUS EMBLICA LEAVES AGAINST BEHAVIOURAL DEFICITS IN KETAMINE-INDUCED SCHIZOPHRENIA IN WISTAR ALBINO RAT: FOCUSING ON OXIDATIVE STRESS STATUS

Manvini.S 1, Pinki Verma 2, B A Vishwanath 3
Department of Pharmacology, Aditya Bangalore Institute of Pharmacy Education &
Research, Yelahanka, Bangalore -560064, Karnataka, India
Manvinis65@gmail.com

The present study investigates the neuroprotective effects of the ethanolic extract of Phyllanthus emblica leaves against behavioral deficits induced by ketamine in Wistar albino rats, with a focus on oxidative stress status. Rats were divided into control, ketamine-treated, standard (Haloperidol), and P. emblica extract-treated groups at doses of 200 and 400 mg/kg. Schizophrenia-like symptoms were induced by chronic ketamine administration, followed by oral treatment with vehicle, Haloperidol, or P. emblica extract. Behavioral assessments included Cook's pole climbing test, forced swimming test, Y-maze test, and open field test to evaluate positive symptoms, negative symptoms, cognitive deficits, and locomotor activity. Biochemical analyses such as superoxide dismutase (SOD), catalase, lipid peroxidation, glutathione assay, and protein assay were conducted to assess oxidative stress markers. Histopathological studies were carried out to examine neuronal integrity and structural changes. The results showed that P. emblica extract significantly improved behavioral performance and restored antioxidant enzyme levels, while histopathological evaluation revealed marked neuroprotection against ketamine-induced neuronal damage. These findings suggest that P. emblica possesses notable neuroprotective and antipsychotic-like properties, likely mediated through its antioxidant potential.

**Keywords:** Phyllanthus emblica, ketamine, schizophrenia, neuroprotection, oxidative stress, behavioral deficits, open field test, histopathology, Wistar albino rats.

## ESTABLISHMENT OF VIRTUAL CLINICAL PHARMACY SERVICES (VCPS)

Jyothilakshmi Bhadra and Naghul Adhithya
Department of Pharmacy Practice, Vivekanandha Pharmacy College for Women
Salem, Tamilnadu, India – 637303
bjyothilakshmi456@gmail.com

In the current research it explores the feasibility of establishing Virtual Clinical Pharmacy Services (VCPS) in Indian hospitals, focusing on awareness, readiness, barriers, and potential impact. A quantitative, cross sectional survey was conducted among licensed pharmacists and Pharm.D interns using a structured questionnaire, with responses analyzes through descriptive statistics and thematic review. Findings revealed strong awareness of VCPS (76%) and high perceived importance (82%), reflecting a growing digital health momentum in India. Respondents highlighted VCPS role in reducing medication errors, enhancing patient safety, improving satisfaction, and addressing healthcare disparities, particularly for chronic, pediatric, and rural patients. However, infrastructural and financial limitations emerged as key challenges, with only 17% reporting adequate infrastructure and 72% citing setup costs as a major barrier. Despite this, 69% indicated willingness to adopt VCPS, suggesting high implementation potential and policr reform. Ethical concerns, especially data privacy (39%), alongside limited regulatory frameworks, were also identified as barriers. Respondents emphasized the need for government support, structured training, and AI integration. Overall, the findings underscore VCPS as a cost effective and scalable strategy for improving healthcare outcomes in India. Strategic priorities include infrastructure enhancement, policy clarity, and workforce development to enable successful integration into mainstream healthcare.

**Keywords:** Virtual Clinical Pharmacy Services (VCPS), Digital health, Pharmacist readiness, Healthcare barriers, Patient safety.

## NEUROTROPHIC EVALUATION OF SEA ANEMONES IN IN-VITRO PARKINSON'S MODEL

Ranil Boopathi S*, Parthasarathi S, Karthi Ravi, Jeyaram Bharathi Jeyabalan

ISBN: 978-81-980623-8-3

Department of Pharmacy Practice, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty, Nilgiris, 643 001, Tamil Nadu, India.

Parkinson's disease (PD) is the fastest-growing neurodegenerative disorder worldwide, projected to affect over 13 million individuals by 2040. Current pharmacotherapies, including levodopa and monoamine oxidase inhibitors, provide only symptomatic relief and lack disease-modifying or neuroprotective potential, underscoring the need for novel therapeutic strategies. Marine invertebrates, particularly sea anemones, are recognized as reservoirs of unique bioactive peptides and secondary metabolites with neuroactive, antioxidant, and cytoprotective properties. This study investigated the neuroprotective capacity of sea anemone extracts in in-vitro models of PD using a structured four-phase methodology. Specimens collected from the Gulf of Mannar underwent aqueous and ethanol-based extraction, followed by treatment of dopaminergic N27 and SH-SY5Y neuronal cell lines. Neuroprotective outcomes were assessed through survival assays, apoptotic markers, and comparative efficacy against Selegiline, a standard reference drug. The tentacle extracts significantly enhanced neuronal viability, mitigated apoptosis, and demonstrated superior cytoprotective effects relative to Selegiline. These results suggest that sea anemone-derived compounds exert their actions through antioxidant defense, attenuation of mitochondrial dysfunction, and modulation of apoptosis-related pathways, thereby conferring both neuroprotective and neurotrophic benefits. The findings provide compelling preliminary evidence for sea anemone extracts as potential disease-modifying agents for PD. However, detailed molecular characterization, identification of active constituents, and validation in in-vivo models are essential to translate these observations into viable therapeutic candidates for PD and related neurodegenerative disorders.

**Keywords:** Dopaminergic Neurons, Neurodegeneration, Neuroprotection, Parkinson's Disease, Sea Anemones.

**PL-188**

## ASSESSING MEDICATION SAFETY AND REAL-WORLD IMPACT OF PHARMACIST-LED INTERVENTIONS ON DRUG-RELATED PROBLEMS AMONG ELDERLY INPATIENTS.

Soumya M K, Margret Chandira R and Sujith S Nair
Vinayaka Mission's Research Foundation, Salem, Tamil nadu, India-636308
mksoumya27@gmail.com

Elderly patients are particularly vulnerable to drug-related problems (DRPs) due to age-associated factors which adversely affect outcomes and healthcare costs. Pharmacists play a vital role in optimizing pharmacotherapy and medication safety. The objective of the research was to assess DRPs in elderly inpatients and to evaluate the impact of pharmacist interventions using the CLEO tool. A prospective interventional study was conducted for six months in a tertiary care hospital following IEC approval. Inpatients aged ≥ 60 years were selected and excluded critically ill patients and those receiving chemotherapy. DRPs assessed through comprehensive medication chart review and implemented pharmaceutical interventions. The clinical, economical and organizational impact of the intervention was evaluated using the CLEO tool. A total of 270 DRPs were identified among 680 admissions during the study period. ADRs were most frequent (N=98; 18.9%) linked to physiological decline; followed by Drug Interactions (N=65; 12.5%), due to polypharmacy; dosing issues (N=38; 7.3%) frequently related to renal /hepatic impairment, non-adherence (N=24; 4.6%) and untreated indications (N=18; 3.5%). Therapeutic duplication (N=12; 2.7%) and drug not indicated (N=15, 3.6%) were less frequent but clinically significant. Distribution of DRP categories was significant ($\chi 2$, $p<0.001$). 85% interventions were accepted by physicians. CLEO scoring reflected 62% clinical impact (p=0.01), 47% economic outcomes (p=0.04), and 34% organizational improvements. The study concluded that pharmacist-led interventions demonstrated a significant impact in identifying and resolving DRPs in elderly inpatients. Interventions proved effective across multiple dimensions. Strengthening clinical pharmacy services in geriatric care can lead to safer, more cost-effective treatment outcomes.

## EFFECT OF LIFESTYLE INTERVENTIONS ON METABOLIC SYNDROME AMONG OVERWEIGHT AND OBESE SUBJECTS: EVIDENCE FROM A RANDOMIZED CLINICAL TRIAL

Prason Kumar J, S. Sathyanarayana Murthy, A.Elphine Prabahar and K.Lakshmi
Chettinad School of Pharmaceutical Sciences, Chettinad Hospital and Research Institute, Chettinad Academy of Research and Education, Kelambakkam-603103, Tamil Nadu, India.

Metabolic syndrome (MetS) is a cluster of medical conditions that is defined by the simultaneous occurrence of at least three of the five predefined components. The objective of this study was to investigate the effects of targeted lifestyle modifications on overweight and obese individuals with MetS. In this 12-week randomized controlled study, participants were assigned to one of the four distinct arms: treatment as usual (TAU) and Lifestyle Intervention groups (LIG) (TAU+exercise, TAU+controlled diet, and TAU+both controlled diet and exercise). The participants were assessed for various metabolic parameters, questionnaires, and treatment cost. Bodyweight showed a significant reduction across all three LIGs, with the TAU+both diet and exercise group demonstrating the most profound reduction. Fasting glucose decreased significantly in all the LIGs, while HOMA-IR improved in the TAU+diet and TAU+diet and exercise groups. Participants of all three LIGs also showed significant reductions in BMI and waist and hip circumference. The lipid profile improved markedly, with decreased triglycerides and increased HDL-C among the LIGs. The LIGs even demonstrated reduced stress (PSS-10) and improved sleep (AIS) and overall quality of life (SF-36). Additionally, these LIGs also reduced the treatment cost over the period of time, thereby reducing the economic burden on the subjects. Thus, it can be concluded that including targeted lifestyle modifications as an adjunctive regimen for MetS improves the QOL not only by reducing body weight but also by improving metabolic parameters.

**Keywords:** Metabolic syndrome, body weight, lifestyle modification, quality of life

## EMOTIONAL INTELLIGENCE – EI AND EFFECT OF MEDICINE IN HEALTH CARE

DR. MD. RAYEES AHMAD, DR.V. GIRIJA SASTRY.
Dept. of Pharmaceutical Chemistry, RP College of Pharmacy, Dharashiv, MH, 413501
Dept. of Pharmaceutical Chemistry, University College of Pharmaceutical Sciences, Andhra University, Visakhapatnam, 530003

Medicine plays a crucial role in the healthcare sector, but the demands of modern life can contribute to a range of chronic diseases, which may hinder the effectiveness of medical treatments. Many patients struggle to achieve the desired outcomes after prolonged periods of medication. This lack of success can stem from various factors, such as hectic schedules, insufficient physical activity, and a disconnect from nature. These issues often result in adverse health effects, highlighting the need for a more comprehensive approach to patient care. To tackle the challenges posed by chronic diseases and the limitations of traditional medicine, emotional intelligence (EI) is emerging as a valuable component within the healthcare sector. When patients receive care that integrates EI with traditional or allopathic medicine, there is a significant potential for enhanced health outcomes and a more holistic approach to patient care. In summary, the integration of emotional intelligence (EI) within the healthcare sector is crucial. By prioritizing EI in interactions with patients and among healthcare teams, professionals can enhance the quality of care, resulting in improved health outcomes as well as a more harmonious working environment. Fostering emotional intelligence allows the healthcare system not only to address physical ailments but also to support the emotional and psychological well-being of patients.

**Key words:** Emotional Intelligence, Medicine, Health care.

## DEVELOPMENT AND VALIDATION OF A QUANTITATIVE PROTON NMR METHOD FOR THE ANALYSIS OF KOJIC ACID

Vijaya Lakshmi Gadi and Shaik Mastanamma
Department of Pharmaceutical Sciences, VJ's College of Pharmacy, Diwancheruvu, Rajahmundry, India- 533296.

ISBN: 978-81-980623-8-3

vijjisamireddi@gmail.com

In this current research study, the unique capability of both identification and quantification of a compound by NMR spectroscopy have been demonstrated. Using NMR spectroscopy for quantification is widely applied in analytical field because of universal existence of NMR active nuclei (1H and 13C). The Linearity, LOD (Limit of Detection), LOQ (Limit of Quantification), and validation studies of Kojic Acid Dipalmitate has been demonstrated using TMB (trimethyl benzene) as internal standard. qNMR is linear ranges of 0.2 to 3.0 mg/ml gives integral values between 0.9 to 2.2 which shows good linearity performance with regression coefficient (R2 value) above 0.993. Moreover, LOD and LOQ are 1.02 and 3.11 mg/ml respectively. Finally, it was found that qNMR method is simple, effective, accurate and reliable method for practical qualification and validation of Kojic Acid Dipalmitate.

**Keywords:** NMR spectroscopy, qNMR, Kojic Acid Dipalmitate

**PL-192**

**CLINICAL ASSESSMENT OF DRY POWDER INHALERS AND METER DOSE INHALERS COMBINATION IN MANAGEMENT OF BRONCHIAL ASTHMA**

Y. Achhireddy*, M Sri Varshitha, M. Raghava Kalyan, and S. Vidyadhara
Department of Pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramulipuram, Chowdavaram, Guntur, Andhra Pradesh, India -522019
achhireddy7375@gmail.com

Bronchial asthma is emerging as a significant health concern in many developing countries. As defined by the National Institutes of Health (NIH), asthma is a chronic inflammatory airway disorder involving various inflammatory cells such as mast cells, eosinophils, T-lymphocytes, neutrophils, and epithelial cells. This inflammation leads to episodic symptoms in affected individuals. The present study aims to compare the efficacy of two combinations: Formoterol/Budesonide and Salmeterol/Fluticasone, administered through Dry Powder Inhalers (DPI) and Metered Dose Inhalers (MDI), in the management of bronchial asthma. This prospective, observational, non-interventional study was conducted in the outpatient department of Tubercular and Chest Diseases at NRI General Hospital, Guntur, including 100 patients diagnosed with asthma. Patients were assessed through pulmonary function tests (PFTs) and Asthma Control Test (ACT) scores before and after 15 days of treatment. The study groups included patients receiving Formoterol/Budesonide or Salmeterol/Fluticasone via DPI or MDI. Statistical analysis revealed significant improvements ($p < 0.05$) in FVC, FEV1, FEV1/FVC, PEFR, and ACT scores, with the DPI forms showing greater efficacy compared to their MDI counterparts. Among all groups, Formoterol/Budesonide via DPI demonstrated the highest improvement in lung function and asthma control with favorable cost-effectiveness. In conclusion, both drug combinations are effective in asthma management, but Formoterol/Budesonide delivered through DPI emerged as the most efficacious and cost-efficient option. This study supports the preference of DPI over MDI for enhanced asthma control

**Key words:** Formoterol/Budesonide, Salmeterol/Fluticasone, DPI, FVC (%), FEV1 (%), FEV1/FVC (%), PEFR, Asthma control.

**PL-193**

**UNVEILING THE KETOGENIC DIET: ITS POTENTIAL IN COMBATTING OBESITY AND IMPROVING HEALTH MARKERS**

Rakhi Turkar, Dr. Tirupati Rasala, Shubham Kamble
The Royal Gondwana College of Pharmacy, Nagpur

Obesity is a major global health issue, with more than 650 million obese adults worldwide, and is associated with serious diseases such as heart disease, type 2 diabetes, and certain cancers. It is generally evaluated using Body Mass Index (BMI). The increasing prevalence of obesity is linked to the modern lifestyle, with unhealthy eating habits and a sedentary way of life, combined with environmental factors. Furthermore, the mental effects of obesity are profound due to social prejudices, which result in anxiety, depression, and poor self-worth, rendering the management even more difficult. The classical ketogenic diet (KD), a high-fat, low-carbohydrate diet, is an effective treatment for obesity and metabolic syndrome that has been utilized in clinical and experimental settings for decades. Studies have shown that a KD can contribute to weight loss by increasing fat burning and decreasing appetite, as well as by improving metabolic health factors, including insulin sensitivity. However, the diet is very restrictive, so nutritional deficiencies may occur, and critical organs can be overworked without proper medical monitoring. Long-term studies are also essential in order to understand the effect of the ketogenic diet on health, insulin resistance, cardiovascular health, and even cancer. In addition, new insights into the role of the gut microbiome in the context of metabolism are beginning to allow for personalized dietary recommendations to enhance metabolic responses. In conclusion, a multi-dimensional strategy, integrating diet, activity, and psychological aspects, is required for the successful combating of the obesity epidemic.

**Keywords:** Obesity, Ketogenic Diet, Metabolic Health, Insulin Sensitivity, Gut Microbiome, Weight Loss, Dietary Interventions.

**PL-194**

**EVALUATION OF ANTICANCER POTENTIAL OF METHANOLIC EXTRACT OF PETALS OF CHRYSANTHEMUM MORIFOLIUM AGAINST HUMAN LIVER CANCER CELL LINE (HEPG2)**

Lokesh Gari Kiran, Amit B patil, Vishal N. Guptaa, Balamuralidhara Veerannaa,
Department of Pharmaceutics, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Shivarathreeshwara Nagara, Mysuru 570015, India
lkiranhari2000@gmail.com

Liver cancer remains one of the leading causes of cancer-related deaths globally, prompting the search for novel and safer therapeutic agents. Medicinal plants are a rich source of bioactive compounds with potential anticancer activity. Chrysanthemum morifolium, traditionally used in Chinese medicine, is known for its antioxidant and anti-inflammatory properties. This study aimed to evaluate the anticancer potential of the methanolic extract of Chrysanthemum morifolium petals against the human liver cancer cell line (HepG2).

Petals were collected, shade-dried, and extracted using methanol via Soxhlet extraction. The extract was subjected to preliminary phytochemical screening. HepG2 cells were cultured and treated with various concentrations of the extract. The cytotoxic effect was assessed using the MTT assay. Morphological changes were observed microscopically, and $IC_{50}$ values were calculated. The methanolic extract exhibited dose-dependent cytotoxic activity against HepG2 cells, with significant reduction in cell viability and morphological alterations indicating apoptosis. Phytochemical analysis confirmed the presence of flavonoids, phenolics, and terpenoids, which may contribute to the observed activity. The methanolic extract of Chrysanthemum morifolium petals demonstrated promising anticancer activity against liver cancer cells. These results support further investigation into its active constituents and mechanisms of action for potential development as a natural anticancer agent.

**PL-195**

**ALLAMANDA CATHARTICA L. LEAVES AS A HEPATOPROTECTIVE AGENT: AN EXPERIMENTAL STUDY IN CCL4 TREATED WISTAR ALBINO RATS.**

Sreelakshmi S.S1, Sellamuthu Venkatesh1*
Associate Professor, Department of Pharmacology, Al Shifa College of Pharmacy, Affiliated to KUHS, Perinthalmanna, Malappuram, Kerala, India.
sreelakshmidlji143@gmail.com.

Liver damage caused by certain toxins like carbon tetrachloride are a major health concerns, prompting the search for effective natural hepatoprotective agents. This study investigates the hepatoprotective activity of the leaves of Allamanda cathartica L. in carbon tetrachloride (CCl4) induced wistar albino rats. Powdered Allamanda cathartica leaves were extracted by maceration and subjected to phytochemical screening and acute oral toxicity testing (OECD 425). Ethanolic extract doses (200 and 400 mg/kg b.wt) were administered to rats with $CCl_4$-induced hepatotoxicity. Silymarin (50 mg/kg) served as standard. Liver function was assessed using biochemical markers (SGOT, SGPT, ALP, GGTP, glucose, bilirubin, protein, lipid profile) and antioxidant enzymes, supported by histopathological examination of liver tissues. Preliminary phytochemical screening of Allamanda cathartica leaf extract revealed the presence of alkaloids, cardiac glycosides, saponins, flavonoids, tannins, proteins, amino acids, sterols, triterpenoids, and carbohydrates. Acute toxicity studies confirmed the extract's safety up to 2000 mg/kg.

ISBN: 978-81-980623-8-3

The ethanolic leaf extract exhibited dose-dependent hepatoprotective activity by normalizing elevated biochemical markers, with results comparable to standard drug Silymarin. Histopathological findings further supported the extract's liver-protective effect. The study shows that Allamanda cathartica leaf extract has promising hepatoprotective activity, likely due to phytoconstituents such as alkaloids, glycosides, saponins, flavonoids, tannins, proteins, sterols, and triterpenoids. Further research is needed to isolate and identify the specific active compound responsible.

**Keywords:** Hepatoprotective activity, Allamanda cathartica, Carbon tetrachloride

## EDUCATE, INNOVATE, EMPOWER: EVALUATING TECHNOLOGY-ENHANCED EDUCATIONAL INTERVENTIONS IN CHRONIC KIDNEY DISEASE MANAGEMENT BY CLINICAL PHARMACISTS

Geetanjali S Salimath* M S Karishetti
Department of Pharmacy Practice, KLE College of Pharmacy, Belagavi, KLE academy of higher education and research, Karnataka, India - 590010.
geetanjalisalimath@klepharm.edu

Chronic Kidney Disease (CKD) significantly affects patients' physical, emotional, and social well-being, lowering their quality of life (QoL). Despite medical advancements, CKD remains a major cause of global morbidity and mortality. Patient-centered care, especially educational interventions, is key to improving health-related QoL (HRQoL). Clinical pharmacists, with their expertise in pharmacotherapy and patient communication, are well-positioned to design and deliver such interventions, bridging the gap between clinical treatment and patient understanding. To assess the impact of a technology-enhanced educational module on CKD patients' QoL using the KDQOL SF-36 questionnaire before and after intervention. A secondary objective was to evaluate the effectiveness of video-based and leaflet-based education in improving QoL. A randomized interventional trial was conducted in the Nephrology Department of a tertiary care hospital in Belagavi, Karnataka. A total of 202 CKD patients were enrolled and randomly assigned to receive either video-based or PIL-based educational interventions. KDQOL SF-36 and PEMAT scales were used to evaluate QoL and intervention effectiveness over six months. All KDQOL domains showed significant improvement post-intervention ($p < 0.0001$). Notable gains were seen in general health (42.1±9.8 to 77±3.6), emotional well-being (45.8±11.9 to 76.7±7.86), and physical functioning (37.3±19.8 to 77.3±9.1). Both age groups benefited, with older patients showing improved emotional/social functioning and younger ones in physical functioning. High acceptability scores on the PEMAT scale reinforced the success of the intervention. Clinical pharmacist-led, technology-enhanced education significantly improved QoL in CKD patients, supporting its integration into routine CKD care.

## PHARMACOGENOMICS: A STEP TOWARDS PERSONALIZED MEDICINE.

SHAIKH NAHID BALASAHEB AND RAJAT SAYYED.
MCES DR.P.A INAMDAR UNIVERSITY

Pharmacogenomics is the study of how an individual's genetic makeup influences their response to drugs. This evolving field combines pharmacology and genomics to develop effective, safe medications and doses tailored to a person's DNA. Traditionally, many drugs are prescribed using a "one-size-fits-all" approach, but this can lead to adverse effects or treatment failure in some individuals. Pharmacogenomics helps predict how a person will respond to a drug—whether they will benefit, experience side effects, or require a different dosage. By understanding genetic variations, healthcare professionals can optimize drug therapy, minimize harmful drug reactions, and increase treatment efficacy. For instance, patients with certain gene variations may metabolize drugs either too quickly or too slowly, affecting the drug's effectiveness. This approach is especially valuable in areas like oncology, cardiology, and psychiatry. Pharmacogenomics represents a major step toward personalized medicine, where treatments are not only disease-specific but also individual-specific. With the growing availability of genetic testing, this field holds great promise in revolutionizing the future of healthcare and making treatment safer, faster, and more accurate.

**Keywords:** Pharmacogenomics, Personalized Medicine, Genetic Variability, Drug Response, Adverse Drug Reaction

## GREEN PHARMACY

Mayda maheskar sopnil dunde
MCES society Allana College of Pharmacy

Green pharmacy is a forward-thinking approach that integrates environmental sustainability into all aspects of pharmaceutical practice, from drug design and manufacturing to usage and disposal. Traditional pharmaceutical practices often lead to the release of active pharmaceutical ingredients (APIs) into the environment, contaminating soil, water bodies, and affecting ecosystems. Green pharmacy aims to minimize this environmental impact by promoting the development of biodegradable and environmentally benign drugs, utilizing green chemistry principles, and encouraging proper disposal methods. It advocates for eco-conscious production techniques that reduce waste, energy consumption, and the use of hazardous solvents. Moreover, the discipline supports the use of plant-based and renewable raw materials in drug formulation, along with innovative green synthesis methods to reduce the chemical burden on the environment. The concept also encompasses public education on responsible medication use and disposal, along with policy development to enforce environmental guidelines in the pharmaceutical industry. Wastewater treatment upgrades and take-back programs for unused medications are critical components in preventing pharmaceutical pollution. Interdisciplinary collaboration among scientists, pharmacists, environmentalists, and policymakers is essential to achieve the goals of green pharmacy. By adopting sustainable practices, green pharmacy not only contributes to environmental protection but also to the long-term safety and health of communities. As healthcare demands grow, integrating environmental responsibility into pharmaceutical processes becomes vital for sustainable development.

**Keywords:** Green pharmacy, pharmaceutical pollution, sustainable healthcare, biodegradable drugs, green chemistry, drug disposal, environmental sustainability, renewable resources, eco-friendly synthesis, public health.

## CRISPR-BASED GENE EDITING FOR NEUROLOGICAL DISEASES

Iqra Khan and Swapnil Daunde
Allana college of pharmacy, azam campus, Pune 411042
khaniqra200612@gmail.com

Alzheimer's disease, Huntington's disease, and Parkinson's disease are persisting global health issues because they are complex diseases with a genetic as well as neurodegenerative nature. Conventional pharmacological interventions are of symptomatic relief only and do not correct the underlying genetic defects. The discovery of Clustered Regularly Interspaced Short Palindromic Repeats (CRISPR)-Cas9 gene editing tool has brought with it a revolutionary method of therapeutic treatment of these disorders in that it allows for accurate, effective, and economical gene manipulation. This review discusses the application of CRISPR-Cas9 in the correction or knockdown of genes responsible for major neurodegenerative disorders. Critical gene targets like HTT in Huntington's disease, APP and PSEN1 in Alzheimer's disease, and SNCA in Parkinson's disease are assessed based on CRISPR-based therapeutic viability. The article also addresses new preclinical breakthroughs, viral vector and lipid nanoparticle-mediated delivery approaches, and off-target issue challenges, along with the issues of ethics and penetration across the blood-brain barrier. Furthermore, the potential of combining CRISPR with stem cell therapy and its eventual use in personalized medicine are emphasized. As research continues, CRISPR promises disease modification or even long-term cures for some neurological diseases, revolutionizing neuropharmacology and gene therapy. More clinical trials and ethical guidelines are needed to convert such experimental modalities into everyday therapeutic practices.

**Keywords:** CRISPR-Cas9, Neurological Disorders, Gene Therapy, Alzheimer's Disease, Neuropharmacology.

**UNDERSTANDING AUTOIMMUNE DISORDERS: MECHANISMS, IMPACT, AND THERAPEUTIC APPROACHES**

Amna Shaikh and Swapnil Dounde
MCE SOCIETY, DR. PAI UNIVERSITY, ALLANA COLLEGE OF PHARMACY, CAMP, PUNE.
amna.0104shaikh@gmail.com

Autoimmune disorders cause the body to attack its own cells by mistake which produces persistent inflammation and tissue damage. The group of autoimmune disorders encompasses rheumatoid arthritis along with systemic lupus erythematosus and type 1 diabetes as well as multiple sclerosis and inflammatory bowel disease. The various conditions display individual characteristics yet they all stem from the same fundamental process of genetic susceptibility combined with environmental triggers and immune system abnormalities. The diagnostic challenges of these complex diseases lead to postponed identification which produces enduring medical consequences. The delivers comprehensive information about autoimmune disorders to second-year pharmacy students by covering their pathophysiology and classification together with their clinical presentation and present-day treatment methods. The pharmaceutical treatment options for autoimmune conditions consist of corticosteroids along with disease-modifying antirheumatic drugs (DMARDs) and biologics and newly developed targeted therapies that focus on immune system modulation. Pharmacy professionals serve as essential contributors to patient care by delivering medication counseling and ensuring prescription compliance while watching for drug reactions and enhancing patient wellness. The rising number of autoimmune diseases requires pharmacy students to understand these conditions because patients need ongoing pharmaceutical management. Future pharmacists will deliver effective patient care when they possess fundamental knowledge about autoimmune disease mechanisms and management strategies for both clinical and community healthcare settings.

**Keywords:** Autoimmune disorders, Immune response, Biologics, DMARDs, Pharmacist role

**PL-201**

**STATISTICAL ANALYSIS OF ADVERSE DRUG EFFECT**

Ateeb Shaikh, Rajat Sayyed
MCES Dr. P.A. INAMDAR UNIVERSITY, Allana College of Pharmacy

This study investigates adverse drug effects (ADEs) through a comprehensive statistical analysis of 5,000 pharmacovigilance case reports. The objective was to identify significant patterns, risk factors, and demographic correlations associated with ADEs. Descriptive statistics showed that 62% of ADEs occurred in females, with the majority reported among individuals aged 45–65. Among drug classes, antibiotics, antipsychotics, and antidepressants were most frequently linked to adverse reactions. Chi-square tests revealed statistically significant associations ($p < 0.05$) between certain drug types and specific adverse effects, such as gastrointestinal disturbances and central nervous system symptoms. A multivariate logistic regression model was applied to assess risk predictors, with polypharmacy, age, and pre-existing conditions emerging as key contributors to ADE incidence. Furthermore, principal component analysis (PCA) helped identify underlying clusters of symptoms, enabling more targeted monitoring strategies. Time- to-onset analysis also indicated that most ADEs occurred within the first two weeks of drug initiation. The findings underscore the importance of early detection and active post-marketing surveillance to ensure drug safety. This statistical approach not only enhances our understanding of ADE patterns but also supports clinical decision-making and regulatory interventions. Improved awareness and monitoring of high-risk populations could substantially reduce the burden of drug-related morbidity and healthcare costs.

**Keywords:** Adverse drug effects, pharmacovigilance, statistical analysis, risk factors, drug safety

**PL-202**

**EFFECT OF POLYHERBAL FORMULATION ON FUMER (BONE SIZE) SIZE OF POSTMENOPAUSAL RAT BY OVARIECTOMY MODEL.**

Mr. Avinash D.Hatkar; Dr. Niraj S. Vyawahare
Dr. D. Y. Patil College of Pharmacy, Kurdi Pune.

This study investigated the effects of a novel polyherbal formulation, comprising cardamom, liquorice, fenugreek, and soybean, on bone size and architecture in an ovariectomized (OVX) rat model. The OVX model is a well-established preclinical model for simulating postmenopausal osteoporosis, characterized by significant estrogen deficiency leading to accelerated bone loss and microarchitectural deterioration. Each component of the formulation contains bioactive compounds potentially beneficial for bone health: cardamom, for its antioxidant and anti-inflammatory properties that may reduce bone resorption; liquorice, for its phytoestrogenic compounds that could exert estrogen-like effects on bone; fenugreek, for its steroidal saponins that have been linked to improved bone mineral density; and soybean, a rich source of isoflavones (genistein and daidzein) known for their osteoprotective effects. The primary objective was to determine whether this polyherbal blend could mitigate the negative impact of estrogen deficiency on bone parameters, specifically focusing on changes in bone size (e.g., length, width, and cortical thickness) and potentially other indicators of bone quality. This research aims to provide preliminary data on the potential of this natural formulation as a complementary strategy for preserving skeletal integrity in an estrogen-deficient state, paving the way for further detailed mechanistic and translational studies.

**PHARMACIST-LED HYGIENE INTERVENTION AND RATIONAL ANTIFUNGAL USE IN SGLT2 INHIBITOR THERAPY**

Anushree Deshpande and Numan Malik
Department of Pharmacy Practice, KLE College of Pharmacy, Belagavi, KLE Academy of Higher Education & Research, Belagavi, Karnataka, India-590010
anushreedeshpande@klepharm.edu

Sodium-glucose co-transporter 2 (SGLT2) inhibitors are widely prescribed for managing type 2 diabetes and have shown significant cardiovascular and renal benefits. However, their glycosuria-promoting action predisposes patients to genitourinary infections. Lack of patient awareness and poor hygiene practices contribute to infection risk and unnecessary antifungal use. Pharmacists can play a pivotal role in education and antifungal stewardship. This prospective interventional study was conducted over six months in a tertiary care teaching hospital. A total of 200 adult patients on SGLT2 inhibitors were enrolled. Baseline assessments were conducted using a validated questionnaire to evaluate knowledge and hygiene practices. Participants received a structured pharmacist-led educational intervention, including counselling and patient information leaflets. Follow-up assessments were performed after one month. Antifungal prescriptions for patients who developed infections were reviewed for utilization and rationality. Post-intervention, awareness of SGLT2 inhibitor-related infections increased from 31% to 59.5%, and daily hygiene practices improved from 31.5% to 64%. Mean knowledge scores rose from 3.81 to 7.23, and practice scores from 4.02 to 7.51 ($p < 0.0001$). Among 66 patients who developed infections, 92.4% of antifungal prescriptions were deemed rational, with fluconazole and clotrimazole being the most used. A structured, pharmacist-led educational intervention significantly improved knowledge, hygiene practices, and rational antifungal use in patients on SGLT2 inhibitors. Pharmacist involvement is crucial in preventing infections and promoting antifungal stewardship in clinical practice.

**Keywords:** SGLT2 inhibitors, Pharmacovigilance, Genital infections, Hygiene education, Antifungal stewardship, Pharmacist intervention

**EVALUATION OF PHARMACOGNOSTIC AND ANTI-INFLAMMATORY ACTIVITY OF AQUEOUS LEAVES EXTRACT OF AEGLE MARMELOS LINN (PLANTS GROWN IN AND AROUND BIDAR DISTRICT) ON CARRAGEENAN INDUCED PAWEDEMA IN ALBINO WISTAR RATS**

Yogeshwari Nayeem Khatib Veerendra Shastri
Department of Pharmacology, Karnataka M.H.Goel College of Pharmacy Bidar – 585 403
yogijs104@gmail.com

The present study aimed to evaluate the pharmacognostic characteristics and anti-inflammatory activity of the aqueous leaves extract of Aegle marmelos Linn., specifically sourced from plants grown in and around the Bidar district. Comprehensive pharmacognostic analysis, including macroscopic and microscopic examination,

ISBN: 978-81-980623-8-3

physicochemical parameters, and preliminary phytochemical screening, was conducted to establish the identity, purity, and quality of the plant material. The anti-inflammatory potential of the extract was assessed using the carrageenan-induced paw edema model in albino Wistar rats, a well-established method for evaluating acute inflammation. Rats were divided into control, standard, and test groups receiving graded doses of the extract. Paw volume was recorded at predetermined intervals following carrageenan administration to monitor the progression of inflammation. The aqueous extract demonstrated significant, dose-dependent inhibition of paw edema compared to the control group, indicating notable anti-inflammatory activity. Phytochemical analysis suggested the presence of flavonoids, tannins, and other bioactive constituents that may contribute to the observed pharmacological effects. The extract's performance was comparable to that of the standard anti-inflammatory drug at higher doses, supporting its therapeutic potential. The findings highlight the importance of region-specific plant evaluation, as environmental factors in the Bidar district may influence phytochemical composition and bioactivity. Overall, the study provides scientific evidence supporting the traditional use of Aegle marmelos leaves for managing inflammatory conditions and encourages further investigation into its active constituents, mechanisms of action, and potential formulation development.

**Keywords:** Aegle marmelos, Pharmacognosy, Anti-inflammatory Activity, Carrageenan-Induced Paw Edema, Albino Wistar Rats, Aqueous Extract, Bidar District, Phytochemicals, Acute Inflammation, Herbal Medicine.

## COMPARISON ON THE EFFICACY OF USING PIRACETAM WITH ORAL IRON VERSUS IRON ALONE IN CHILDREN WITH BREATH-HOLDING SPELLS IN A TERTIARY CARE HOSPITAL

SHAIMOL T
Devaki Amma Memorial College of Pharmacy

Breath holding spells (BHS) are one of the most frequent and important diagnostic challenges in paediatrics. These are apparently frightening events relatively common in children. Parental reassurance and non-pharmacological methods are usually followed. But in some cases, BHS can be very stressful for the parents and these methods alone may not be sufficient. In such conditions pharmacological agents may be desired in some of these patients. Iron supplements and piracetam are the two different pharmacological methods that are used for treating breath holding spells in children. But not much study has been conducted to see the effects of these drugs in paediatrics. This is the first time such kind of study is conducted in our study site and it is hypothesized to show some results to compare two therapeutic regimen that are commonly prescribed for breath holding spells in children. A total of 70 breath holding spells cases were enrolled into the study of which 35 patients (A) were given iron alone and 35 patients (B) were given piracetam and oral iron. The study provides the data for comparing the efficacy of using piracetam with oral iron versus iron alone in children with breath holding spells in the outpatient department of a tertiary care hospital in Calicut. The study concluded that piracetam appears to be safe and effective drug for breath holding spells. Piracetam in addition to oral iron in children with breath holding spells can decrease the frequency and severity of attacks than using iron alone, thus reducing the distress of the disturbed parents and suffering of their children.

**PL-206**

## TESTING AND REFINING BEHAVIORAL, EDUCATIONAL AND SOCIAL LIFE INTERVENTIONS THAT CAN IMPROVE OUTCOMES AND QUALITY OF LIFE OF AUTISM

Ms Vidya Mukund Yelam, Dr. Dharmendra Ahuja
Faculty of pharmaceutical sciences
Jayoti Vidyapeeth Women's University, Jaipur

This study underscores the multi-factorial origins and complex management of Autism Key findings reveal that: Prenatal and perinatal factors such as birth asphyxia, maternal infections, and nutritional deficiencies are primary causes. Male children and those aged 6–10 years are more commonly affected. It is the most prevalent comorbidity, requiring long-term treatment. Combination therapy merging pharmacological and physical rehabilitation is more effective than standalone treatments. Most critically, the study highlights the undervalued yet essential role of clinical pharmacists in enhancing therapeutic adherence, optimizing drug use, and improving quality of life for children with CP. Their collaboration with physicians, physiotherapists, and caregivers can significantly influence long-term patient outcomes. Assessments such as the Autism diagnostic observation schedule (ADOS) or Autism diagnostic interview – revised (ADI-R) are used by clinicians and researchers to diagnose and assess autism spectrum disorder (ASD). To combat Autism more effectively, healthcare systems must adopt a multidisciplinary, patient- centered approach that emphasizes early diagnosis, continuous therapy, caregiver education, and improved access to rehabilitative and pharmacological care. Future strategies should also focus on strengthening maternal and neonatal care services, especially in rural and resource-limited settings, to reduce the incidence and burden of Autism.

**Keywords**- Autism, Educational and Social Life, Clinical observations, Autism diagnostic interview – revised (ADI-R)

## THERAPEUTIC POTENTIAL OF AGMATINE IN ALCOHOL USE DISORDER: PRECLINICAL INSIGHTS AND FUTURE DIRECTIONS

Mayur B. Kale, Milind J. Umekar, Brijesh G. Taksande*
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India – 441 002
mayur.kale28@gmail.com

Alcohol Use Disorder (AUD) is a chronic and relapsing condition that involves compulsive alcohol consumption, withdrawal symptoms, cognitive dysfunction, and high relapse rates. Current therapeutic options for AUD remain limited in efficacy and are often accompanied by adverse effects, highlighting the urgent need for novel treatment strategies. Agmatine, a naturally occurring polyamine formed by the decarboxylation of L-arginine, has emerged as a promising neuromodulator with diverse biological functions, including neuroprotection, analgesia, anxiolysis, and antidepressant effects. This review consolidates preclinical evidence supporting agmatine's potential in alleviating behavioral, cognitive, and neurochemical disturbances associated with AUD. Special emphasis is placed on its interaction with imidazoline receptors, regulation of glutamatergic and GABAergic systems, and attenuation of ethanol-induced neurotoxicity. The mechanistic insights, behavioral outcomes, and pharmacological interventions highlighted herein pave the way for future translational studies and clinical applications.

## NETWORK PHARMACOLOGY-BASED STRATEGY FOR INVESTIGATION OF ANTI-OBESITY EFFECT OF SOLANUM LYCOPERSICUM VAR. CERASIFORME

Sumeet Sanjay Rayagoudar1, Nikita Kanbarkar, Shamanand Mallapure
1P.G. Student, Pharmacology department, Rani Chennamma College of Pharmacy Belagavi-10, Karnataka INDIA
sumeetrayagoudar@gmail.com

Cherry tomato (Solanum lycopersicum var. cerasiforme) is a nutrient rich fruit widely consumed for its antioxidant, anti-inflammatory, and therapeutic benefits. It contains several bioactive phytochemicals with reported roles in metabolic regulation. Due to its diverse phytoconstituents, cherry tomato holds promise as a natural intervention against metabolic disorders, including obesity. Hormone-induced obesity, such as that associated with progesterone imbalance, involves complex molecular pathways requiring multi-targeted therapeutic strategies. The present study aimed to evaluate the anti-obesity potential of cherry tomato fruit juice using in silico approaches. Initially, drug-likeness and toxicity profiles of its phytoconstituents were analysed to ensure pharmacokinetic suitability. Swiss Target Prediction identified 298 target genes associated with the compounds, while 119 obesity-related genes were retrieved from GeneCards. Twenty-six overlapping genes were subjected to STRING and KEGG pathway analysis, revealing 114 enriched pathways, 17 of which were directly linked to obesity mechanisms. Molecular docking was performed to validate interactions. Lycopene showed strong binding with SQLE (−11.2 kcal/mol) forming 17 non-hydrogen bond interactions. Flazin docked with PDE4D (−8.4 kcal/mol), forming an H-bond with Asp484. Luteolin interacted with ADORA1 (−8.7 kcal/mol), while Beta carotene and Apigenin exhibited strong binding with ESR1 (−9.2 and −8.3 kcal/mol, respectively). Compared to standard ligands such as Rolipram and

ISBN: 978-81-980623-8-3

Bazedoxifene, these compounds demonstrated comparable or better interaction profiles. These findings suggest that Cherry Tomato fruit juice possesses promising anti-obesity potential by modulating multiple targets and pathways implicated in progesterone-induced obesity. Further experimental validation is recommended to confirm these therapeutic interactions and support its functional application in metabolic health.

**PL-209**

**ANTI-OBESITY EFFECT OF HYDROALCOHOLIC EXTRACT OF ACACIA SUMA HEARTWOOD IN HFD INDUCED C57BL/6 MICE**

Dr. Nikita Kanbarkar
Associate professor; Pharmacology Department, Rani Chennamma College of Pharmacy, Belagavi– 590010, Karnataka, INDIA

Obesity is a multifactorial, chronic yet preventable metabolic disease which negatively affect body functioning where metabolic dysfunction of food digestion process creates an imbalance in both energy intake and energy expenditure. This study was designed to explore anti-obesity effect of hydro-alcoholic extract of Acacia suma (HAEAS) in high fat diet (HFD) fed C57BL/6 mice. The study duration was seven weeks and animals were divided into six groups (n=6) Group I- Normal; received a normal diet, Group II- Obese; received a HFD (60% fat), Group III- received HAEAS 100mg/kg + HFD, Group IV- received HAEAS 200mg/kg + HFD, Group V-HAEAS 400mg/kg+ HFD, Group VI- Standard; Orlistat 10mg/kg+ HFD. Anthropometrical, nutritional, histopathology and lipid profile parameters of all the groups were studied. The HAEAS has significantly reduced body weight, body mass index, adipose tissue weight and serum level of cholesterol, low density lipo-protein, triglycerides in HFD fed C57BL/6 mice. HAEAS supresses adipogenesis by reducing number and size of adipocytes in 3T3-L1 cells. The result suggests that HAEAS has beneficial effect in inhibiting high fat diet induced obesity by regulating adipogenesis and promoting lipolysis. Hence, Acacia suma may be the promising agent to control and manage obesity.

**EVALUATION OF ANXIOLYTIC POTENTIAL OF ETHANOLIC EXTRACT OF MANILKARA ZAPOTA L. LEAVES IN RAT MODELS**

Nataraj G R, TA Noor Mohammed Khadeer, Ashwini and Abubaker Siddiq
Department of Pharmacology, SJM College of Pharmacy, Chitradurga, Karnataka, India.
itsnattu007@gmail.com

Anxiety is a disorder of all individuals with different level, which significantly affect daily functioning. The conventional anxiolytics on long-term use often leads to adverse effects like memory problems, mood swings, aggressive behaviour, vision issues, sleep disturbances, and even liver damage. Manilkara zapota L., traditionally used for various ailments, may offer a safer alternative. The current research aimed to investigates the anxiolytic potential of ethanolic leaf extract of M zapota (EEMZ) in rat's models. The coarse powdered leaves were subjected to soxhlet extraction with 70% ethanol (1:10 w/v, 60 °C). The EEMZ was screened for phytochemical, acute toxicity, followed by anxiolytic gauging against 28 days rat model. Rats were divided into four groups (n = 6): control, diazepam (1 mg/kg), EEMZ low-dose (100 mg/kg), and high-dose (200 mg/kg). Assessment includes Behavioural tests by using Elevated Plus Maze (EPM), Open Field Test (OFT), Hole Board Test (HBT), and Rota rod weekly for 4 weeks. On day 29, brain homogenates was analysed for monoamine oxidase A (MAO A) activity and lipid peroxidation. Results proclaim High-dose of EEMZ significantly improved open-arm time, central-zone activity, and exploratory behaviour without sedation and also reduced MAO A activity and lipid peroxidation which was statistically significant between $p<0.01$ to $p<0.001$, similar to diazepam against the control group. These results suggest EEMZ (200 mg/kg) exhibit significant anxiolytic effects, supporting its potential as a natural anxiolytic remedy for further research.

**Keywords:** Manilkara zapota L, Elevated Plus Maze, Open Field Test, Hole Broad Test, Monoamine Oxidase A.

**PL-211**

**PHARMACOLOGICAL EVALUATION OF THE ANTI-INFLAMMATORY, ANTI-ARTHRITIC, AND HEPATOPROTECTIVE POTENTIAL OF ATYLOSIA GOENSIS**

P. Ravi Kumar, Leemol Shaju
Department of Pharmacognosy
Sarojini naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana

This study investigated the anti-arthritic properties of Atylosia goensis, an indigenous plant from India's Western Ghats. We prepared an ethanolic extract using the Soxhlet method and identified a wide range of phytochemicals, including fatty acids, sterols, and other beneficial compounds, through liquid chromatography-mass spectroscopy (LC-MS). Notably, one key component, ursolic acid, was precisely characterized using 1H NMR, 13C NMR, and mass spectrometry. Our research evaluated the extract's anti-inflammatory and anti-arthritic activity both in-vitro and in-vivo. The extract significantly inhibited the Cox-2 enzyme, suggesting potential anti-inflammatory effects. When tested in an in-vivo model, ursolic acid demonstrated a significant reduction in joint swelling, especially at a higher dose of 400 mg/kg over a 24-day period. Additionally, we observed that ursolic acid provided notable hepatoprotective benefits, as shown by the improved levels of liver enzymes (SGPT, SGOT, and ALP) in the treated groups. Histopathological analysis confirmed these findings, revealing a reduction in inflammation in the areas treated with ursolic acid. This research highlights the therapeutic potential of Atylosia goensis and its compound, ursolic acid, as promising anti-inflammatory and hepatoprotective agents for managing inflammatory and arthritic conditions.

**Keywords:** Atylosia goensis; cyclooxygenase-1; cyclooxygenase-2; ethanolic extraction; in-vivo anti-arthritis activity.; ursolic acid

**PL-212**

**NEOANTIGEN PEPTIDE VACCINE DESIGN FOR PAN-CANCER IMMUNOTHERAPY**

Pinkan Sadhukhan and Nibedita Mahata
Department of Biotechnology, National Institute of Technology Durgapur, Durgapur, West Bengal, India-713209
pinkansadhukhan15@gmail.com

With the advent of AI, cancer immunotherapy has focused on exploiting gene-specific mutations. In this study, we aimed to design a pan-cancer neoantigen from COSMIC data spanning 52 cancer types. As top occurring genes in most of the events, TP53 and PIK3CA were selected with their top missense mutation profiles in coding sequences, i.e. R175H, and E545K, respectively. Two 9-mer peptides encompassing the mutation sites were identified by screening with Propred-I, ABCpred and Kolaskar & Tongaonkar method, revealing positive predictions for both cytotoxic T-lymphocyte and B-cell inducing potential. Subsequently, a peptide neoantigen construct was designed with RS-09 TLR4 agonist (adjuvant) and H-linker (proteasomal and lysosomally cleavable). This 68mer peptide 3D structure was predicted through AlphaFold3 and the Robetta webserver. Here, the Robetta (RosettaFOLD) predicted model resulted in better-quality scores (Ramachandran Plot G-factor, ERRAT, Verify3D, Z-score by ProSA and VoroMQA). 100ns molecular dynamics "protein in water" trajectories were calculated for PCA analysis resulted the free energy landscape, where the local minima of the "Backbone" were observed at 99230.0-time frame, indicating a energetically favoured vaccine model. This snapshot was utilized for molecular docking with human nasal TLR4, and the complex was studied for MD simulation. The flexible residual anarchy of the bounded TLR4 can be correlated with activation of the downstream signalling cascade. Immunosimulation shows a short-lived antigenic presence, supports hit-and-run expression of neoantigens. Due to a low instability index (34.88), this peptide is suitable for commercial synthesis (PepSySco score: 0.87) or can be codon-optimised for E. coli expression.

**Keywords:** Neoantigen, Cancer vaccine, Immunoinformatics, Quantum vaccinology.

**PL-213**

**RANDOMIZED CLINICAL TRIAL OF UC-II AND ETORICOXIB IN ARTHRITIS PATIENTS: ASSESSING PAIN RELIEF, INFLAMMATORY CONTROL, AND FUNCTIONAL MOBILITY**

Komaragiri Krishna, Mitta Raghavendra, Chadalawada Arun Kumar, Pakanati Krishna Sravanth
Department of Pharmaceutical Sciences, Vignan's Foundation for Science, Technology, and Research, Guntur, Andhra Pradesh, India – 522213

ISBN: 978-81-980623-8-3

Arthritis is a chronic inflammatory disease characterized by pain, stiffness, and reduced quality of life, where nonsteroidal anti-inflammatory drugs (NSAIDs) like etoricoxib are widely used but limited by long-term adverse effects. This randomized clinical study was conducted at Aditya Multispeciality Hospital evaluated the efficacy of undenatured type II collagen (UC-II) compared with etoricoxib in 30 arthritis patients (15 per each group). Clinical outcomes were measured at screening, baseline, and follow-up visits include day 15, 30, and 45 using WOMAC (pain, stiffness, function), 6-minute walk test (6MWT), physician global assessment (PGA), and visual analogue scale (VAS), alongside biomarkers (IL-6, IL-1β, TNF-α, hs-CRP) and quality-of-life (EQ-5D) scores. Both groups showed significant reductions in WOMAC pain, stiffness, and functional scores by day 30 ($p < 0.05$), but UC-II demonstrated superior improvements in mobility (6MWT: 423 ± 28.5 m vs. 365 ± 12.5 m; $p = 0.0001$), greater reductions in inflammatory markers (IL-6 and TNF-α), and better quality-of-life outcomes (EQ-5D: 82.3 ± 4.76 vs. 69.9 ± 6.47; $p = 0.0001$). Major finding of this clinical study, UC-II maintained and enhanced symptom relief through day 45, while etoricoxib-treated patients showed partial relapse in WOMAC and VAS scores. These findings suggest that UC-II is effective, well tolerated, and offers sustained improvements in pain, mobility, inflammation, and quality of life, representing a safer and more beneficial long-term therapeutic alternative to NSAIDs in arthritis management.

**Keywords:** Arthritis, UC-II, Etoricoxib, WOMAC, Biomarkers.

**PL-214**

**CLINICAL OUTCOME OF MIDODRINE IN HEART FAILURE PATIENTS IN DISTRICT HOSPITAL.**

Pratiksha Sharma1, Tshering Doma Bhutia1, Dr. Kalyan Roy1
Department of Pharmacy Practice, Government Pharmacy Collage Sajong, Sikkim, India- 737135

Heart failure (HF) is a chronic progressive condition where the heart cannot pump blood effectively, causing breathlessness, fatigue, and fluid overload. Guideline-directed medical therapy (GDMT) improves outcomes in HF, but hypotension often limits optimal dosing, especially in reduced ejection fraction (HFrEF). This study aimed to evaluate the effectiveness of Midodrine, an oral α-adrenergic agonist, in improving blood pressure, left ventricular ejection fraction (LVEF), reducing heart rate in hypotensive HF patients, and monitoring its adverse effects. A prospective observational study was conducted in the Cardiology Department of a district hospital in Sikkim. Adult patients (18-90 years) with a diagnosis of HF and systolic blood pressure <90 mmHg who were prescribed Midodrine were enrolled. Patients were grouped based on their daily Midodrine dose (5 mg, 10 mg, or 20 mg). Blood pressure and heart rate were monitored using bedside cardiac monitors, and LVEF was assessed via transthoracic echocardiography. Follow-ups were done at two weeks (BP/HR) and two months (LVEF). Adverse drug reactions were also recorded. The use of Midodrine resulted in significant improvements in blood pressure and heart rate stabilization, along with a noticeable increase in LVEF over time. Most patients tolerated the drug well, with only a few experiencing minor, manageable side effects. Midodrine appears to be a safe and effective option for managing hypotension in heart failure patients. It enables better tolerance and continuation of GDMT, thereby supporting improved clinical outcomes. These findings suggest that Midodrine could play an important supportive role in Heart failure.

**Keywords:** Heart Failure, Hypotension, Midodrine, HFrEF, Guideline-Directed Medical Therapy (GDMT), Left Ventricular Ejection Fraction (LVEF).

**UNDERSTANDING ANTIBIOTIC USE AND RESISTANCE IN INDIA: A KAP SYSTEMATIC REVIEW AND META-ANALYSIS**

Nunam Limboo*1, Chamta Gurung1, Anish Pradhan2
Government Pharmacy College Sajong, Department of Pharmacy Practice, Sikkim India
Government Pharmacy College Sajong, Department of Pharmaceutical Chemistry, Sikkim India

Antibiotic resistance (ABR) is major global health challenge. In India it is urgent because of widespread antibiotic use, lack of regulations and self-medication. Understanding people's knowledge, attitudes, and practices is essential to identify the main cause of inappropriate use and to design effective strategies to combat antibiotic resistance. We performed a systematic search on PubMed and Google Scholar, out of all the research, 17 studies were reviewed. Our data collection followed the PRISM guidelines, focusing on knowledge, attitudes, and practices (KAP) related to antibiotics use and antibiotic resistance. In 17 studies, only (56.6%) of participants reported proper antibiotic use, with medical practitioners (67.6%) and students (60.4%) but lowest in general public (33.2%). Overall knowledge was high (70.8%), particularly among practitioners (95.9%) and interns (93.5%), but low in general public (15.7%). Positive attitudes were common (70.1%) but weaker in general public (46.0%). Subgroup analysis confirmed significant gaps between public and medical groups. Overall, high knowledge and positive attitudes did not lead to responsible practices. Funnel plot analysis suggested possible publication bias in practice related studies. Antibiotics use in India show good awareness among healthcare professionals but inconsistent practice especially in general public. For effective control of antibiotic use in India requires closing the gap between knowledge and practice by community education, strict regulation of OTC antibiotic sales and strengthened antibiotic stewardship. Closing these gaps is essential to prevent antibiotic misuse and combat antimicrobial resistance.

**Keywords:** Antibiotic resistance; Antibiotic use; Knowledge attitudes and practices (KAP); Antimicrobial stewardship; India; Public health; Rational drug use

**EVALUATION OF ANTIPSYCHOTIC AND ANTIOXIDANT ACTIVITY OF ETHANOLIC EXTRACT OF IPOMOEA BATATAS IN SWISS ALBINO MICE**

Monisha R1, Pinki Verma2, B A Vishwanth3
Department of Pharmacology, Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka, Bangalore-560064, Karnataka, India
monishar222001@gmail.com

Neuropsychiatric disorders such as schizophrenia are associated with oxidative stress and dopaminergic dysregulation. Conventional antipsychotics provide symptomatic relief but are often limited by adverse effects. Ipomoea batatas (sweet potato) is a medicinally important plant rich in flavonoids, phenols, and anthocyanins with reported neuroprotective and antioxidant potential. The present study was designed to evaluate the antipsychotic and antioxidant activity of ethanolic extract of Ipomoea batatas in Swiss albino mice. To evaluate the anti-psychotic and antioxidant activities of ethanolic extract of Ipomoea batatas in Swiss Albino Mice. Ethanolic extract of Ipomoea batatas (EEIB) was prepared by Soxhlet extraction and phytochemical screening was performed. Swiss albino mice were divided into groups and treated with EEIB at graded doses (200, 400, 800 mg/kg, p.o.) for 14 days. Haloperidol-induced catalepsy and apomorphine-induced climbing tests were employed to assess antipsychotic activity. Antioxidant activity was evaluated by in vivo estimation of lipid peroxidation, catalase, and reduced glutathione levels in brain tissue homogenates. Standard drugs (haloperidol and ascorbic acid) were used for comparison. EEIB demonstrated significant dose-dependent reduction in haloperidol-induced catalepsy and apomorphine-induced climbing behavior ($p < 0.05$), suggesting antipsychotic-like activity. Antioxidant studies revealed a marked decrease in malondialdehyde levels with concurrent elevation of catalase and glutathione activity in treated groups as compared to the disease control. Phytochemical analysis confirmed the presence of flavonoids and polyphenols, which may contribute to the observed effects. The findings suggest that Ipomoea batatas ethanolic extract exhibits promising antipsychotic and antioxidant activities in Swiss albino mice. These results indicate its therapeutic potential as an adjunct or alternative in the management of psychotic disorders, warranting further mechanistic and clinical investigations.

**Keywords:** Ipomoea batatas, antipsychotic, antioxidant, Swiss albino mice, oxidative stress.

**UNRAVELLING THE ANTI-DIABETIC POTENTIAL OF PERILLAE FRUTESCENS: A SYSTEMS PHARMACOLOGY INSIGHT INTO ITS EFFECT ON INSULIN RESISTANCE**

Ramya Sunkara and Jithendra Chimakurthy

ISBN: 978-81-980623-8-3

Department of Pharmaceutical Sciences, School of Biotechnology and Pharmaceutical Sciences, Vignan's foundation for Science, Technology, and Research, Vadlamudi - 522213, Guntur, Andhra Pradesh, India.
sunkararamya111@gmail.com

Type 2 Diabetes Mellitus (T2DM) is a chronic metabolic disorder caused by varied pathological abnormalities like insulin resistance, Beta Cell destruction, dyslipidaemia, hepatic glucose production, impaired insulin secretion, chronic inflammation etc. The sprouted seeds of Perilla frutescens (PF) had been reported to exhibit antidiabetic activity, but the active compounds, drug targets, and molecular mechanisms remain unclear. This study aimed to categorize the active compounds of the seeds and identify their target proteins and explore their interaction with the biological systems of involved in insulin resistance, using an in sil ico approach with Systems Pharmacology, molecular docking. A total of 22 active compounds were identified from extensive literature review and drug databases, 18 of them were chosen for further studies, considering their oral bioavailability (OB) ≥ 30% and drug-likeness (DL) ≥ 0.18. 172 overlapped targets were selected from drug and disease targets, to evaluate the degree of interaction. Protein-protein interaction (PPI) analysis revealed the most potential 10 hub targets [TP53, AKT1, IL6, EGFR, BCL2, TNF, MYC, CASP3, JUN, CTNNB1], construction of drug-compound-gene-disease network lead to the identification of the five most potential compounds [Apigenin, Luteolin, Eugenol, Arachidonic acid, Stigmasterol] which could increase the insulin receptor sensitivity. Molecular docking studies showed with most relevant targets - TP53, AKT1, IL6, EGFR, BCL2, exhibited strong binding affinities for 2 ligands luteolin and apigenin. Gene Ontology (GO), and KEGG pathway enrichment analyses were performed. This study provides novel insights into the antidiabetic mechanisms of PF, supporting its potential in future drug development for T2D.

**Keywords:** Perilla frutescens, Insulin resistance, Systems pharmacology, Molecular docking

## PL-218

## SILICOXPLORE: A COMPREHENSIVE CLOUD-BASED PLATFORM FOR DRUG DISCOVERY, CASE STUDY ON EGFR-TARGETED GLIOBLASTOMA TREATMENT

Mahima Sudhir Kolpe and Md Ataul Islam*
SilicoScientia Private Limited, Nagananda Commercial Complex, No. 07/3, 15/1, 18th Main Road, Jayanagar 9th Block, Bengaluru – 560041
ataul.islam@silicoscientia.com

Artificial intelligence (AI) and machine learning (ML) are significantly transforming drug discovery by allowing the exploration of an extra-large chemical space, which speeds up and reduces risks in the traditionally costly and time-consuming process. The SilicoXplore platform, developed by SilicoScientia Private Limited, exemplifies this progress, providing a complete, end-to-end drug discovery solution that incorporates over twenty modules, many of which are specifically developed using ML. This platform efficiently manages various drug discovery approaches, such as structure-based and ligand-based drug design, pharmacokinetics, toxicity prediction, molecular dynamics (MD) simulations, and quantum chemical calculations, for extensive datasets. A key scientific insight that drives SilicoXplore's effectiveness is the integration of physics-based models with machine learning approaches, combining mechanistic understanding with data-driven prediction power. Glioblastoma multiforme (GBM), an aggressive and incurable brain tumor driven by EGFR, indicates a poor prognosis due to its relentless nature. The SilicoXplore platform was used to identify potential EGFR pathway modulators from existing compound libraries. Out of 25000 from BindingDB, 19000 compounds were retained after extensive curation. The ML-based SilicoScreen tool of SilicoXplore produced a highly predictive, statistically robust model. The SimSearch tool identified over 10000 active compounds similar to dataset actives, respecting the non-redundancy of 55145 compounds. ToxAI and SilicoPhysChem pinpointed the top 30 molecules. Additionally, PharmFrag analyzed pharmacophoric features and selected six promising molecules for EGFR-targeted glioblastoma therapy. Therefore, SilicoXplore, which combines advanced ML methods with physics-based approaches, efficiently explores large chemical spaces to find lead-like molecules without the need for extensive computational resources or programming skills.

**Keywords:** Artificial intelligence, SilicoXplore, Glioblastoma multiforme, EGFR, Virtual screening

## AMELIORATIVE EFFECTS OF CAPTOPRIL, SPIRONOLACTONE, AND METFORMIN ON DIABETIC NEUROPATHY IN RATS: ROLE OF INFLAMMATION, OXIDATIVE STRESS, AND NEUROTROPHIC RESTORATION

Chandana G[1]*, Dr. Bharathi D R[2], Dr. Mohammad Ali[3]
[1] Ph.D. Scholar, Department of Pharmacology, Adichunchanagiri College of Pharmacy, B.G. Nagara – 571448, Karnataka, India.
[2] HOD & Research Guide, Department of Pharmacology, Adichunchanagiri College of Pharmacy, B.G. Nagara – 571448, Karnataka, India.
[3] Professor, Department of Pharmacology, Adichunchanagiri College of Pharmacy, B.G. Nagara – 571448, Karnataka, India.
rambha.eesh@gmail.com

Diabetic neuropathy (DN) is a debilitating microvascular complication of diabetes, driven by hyperglycemia-induced oxidative stress, inflammation, and neuronal damage. Current therapies provide only symptomatic relief, underscoring the need for disease-modifying interventions. This study aimed to evaluate the neuroprotective potential of captopril, spironolactone, and metformin, individually and in combination, in streptozotocin (STZ)-induced diabetic rats. Wistar rats were divided into six groups: normal control, diabetic control, and diabetic rats treated with captopril, spironolactone, metformin, or their combination. Behavioral assessments (mechanical hyperalgesia, thermal allodynia, rotarod performance), biochemical markers (fasting blood glucose, lipid profile), oxidative stress indices (MDA, GSH, SOD, CAT), inflammatory cytokines (IL-6, TNF-α), and neurotrophic factor (NGF) levels were evaluated. STZ-induced diabetic rats exhibited significant hyperglycemia, oxidative stress, elevated pro-inflammatory cytokines, and reduced NGF levels, accompanied by motor and sensory deficits. Treatment with captopril, spironolactone, or metformin significantly improved behavioral outcomes, reduced oxidative stress, and suppressed inflammatory mediators ($p < 0.05$–$0.001$). Combination therapy exerted the most pronounced effects, restoring NGF levels and motor coordination near to control values. Captopril, spironolactone, and metformin, particularly in combination, demonstrate potent neuroprotective effects in DN through modulation of oxidative stress, inflammation, and neurotrophic support. These findings highlight their potential as a multifactorial therapeutic strategy for DN.

**Keywords:** Diabetic neuropathy, captopril, spironolactone, metformin, oxidative stress, inflammation, neurotrophic factor.

## KNOWLEDGE, ATTITUDE AND PRACTICE REGARDING ADR PREVENTION AMONG HEALTHCARE PROFESSIONALS (HCPS)

Shekinah J | Drishya L | Shaiju S Dharan
Student, Department of Pharmacy Practice, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Thiruvanthapuram, 695 124
shekinah656@gmail.com

Pharmacovigilance is a science of spotting, evaluate and understand the prevention of ADR. It also involves in resolving problem related to vaccine preparation, other medical conditions together with reporting the ADR and other medical relate problem where they correct it or withdraw the drug from the healthcare list. It plays a critical role in monitoring and safety of patient. Every year FDA list will be update with new drugs and withdrawal of ADR drugs. Studies show that 4,108 hospital admissions are based the 190 ADR drugs were 60 are preventable. ADR is the reaction that result from use of a drug. ADR plays an important role in drugs marketing and withdrawal. Healthcare professionals (HCPs) include nurses, physicians, pharmacist and have an important role in preventing the ADRs in the patient. However, there is a huge gap between the knowledge and practice of ADR prevention and reporting. Community pharmacist have an important role in reporting ADR but 90 % are fail to report due to lack of time and busy schedule.The aim of this survey to know how many HCPs know the pharmacovigilance ADR prevention and knowledge about ADR. Main objectives of this survey is to promote patient safety and encourage the ADR reporting.

**Key word:** safety of patient, practice and knowledge of ADR, pharmacovigilance

## THERAPEUTIC EVALUATION OF ALOE BARBADENSIS GEL IN EXPERIMENTAL PEPTIC ULCER MODELS

Fatima Mohammad Yasin1,2, Parag1,2 , Ajazuddin1,2
Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh, INDIA-490023
Department of Pharmacy, Rungta International Skill University, Kohka, Kurud Road, Bhilai, INDIA-490023
fatimamohdxd@gmail.com

Peptic ulcer disease (PUD) is a common gastrointestinal disorder, manifested as mucosal erosion of the stomach or duodenum, and is associated with non-steroidal anti-inflammatory drug (NSAID) use and Helicobacter pylori. The gastroprotective effect of Aloe barbadensis gel was investigated in ethanol-induced gastric ulcer models in Wistar rats (n = 6 per group) in this study. Fresh mucilaginous gel from mature leaves was given orally in graded doses (187.08, 374.42, and 561.25 mg/kg) for 7 days. Macroscopic and histopathological examinations showed dose-dependent inhibition of ulcer index. Complete mucosal healing was observed in the highest dose group (561.25 mg/kg), and the ulcer index was significantly reduced to 0.42 ± 0.06 from 2.87 ± 0.14 in the ulcerated control group ($p < 0.001$). Mucosal thickness and epithelial integrity were restored, and hemorrhagic lesions and inflammatory infiltration were significantly reduced. Chemical profiling of the gel revealed anthraquinones, polysaccharides (acemannan), sterols, and mucilaginous glycoproteins, which may play a significant role in enhancing mucosal protection, prostaglandin-mediated cytoprotection, and epithelial regeneration. No side effects were observed at therapeutic doses. The results indicate that Aloe barbadensis gel accelerates ulcer healing by promoting mucosal defense and repair mechanisms, and its activity is superior to conventional antiulcer drugs, such as omeprazole and cimetidine, during the early stages of healing. Its biocompatible and regenerative properties support its potential inclusion in phytotherapeutic regimens for PUD management.

**Keywords:** Aloe barbadensis, Ethanol-induced ulcer, Gastric mucosal healing, Ulcer index, Oral gel formulation.

## RECENT PATTERNS IN MICROBIAL ISOLATES FROM DIABETIC FOOT INFECTIONS

Ruby R1, Thameemul Ansari L H*
Crescent School of Pharmacy, BS Abdur Rahman Crescent Institute of Science and Technology, Vandalur, Chennai, India
Thameem0709@gmail.com

Diabetic foot infections (DFIs) affect around 15% of people worldwide, often due to poor blood sugar control, weakened immunity, and hormonal imbalances. These issues can lead to serious complications such as bone infections (osteomyelitis), the need for amputation, and growing resistance to antibiotics. This review, carried out in India between 2023 and 2024, looked at recent studies to understand the types of microorganisms found in DFIs and how they respond to antibiotics. The findings revealed that a significant proportion of infections were polymicrobial, involving both Gram-positive and Gram-negative bacteria and fungal species, thereby complicating treatment due to increased antimicrobial resistance and therapeutic challenges. These mixed infections often resist common antibiotics and can cause harmful side effects. While most doctors follow standard treatment guidelines when prescribing antibiotics, the review found that nearly half of the hospitals in India do not strictly follow these protocols. These findings highlight the urgent need for stricter adherence to standardized treatment guidelines to improve clinical outcomes in patients with diabetic foot infections. Moreover, the study underscores the significance of designing context-specific therapeutic strategies that consider regional variations in microbial profiles and healthcare infrastructure.

## A STUDY ON THE NEED OF INDIVIDUALISATION OF VANCOMYCIN DOSING USING THERAPEUTIC DRUG MONITORING IN THE TREATMENT OF MRSA INFECTIONS

Shafeena T1, Dr. Venkatalakshmi Ranganathan*
Crescent School of Pharmacy, B.S Abdur Rahman Crescent Institute of Science and Technology, Chennai, Tamil Nadu, India
venkatalakshmi@crescent.education

Vancomycin is a critical antibiotic used to treat serious infections, particularly those caused by Methicillin-resistant Staphylococcus aureus (MRSA). Due to its narrow therapeutic index and significant pharmacokinetic variability among patients, therapeutic drug monitoring (TDM) is essential for optimizing dosing regimens and improving treatment outcomes. This study evaluates the need of optimization of vancomycin dosing through therapeutic drug monitoring (TDM) in the treatment of MRSA infections with primary objective of assessing the duration of vancomycin treatment. An ambispective observational study was conducted over a 12month period, combining six months of retrospective data and six months of prospective data. Patient demographics, laboratory investigations and treatment outcomes were recorded for hospitalized patients aged over 18 years who received intravenous vancomycin. The study assessed the percentage of patients achieving therapeutic trough levels, and the duration of therapy until culture negativity. Statistical analysis was performed using SPSS software. A total of 49 patients who received vancomycin for the treatment of MRSA infections were included in the study. The findings indicated significant proportion of subtherapeutic levels and toxic levels when patients were administered on the basis of weight-based protocols. Additionally, the study identified key demographic factors influencing dosing and treatment outcomes, emphasizing the need for individualized dosing strategies. This study finding advocate for the routine implementation of TDM in clinical practice to enhance patient safety and efficacy of vancomycin therapy. Further research is warranted to explore the association of TDM on therapeutic outcome and duration of vancomycin therapy across diverse healthcare settings.

**Keywords:** Individualization; Vancomycin; Therapeutic drug monitoring (TDM); Methicillin resistant staphylococcus aureus (MRSA); Narrow therapeutic index; Pharmacokinetics; pharmacodynamics; trough

Digital twin is a novel technology reshaping the healthcare and pharmaceutical sectors by creating virtual clones of humans using AI. The data for the clone is obtained from electronic health records, biosensors, wearables, and genetic testing. AI and machine learning models are utilised to simulate physiological behaviour, personalize treatment therapies, and predict the progression of diseases. Digital twin hastens drug discovery and testing in pharmaceuticals by reducing reliance on human trials and promoting in-silico models. In emergency medicine, digital twins collect real-time data through IoT wearables continuously to prepare hospitals before patient arrival, and proactive healthcare interventions can be achieved. Additionally, significant wait-time reduction, workflow improvement, and enhanced resource allotment is attainable. The game-changing skill of digital twins is to predict diseases like cancer or diabetes before the symptoms appear. This is achieved by detecting subtle biomarkers and unexpected developments in the recorded data. Using this data as the basis, clinicians can stimulate “what if” scenarios and recommend targeted strategies. Notable examples include IBM Watson’s AI-driven cancer treatments and Dassault Systems’ "Living Heart Project," which demonstrate Digital Twins’ potential in patient-specific therapy design. Despite the developing technology and its assurances, challenges like data security, interoperability, ethical concerns, and regulatory compliance may cause problems. Various regulatory agencies, like EMA and FDA, are developing frameworks supporting DTS integration into clinical practice and drug approval. With the advancement of AI and IoT technologies Digital twin transforms healthcare from reactive to predictive, enhancing personalised medicine, hospital workflow, and accelerating therapeutic breakthroughs.

**ANTIOXIDANT AND IN VIVO ANTI INFLAMMATORY ACTIVITY OF METHANOL EXTRACT OF HYDYOTIS HERBACEA**

M. Ponnithra, S. Pandian, T. Shri Vijaya Kirubha
Mother Terasa College of Pharmacy, Mettusalai, Iluppur, Pudukkottai-622102
ponnithra2004@gmail.com

Hydyotis herbacea plant is an erect glabrous annual or biennial herb used as bitter tonic and febrifuge. In this article we revealed the in vitro antioxidant and in vivo anti-inflammatory activities of crude methanol extract of H. herbacea. Qualitative phytochemical screening of the extract showed the presence of flavanoids, glycosides, steroids, triterpenoids, saponins etc. The total phenol and flavonol contents were found to be 124.32 ± 3.92 and 48.64±1.86 respectively. The extract showed potent in vitro antioxidant activity. The IC50 values are 2.65 ± 0.02 (ABTS method), 82.36 ± 0.52 (Nitric oxide method), 23.50±1.00 (Deoxy ribose method), 72.5 ± 0.75 (Hydrogen peroxide method), 9.23 ± 0.08 (Super oxide radical method). The total antioxidant capacity was found to be 3.56 ± 0.12. Methanol extract at 100 and 200 mg/kg bw produced significant and dose dependent inhibition of paw edema after 1 to 3 h of treatment when compared to control in formalin induced paw edema method with percentage inhibitions of 23.70 ± 1.37 to 40.50 ± 0.36 and 32.64 ± 0.54 to 52.76 ± 0.66, respectively. In carrageenan induced paw edema, the percentage inhibitions at 100 and 200 mg/kg after 1-3 h were found to be 25.56 ± 0.72 and 44.36 ± 1.32 to 57.83 ± 0.84, respectively. The standard ibuprofen showed similar results.

**Keywords:** Hydyotis herbacea, anti-inflammatory activity, formalin induced paw edema, Carrageenan induced paw edema

**A PROSPECTIVE STUDY ON ADVERSE DRUG REACTION OF ANTICONVULSANT DRUGS IN A TERTIARY CARE HOSPITAL**

Sakthivel M and Navaneetha krishnan S
Department of Pharmacology including Pharmacy practice, Dr.Kalam College of Pharmacy, Avanam, Thanjavur, Tamilnadu, India - 614 623.
sakthivelmohanpharma@gmail.com

Anticonvulsants remain the cornerstone of epilepsy management, but their long-term use is often complicated by adverse drug reactions (ADRs), which may compromise treatment adherence, patient safety, and overall quality of life (QoL). This study aimed to evaluate the frequency, severity, and impact of ADRs associated with commonly prescribed anticonvulsants—Levetiracetam, Brivaracetam, Lamotrigine, Valproic Acid, Phenytoin, and Carbamazepine—in patients with epilepsy. A total of 150 epilepsy patients receiving long-term anticonvulsant therapy were enrolled. ADRs were assessed using the WHO-UMC criteria and Naranjo's scale, while severity was classified with the Hartwig and Siegel Scale. Adherence was measured with the MMAS-8 tool, and QoL impact was evaluated. Descriptive statistics summarized ADR patterns, and chi-square tests compared ADR frequency and severity across drugs. The findings revealed that levetiracetam (62.96%) and carbamazepine (57.69%) were associated with the highest ADR rates, whereas phenytoin demonstrated the lowest (41.67%). Neurological and psychiatric ADRs, particularly mood changes and cognitive disturbances, were the most prevalent and significantly affected adherence and QoL. Patients experiencing severe ADRs showed reduced medication adherence (MMAS-8 <6) and poorer QoL scores. In conclusion, ADRs remain a critical challenge in epilepsy management, with neurological, psychiatric, and metabolic manifestations being the most common. Early detection, dose adjustments, and patient education are essential strategies to improve drug tolerability. Personalized therapy optimization and regular monitoring may enhance adherence, minimize ADR burden, and ensure effective long-term seizure control.

**Keywords:** Epilepsy, Anticonvulsants, Adverse drug reactions (ADRs), Treatment adherence, Quality of Life (QoL).

**ANTIMOTIVATIONAL PROPERTIES OF QUERCETIN AGAINST ETHANOL REWARD IN A MOUSE RUNWAY MODEL**

Vulli Naga Jyothi, Neha Ghongane, Vijayapandi Pandy
Department of Pharmaceutical Sciences, School of Health Sciences and Technology, Dr. Vishwanath Karad MIT World Peace University (MIT-WPU), Paud Road, Kothrud, Pune-411038 India
vijayapandi.pandy@mitwpu.edu.in

Quercetin, a naturally occurring bioflavonoid, possesses potent antioxidant and neuromodulatory properties and has been reported as an effective neuroprotective agent against neurological disorders by reducing oxidative stress and neuroinflammation. The present study aims to evaluate the therapeutic potential of quercetin in attenuating alcohol-seeking behavior using a mouse model. Alcohol craving and reinforcement were assessed using a modified runway model of drug self-administration, wherein mice were trained to traverse a runway apparatus to obtain ethanol in the goal box. Following habituation and training, mice were administered quercetin at two doses (0.1 and 0.5 mg/kg, p.o.) or the reference drug naltrexone (5 mg/kg, p.o.) prior to testing. The primary behavioral measure (latency to reach the goal box from the start box) was used as an indicator of alcohol-seeking behavior. Quercetin treatment significantly increased latency and reduced approach behavior, similar to the effects observed with naltrexone, indicating decreased motivation toward ethanol reward. Notably, these effects were achieved without inducing non-specific motor impairments. These findings suggest that quercetin exhibits anticraving properties by attenuating the reinforcing effects of ethanol. The study highlights the potential of quercetin as a therapeutic strategy in the management of alcohol use disorder.

**Keywords:** Alcohol use disorder, Ethanol-seeking, Mice, Quercetin, Runway model

**PL-228**

**IN VITRO ASSESSMENT OF ANGIOGENESIS BY USING A CHICK EGG MODEL**

P. Bhargavisri*and G. Manasa
Department of Pharmacology, V. V. Institute of Pharmaceutical Sciences, Seshadri Rao Knowledge Village, Gudlavalleru, Andhra Pradesh, India– 521 356.
bhargavisripenumudi@gmail.com

Angiogenesis, the formation of new blood vessels from pre-existing vasculature, plays a critical role in both physiological processes such as wound healing and pathological conditions including tumor growth. Reliable in vitro models are essential for evaluating the angiogenic potential of various biomolecules and therapeutic agents. This study utilizes the chick chorioallantoic membrane (CAM) assay, an established ex vivo model derived from fertilized chicken eggs, to assess angiogenesis in a controlled environment. Fertilized eggs were incubated and the CAM was exposed on day 7 of embryonic development. Test substances were applied to the CAM surface, and angiogenic responses were evaluated after 72 hours using stereomicroscopy and digital image analysis. Quantitative assessment included vessel count, branching points, and vessel length. Results demonstrated the model's sensitivity in detecting both pro-angiogenic and anti-angiogenic activities, highlighting its value as a cost-effective, ethical, and reproducible platform for angiogenesis research. This study supports the CAM assay as a robust tool for preclinical screening of angiogenic modulators in biomedical and pharmaceutical research.

**Keywords:** Angiogenesis, Chorioallantoic, sodium chloride

**A PROSPECTIVE OBSERVATIONAL STUDY TO COMPARE THE OVERALL EFFICACY AND SAFETY PARAMETERS ASSOCIATED WITH LEVETERACETAM AND COMBINATION OF LEVETERACETAM AND CLOBAZAM IN PATIENTS WITH EPILEPSY**

Renuka, B. Divya chandana , Sk Shafiya Begum, S. Vidyadhara
Department of Pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramulipuram, Chowdavaram, Guntur, Andhra Pradesh, India -522019
gollapothurenuka@gmail.com

Epilepsy is a prevalent neurological disorder, yet only 60–65% of patients achieve remission with current anti-epileptic drugs (AEDs). Levetiracetam, a newer AED, is widely preferred for its safety and tolerability. This study compared the efficacy and safety of Levetiracetam monotherapy with its combination with Clobazam in epilepsy patients.A hospital-based, prospective observational study was conducted in the Neurology outpatient department of NRI General Hospital over 9 months. A total of 93 patients were enrolled: Group I (Levetiracetam,

ISBN: 978-81-980623-8-3

n=35; mean age 41.11 ± 14.20 years) and Group II (Levetiracetam + Clobazam, n=58; mean age 34.07 ± 13.04 years). Clinical outcomes were assessed using seizure frequency, duration, severity (NHSSS), and scales for anxiety (HAM-A), depression (HAM-D), sleep (MOS sleep scale), and autonomic symptoms. Adherence and adverse drug reactions were also evaluated. Scores were recorded at baseline and after 3 months.Both groups showed statistically significant improvement ($p<0.05$) in seizure frequency, duration, severity, anxiety, and depression. Reduction in autonomic symptoms was more notable in the combination group, though seizure outcomes did not differ significantly. Patients with longer seizure history (>4 years) in the monotherapy group showed less improvement in seizure frequency. Common adverse effects in both groups included headache, sleepiness, unsteadiness, and weakness. Both regimens were effective and well tolerated, but given comparable efficacy, fewer drugs, and better cost-effectiveness, Levetiracetam monotherapy may be considered the preferred first-line approach.

## ASSESSMENT OF ANTIOXIDANT, CYTOTOXIC AND ANTIPROLIFERATIVE PROPERTIES WITH GC-MS PROFILING AND IN SILICO STUDY OF METHANOLIC EXTRACTS OF ANNONA SQUAMOSA L. LEAVES

Palash Chandra Biswas and Vikash Jakhmola
Uttaranchal Institute of Pharmaceutical Sciences, Uttaranchal University, Dehradun, Uttarakhand, India -248007.
palash1976biswas@gmail.com

One of the main sources for developing new, efficient medications is thought to be medicinal plants. In this context, the study's aim to examine polyphenolic and flavonoid fractions in Annona squamosa L. leave's methanolic extracts, using phytochemical screening and to assess antioxidant, cytotoxic and antiproliferative properties of these fractions. GC-MS profiling was used to find out the medicinally active polyphenolic compounds. Antioxidant property of the extracts was measured by peroxide scavenging method. Extracts were tested in human breast cancer (MCF-7) and Cervical cancer (HeLa) cell lines, through MTT assay. IC50 was calculated by using software Graph Pad Prism 6. In silico analysis was conducted using the extract's phytochemical screening, molecular docking, and the Swiss ADME web portal. The study validated receptors and protein structures used in docking investigations, and the IMODS web portal was used for simulation studies. Methanolic leaf extracts of A squamosa L. were found to contain many bioactive compounds, like kaempferol (C15H10O6), Quarcetin (C27H30O15), Phytol (C20H40O) etc, that shows strong antioxidant activity and MTT assay results displayed a remarkable antiproliferative and cytotoxic effects in (MCF-7) and (HeLa) cell lines, that can be used for development of novel drugs for breast cancer and cervical cancer therapy in future.

**Keywords**: Annona squamosa, antiproliferative, cervical cancer, In-silico analysis, MTT assay,

## ADVERSE EVENTS FOLLOWING IMMUNIZATION: IDENTIFICATION AND REPORTING IN A PROSPECTIVE OBSERVATIONAL STUDY

M.Rathna Harshitha*,S.Navya sri, V.Sindhu Vaishnavi and S.Vidyadhara
Department of Pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramulipuram, Chowdavaram, Guntur, Andhra Pradesh, India -522019
harahudr17@gmail.com

Vaccination mimics infection in the body, activating the immune system and generating a potent immune response. While vaccines are widely regarded as safe and effective, continuous monitoring of their safety profile is essential, particularly in pediatrics. This prospective observational study aimed to identify and report adverse events following immunization (AEFIs) in children and to assess their causality, severity, predictability, and preventability. A total of 348 neonates receiving vaccinations at the immunization center of NRI General and Super Specialty Hospital, chinnakakani, Guntur, between June and March were enrolled. Participants were observed for 30 minutes post-vaccination and followed up via telephonic survey after one week, with the procedure repeated for subsequent doses until 14 weeks. The incidence of AEFIs after zero dose, Pentavalent-I, Pentavalent-II, and Pentavalent-III was 81.6%, 92.26%, 96.83%, and 94.54%, respectively. The most frequent events were fever (29.52%), swelling (28.08%), erythema (26.8%), crying for 24 hours (14.6%), and crying for 48 hours (1%). Pentavalent vaccine was most often implicated, followed by BCG. All 3821 AEFIs were consistent, predominantly vaccine product-related reactions. Severity assessment revealed 60.77% mild and 38.97% moderate cases. Predictability analysis showed all 3182 events were predictable, while 70.48% were not preventable. A 100% scar success rate was observed with BCG at 12 weeks. Overall, most AEFIs were mild and non-serious, underscoring the importance of vigilant monitoring to predict and prevent severe reactions.

**Keywords:** AEFI, causality, severity, BCG, pentavalent, erythema.

Manipal Academy of Higher Education, Manipal, Karnataka, India-576104
alan.raj@learner.manipal.edu

The study aims to optimize and functionalize the PEGylated PLGA based polymeric nanoparticles of glutaminase inhibitor CB839 using integrin targeted RGD peptide to target triple negative breast cancer (TNBC). CB839 is an allosteric GLS inhibitor with poor plasma half-life and low solubility, requiring frequent dosing. PLGA nanoparticle was prepared using single emulsion technique (GiPG) and optimized using Box-Behnken design with PLGA-PEG, PVA, and sonication amplitudes as independent variables and particle size, PDI, zeta potential, and %EE as dependent variables. The optimized formulation was subjected to cRGDfk conjugation using the EDC/NHS technique. The final formulation showed a particle size of 245.7±3.56, PDI 0.223±0.011, ZP -10.46±3.97, and %EE of 65.12±5.65. The cRGDfk conjugated nanoparticles (GiPG@R) show no significant change in PS and PDI but a slight change in ZP due to the amine group. The SEM and TEM images show that the nanoparticle surface was smooth and spherical. The drug is released more in acidic pH, where the PLGA was degraded in acidic medium, representing the tumor microenvironment. The fluorescence microscopy reveals that GiPG@R was taken up by the cells via receptor-mediated endocytosis. The cell line studies revealed that the GiPG and GiPG@R show potent cytotoxicity compared to free CB839. This finding was supported by the scratch wound assay, the GiPG@R shows better anti-migratory property in MDA-MB-231 at a reduced dose. There has been no approved therapy to block GLS directly in TNBC. So, it is concluded that GiPG@R may overcome the issues and be an alternative treatment strategy against TNBC.

**Keywords:** TNBC, CB839, glutaminase, nanoparticles, anticancer

## ENHANCING THE THERAPEUTIC EFFICACY OF MADHUCA LONGIFOLIA FLOWER EXTRACT THROUGH CONCURRENT ADMINISTRATION WITH PROBIOTIC LACTOBACILLUS PLANTARUM IN A STREPTOZOTOCIN-INDUCED ALZHEIMER'S DISEASE MODEL

Smrithi S Pillai, Shweta Maury
Department of Pharmaceutical Pharmacology, SSR College of Pharmacy, Sayli, Silvassa 396230, UT of Dadra and Nagar Haveli and Daman and Diu, India
pillaismrithis2002@gmail.com

Alzheimer's Disease (AD) is a neurodegenerative disease that causes symptoms such as memory loss, impaired reasoning, and cognitive impairment. AD is becoming more prevalent worldwide, causing significant challenges for individuals, families and healthcare providers. The objective of this study was to evaluate whether the bioactive nature of Madhuca longifolia flower extract could, when combined with probiotics in addition, slow down the progression of AD by reducing hallmark protein aggregation, oxidative stress and inflammation but

ISBN: 978-81-980623-8-3

returning normal gut microbiota balance. The hypothesis was that the experimental groups were given Madhuca longifolia extract, probiotics, or both to model AD. They assessed brain health by examining gross pathology, behavioral memory and cognition tests, histopathological analysis, and the composition of the gut microbiota. Additionally, they measured short-chain fatty acid (SCFA) level and their body composition. The combined treatment group demonstrated marked improvements in cognitive performance, decreased onset of characteristic pathological changes, and reduced levels of neuroinflammation and oxidative stress. The gut microbiota's composition shifted towards improved health, and the increase in SCFA production indicated an improvement in brain function. The results suggest that Madhuca longifolia extract and probiotics have the potential to effectively target both neurological and gut aspects of AD. Essentially, the combination of extract from Madhuca longifolia and probiotics is a highly effective integrated treatment for AD in its entirety. The outcomes offer solid guidance for future research to convert the combination into an effective treatment

**Keywords:** Alzheimer's Disease, Madhuca longifolia, probiotics, gut–brain axis, neuroinflammation.

**PL-234**

**REGENARATING PANCREATIC B – CELLS: THE PROMISE OF STEM CELL THERAPY IN TYPE 1 DIABETES**

A.Dinesh kumar*, A.Gayathri, T.Shri Vijaya kirubha
Department of Pharmacology, Mother Terasa College of Pharmacy Illuppur, Pudukkottai, Tamilnadu – 622 102.
dineshkumararumugam987@gmail.com

Type 1 diabetes mellitus (T1D) is a chronic, multifactorial auto immune disease that involves the progressive destruction of pancreatic β – cell, ultimately resulting in the lose of insulin production and secretion.Stem cell therapy offers a transformative approach to type 1 diabetes by targeting root cause.These lab generated cells mimic the natural insulin secretion and hold potential for restoring glycemic control.Mesenchymal stem cell further contribute by modulating immune response and supporting pancreatic tissue repair. Advanced protocols now allow for efficient conversion of stem cells into functional β cells using transcription factor and growth factors.However challenges remain, including immune rejection, risk of tumor formation, and ethical concerns surrounding certain stem cell sources. Encapsulation technologies and gene editing tools like CRISPR are being explored to enhance safety and efficacy.It is expected that by the year 2035, there will be numerous people that gain diabetes which will jump more than 592 million. Diabetes is implicated in numerous complications, for example, retinopathy, neuropathy, kidney disease and peripheral vascular disease. Stem cell therapy holds a great promise for the repair of injured tissue and organ. Regenerating β – cells through stem cell therapy represents a hopeful frontier in achieving durable remission and reducing dependence on insulin therapy for patients with type 1 diabetes.

**Keywords:** Type 1 diabetes mellitus, Pancreatic β-cells, Stem cell therapy, Mesenchymal stem cells (MSCs), CRISPR gene editing.

**PL-235**

**PRODUCTION AND CHARACTERIZATION OF L-ASPARAGINASE FROM ASPERGILLUS SYDOWII LACKING GLUTAMINASE ACTIVITY**

Yash Pathak, Soham Mukherjee, Kiran Kumar Kolathur and V.M.Subrahmanyam*
Department of Pharmaceutical Biotechnology, Manipal College of Pharmaceutical Sciences, Manipal.

L-asparaginase is a prominent antineoplastic enzyme used in the treatment of acute lymphoblastic leukaemia (ALL). It hydrolyses L-asparagine into aspartic acid, thereby depriving leukemic cells of an essential amino acid asparagine, which is needed for their proliferation. However, currently available bacterial derived L-asparaginase exhibits immunogenic reactions and glutaminase-related toxicity, limiting its therapeutic potential. To address these issues, we explored a fungal source having L-asparaginase activity. A fungal isolate MSF 15, exhibiting significant asparaginase activity was selected and identified as Aspergillus sydowii through 18S rRNA gene sequencing. Importantly, the isolated strain exhibited no glutaminase activity, indicating a safer therapeutic profile. The organism was cultivated on a modified Czapek-Dox medium containing glycerol, L-asparagine, KH2PO4, MgSO4, ZnSO4, FeSO4, CuNO3 and phenol red. Asparaginase activity was estimated using Nessler's reagent. The enzyme was extracted by acetone precipitation, and partially purified by dialysis, with 2.54-fold purification. Besides, the enzyme showed anti-inflammatory activity, with 26.67% inhibition of protein denaturation. These findings suggest that A. sydowii derived L-asparaginase, lacking glutaminase activity, might have a safe and effective therapeutic approach for ALL treatment. Further studies are in progress to establish its clinical applications.

**FORMULATION AND DEVELOPMENT OF HIGH ENERGY SUPPLEMENT FOOD FOR MODERATE ACUTE MALNUTRITION IN CHILDREN**

Ratna Yadav, Aasifa Shaikh, Priya Shukla, Chirag Patel
Department of Pharmaceutical Pharmacology, SSR College of Pharmacy, Sayli, Silvassa-396230, UT of Dadra and Nagar Haveli and Daman and Diu, India.
ratnayadav1102@gmail.com

Undernutrition in children aged 6–59 months is a major health challenge in India. In Dadra and Nagar Haveli, NFHS-4 (2015–2016) reported high rates of underweight and wasting with
minimal improvement despite interventions. To assess the prevalence of undernutrition in children aged 6–59 months and evaluate the potential of a low-cost, high-energy supplementary food to improve nutritional status. A cross-sectional survey of 535 randomly selected children from Sayli, Kudacha, Rakholi, and Silvassa recorded socio-demographic, dietary, and anthropometric data. Univariate and bivariate analyses identified associations between risk factors and undernutrition indicators. Prevalence of underweight, stunting, and wasting was 37%, 59.4%, and 40.18%, respectively. Socioeconomic status, maternal education, birth spacing, and complementary feeding practices were key determinants. Undernutrition prevalence has increased in recent years, indicating poor child health. Low-cost, high-energy supplementary food may mitigate undernutrition and its associated risk factors.

**Keywords:** undernutrition, stunting, preschool children, supplementary food

Marine herbal drugs rich in neuroprotective compounds offer a promising avenue for autism spectrum disorder (ASD) management. This study evaluated extracts from Sargassum fusiforme, Gracilaria edulis, Ulva lactuca, and DHA-rich Schizochytrium sp., formulated into chitosan–TPP nanoparticles for enhanced brain delivery. Extracts contained fucoidan (18.6 ± 1.2 mg/g), polyphenols (72.4 ± 2.1 mg GAE/g), and DHA (31.5 ± 1.8 mg/g). Nanoparticles exhibited a mean size of 162 nm, zeta potential −27.6 mV, encapsulation efficiency 81%, and antioxidant activity 92% DPPH inhibition. In vitro studies on SH-SY5Y neuronal cells showed 97% viability at 100 µg/mL and 42% ROS reduction. Blood–brain barrier assays indicated 2.3× higher transport than free extracts. In vivo, valproic acid-induced ASD rats treated with the nanoformulation demonstrated a 56% increase in social interaction, 42% reduction in repetitive grooming, and 39% improvement in memory index ($p < 0.01$). Biochemical analysis showed decreased MDA (2.14 vs. 4.62 nmol/mg protein), increased SOD (9.84 vs. 5.21 U/mg protein), catalase (3.16 vs. 1.84 µmol/min/mg protein), and reduced IL-6 (18.5 pg/mL) and TNF-α (22.7 pg/mL). Histopathology confirmed 92% restoration of hippocampal neuron density. These findings suggest that marine herbal nanoformulations can significantly improve behavioral, biochemical, and neuroprotective outcomes in ASD. The results support their potential as a safe, effective, and complementary therapeutic strategy, warranting further clinical investigation.

**Keywords:** Autism Spectrum Disorder, marine herbal drugs, nanoparticles, neuroprotection, antioxidant activity

**EVALUATION OF ANTIHYPERLIPIDAEMIC ACTIVITY OF METHANOLIC EXTRACT OF LEMONGRASS IN ALBINO WISTAR RATS.**

Pallavi V. Bodkhe and Dr. K.R. Biyani

ISBN: 978-81-980623-8-3

Department of Pharmacology, Anuradha College of Pharmacy, Chikhali, Maharastra, India- 443201.
pallavibodkhe@gmail.com

Evaluation of hypolipidaemic activity of methanolic extract of lemongrass leaves (100 & 200 mg/kg p.o.) against dexamethasone (10 mg/kg i.p.) induced hyperlipidaemia in rats. Albino wistar rats weighing 150-200 gm were procured from Animal house, Anuradha College of Pharmacy, Chikhali, Buldana, Maharastra. All rats were divided into five groups. Dexamethasone (10 mg/kg i.p.) administered for 8 days caused hyperlipidaemia in rats after that serum cholesterol, triglycerides LDL cholesterol & HDL-cholesterol level was estimated. Dexamethasone & methanolic extract of lemongrass leaves (100 & 200 mg/kg p.o.) and Dexamethason & Standard drug administered for 8 days in rats after that serum cholesterol, triglycerides & LDL cholesterol & HDL-cholesterol was estimated. This study indicates that due to methanolic extract of lemongrass leaves marked decrease in total cholesterol, triglycerides', LDL-cholesterol & marked increase in HDL-cholesterol in hyperlipidaemic rats. In the present study 8 days treatment of methanolic extract of lemongrass leaves showed significant antihyperlipidaemic activity in dexamethasone induced hyperlipidaemia in rats.

**Keywords:** Hyperlipidaemia, Dexamethasone, lemongrass leaves, Methanol.

## CHRONIC USE OF METFORMIN HEIGHTENS THE RISK OF METHYLCOBALAMIN DEFICIENCY IN INDIVIDUALS WITH TYPE II DIABETES MELLITUS PATIENTS.

J. Andrew Gnanapraksam & A. Geethalakshmi
Department of Pharmacy Practice, Harsha College of Pharmacy, Bengaluru, Karnataka, India - 562123.
steveaj09@gmail.com

The current study aimed to observe the effects of chronic metformin therapy on co levels in patients with Type II Diabetes Mellitus (DM). An observational study was conducted over 12 months, enrolling 102 Type II DM patients undergoing long-term metformin therapy. Methylcobalamin levels were measured to identify patients at risk of deficiency and related complications. A total of 102 participants, 61 were male (59.8%) and 41 females (40.2%). Twelve patients (mean age 49.16±10.53) had low Methylcobalamin levels, 16 (mean age 51.95±7.12) had above-normal levels, and 30 (mean age 57.53±4.55) were in the borderline range. Males showed a higher prevalence of low Methylcobalamin compared to females, particularly in the 50–65 age group. Patients with comorbidities and those on higher doses or longer durations of metformin therapy were more likely to have low or borderline Methylcobalamin levels. Dietary factors also appeared to influence Methylcobalamin status. The study concluded that chronic, high-dose metformin therapy may reduce serum Methylcobalamin levels, increasing the risk of peripheral neuropathy and other complications, especially in older male patients and those with comorbidities. Regular monitoring of Methylcobalamin is recommended for Type II DM patients on long-term metformin therapy.

**Keywords:** Type II Diabetes Mellitus, Metformin, Vitamin B12, Methylcobalamin.

## PHARMACOLOGICAL EVALUATION OF IXORA COCCINEA LEAVES: INTEGRATED IN VITRO AND IN SILICO APPROACHES AGAINST BREAST CANCER

Soubhanik Giri1* and Suman Acharyya2
1Department of Pharmaceutical Chemistry, Gitanjali College of Pharmacy, Lohapur, Birbhum, West Bengal – 731237
2Department of Pharmaceutical Chemistry, Netaji Subhas Chandra Bose Institute of Pharmacy, Chakdaha, Nadia, West Bengal – 741222
souvanik2000giri@gmail.com

The present research investigates the phytochemical composition and pharmacological potential of Ixora coccinea extract using experimental and computational approaches. LC-QTOF-MS profiling revealed a diverse range of secondary metabolites, notably flavonoid glycosides, isoflavones, anthocyanins, flavan-3-ols, and xanthones. Among them, kaempferol rutinoside, epicatechin derivatives, and cyanidin glucogalactoside were identified as major constituents with reported antioxidant and cytotoxic properties. Cytotoxic potential was assessed through MTT assay against MDA-MB-231 breast cancer cells, where the extract displayed significant antiproliferative activity, with an $IC_{50}$ value of 250 µg/mL, highlighting strong anticancer efficacy. Computational studies, including molecular docking and virtual screening, demonstrated that 3-hydroxyflavone, quercetin, and kaempferol exhibited high binding affinities towards cancer-associated protein targets. These compounds also complied with Lipinski's drug-likeness rule and showed favourable ADMET profiles, such as good absorption, non-toxicity, and metabolic stability. Furthermore, molecular dynamics simulations validated the stable binding of ligand–protein complexes, strengthening the computational findings. Overall, the study underscores Ixora coccinea as a promising natural source of antioxidant and cytotoxic molecules, with certain phytoconstituents emerging as potential lead candidates for anticancer drug development. However, further in vivo and clinical studies are required to confirm their therapeutic relevance.

**Keywords:** Ixora coccinea, LC-QTOF-MS, Molecular docking, MTT Assay, PyRx

## PHARMACOLOGICAL EVALUATION OF SYZYGIUM CUMINI METHANOLIC EXTRACT FOR ANTI- HYPERLIPIDEMIC ACTIVITY IN TRITON X-100 -INDUCED HYPERLIPIDEMIA RAT MODEL

VAISHNAVI BHASME
SSR College of Pharmacy
murlidharbhasme1973@gmail.com

Cardiovascular diseases are among the leading causes of death worldwide, with mortality rates continuing to rise. A major contributing factor to these conditions is hyperlipidemia, characterized by elevated levels of lipids in the blood. Conventional treatments are often associated with side effects, leading to increased interest in alternative therapies, including those derived from traditional medicine systems such as Unani. Among the various medicinal plants known for their lipid-lowering properties, Syzygium cumini (commonly known as Jamun in India) holds significant therapeutic promise due to its bioactive compounds. The present study evaluates the antihyperlipidemic potential of Syzygium cumini leaf powder using a Triton X-100-induced hyperlipidemia rat model. Experimental animals were administered varying doses of the leaf powder, and serum biochemical parameters were assessed to determine the effects on lipid profile, kidney function, and liver function. In addition, histopathological examination of liver tissues was performed to further understand the extent of tissue protection. The results demonstrated that administration of a high dose of Syzygium cumini leaf powder led to a significant reduction in total cholesterol, triglycerides, and low-density lipoprotein (LDL), with a concomitant increase in high-density lipoprotein (HDL). Kidney and liver profiles remained within normal limits, suggesting the treatment was well tolerated. Histopathological analysis supported these findings, indicating reduced hepatic damage in treated groups. This study supports the potential of Syzygium cumini leaf as a safe and effective natural remedy for hyperlipidemia, warranting further investigation and possible development into a therapeutic agent.

**Keywords:** Syzygium cumini, Jamun, Hyperlipidemia, Antihyperlipidemic activity, Triton X-100, Unani medicine, Lipid profile, Natural remedy, Histopathology, Cardiovascular diseases

## PHARMACOECONOMIC ASSESSMENT OF HERBAL ADAPTOGEN THERAPY (WITHANIA SOMNIFERA) COMPARED TO CONVENTIONAL ANXIOLYTICS IN THE MANAGEMENT OF GENERALIZED ANXIETY DISORDER

Neha Desai and Sachin Narkhede
Smt. B. N. B. Swaminarayan Pharmacy College
neha.pharm27@gmail.com

Generalized Anxiety Disorder (GAD) is a psychiatric condition that imposes both clinical and economic burden, affecting nearly 7–8% of the Indian population, contributing to reduced productivity and quality of life. Conventional anxiolytics such as SSRIs and benzodiazepines are effective but associated with adverse events, dependency, and higher long-term costs. Withania somnifera a traditional adaptogen, has demonstrated anxiolytic activity in many clinical studies, yet limited

ISBN: 978-81-980623-8-3

evidence exists on its pharmacoeconomic relevance. The present study was designed to compare the cost-effectiveness of Ashwagandha with conventional anxiolytics. Retail market prices were analysed to estimate average monthly treatment costs: Ashwagandha capsules 500 mg BID (₹600), escitalopram 10 mg OD (₹1,200), and alprazolam 0.5 mg BID (₹900). Clinical effectiveness values were derived and expressed as mean reduction in Hamilton Anxiety Rating Scale (HAM-A) scores over 8 weeks: Ashwagandha 12 points, escitalopram 13 points, alprazolam 11 points. A decision-analytic model was constructed using TreeAge Pro. Incremental Cost-Effectiveness Ratios (ICERs) were calculated, and Monte Carlo simulations were applied for probabilistic sensitivity analysis. Results showed that Ashwagandha produced a comparable reduction in HAM-A scores at nearly 50% lower monthly cost than SSRIs, with ICER analysis indicating a saving of ₹50 per unit reduction. Sensitivity testing confirmed robustness in over 85% of simulations, supporting Ashwagandha as a cost-effective alternative for GAD management.

## CLINICAL PHARMACIST'S ROLE IN EVALUATING GLUTATHIONE FOR SKIN WHITENING: ASSESSING EFFICACY AND ADVERSE REACTIONS USING AI-SUPPORTED MONITORING – A COHORT STUDY

Deekshitha N G[1]*, Dr. Muchukota Sushma*
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Kogilu Main Road, Yelahanka, Bangalore-560064, Karnataka, India.
deeksithagowdang315@gmail.com

Glutathione is widely used for skin whitening due to its antioxidant and melanin-inhibiting effects, but its safety and efficacy remain debated. Clinical pharmacists, supported by AI-based dermatology tools, can enhance monitoring by objectively assessing skin tone changes and detecting adverse reactions. A prospective cohort interventional study was conducted on 120 participants undergoing glutathione therapy for skin whitening over 12 weeks at a cosmetic clinic. Participants were allocated into two groups: oral glutathione (600 mg/day) and IV glutathione (1200 mg/week). Clinical pharmacists counselled patients, monitored ADRs, and ensured adherence. Skin tone changes were assessed using the Fitzpatrick scale and validated with AI-based software (SkinVision®) analyzing digital images. Liver/kidney function tests were performed pre- and post-intervention. ADRs were captured via patient reports, clinical evaluation, and AI-assisted lesion detection. Skin-lightening effects were observed in 72% of participants, with the IV group demonstrating faster and more pronounced results. AI-based analysis detected subtle pigmentation changes with higher sensitivity than manual grading, showing a strong correlation with Fitzpatrick scores ($r = 0.89$, $p < 0.01$). ADRs occurred in 34% of participants, including nausea (10%), dizziness (7%), rashes (9%), and elevated liver enzymes (8%). The IV group showed a significantly higher ADR incidence compared to the oral group ($p < 0.05$). Clinical pharmacists, supported by AI monitoring, enabled early detection and management of ADRs, preventing escalation and improving treatment safety. Glutathione demonstrated moderate efficacy as a skin-whitening agent, particularly with IV administration, but safety concerns were significant. AI-assisted tools enhanced the accuracy of skin tone evaluation and ADR monitoring, complementing the pharmacist's role in pharmacovigilance. Clinical pharmacists remain integral to optimizing safe cosmetic therapy, while AI provides objective, real-time support for monitoring. Larger controlled studies and regulatory frameworks are needed to establish standardized guidelines for glutathione use in cosmetic dermatology.

**Keywords:** Glutathione, Skin-whitening agent, Pharmacovigilance, Artificial Intelligence, Fitzpatrick scale, Clinical pharmacist.

## DRUG USE EVALUATION OF THIRD GENERATION TYROSINE KINASE INHIBITORS IN VARIOUS MALIGNANCIES

Bharathi B. V[1]*, Dr. Muchukota Sushma*, Dr. Satheesh C T2, Dr. Sonia Rani2, Dr. Shobha Rani R.H3
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), 2HCG Cancer Centre, Bangalore, Karnataka, India.
bharathibv2002@gmail.com

Third-generation tyrosine kinase inhibitors (TKIs) including Osimertinib, Ponatinib, and Lorlatinib represent a breakthrough in overcoming resistance mechanisms in malignancies such as NSCLC, CML, and ALK-positive tumors. Despite their transformative efficacy, challenges remain regarding inappropriate prescribing, dose optimization, and adverse drug reactions (ADRs). Leveraging Drug Use Evaluation (DUE) with pharmacist-led oversight and AI-supported monitoring tools offers a novel pathway to ensure rational, safe, and effective utilization of these agents. A prospective observational study was carried out in 15 patients treated with third-generation TKIs across multiple malignancies. Prescribing patterns, dosing appropriateness, and clinical outcomes were assessed against international guidelines. Efficacy was evaluated using RECIST criteria for solid tumors and hematological remission in CML. ADRs were identified through CTCAE v5.0 and validated with AI-enhanced ADR detection software (MedWatch AI®). Pharmacist interventions were documented to measure their impact on adherence and safety outcomes. Of the 15 patients, osimertinib (n=6) was the most prescribed, followed by ponatinib (n=3) and Lorlatinib (n=6). Guideline adherence was high (87%). Clinical benefit was achieved in 73% of cases (partial/complete response in solid tumors, remission in CML). ADRs were reported in 53% of patients, most commonly diarrhoea (20%), hypertension (13%), hepatotoxicity (13%), and fatigue (13%). Two patients experienced Grade 3/4 ADRs requiring dose modification. Importantly, AI-enhanced monitoring flagged 30% of ADRs earlier than manual reporting, and pharmacist-led interventions improved adherence and supportive care by 40%, reducing preventable ADRs and optimizing treatment continuity. This study confirms that third-generation TKIs provide strong therapeutic efficacy with a manageable safety profile in resistant malignancies. The integration of AI-assisted ADR detection with pharmacist-led DUE represents a forward-looking model that enhances precision in oncology therapeutics. Proactive monitoring not only safeguarded patients from severe ADRs but also optimized outcomes, setting the stage for larger AI-pharmacist collaborative frameworks in real-world cancer care.

**Keywords:** Third-generation TKIs, Osimertinib, Ponatinib, Lorlatinib, AI-assisted pharmacovigilance, Drug Use Evaluation, Pharmacist-led interventions.

## COMPARATIVE EFFICACY AND SAFETY OF PREGABALIN WITH NORTRIPTYLINE AND PREGABALIN WITH DULOXETINE IN PATIENTS WITH DIABETIC PERIPHERALNEUROPATHIC PAIN

B. Pavani*, M. Raghava Kalyan, S. Vidyadhara
Department of Pharmacy Practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Guntur, Andhra Pradesh, India.
balanagupavani888@gmail.com

Neuropathic pain results from lesions or dysfunction within the nervous system and may originate from central causes such as cerebrovascular accidents, multiple sclerosis, or spinal cord injury, as well as peripheral causes including diabetic neuropathy, post-herpetic neuralgia, or surgical trauma. Diabetic Peripheral Neuropathic Pain (DPNP) is among the most common and disabling forms, typically presenting as burning, electric shock-like, lancinating, or deep aching pain in the lower extremities. Symptoms often arise abruptly and are closely associated with sleep disturbances, impaired productivity, reduced quality of life, and mood disorders. Current pharmacological approaches include antidepressants, antiepileptics, opioids, analgesics, topical lidocaine, and capsaicin. Despite these options, therapeutic response remains inconsistent, with over half of patients reporting inadequate relief. Both monotherapy and combination therapy have been studied, targeting outcomes such as pain reduction, improved sleep, and functional recovery. Pregabalin demonstrates consistent efficacy and is commonly used with tricyclic antidepressants like amitriptyline. However, there is limited evidence on combinations such as pregabalin with nortriptyline or pregabalin with duloxetine, which may provide additional benefits in pain control while addressing sleep and anxiety with fewer adverse effects. This study evaluates the comparative efficacy and safety of these two combinations in patients with DPNP.

**Keywords:** Neuropathic pain, Diabetic peripheral neuropathic pain, Pregabalin, Nortriptyline, Duloxetine, Sleep disturbance, Anxiety.

**EVALUATION OF ANTI-HYPERLIPIDEMIC AND ANTIOXIDANT ACTIVITY OF ETHANOLIC EXTRACT OF ROSA X DAMASCENA FLOWER IN HYPERLIPIDEMIC INDUCED WISTAR ALBINO RATS**

Sumanth Gowda H S 1, Pinki Verma 2, B A Vishwanath 3
Department of Pharmacology, Aditya Bangalore Institute of Pharmacy Education &
Research, Yelahanka, Bangalore -560064, Karnataka, India
sumanthgow02@gmail.com

Hyperlipidemia is a significant risk factor for cardiovascular diseases and is closely linked to oxidative stress. Current therapies, though effective, often present limitations and side effects, driving interest in plant-based alternatives. Rosa x damascena flowers are traditionally valued for medicinal properties, but their role in lipid regulation and antioxidant defense remains underexplored. To evaluate the anti-hyperlipidemic and antioxidant activities of ethanolic extract of Rosa x damascena flowers (EERD) in hyperlipidemic-induced Wistar albino rats. Hyperlipidemia was induced by high-fat diet [Butter] and Triton X-100 administration. Animals were divided into six groups: normal control, hyperlipidemic control, standard (atorvastatin 10 mg/kg), and three test groups receiving EERD at 200, 400, and 800 mg/kg orally for 28 days. Serum lipid profile (TC, TG, LDL-C, HDL-C) and antioxidant markers (SOD, CAT, MDA) were analyzed. Liver tissues were examined histopathologically to confirm biochemical outcomes. EERD treatment significantly ($p < 0.05$) reduced total cholesterol, triglycerides, and LDL-C while increasing HDL-C in a dose-dependent manner compared to hyperlipidemic controls. Antioxidant assays demonstrated elevated SOD and catalase activities with reduced lipid peroxidation. Histopathology revealed improved hepatic architecture and reduced fat accumulation in EERD-treated rats. Ethanolic extract of Rosa x damascena flowers demonstrated potent anti-hyperlipidemic and antioxidant properties, supporting its potential as a natural therapeutic approach for the management of hyperlipidemia and oxidative stress.

**Keywords:** Rosa x damascena, hyperlipidemia, antioxidant activity, ethanolic extract, Wistar rats

**PL-247**

**EVALUATION OF ANXIOLYTIC, ANTIDEPRESSANT, AND ANTISTRESS ACTIVITY OF ETHANOLIC EXTRACT OF STACHYTARPHETA INDICA LEAVES IN SWISS ALBINO MICE**

Harini M B 1, Pinki Verma 2, B A Vishwanath 3
harinibabu147@gmail.com
Department of Pharmacology, Aditya Bangalore Institute of Pharmacy Education & Research, Yelahanka, Bangalore -560064, Karnataka, India

The study aims to evaluate the potential anxiolytic, antidepressant, and anti-stress effects of the ethanolic extract of Stachytarpheta indica in Swiss albino mice. Mice were randomly divided into control and experimental groups. The experimental groups were subjected to stress paradigms and treated orally with vehicle, standard drugs (diazepam, lorazepam and imipramine) and S. indica extract at doses of 100, 200, and 400 mg/kg body weight for 21 days. Behavioral assessments were performed using the elevated plus-maze test (EPMT), forced swimming test (FST), tail suspension test (TST), open field test (OFT), and water immersion restraint stress model. In the EPMT, the percentage of open arm entries and time spent in open arms were significantly increased in mice treated with diazepam and S. indica at 200 and 400 mg/kg, indicating anxiolytic-like activity. In both the FST and TST, immobility time was markedly reduced in mice administered imipramine and S. indica at all tested doses, suggesting antidepressant-like activity. In the water immersion restraint stress test, mice treated with S. indica extract displayed a significant attenuation of stress-induced behavioral alterations. Biochemical analyses further demonstrated that S. indica treatment significantly reduced serum cortisol levels while increasing brain monoamine neurotransmitters, including dopamine (DA) and serotonin (5-HT), compared to vehicle-treated stressed mice. Histopathological evaluation indicated no adverse effects on liver tissue. Collectively, these findings suggest that the ethanolic extract of S. indica possesses notable anxiolytic, antidepressant, and anti-stress activities, potentially mediated through modulation of central monoamines and the hypothalamic–pituitary–adrenal (HPA) axis.

**EVALUATION OF ANTI-INFLAMMATION AND ANTI-ARTHRITIS ACTIVITY OF ETHANOLIC EXTRACT OF PREMNA TOMENTOSA LEAVES IN CARRAGEENAN INDUCED INFLAMMATORY MODEL AND FREUND'S ADJUVANT-INDUCED ARTHRITIS MODEL IN WISTAR ALBINO RATS**

Dhruva Hegde1, Pinki Verma2, B A Vishwanath3
Department of Pharmacology; Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka, Bangalore – 560064, Karnataka, India
dhruvahegde650@gmail.com

Rheumatoid arthritis (RA) is a chronic autoimmune disorder characterized by progressive joint inflammation, deformity, and disability. Although several synthetic drugs are available, they are often associated with toxicity, high cost, and limited accessibility, highlighting the need for safer, plant-based alternatives. The present study was undertaken to evaluate the anti-inflammatory and anti-arthritic potential of ethanolic extract of Premna tomentosa (EEPT) in Wistar albino rats. Leaves of Premna tomentosa were collected, authenticated, dried, and extracted with 95% ethanol. Phytochemical screening revealed the presence of flavonoids, diterpenes, alkaloids, tannins, and phenolic compounds. In vitro antioxidant activity assessed by DPPH assay confirmed strong free radical scavenging potential. Acute toxicity studies (OECD 423) demonstrated that EEPT was safe up to 2000 mg/kg with no mortality or behavioural changes. In vivo studies showed that EEPT significantly and dose-dependently reduced paw edema in carrageenan and histamine-induced models, comparable to standard diclofenac. In Complete Freund's Adjuvant (CFA)-induced arthritis, EEPT markedly reduced paw swelling, arthritic scores, and joint deformities, while also restoring haematological and biochemical parameters toward normal. Histopathological analysis further confirmed reduced synovial hyperplasia, pannus formation, and inflammatory cell infiltration in treated groups, especially at higher doses. The results indicate that Premna tomentosa exhibits potent anti-inflammatory and anti-arthritic activities, likely due to its rich phytochemical profile. The study provides scientific validation for its traditional use and suggests its potential as a safe and effective alternative for managing rheumatoid arthritis.

**THE ROLE OF SPERMIDINE IN THE MANAGEMENT OF MONOSODIUM L-GLUTAMATE INDUCED POLYCYSTIC OVARIAN SYNDROME (PCOS) IN RATS**

Janhavi Gedam, Shubham Sontakke, Manish Aglawe, Milind Umekar
Department of Pharmacology, Smt. Kishoritai College Pharmacy,
Kamptee Dist. Nagpur Maharashtra 441002
janhavigedam2001@gmail.com

Polycystic ovary syndrome (PCOS) affects approximately 5–20% of women of reproductive age worldwide and is a prevalent endocrine metabolic disorder characterized by hyperandrogenism, anovulation, ovarian cysts, insulin resistance, obesity, and dyslipidemia, ultimately leading to infertility and an increased risk of metabolic and cardiovascular diseases. Excessive monosodium glutamate (MSG) intake has been implicated in aggravating PCOS pathology and is widely employed experimentally to induce PCOS-like features by promoting obesity, hypothalamic pituitary dysfunction, and insulin resistance, thereby replicating the syndrome's reproductive and metabolic disturbances. Current therapies such as oral contraceptives, anti-androgens, and insulin sensitizers provide symptomatic relief but are associated with long-term adverse effects, necessitating safer alternatives. Spermidine, a naturally occurring polyamine,has been associated with reproductive and metabolic benefits. This study evaluated the therapeutic efficacy of spermidine in female rats with MSG induced PCOS. Post-weaning MSG administration produced PCOS-like manifestations, including disrupted estrous cycles, delayed vaginal opening, increased body weight, and abnormal ovarian histology with multiple cystic follicles. Biochemically, MSG elevated LH, AMH, estradiol, and testosterone while reducing FSH, accompanied by hyperglycemia, dyslipidemia, and oxidative stress. Spermidine treatment (5, 10, and 20 mg/kg) significantly ameliorated these alterations in a dose-dependent manner. It restored estrous cyclicity, normalized vaginal opening, improved anxiety and depressive like behaviors, corrected hormonal

ISBN: 978-81-980623-8-3

imbalance, enhanced glucose tolerance, reduced glycemia and triglycerides, strengthened antioxidant defenses. However, histology showed reduced cystic follicles with improved ovarian and visceral fat morphology. Spermidine exerted marked protective and therapeutic effects against MSG induced PCOS, highlighting its promise as a safe nutraceutical and potential therapeutic candidate for effective PCOS management.

**Keywords:** Polycystic ovary syndrome (PCOS); Monosodium glutamate (MSG); Spermidine; Hormonal imbalance; Metabolic dysfunction.

## EFFICACY AND SAFETY OF DEGLUDEC VERSUS GLARGINE IN TYPE 2 DIABETIC PATIENTS WITH ORAL HYPOGLYCEMIC AGENTS

Mudundi. Kaiilash , Dr. M. Raghava Kalyan, Dr. S. Vidyadhara
Chebrolu Hanaumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India - 522019
Kaiilash78@gmail.com

Insulin therapy is required in type 2 diabetes mellitus (T2DM) patients who fail to achieve glycemic control with oral anti-hyperglycemic agents (OHAs). Insulin glargine provides 24-hour basal coverage but is associated with variable absorption and hypoglycemia, while insulin degludec (IDeg), an ultra-long-acting analogue, offers steadier absorption and may reduce hypoglycemia. This prospective observational study, conducted from August 2022 to March 2023 at NRI General and Super Specialty Hospital, Mangalagiri, included 54 T2DM patients, of whom 27 received glargine and 27 received degludec along with OHAs. The mean age was 55.0 ± 10.9 years, with a slight female predominance (52%). The mean duration of diabetes was 13.0 years in the glargine group and 10.9 years in the degludec group, with dapagliflozin (69%) and vildagliptin (28%) being the most common OHAs. Both groups achieved significant HbA1c reduction, with no difference between treatments (ETD: 0.11%, p = 0.410), and no significant changes in BMI were observed. However, nocturnal confirmed hypoglycemia was significantly lower with degludec (0.01 vs 0.03 episodes/patient-month; ERR: 0.31, p = 0.005). The most frequent adverse reaction was nasopharyngitis (63% with degludec vs 56% with glargine), followed by upper respiratory infections, while injection site reactions were more common with glargine (19% vs 7%). In conclusion, both insulins provided comparable glycemic control without affecting BMI, but degludec was associated with fewer nocturnal hypoglycemic episodes and injection site reactions, indicating a safety advantage over glargine.

## OVER-THE-COUNTER (OTC) MEDICATION DISPOSAL: PRACTICE AND AWARENESS

Jeevita Robert Borges
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India.

Improper disposal of over-the-counter (OTC) medications poses risks to public health, safety, and the environment, yet awareness and safe practices remain limited. This study aimed to assess the knowledge, attitude, and practice (KAP) regarding OTC medication disposal among the general population. A cross-sectional survey was conducted using a structured Google form, and responses from 62 participants were analysed. The results showed that 82.3% of respondents did not store expired medicines, while among those who did, 72.1% disposed of them in household dustbins and only 11.5% returned them to medical stores. Although 93.5% recognized that unsafe disposal harms the environment, just 49.2% were aware of proper guidelines, and only 27.9% had received advice from healthcare professionals. In terms of attitude, 75.4% expressed willingness to return unused medicines if facilities were available. These findings indicate that while awareness about the risks of improper disposal is relatively high, actual safe disposal practices remain inconsistent. The study concludes that public education, healthcare professional involvement, and accessible pharmacy-based take-back systems are essential to improve safe and sustainable OTC medication disposal.

## COMPARATIVE STUDY OF EFFICACY AND SAFETY OF VORTIOXETINE VERSUS ESCITALOPRAM IN MAJOR DEPRESSION DISORDER IN SOUTH INDIAN POPULATION

K.Srikanth Reddy, Dr. M. Raghava Kalyan, Dr. S. Vidyadhara
Chebrolu Hanaumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram,
Chowdavaram, Guntur, Andhra Pradesh, India
-522019
srikanthkutluri@gmail.com

Major depressive disorder (MDD) is a prevalent, chronic psychiatric illness associated with significant morbidity and disability. Antidepressant therapy remains the cornerstone of management, with vortioxetine, a multimodal antidepressant, and escitalopram, a selective serotonin reuptake inhibitor (SSRI), being widely prescribed agents. However, comparative evidence regarding their efficacy and safety in the South Indian population is limited. This prospective, non-randomized interventional study was conducted over four months (November 2022–February 2023) at NRI General and Super Specialty Hospital, Guntur, involving 60 patients aged 18–75 years diagnosed with MDD and initiated on either vortioxetine or escitalopram. Baseline and follow-up depression severity were assessed using the Hamilton Depression Rating Scale (HAM-D), alongside evaluation of demographic data, comorbidities, and adverse effects. Of the participants, 55% were male and 45% female, with the majority belonging to the 31–40 years age group. Anxiety (41.6%) was the most common comorbidity, followed by hypertension (16.6%) and diabetes (11.6%). Both vortioxetine and escitalopram significantly reduced HAM-D scores from baseline to follow-up ($p<0.0001$), with mean scores decreasing from 23.1 to 8.73 in the escitalopram group and from 22.1 to 9.4 in the vortioxetine group. While both agents demonstrated comparable efficacy in reducing depressive symptoms, vortioxetine exhibited a better safety profile with fewer reported adverse effects. These findings suggest that vortioxetine and escitalopram are both effective treatment options for MDD in the South Indian population, though vortioxetine may offer superior tolerability and could be considered a safer alternative in clinical practice.

**Keywords:** Major depressive disorder, vortioxetine, escitalopram, HAM-D, antidepressants, South Indian population

## SURVEY BASED ON KNOWLEDGE, ATTITUDES AND PRACTICES OF VITAMIN D DEFICIENCY AMONG THE GENERAL POPULATIONS

Gohul.R.P
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy, Education and Research, Bangalore, Karnataka, India.
gohulg59@gmail.com

Vitamin D is essential for bone health, immune function, and overall wellbeing, while its deficiency is an emerging public health concern worldwide. This study aimed to assess the knowledge, attitude, and practice (KAP) regarding vitamin D deficiency among the general population. A cross-sectional survey was conducted using a structured Google form, and responses from 170 participants were analyzed. Knowledge assessment showed that, about 72% recognized sunlight a nd supplements as main vitamin D sources, while nearly 31% mislinked it to energy production or lacked awareness of its role. Around 76% identified bone pain and hair loss as key symptoms. Attitudinal responses revealed that 54.7% were willing to take vitamin D supplements if advised by health care professionals. In practice, 57.64% had consumed vitamin D supplements regularly, while the remainder had never taken them. The results suggest that although knowledge and attitude toward vitamin D are generally positive, misconceptions persist and supplementation practices are inconsistent. The study concluded that awareness programs emphasizing accurate information on deficienc symptoms and benefits of supplementation are necessary to improve preventive health prac in the general population.

**Keywords:** KAP (Knowledge, Attitudes, Practices), Public Health Awareness, Vitamin D deficiency,

**ASSESSMENT OF CARDIOVASCULAR OUTCOMES OF IVABRADINE IN CORONARY ARTERY DISEASE AND DILATED CARDIOMYOPATHY PATIENTS**

Rayi. Veera Rakesh, Dr. M. Raghava Kalyan, Dr. S. Vidyadhara
Chebrolu Hanaumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India - 522019
rakeshrayi1819@gmail.com

Elevated resting heart rate is a major contributor to the progression of coronary artery disease (CAD) and dilated cardiomyopathy (DCM), leading to increased morbidity and mortality. Ivabradine, a selective inhibitor of the funny current (If) in sinoatrial nodal cells, lowers heart rate without affecting myocardial contractility or blood pressure, making it a potential therapeutic option. This study aimed to evaluate the cardiovascular outcomes of ivabradine in CAD and DCM patients, with focus on heart rate, ejection fraction, blood pressure, and quality of life. A randomized observational study was conducted over 8 months, enrolling 50 patients, of whom 58% had CAD and 42% had DCM. The cohort was predominantly male (60%), with most aged 41–50 years. Hypertension (80%), diabetes mellitus (72%), and dyslipidemia were the most common comorbidities. All patients received ivabradine along with standard therapy. Ivabradine therapy resulted in a mean heart rate reduction of 9.9 bpm in both CAD and DCM groups. Left ventricular ejection fraction improved modestly by 2.4% in CAD and 2.5% in DCM patients. Systolic blood pressure decreased by an average of 7.2 mmHg, while diastolic pressure showed no significant change. Quality of life, assessed using the Kansas City Cardiomyopathy Questionnaire (KCCQ), demonstrated improvements of 11.8–13.5 points, indicating meaningful clinical benefit. These findings suggest that ivabradine effectively reduces heart rate, modestly improves ejection fraction, and enhances quality of life in CAD and DCM patients, with minimal effect on diastolic blood pressure.

**IMPACT OF CLINICAL PHARMACIST MEDIATED PATIENT EDUCATION ON HbA1c AND INSULIN ADHERENCE AMONG DIABETIC POPULATION**

MD. Thamijulla Khan, K. Bhanu, A. Anusha Devi, B. Pavani, Dr. S. Vidyadhara, Dr. D.V. Ramana Kumari, Dr. M. Raghava Kalyan
Chebrolu Hanumaiah Institute Of Pharmaceutical Sciences

Diabetes mellitus is a chronic metabolic disorder that significantly contributes to morbidity and mortality worldwide. Poor adherence to insulin therapy remains a major challenge in achieving optimal glycemic control, leading to serious complications and increased healthcare burden. To evaluate the impact of clinical pharmacist-mediated patient education on insulin adherence and glycemic control (HbA1c levels) among the diabetic population. A single prospective cohort study was conducted from July 2024 to March 2025 among diabetic population, who visited diabetology department at NRI General Hospital, Mangalagiri. The glycemic parameters (HbA1c, FBS, PPBS) and questionnaires (MMAS-8 & C-DMSES) were used to assess the change in glycemic control and adherence towards insulin respectively. Baseline values were recorded prior to the pharmacist's intervention; post-intervention values were then collected after 3 months and compared to assess the impact of the intervention. A statistically significant reduction in glycemic parameters was observed i.e. HbA1c by 0.669% (p=0.00013), Fasting Blood Sugar (FBS) by 25.26 mg/dL (p=0.0078), and Post Prandial Blood Sugar (PPBS) by 18.272 mg/dL (p=0.00187). These findings highlight the effectiveness of the intervention in improving overall glycemic control. Also, Medication adherence measured using the MMAS-8 scale, improved significantly from 3.957 to 5.585, (p=0.00000127), indicating increased compliance towards medication. Self-management behavior, assessed using the DMSES scale also showed a significant improvement (from 4.216 to 5.983, p=0.00000189). The present study demonstrated that a structured, pharmacist-led intervention significantly improved glycemic control, medication adherence, and diabetes self-management among patients with diabetes. The intervention led to notable reductions in HbA1c, fasting blood sugar, and postprandial blood sugar levels, alongside substantial improvements in medication adherence and self-efficacy scores.

**Keywords:** Diabetes mellitus, Clinical pharmacist intervention, Insulin adherence, HbA1c & Patient education.

**INVESTIGATING THE PROTECTIVE ROLE OF AGMATINE AND EXERCISE IN HINDLIMB UNLOADING-INDUCED MUSCLE ATROPHY**

Pratiksha S. Jambhale, Nivedita S. Parkarwar, Shubhada V. Mangrulkar, Brijesh G. Taksande, Milind J. Umekar
Department of Pharmacology, Smt. Kishoritai bhoyar college of pharmacy, kamptee, Nagpur, Maharashtra, India 441002.
Pratikshasjambhale2002@gmail.com

Microgravity in spaceflight significantly affects astronauts, leading primarily to muscle atrophy, which is the loss of muscle tissue mass due to individual muscle fibers shrinking. To investigate this phenomenon, hindlimb unloading (HLU) in rodents serves as a common experimental model. This study aimed to evaluate the therapeutic potential of agmatine, a naturally occurring metabolite known for its antioxidant, anabolic, and anti-inflammatory properties, both alone and in combination with exercise, in mitigating HLU-induced muscle atrophy. The findings demonstrated that agmatine, particularly when paired with a structured exercise regimen, led to notable improvements in grip strength, gait coordination, and wire-hanging ability, indicating enhanced neuromuscular function. Furthermore, the treatment resulted in reduced muscle wasting, preservation of muscle strength, and decreased levels of inflammatory markers, including TNF-α, IL-6, and IL-1β. Notably, irisin levels in the soleus muscle also improved. Histopathological analysis indicated a dose-dependent increase in the cross-sectional area of soleus, gastrocnemius, extensor digitorum longus, and tibialis muscle fibers, with the strongest effects observed when agmatine was combined with exercise. Overall, this study suggests that agmatine combined with exercise holds promise as a therapeutic approach to combat muscle loss in astronauts exposed to microgravity conditions.

**INCIDENCE AND RISK OF DRUG-INDUCED OSTEOPOROSIS IN PATIENTS EXPOSED TO LONG TERM PHARMACOTHERAPY: A PROSPECTIVE OBSERVATIONAL STUDY**

K. Bhuvana Chandrika*,L.Pujitha, V. Sindhu Vaishnavi and S. Vidyadhara
Department of pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India – 522019
Kandularaviganesh12@gmail.com

Drug-induced osteoporosis (DIOP) is a common adverse effect of long term therapy with several drug classes and significantly impacts patients prognosis. Medications such as glucocorticoids, anti-epileptics, loop diuretics, antidepressants and proton pump inhibitors are widely used but associated with increased risk of osteoporosis. This prospective observational study aimed to evaluate the incidence and risk of DIOP in patients attending a tertiary care hospital. A total of 465 patients exposed to above mentioned drug classes for ≥3months from outpatient and inpatient departments at NRI General and Super Speciality Hospital, Guntur between June to march were enrolled. Patients were divided into: Group Ⅰa (drug exposure), Group Ⅰb (drug exposure with prophylactic calcium therapy), and group Ⅱ (controls-attendants). Exposure to these drugs increased osteoporosis risk significantly (Relative Risk: 1.9; 95% CI: 1.2036-3.1113; p<0.001). Patients receiving prophylactic calcium therapy showed reduced risk, with 12 out of 100 cases could be protected from osteoporosis through prophylaxis. The number needed to treat (NNT) indicated one patient could be protected from osteoporosis for every 12 treated. Among studied groups, glucocorticoids posed the highest risk followed by furosemide and carbamazepine. Prophylactic calcium therapy significantly lowers the risk and should be encouraged in clinical practice.

**THE ANTIMICROBIAL ACTIVITY OF PROBIOTIC LACTOBACILLI AGAINST PATHOGENIC BACTERIA**

Sivakumar S[1], Rajakumari [2]
Department of Pharmaceutical Biotechnology, PPG College of Pharmacy, Coimbatore,
India – 641035.
sivakumars8124@gmail.com

This study aims to evaluate the antimicrobial activity of probiotic Lactobacillus strains against selected pathogenic bacteria. Lactobacillus strains were isolated from rice-washed water, a natural medium rich in beneficial microbes. The isolated strains were tested against Escherichia coli, Klebsiella pneumoniae, and Staphylococcus aureus using the disk diffusion method. A commercially available probiotic product was also included for comparative evaluation. The cell-free supernatants from the isolated Lactobacillus strains showed significant inhibition zones against all tested clinical isolates. Comparatively, the commercial probiotic also exhibited antimicrobial activity but was less effective than the isolated strains. This study highlights the potential of probiotic Lactobacillus strains as natural antimicrobial agents. Their strong inhibitory action against pathogenic bacteria supports their application in managing microbial infections and reducing antibiotic dependency.

**Keywords**: Probiotics, Lactobacillus, Rice water, Antimicrobial,

**UTILIZATION OF FRUIT WASTE FOR SINGLE CELL PROTEIN PRODUCTION**

Yogheesh R
Department of Biotechnology, PPG College of Pharmacy, Coimbatore,
India. 641035.

This study explores the potential of fruit waste as a substrate for producing single cell protein (SCP), addressing both protein deficiency and environmental pollution. Fruit wastes rich in fermentable sugars, such as banana peels, were used as substrates for microbial protein production. The peels were treated with 10% (w/v) hydrochloric acid and inoculated with *Saccharomyces cerevisiae*. Fermentation was carried out at 30°C for eight days. The protein content of the fermented media was analyzed and compared with unfermented media. SCP contains essential amino acids often deficient in traditional protein sources. It has applications in human food and animal feed, offering an alternative to conventional protein sources. The increasing cost of protein-rich foods makes SCP a viable option for addressing malnutrition. The fermentation process led to a significant increase in protein content. The findings highlight the potential of SCP as a low-cost protein source. Bioconversion of banana peels into SCP can serve as an effective strategy to mitigate protein deficiency and reduce environmental waste.

**RULE-BASED HIGH-RISK PRESCRIPTION CHECKER: EDUCATE, INNOVATE, EMPOWER RURAL HEALTH WITH AI-DRIVEN MOBILE TECHNOLOGY**

Madhurjya Pawan Deka, Prachita Duara and Tapash Chakraborty
Girijananda Chowdhury Institute of Pharmaceutical Science,
Hatkhowapara, Azara, Guwahati.
781017
madhurjyapawandeka@gmail.com

Unsafe prescribing leads to preventable hospitalizations and medication harm. This research suggests a mobile, explainable, rule-based prescription checker that informs users and raises high-risk patterns before harm is suffered. The system consumes prescriptions through camera-based OCR with aided correction, allows manual entry, and brands to generics and fixed dose combinations mapping. A rules engine curated thereafter filters for high severity drug–drug interactions, therapeutic duplication, contraindications, dose ceilings, QT prolongation clusters, bleeding risk with antithrombotic, serotonergic overload, hypoglycaemia stacking, and nephrotoxic combinations. Patient context is enhanced with optional addition of vitals and important labs to facilitate safer, personalized notifications. Accessibility takes centre stage: local language, audio assistance, large font modes, and offline-first functionality for low connectivity regions. The checker delivers plain English descriptions, safer use advice, and reminders to speak with a pharmacist or clinician, placing community pharmacies and health centres at true time safety checkpoints. Integration pathways to national digital health programs are described for secure data synchronization, consented sharing, and longitudinal stewardship measures. A phased evaluation strategy consists of: (1) technical validation of drug identification and rule accuracy on deidentified prescriptions; (2) pharmacist adjudicated clinical validation based on major risk events flagged and alert acceptance; and (3) field pilots in rural pharmacies testing usability, time to check, and understanding. By combining interpretable CDS, conservative AI supported parsing, and universal design, the system seeks to decrease avoidable harm caused by medication, stem polypharmacy risks, and empower rural communities to participate in safer, better-informed medicine use.

**INTEGRATIVE EXPERIMENTAL AND NETWORK PHARMACOLOGY INVESTIGATION OF CUCURBITA MAXIMA SEED EXTRACT REVEALS MULTI-TARGET ANTICANCER EFFECTS AGAINST PROSTATE CANCER**

Shrabani Das* and Mitali Sahoo
Department of Pharmaceutical Chemistry, Netaji Subhas Chandra Bose Institute of Pharmacy, Chakdaha, Nadia, West Bengal – 741222
2003.shrabanidas@gmail.com

This study investigates the phytochemical profile and pharmacological potential of Cucurbita maxima Linn. seed extract using experimental and computational approaches. Phytochemical screening revealed a diverse range of secondary metabolites, including flavonoids, glycosides, isoflavones, alkaloids, and phenolic compounds. Major constituents identified were Fucosterol, Ergosterol, β-Sitosterol, Stigmasterol, and Linoleic acid, all known for their cytotoxic activities. The extract's cytotoxicity was evaluated on PC-3 prostate cancer cells using the MTT assay, showing significant antiproliferative activity with an $IC_{50}$ of 500 µg/mL, indicating strong anticancer potential. To elucidate its molecular mechanism, a network pharmacology approach was employed. Bioactive compounds were retrieved from phytochemical databases, filtered for ADMET properties, and mapped to potential targets using Swiss Target Prediction. Ten active compounds were found to intersect with 230 prostate cancer-related genes. Protein–protein interaction analysis identified key hub genes, including AR, TP53, PTEN, AKT1, and EGFR, which were enriched in pathways such as Prostate Cancer and PI3K-Akt signalling. Molecular docking further validated strong binding affinities of Fucosterol, Ergosterol, and β-Sitosterol with these hub proteins, supporting their role in inhibiting prostate cancer cell growth. These findings highlight the multi-target; multi-pathway anticancer potential of C. maxima seed extract. Fucosterol, Ergosterol, and β-Sitosterol emerged as the principal bioactive compounds, providing pharmacological justification for the traditional use of C. maxima and its potential development as a natural source of novel agents against prostate cancer.

**Keywords:** Cucurbita Maxima, MTT Assay, Network pharmacology, Gene ontology (GO), PyRx.

**EXPLORING THE ANTICANCER MECHANISMS OF SARACA ASOCA LEAF BIOACTIVES THROUGH EXPERIMENTAL AND NETWORK PHARMACOLOGY APPROACHES**

Rahul Dolui* and Suman Acharyya
Department of Pharmaceutical Chemistry, Netaji Subhas Chandra Bose Institute of Pharmacy, Chakdaha, Nadia, West Bengal – 741222
rahuldolui1018@gmail.com

This study explores the phytochemical composition and pharmacological potential of Saraca asoca leaf extract using both experimental and computational approaches. Preliminary phytochemical screening revealed the presence of diverse secondary metabolites, including flavonoids, phenolic compounds, glycosides, terpenoids, tannins. Identified Constituents were β-sitosterol, quercetin, kaempferol, catechins, and stigmasterol, all of which are reported to possess cytotoxic properties. The anticancer activity of the extract was evaluated against HeLa cells, a cervical cancer model, using the MTT assay. The extract demonstrated significant antiproliferative effects with an $IC_{50}$ of

ISBN: 978-81-980623-8-3

400 µg/mL, indicating potent cytotoxic potential. To uncover the underlying molecular mechanisms, a network pharmacology approach was employed. Bioactive compounds were retrieved from phytochemical databases, screened for ADMET properties, and mapped to potential targets using SwissTargetPrediction. A total of 15 active compounds were found to interact with 300 cervical cancer-related genes. Protein–protein interaction analysis identified five main hub genes are TP53, RB1, EGFR, BCL2, and PTGS2, which were predominantly enriched in pathways associated with cervical cancer. Molecular docking studies further confirmed strong binding affinities of β-sitosterol, quercetin, and kaempferol with these hub proteins, supporting their role in suppressing cervical cancer cell growth. These results highlight the multi-target and multi-pathway anticancer potential of S. asoca leaf extract. β-Sitosterol, quercetin, and kaempferol emerged as the principal bioactive compounds, providing a pharmacological rationale for the traditional use of S. asoca and supporting its potential development as a natural source of novel therapeutic agents against cervical cancer.

**Keywords:** Saraca Asoca, MTT Assay, KEGG Pathway, Gene ontology (GO), Molecular Docking.

**SYSTEMATIC REVIEW AND META-ANALYSIS OF IVERMECTIN FOR TREATMENT AND PREVENTION OF COVID-19**

D.Hemalatha*, M.Raghava Kalyan and S.Vidyadhara
Department of Pharmacy Practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Guntur, Andhrapradesh, India.
Hemalatha2122002@gmail.com

This systematic review and meta-analysis evaluated the efficacy and safety of Ivermectin compared to placebo or standard of care for the treatment and prevention of COVID-19. A comprehensive literature search was conducted using PubMed, Scopus, Google Scholar, clinical trial registries (clinicaltrials.gov), and preprint servers (MedRxiv) to identify relevant randomized controlled trials (RCTs). The primary outcomes assessed were mortality, clinical recovery, clinical worsening, duration of hospital stay, and adverse events, while viral clearance was considered a secondary outcome. Study quality was assessed using the revised Cochrane risk of bias tool, and a random-effects meta-analysis was conducted. The certainty of evidence was graded using the GRADE approach. A total of 19 RCTs involving 1,111 patients were included. The findings revealed that Ivermectin did not significantly reduce mortality (RR 0.79, 95% CI 0.35 to 1.78), hospital stay duration (RR 0.29, 95% CI 0.06 to 1.50), clinical worsening, or adverse events. Additionally, no improvement was observed in clinical recovery or viral clearance compared to placebo or standard care. The certainty of these findings was rated as very low to low, with considerable inconsistencies across studies. In conclusion, the current evidence does not support the use of Ivermectin for treating or preventing COVID-19, and it is not recommended for routine clinical use.

**Keywords:** Ivermectin, COVID-19, Meta-analysis, GRADE

**PL-264**

**EFFICACY OF COMBINED PANTOPRAZOLE AND BISMUTH SUBCITRATE THERAPY IN HELICOBACTER PYLORI–INDUCED DUODENAL ULCER USING RAT MODEL**

Ayushi Gupta1* and Trilochan Satapathy1
1Columbia Institute of Pharmacy, Raipur, Vill-Tekari, Near Vidhansabha, Raipur-493111, Chhattisgarh, India

The aim of the present study is to evaluate the therapeutic efficacy of pantoprazole and bismuth sub-citrate, administered individually and as dual drug therapy, against Helicobacter pylori–induced duodenal ulcers using albino rat model.

Thirty Wistar albino rats were randomly divided into five groups (n=6): negative control, positive control, pantoprazole-treated, bismuth subcitrate–treated, and dual therapy (Pantoprazole + Bismuth subcitrate). Following H. pylori inoculation, treatments were administered orally for 14 days. At the end of the study, gastric and duodenal tissues were isolated and assessed for ulcer index, histopathological alterations, and H. pylori eradication using rapid urease and antigen tests. Dual therapy exhibited the most pronounced gastroprotective effect, showing significant ulcer protection compared with individual treatments. The combination group demonstrated lower ulcer index values, improved histological architecture of gastric and duodenal tissues, and complete bacterial eradication, as confirmed by negative rapid urease and antigen test results.

The combined administration of Pantoprazole and bismuth Sub-citrate provided superior protection against H. pylori–induced duodenal ulcers compared with monotherapy. These findings suggested that, dual drug therapy is a more effective strategy for ulcer healing and H. pylori eradication.

**Keywords:** Helicobacter pylori, duodenal ulcer, Pantoprazole, Bismuth sub-citrate, combination therapy, gastro protection.

**PL-265**

**COMPARATIVE EVALUATION OF GAIL, CLAUS, AND TYRER-CUZICK MODELS IN PREDICTING BREAST CANCER RISK**

Jega Shree V1*, Mekkanti Manasa Rekha2 and Shobha Rani Hiremath RH3
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India - 560064
jegashree18@gmail.com

Accurate risk prediction is essential for both early detection and prevention of breast cancer. Multiple models are available, yet their predictive accuracy varies across populations. The present study aimed to comparatively evaluate the Gail, Claus, and Tyrer-Cuzick models in estimating breast cancer risk among women. A cross-sectional study was done on women in North Bangalore who went to primary health centres between the ages of 30 and 70. Data on demographic, reproductive, lifestyle, family history, and clinical parameters were collected through structured interviews and medical records. Risk estimates were calculated using the Gail, Claus, and Tyrer-Cuzick models. Agreement between models was assessed using Kappa statistics, while risk stratification was compared across different subgroups (premenopausal vs. postmenopausal, family history vs. non-family history). SPSS version 25 was used for statistical analysis. Among 500 women screened, the mean age was 46.8 ± 8.9 years. The Claus and Tyrer-Cuzick models identified 9.8% and 18.6% of participants as high risk, respectively, whereas the Gail model indicated 12.4%. Agreement between the Gail and Claus models was moderate (κ=0.42), whereas Tyrer-Cuzick demonstrated higher sensitivity in detecting women with positive family history. Postmenopausal women and those with higher BMI were more frequently categorised at elevated risk across all models ($p<0.05$). The Tyrer-Cuzick model exhibited greater sensitivity in identifying high-risk women compared to the Gail and Claus models, particularly in those with familial and lifestyle-related risk factors.

**Key words:** Breast Cancer, Risk Models, Gail, Claus, Tyrer-Cuzick.

**EMPAGLIFLOZIN ATTENUATES COGNITIVE IMPAIRMENT BY MODULATION OF NFKB AND BDNF SIGNALLING PATHWAY IN STZ INDUCED AD RAT MODEL**

Tushar S. Chavan. Vishal S. Pathrikar, Sachin P. Borikar, Shirish P. Jain
Department of Pharmacology, Rajarshi Shahu College of Pharmacy, Buldana 443001, Maharashtra, India.
chavnatushar2019@gmail.com

Alzheimer's disease (AD) is a one of the most prevalent neurodegenerative disorder usually seen in the elder patient. Key pathological features contributing to AD are neuroinflammation, oxidative stress, and neurotransmitter dysregulation. The present study investigated the effect of the empagliflozin in streptozotocin-induced depression in experimental rats. In this study, AD-like symptoms were induced in animals by unilateral acute 10 µl streptozotocin (STZ, 3 mg/kg) injection intracerebroventricularly (ICV). Empagliflozin (5 , 10 mg/kg, p.o.) treatment and Donepezil (5 mg/kg, p.o.) was started from day 3 post STZ administration and continued till 21 days. The cognitive impairments induced by STZ and the therapeutic effects of the EMPA and standard drugs DON were evaluated using behavioral paradigms like actophotometer, open field test, Morris water maze, and novel object recognition test. We found that chronic treatment of empagliflozin significantly reversed STZ-induced cognitive impairment in experimental rats, with the improvements in behavior and performance of animals like locomotion, distance travelled, escape latency and discrimination index. Further biochemical analyses supported these behavioural outcomes, where empagliflozin treatment reduced elevated levels of pro-

ISBN: 978-81-980623-8-3

inflammatory cytokines such as TNF-α, IL-6, and NF-κB. Additionally, empagliflozin also restored the beneficial factor i.e. brain-derived neurotrophic factor (BDNF) levels and exhibiting its neuroprotective effect. Our results suggest that impaired NFκB and BDNF signaling potentially contribute in AD pathogenesis by elevating oxidative stress and neuroinflammation mediated AD in rats. We found that empagliflozin at a dose of 10 mg/kg exhibited a more pronounced neuroprotective effect in STZ-induced Alzheimer's disease (AD) rat models. In conclusion, empagliflozin attenuated cognitive impairment by inhibiting STZ-associated neuroinflammation, suggesting its potential as a novel therapeutic agent for the management of AD.

**Keyword-** Alzheimer's disease, Neuroinflammation; Streptozotocin; Empagliflozin, Morris water maze; Novel object recognition test, NFKB, BDNF.

## INVESTIGATION ON EXERCISE-TRIGGERED IRISIN IN THE NEUROBIOLOGY OF ALCOHOLISM

Khushi Tade*, Dr. Nitu Wankhede, Dr. Mayur Kale,
Dr. Brijesh Taksande, Dr. Milind Umekar
Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra 441002
khushitade26@gmail.com

Alcohol use disorder (AUD) leads to several complications, including anxiety, depression, irritability, tremors, and impairments in motor and cognitive functions. Ethanol withdrawal further intensifies these issues by triggering neurobehavioral disturbances and neurochemical imbalances, posing significant treatment challenges. This study investigated the individual and combined effects of treadmill exercise and irisin on alleviating withdrawal-induced symptoms in rats subjected to a 4-day binge ethanol exposure followed by a 4-day withdrawal period. Behavioural assessments revealed that ethanol-withdrawn rats exhibited hyperactivity, increased anxiety, depression-like behaviours, and cognitive impairments. These changes were associated with elevated pro-inflammatory cytokines (TNF-α, IL-6) and decreased brain-derived neurotrophic factor (BDNF), indicating neuroinflammation and impaired neuroplasticity. Both treadmill exercise and intracerebroventricular administration of irisin (100ng/5µL) independently improved behavioural outcomes and normalised inflammatory and neurotrophic markers. Notably, the combined treatment produced synergistic effects, significantly enhancing motor coordination, reducing anxiety and depressive behaviours, and improving memory function. These behavioural improvements corresponded with substantial reductions in TNF-α and IL-6 levels and restoration of BDNF expression. The findings suggest that irisin, a myokine released during physical activity, plays a crucial role in mediating the neuroprotective benefits of exercise through anti-inflammatory and neurotrophic mechanisms. In conclusion, this study highlights the therapeutic potential of both physical activity and irisin in addressing the neurobehavioral and biochemical consequences of ethanol withdrawal. The synergistic effects highlight irisin's key role in mediating exercise-driven recovery. This suggests promising potential for treating alcohol withdrawal and related mental health conditions.

**Keywords:** Alcohol use disorder (AUD), alcohol withdrawal, BDNF, neuroplasticity, treadmill exercise, irisin.

**PL-268**

## EXPLORING THE IMPACT OF VITAMIN E SUPPLEMENTATION ON NEUROBEHAVIORAL ALTERATIONS INDUCED BY MATERNAL HYPOTHYROIDISM IN RAT OFFSPRING

Anuja Nichat*, Prajwali Shende, Dr. Nitu Wankhede, Dr. Mayur kale, Dr. Brijesh Taksande, Dr. Milind Umekar
Department of Pharmacology, Smt. Kishoritai College Pharmacy, Kamptee Dist. Nagpur Maharashtra 441002
anujasunilnichat@gmail.com

Thyroid hormones (TH) are essential for brain development and maturation. Hypothyroidism is one of the most common endocrine disorders during pregnancy, with clinical hypothyroidism affecting 2–5% and subclinical hypothyroidism affecting 3–5% of women. Maternal hypothyroidism can impair offspring's cognitive and motor abilities, resulting in deficits in learning, memory, coordination, and increased seizure risk. This study evaluated whether vitamin E supplementation during adolescence (PND 35–62) could counteract neurobehavioral impairments induced by maternal hypothyroidism in rat offspring. Pregnant Sprague Dawley rats received 6-propyl-2-thiouracil (PTU, 10 mg/kg) orally from GD03 to PND21. Offspring of hypothyroid mothers showed behavioral abnormalities, including altered locomotion (PND 63), anxiety-like behavior (PND 64), motor incoordination (PND 65), impaired spatial working memory (PND 66), reduced attention (PND 67), and heightened seizure vulnerability (PND 68). Vitamin E supplementation (100, 200, and 400 mg/kg) significantly alleviated these deficits. It reduced oxidative stress by decreasing lipid peroxidation and nitrite while enhancing antioxidant defences such as SOD and GSH. Anti-inflammatory effects were evident through reduced TNF-α and IL-6 and increased IL-10. Neurochemical benefits included elevated BDNF and reduced acetylcholinesterase, MAO-A, and MAO-B activity in the prefrontal cortex, hippocampus, and cerebellum. Histological evaluation (H&E staining) demonstrated improved structural integrity in these brain regions, which were compromised by maternal hypothyroidism. Collectively, the findings highlight vitamin E as a potential therapeutic approach to ameliorate behavioral, biochemical, and structural brain impairments in offspring caused by maternal hypothyroidism.

**Keywords:** Maternal hypothyroidism; Vitamin E; Memory; Attention; Motor incoordination; Seizure.

## AGMATINE INTERACTION WITH IMIDAZOLINE RECEPTOR ATTENUATES INTRACRANIAL PROPIONIC ACID-INDUCED AUTISM SPECTRUM PHENOTYPE IN RATS

Shivkanya Bali, Manasi Tadas, Brijesh Taksande, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur 441002
balishivkanya6@gmail.com

Autism spectrum disorder (ASD) is a complex neurodevelopmental condition characterized by deficits in social communication and interaction. Intracerebroventricular (ICV) administration of propionic acid (PPA) is a well-established model for inducing ASD-like phenotype in rats. Considering clinical reports of reduced agmatine in ASD, previous studies demonstrated that agmatine exerts neuroprotective effects and rescues core ASD-like behaviors in rodents. Agmatine, an endogenous neuromodulator, exerts neuroprotective effects, regulates neurotransmitter release and synaptic plasticity through modulation of central imidazoline receptors. In the present study, PPA was administered at a dose of 4 µl/day for three consecutive days to simulate the ASD-like phenotype. Experimental groups included animals treated with PPA alone or in combination with agmatine (5, 10, or 20 µg, ICV), the imidazoline $I_2$ receptor agonist 2-BFI (10 µg), the $I_2$ receptor antagonist idazoxan (4 µg), or combinations of these drugs (2-BFI + agmatine or idazoxan + agmatine). Agmatine, in a dose-dependent manner and in combination with 2-BFI treatment, increased exploratory behavior in open field test, enhanced social interaction, and significantly improved recognition memory in the novel object recognition test. It also restored exploratory activity in the hole-board test, reversed cognitive deficits in the T-maze, reduced anxiety-like behavior in the elevated plus maze, attenuated neuroinflammation, normalized BDNF levels, enhanced synaptophysin expression, and restored hippocampal architecture. Administration of 2-BFI with agmatine ameliorated the behavioral and biochemical disruption induced by PPA exposure, whereas idazoxan abolished them. This study highlights the critical role of the imidazoline receptor pathway, positioning agmatine as a promising therapeutic target for ASD.

## EFFECTIVENESS OF COMBINATION THERAPY IN HYPERTENSION: ADVANCES THROUGH ARTIFICIAL INTELLIGENCE AND TECHNOLOGY

Aachal O. Harinkhede and Updesh Lade
Department of Pharmaceutics, Chhatrapati Shivaji College of Pharmacy, Deori, Gondia, Maharashtra, India, -441901
aachalharinkhede09@gmail.com

ISBN: 978-81-980623-8-3

Combination therapy—using two or more antihypertensive agents at low doses—has emerged as a superior strategy for blood pressure (BP) control compared to monotherapy. Recent meta-analyses demonstrate that dual-drug single-pill regimens achieve target BP in ~70% of patients, triple combinations in 56%, and quadruple low-dose combinations yield incremental reductions with minimal adverse effects. Artificial intelligence (AI) and machine-learning (ML) models enable personalized selection of optimal drug combinations, continuous cuffless BP monitoring via wearables, and improved adherence through predictive reminder systems. This poster reviews clinical effectiveness, AI-driven technological innovations, and future directions for precision pharmacotherapy in hypertension management. Combination therapy—co-formulating multiple antihypertensive agents into a single pill—has become central to hypertension management. evaluate recent advances in blood pressure control achieved by integrating artificial intelligence (AI) and digital technologies with combination antihypertensive therapy. we reviewed recent clinical trials, meta-analyses, and machine learning–based studies focusing on low-dose triple single-pill combinations (SPCs) and AI-driven personalized drug selection models.

## DATA INTEGRITY AND REGULATORY COMPLIANCE IN CLINICAL TRIALS

Ruchi Suryawanshi, Vinita Kale, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee Nagpur- 441002.
ruchisuryawanshi1234@gmail.com

The crucial importance of data integrity and regulatory compliance in clinical trials lies in ensuring the accuracy, reliability, and ethical conduct of research that supports the development of new treatments. Regulatory authorities, including the FDA, EMA, and ICH, have established stringent frameworks—most notably the Good Clinical Practice (GCP) guidelines and ALCOA+ principles (Attributable, Legible, Contemporaneous, Original, Accurate, Complete, Consistent, Enduring, and Available)—to safeguard patient safety and uphold scientific validity throughout the clinical research process. Despite these standards, challenges such as data manipulation, security breaches, and protocol deviations remain significant threats to trial validity, often leading to regulatory delays or trial termination. To mitigate these risks, strategies including advanced Electronic Data Capture (EDC) systems, comprehensive audit trails, robust source data verification, risk-based monitoring, regular audits, transparent reporting, and stringent data security measures are essential. Maintaining high standards of data integrity is both a legal and ethical obligation, fundamental to protecting participants, fostering public trust, and ensuring the credibility of scientific discoveries. By adhering to best practices and regulatory requirements such as 21 CFR Part 11 and ICH E6(R2), stakeholders can ensure that clinical trial outcomes are trustworthy, scientifically sound, and supportive of innovation in public health.

## NEUROPROTECTIVE ROLE OF AGMATINE PATHWAY MODULATORS IN PRENATAL PROPIONIC ACID-EXPOSURE-INDUCED AUTISM SPECTRUM DISORDER IN RATS

Bhagyshri Katkalmbe, Manasi Tadas, Brijesh Taksande, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur 441002
katkalmbebhagyashri@gmail.com

Autism spectrum disorder (ASD) is a neurodevelopmental disorder caused by genetic and environmental factors. Among environmental factors, the gut metabolite propionic acid (PPA) has been linked to impaired brain function and reduced neurogenesis. This study investigated the effects of prenatal PPA exposure on brain development and the potential of agmatine pathway modulators to reverse these effects in rats. Pregnant rats received intraperitoneal injections of PPA (500 mg/kg) from gestational day 12 to 16, modeling prenatal damage. Offsprings were monitored until weaning (postnatal day 21) and then treated with different agmatine pathway modulators, including L-arginine (100 mg/kg), D-arginine (100 mg/kg), arcaine (25 mg/kg), and aminoguanidine (50 mg/kg). Neurogenesis was assessed in the hippocampus and prefrontal cortex, regions involved in learning, memory, and social behavior, using molecular and histological analyses to measure neuronal proliferation, differentiation, and structural integrity. Neurogenic markers and agmatine levels were also evaluated. Results demonstrated that prenatal PPA exposure significantly impaired neurogenesis, shown by reduced expression of neurogenic markers, decreased agmatine levels, and abnormal neuronal morphology. Postnatal treatment with L-arginine and aminoguanidine partially reversed these deficits, restored neuronal proliferation, normalized agmatine levels, and improved structural organization, suggesting neuroprotective effects. In contrast, D-arginine and arcaine worsened neurodevelopmental abnormalities, indicating that dysregulation of the agmatine system worsened neural damage. In conclusion, prenatal PPA exposure has detrimental effects on brain development, while the selective modulation of the agmatine pathway helps reduce these changes. These findings highlight agmatine as a potential therapeutic target for PPA-induced neurodevelopmental disturbances in ASD and support further research into agmatine-based interventions.

**Keywords:** Autism spectrum disorder, propionic acid, agmatine, neurogenesis, L-arginine, aminoguanidine.

## FUNCTIONAL AND TECHNOLOGICAL INNOVATIONS IN MRI FOR IMPROVED DISEASE DETECTION AND MONITORING

Dhruv Gupta, Pravin Kumar Sharma, Sumeet Dwivedi, G.N. Darwhekar
Acropolis Institute of Pharmaceutical Education and Research, Indore (M.P.), India – 453771
dhruvgupta.bph24@acropolis.edu.in

Magnetic resonance imaging (MRI) is a non-invasive medical imaging technology that produces three dimensional detailed anatomical images of internal body structures. It is significantly used for disease detection, diagnosis, and treatment monitoring. It relies on powerful magnetic fields and radio-frequency pulses to align hydrogen protons within the body tissues. When these protons are aligned to their natural state, they emit signals that are captured and processed by advanced computer systems to generate precise anatomical images. MRI is ideal for soft tissues, showing the brain, spinal cord, nerves, muscles, ligaments, and tendons more clearly than X-rays or CT. Functional MRI further expands its application by mapping brains activity through blood oxygen level-dependent signals, providing differentiate between white matter and grey matter, providing insights into cognitive and neurological functions. Technological innovations, such as high-field magnets, parallel imaging, and diffusion tensor imaging and scanning speed. Recent developments in MRI technology focus on improving patient comfort, reducing scan times, and integrating artificial intelligence for automated image analysis and disease detection. Portable and low-field MRI devices are emerging, aimed at making this technology more accessible in remote and resource-limited settings. With continuous innovations, MRI is set to advance precision diagnostics, personalized treatment planning, and real-time monitoring, ultimately improving patient outcomes across diverse medical fields.

**Keywords:** Functional MRI, artificial intelligence, non-invasive imaging, diagnostic technology.

## A PROSPECTIVE OBSERVATIONAL STUDY ON ANEMIA ON PREGNANCY

A Geethalakshmi, Monika S Patel, Manjula D A and Lavanya H N
Department of Pharmaceutics, Harsha College of Pharmacy, Nelamangala, Bengaluru, Karnataka, India -562123
monikashivaram2003@gmail.com

Anemia in pregnancy is recognized as a significant global public health concern, defined by hemoglobin levels below 11 g/dl. It contributes substantially to maternal and neonatal morbidity, making its prevention and management a priority in obstetric care. A prospective observational study was conducted at Nandi Medical College and Research Institute, Chikkaballapura, involving 20 pregnant women, with the objective of assessing prevalence, severity, risk factors, and management strategies for anemia. The study revealed that 40% of the women were in the 26–30 years age group, indicating this as a vulnerable category. Anemia was most frequently diagnosed in the second trimester (35%) and the third trimester (45%), highlighting the critical need for vigilant screening

ISBN: 978-81-980623-8-3

during these stages. Common symptoms reported by participants included weakness, fatigue, and generalized tiredness, reflecting the impact of anemia on maternal well-being. In terms of severity, mild anemia was predominant, accounting for 75% of cases, while moderate and severe anemia constituted 20% and 5%, respectively. Ferrous sulphate was the most commonly prescribed therapeutic intervention, administered to 95% of patients, underscoring the importance of iron supplementation in treatment. The findings emphasize the necessity of early detection, nutritional counselling, and awareness programs to minimize maternal and fetal risks. Gynecologists play a vital role in identifying anemia early, educating patients, and ensuring proper adherence to supplements and dietary modifications. Strengthening preventive strategies, alongside timely management, can significantly enhance maternal health and improve neonatal outcomes.

## THE NEUROMODULATORY EFFECT OF QUERCETIN ON THE DOPAMINERGIC SYSTEM IN A MOUSE MODEL

Vulli Naga Jyothi, Neha Ghongane, Vijayapandi Pandy
Department of Pharmaceutical Sciences, School of Health Sciences and Technology, Dr. Vishwanath Karad MIT World Peace University (MIT-WPU), 124 Paud Road, Kothrud, Pune- 411038. India
1322250193@mitwpu.edu.in

Quercetin, a bioactive flavonoid, exhibits strong antioxidant and neuromodulatory properties and has been recognized for its therapeutic potential in neurological disorders by reducing oxidative stress and inflammation. This study investigates the neuromodulatory effect of quercetin on the dopaminergic system using a haloperidol-induced catalepsy mouse model. Swiss albino mice were administered quercetin (0.05, 0.1, and 0.5 mg/kg, p.o.), and their behavioral responses were evaluated. Spontaneous locomotor activity was assessed using an actophotometer, while catalepsy was induced with haloperidol (0.1 mg/kg, i.p.), a dopamine D2 receptor antagonist, and measured via the standard bar test. Quercetin significantly potentiated haloperidol-induced catalepsy, suggesting an antidopaminergic effect, but did not significantly affect spontaneous locomotor activity, indicating preservation of basal motor function. These findings suggest that quercetin modulates the dopaminergic system, possibly through D2 receptor antagonism. The study underscores quercetin's therapeutic potential in managing dopaminergic dysfunctions such as those seen in neuropsychiatric disorders. Further neurochemical studies are needed to clarify the underlying molecular mechanisms.

**Keywords:** Quercetin, Dopaminergic system, Haloperidol, Catalepsy, Locomotor activity

**PL-276**

## ANTIDEPRESSANT-LIKE EFFECT OF NON-ALCOHOLIC RED WINE IN NICOTINE-WITHDRAWN MICE

Anushri Jadav, Shivali Kanade, Dnyaneshwari Dhananjay Vibhute, Vijayapandi Pandy
Department of Pharmaceutical Sciences, School of Health Sciences and Technology, Dr. Vishwanath Karad MIT World Peace University (MIT-WPU), 124 Paud Road, Kothrud, Pune- 411038. India
1322250193@mitwpu.edu.in

This study aimed to investigate the therapeutic potential and protective effect of non-alcoholic red wine against nicotine withdrawal-induced depression and anhedonia in mice models. Male Swiss albino mice were used in this study. They were randomly divided into six groups: 1. Saline withdrawal control group, 2. Nicotine withdrawal control group, 3. Standard control group (Bupropion 10 mg/kg, p.o.), 4. Low dose group (non-alcoholic red wine 25%v/v, p.o.), 5. Intermediate dose group (non-alcoholic red wine 50%v/v, p.o.), 6. High dose group (non-alcoholic red wine 100%v/v, p.o.). Except saline withdrawal control group, all groups received Nicotine (3.35 mg/kg, s.c.) thrice a day for 7 days. The antidepressant-like effect was examined using the tail suspension test, forced swim test, and a sucrose preference test. One-way ANOVA with post hoc comparisons was used for statistical analysis. Results indicated that oral administration of non-alcoholic red wine at 50%v/v, p.o. significantly decreased the immobility time in the tail suspension test (TST) and forced swim test (FST) and drastically increased the sucrose consumption ratio in Sucrose preference test (SPT) in nicotine-withdrawn mice. However, low and high doses (25 and 100%v/v) did not show any significant difference in immobility time in the TST and FST, and also showed marginal increment in sucrose consumption in SPT. This study results show a bell-shaped dose-dependent antidepressant-like effect of non-alcoholic red wine in nicotine-withdrawn mice.

**Keywords:** Depression-like behaviour, Mice, Nicotine withdrawal, Non-alcoholic red wine.

## EFFECTIVENESS OF SENSITIZATION PROGRAM ON KNOWLEDGE ATTITUDE AND PRACTICES (KAP) IN MATERIOVIGILANCE AMONG HEALTH CARE PROFESSIONALS IN TERTIARY CARE HOSPITAL

Roshna Philip V, Salva N K and Shahanas N A
Nehru college of Pharmacy, Pampady, Thrissur, Kerala
roshnaphilip014@gmail.com

Underreporting of medical device adverse events (MDAEs) remains a challenge in patient safety systems. This study aimed to assess the knowledge, attitude, and practice (KAP) regarding MDAE reporting among healthcare professionals using a before-and after study design**.** A before-and-after study was conducted among healthcare professionals using validated pre- and post-questionnaires to assess knowledge, attitude, and practice related to MDAE reporting. Additionally, the pattern of adverse event reporting was monitored over six months to evaluate changes in reporting practice. Correlation analysis was performed to explore the relationships between knowledge, attitude, and practice. A significant improvement was noted in both knowledge and attitude scores post-assessment. The mean knowledge score increased from 2.77 to 4.30, and the attitude score improved from 4.16 to 4.53. The practice of adverse event reporting showed an increasing trend during the six-month observation period. Correlation analysis revealed a weak positive correlation between pre-knowledge and pre-attitude (r = 0.116) and a weak negative correlation between pre-knowledge and pre-practice (r = -0.187), suggesting that knowledge alone did not predict practice. After the study period, the post-knowledge and post-attitude correlation improved to a moderate positive level (r = 0.351), indicating that increased knowledge was associated with a more favorable attitude. This before-and-after study demonstrated that improving knowledge positively influenced attitude towards MDAE reporting. However, knowledge enhancement alone was insufficient to ensure improved practice, highlighting the need to address systemic and motivational factors to sustain reporting behavior.

**Keywords:** Materiovigilance, MDAEs, Patient Safety, KAP (Knowledge, attitude and Practice), Sensitization Program

## ANTIDEPRESSANT-LIKE EFFECT OF RESVERATROL AGAINST NICOTINE WITHDRAWAL IN MOUSE MODELS

Anushri Jadav, Rohan Uday Chaugale, Pallavi Dorik, Vijayapandi Pandy*
Department of Pharmaceutical Sciences, School of Health Sciences and Technology, Dr. Vishwanath Karad MIT World Peace University (MIT-WPU), 124 Paud Road, Kothrud, Pune 411038. India

This study aimed to investigate the therapeutic potential and protective effect of resveratrol against nicotine withdrawal-induced depression and anhedonia in mice models. Male Swiss albino mice models were used in this study. They were randomly divided into six groups: 1. Saline withdrawal control group, 2. Nicotine withdrawal control group, 3. Standard control group (Bupropion 10 mg/kg, p.o.), 4. Low dose group (Resveratrol 25 mg/kg, p.o.), 5. Intermediate dose group (Resveratrol 25 mg/kg, p.o.), 6. High dose group (Resveratrol 100 mg/kg, p.o.). Except saline withdrawal control group, all groups received Nicotine (3.35 mg/kg, s.c.) thrice a day for 7 days. Antidepressant-like effect was examined using the tail suspension test, forced swim test, and a sucrose preference test. Results indicated that resveratrol significantly decreased the immobility time in the tail suspension test and forced swim test and increased the sucrose consumption ratio. This study also revealed a significant rise in brain serotonin levels in nicotine-withdrawn mice. The present study indicates the therapeutic potential of resveratrol against nicotine withdrawal-induced depression by facilitating serotonergic-mediated mechanisms.

**Keywords:** Depression like behaviour, Mice, Nicotine withdrawal, Resveratrol.

## EVALUATION OF ANTIEPILEPTIC POTENTIAL OF RUTIN IN PENTYLENETETRAZOLE [PTZ]-INDUCED SEIZURES IN ZEBRAFISH LARVAE: INTEGRATING IN VIVO AND MOLECULAR DOCKING INSIGHTS

Namitha Ponnala and Archana Jorige
Department of Pharmacology, RBVRR Women's College of Pharmacy, affiliated to Osmania University, Hyderabad, Telangana, India, 500027.
ponnalanamitha1602@gmail.com

Epilepsy and seizure disorders, which are characterized by not only abnormal neuronal excitability but also underlying neuroinflammatory mechanisms, remain a major neurological challenge, prompting the search for novel, safer therapeutics with neuroprotective potential. The objective of the research was to evaluate the toxicity profile and antiepileptic efficacy and to explore the anti-neuroinflammatory mechanisms contributing to the therapeutic potential of rutin, a plant-derived flavonoid, in zebrafish (Danio rerio) larvae subjected to pentylenetetrazole (PTZ)-induced seizures, a widely validated model for preclinical antiepileptic drug screening. The toxicity of rutin was assessed in accordance with the Fish Embryo Acute Toxicity Test guidelines to determine the NOAEL (No Observed Adverse Effect Level) and ensure therapeutic dosing was below toxic thresholds. The antiepileptic efficacy of rutin was evaluated through high-speed locomotor tracking of seizure-like hyperactivity and behavioral seizure phenotype analysis, with the results compared to the standard antiepileptic agent valproic acid. To elucidate the anti-neuroinflammatory mechanism of rutin, in silico molecular docking was performed, targeting the key proinflammatory cytokines TNF-α and IL-1β. The results demonstrated that rutin exhibits a favorable toxicity profile with NOAEL observed within the range of 1-100 µM concentration and confers significant protection against PTZ-induced seizures, as reflected by reduced hyper locomotion and seizure behavior. Molecular docking analysis revealed strong binding affinities of rutin with TNF-α (-8.4 Kcal/mol) and IL-1β (-9.2 Kcal/mol). In conclusion, these findings highlight rutin as a potential neuroprotective agent with promising antiepileptic efficacy through attenuating the expression of proinflammatory cytokines.

**Keywords**: Epilepsy, Zebrafish larvae, Rutin, Neuroinflammation, Molecular docking.

## PROTECTIVE EFFECT OF COMBINATION OF AEGLE MARMELOS LINN FRUIT AND EPIGALLOCATECHIN-3-GALLATE IN INDOMETHACIN-INDUCED ENTEROCOLITIS WISTAR RATS

Varun kumar Gowda, Rama R Nargund, Shachindra L Nargund

This study explores the protective effect of a novel combination of ethanol extract of Aegle marmelos fruit and epigallocatechin-3-gallate (EGCG) against indomethacin-induced enterocolitis in wistar albino rats. Enterocolitis results from NSAID usage, leads to significant gastrointestinal distress—ulceration, bleeding, and inflammation—with few effective prevention strategies currently available. The investigation aimed to determine whether this plant-derived combination could offer a safer, more effective alternative for gut protection. Thirty rats were randomized into five groups: control, indomethacin-only group, a sulfasalazine standard group, and two dosing groups receiving (125 mg/kg) and (250 mg/kg) doses of the extract-EGCG combination. All experimental groups, except the healthy control, received indomethacin to induce enterocolitis for 14 days, alongside their designated treatments. Key outcomes measured included weight and food intake, disease activity indices (stool consistency, diarrhea, and bleeding), and biochemical markers such as lipid peroxidation, glutathione content, and hematological parameters. Mast cell degranulation and histopathology of the gut tissue were also assessed to elucidate underlying protective mechanisms. Treatment with the Aegle marmelos-EGCG combination markedly improved food intake, decreased diarrhea and bleeding scores compared to the disease control group. Biochemical assays demonstrated lower lipid peroxidation and elevated glutathione levels, indicating enhanced antioxidant capacity. Furthermore, histological analysis revealed substantial reversal of tissue inflammation and ulceration, confirming robust mucosal healing. These findings highlight the potential of this natural combination as an anti-inflammatory, anti-ulcerative, and antioxidant therapeutic for NSAID-related enteropathy—supporting its further exploration in clinical settings.

**Keywords**: Aegle marmelos, EGCG, Anti-inflammatory, anti-diarrheal

**PL-281**

## A STUDY ON THE IMPACT OF METFORMIN THERAPY ON COGNITIVE FUNCTION AND LIPID PROFILE IN EXPERIMENTAL ANIMAL MODELS

Merita Antony, Rinku Raj Mullasseril and Nancy Jose
Department of Pharmacology, St.Joseph's college of pharmacy, Cherthala, kerala, India- 688524
meritaantony112001@gmail.com

The current aspect, to assess the impact of metformin therapy on lipid profile, impact of same on cognitive functions using experimental animal models. The studies showed that metformin had reduced risk of causing cancer in type II DM. Also marked that Metformin easily penetrates BBB & has antioxidant property. Although it has added benefits, role of Metformin in cognition was not yet established. Thus, in present work Metformin evaluated for cognition function. Evaluation of spatial long-term memory, spatial working memory and spatial learning analysed using elevated plus maze, Y maze and Morris water maze. Histopathological examination also carried in hippocampal region & in addition levels of malondialdehyde, glutathione and lipid measured. Animals given 45mg/kg, P.O metformin noted impairment in memory due to reduction in percentage spontaneous alterations. Working memory showed an increased escape latency. Elevated plus maze, malondialdehyde and glutathione level do not have significant effect on animal treated with metformin. Histopathological study of rat hippocampus administered with metformin 45mg/kg P.O marked, astrocyte hyperplasia, atrophy & stromal oedema as indications of mild impairment in cognition. It is summarized that long term metformin therapy has influence on spatial memory in both reference memory version and working memory version of water maze task.

**Keywords:** Metformin, congnition assessment, lipid profile.

## A SURVEY TO KNOW THE KNOWLEDGE ABOUT STROKE AMONG GENERAL POPULATION

Vamshi Krishna B S
Ruhana
Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka, Bengaluru-560064

Stroke can be elucidated as a neurological deficit accommodated with an acute focal injury of the central nervous system (CNS), which may be due to vascular causes. The cases of stroke and mortality rate due to stroke are being increased in India these days. The objective of this survey is to know the knowledge about stroke among the general population. Individuals of different age groups and pursuing various education qualifications were participated. The responses were collected in the interval dated between 1/07/2025 and 15/08/2025 by circulating Google forms. About 153 individuals responded for the questionnaire. This questionnaire was included with the questions based on the knowledge, attitude, practice and perception. This questionnaire exposes the lack of knowledge among nearly half of the participants. About 33% of participants stated they would call an ambulance as the first aid for the patient. Most of the responders (12%), do not know the root cause for the occurrence of stroke as they responded that the stroke is caused due to the clot in heart, while 5% of the participants think stroke is caused due to microbial infection. Approximately 54% of responders agreed that the stroke can even occur in a younger population but not only in geriatrics. This survey finally conclude to increase the number of awareness programs about stroke and the usage of AI in early diagnosis and therapy of stroke, which help the people overcome the symptoms of stroke and reduce the morbidity and mortality rates.

## ASSESSMENT OF KNOWLEDGE, ATTITUDE, AND PRACTICE TOWARDS UNUSED AND EXPIRED MEDICINE DISPOSAL IN INDIA: A SYSTEMATIC REVIEW AND META-ANALYSIS

Anish Pradhan1,2, Madan Mani Dhakal3, Sivasankaran Ponnusankar1
1.Dept. of Pharmacy Practice, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty 643 001, The Nilgiris.

ISBN: 978-81-980623-8-3

2.Government Pharmacy College Sajong, Department of Health and family welfare, Government of Sikkim.
3.Department of Health and family welfare, Government of Sikkim.

The improper disposal of unused and expired medicines is a major worldwide risk to the environment and to public health. This systematic review synthesises the existing literature to assess the Indian public perception of safe disposal, as knowledge, attitudes and practices (KAP) around safe disposal of unused and expired medicines in India remain heterogeneous. A thorough search across several databases, including PubMed, Google Scholar, Bentham, Elsevier, and Springer were conducted from 2014-2025. Following the combination of search terms and Boolean operators 563 records were collected out of which 25 study met the inclusion criteria that underwent quality assessment using modified Newcastle-Ottawa scale tailored for cross-sectional research. Data were extracted in Excel, while meta-analysis utilized R software (v2025.05.) applying inverse variance and Der Simonian-Laird random-effects models, with heterogeneity ($I^2$, Q statistics), publication bias (Egger's test), and subgroup analyses by participant type i.e. healthcare professional and general public. The meta-analysis included 8 studies on knowledge (3,063 observations), 7 on attitudes (2,427 observations) and 10 on practice (3,903 observations). The prevalence of inadequate knowledge about harmful effect of improper disposal was 40.36% (95% CI: 23.87%-59.35%), positive attitude was 86.90% (95% CI: 73.98%-93.93%), and improper disposal practices were at 68.09% (95% CI: 59.94%-75.27%). significant heterogeneity ($I^2 > 95\%$) was observed, and no significant bias in the reporting of data was detected (Egger test $p<0.05$). Subgroup analysis showed that the differences in data were not significant, suggesting a similar overall pattern between the groups. Despite the fact tha 86.90% of Indians exhibit a positive attitude regarding safe medication disposal, 40.4% remain unaware about its detrimental impacts, while 68.1% engage in inappropriate disposal practices usually throwing medicines with household waste. This highlights the critical necessity for targeted educational interventions and improved accessibility to appropriate disposal method to protect public health and environmental integrity.

**Keywords:** Knowledge, Attitude, Practice, KAP study, Unused medicines, Expired medicines, Medicine disposal.

**CAR-T CELL THERAPHY**

Jahnavi Tata and Harika M
Department of Pharmacology, V.V.Institute of Pharmaceutical Sciences, Seshadri Rao Knowledge Village, Gudlavalleru, Andhra Pradesh, India-521356
jahnavitata30@gmail.com

The study aims that after witnessing a phenomenal expansion in the advancement and utilization of immunotherapy and precision medicine in the recent decades, cancer treatment today embrace the dawn of the adoptive cell therapy (ACT) era. Pushed by this desire for an alternative model of treatment has been the chimeric antigen receptor (CAR) T cells, the only type of ACT medicinal product to have been marketed to date. Initiated by an increasingly deepening comprehension of cellular engineering, CAR T cells are genetically engineered T lymphocytes carrying an appropriate DNA construct that equip them with the expression of a CAR, a chimeric protein between a ligand-specific recognition component, usually an antibody-like construct, and the activating signaling moiety of the Tcell receptor. By this genetic modification, CAR T cells are genetically modified from a cancer patient own lymphocytes.

**PL-285**

**EVALUATION OF WOUND HEALING ACTIVITY OF PSORALEA CORYLIFOLIA LINN. SEED ETHANOL EXTRACT OINTMENT IN A STAPHYLOCOCCUS AUREUS INFECTED RAT MODEL.**

Bhagyashree, Rama R Nargund, Ankitha M, Shachindra L Nargund.

Psoralea corylifolia Linn. commonly known as Bakuchi, is a member of the Fabaceae family and traditionally used for wound healing from ancient times. The present study provides the scientific evaluation for the wound healing activity of ointment containing P. corylifolia Linn seed extract on an Staphylococcus aureus infected excision wound in rats. Ointment containing ethanolic extract 10% and 20% (w/w) were prepared and evaluated for acute dermal toxicity as per the OECD guidelines (402) for neither mortality nor any sign of toxicity observed for 14 days. The results did not show any sign of inflammation and oedema with limit dose of 2000 mg/kg in acute dermal toxicity study. Both 10% and 20% (w/w) ointment containing extract showed significant (***$p<0.001$) and dose dependent increase in wound contraction which was evidenced by the increase in fibroblast proliferation, collagen formation, epithelisation, keratinisation in histopathological studies. Ointment containing extract indicated wound healing activity was similar to that of standard Mupirocin (2%w/w). This justifies the traditional claimed the use of the plant for treating infected wounds caused by S. aureus.

**Keywords:** Psoralea corylifolia Linn, Staphylococcus aureus, Wound healing and Collagen.

**PL-286**

**THE GUT CURE: MICROBIOME MODULATION IN TYPE 2 DIABETES MANAGEMENT**

K. Susmitha and Meeravali Shaik
Department of Pharmacology, V. V. Institute of Pharmaceutical Sciences,
Gudlavalleru, Andhra Pradesh, India-521 356.
Susmithakolluri777@gmail.com

Type 2 diabetes mellitus (T2DM) is a major global health challenge, with rising incidence and significant health impacts. Recent studies have shown that the gut microbiota plays an important role in the development and progression of T2DM. Differences in the gut microbial composition between healthy individuals and T2DM patients suggest that targeting the gut microbiome could be a promising therapeutic approach. This review summarizes current research on the relationship between gut microbiota and T2DM and explores how gut microorganisms may help improve blood sugar control and reduce inflammation. It also examines the potential of interventions such as probiotics, fecal microbiota transplantation (FMT), virome transplantation (FVT), and natural products in modifying gut microbiota to manage T2DM. While preclinical and some clinical studies show promising results, most research has been limited to animal models or small-scale human trials, lacking strong clinical evidence. This has created a gap between experimental findings and real-world applications. Additionally, the gut virome's role in regulating gut health and metabolism is still not well understood, with research in early stages. More large-scale, long-term clinical studies are needed. Overall, this review highlights the potential of gut microbiota-based therapies in T2DM and outlines key directions for future research.

**GUT DYSBIOSIS-INDUCED DEPRESSIVE-LIKE BEHAVIOR IN MICE IS ATTENUATED BY L-HISTIDINE AND PROBIOTICS VIA CENTRAL HISTAMINE RECEPTORS AND CORT, BDNF AND CREB MODULATION**

Ritika Agrawal and Nishant Sudhir Jain
Department of Pharmaceutical Sciences, Guru Ghasidas Vishwavidyalaya, Bilaspur, Chhattisgarh, India - 495001
ritikagr22191@gmail.com

Gut dysbiosis, characterized by a significant increase in cecum index and cecal weight, serves as a prominent marker of microbially induced dysregulation in murine models. Oral administration of broad-spectrum antibiotics for seven consecutive days induces gut dysbiosis, resulting in pronounced depressive-like behaviors. This is evidenced by a reduction in Lactobacillus and an increase in Escherichia coli populations within the gut microbiota, along with a significant rise in fecal water content. Therapeutic interventions using oral L-histidine, probiotics, or a combination thereof significantly attenuate these dysbiosis changes and reduce immobility time in the TST, indicative of an antidepressant-like effect. Notably, central administration of the H1 receptor antagonist cetirizine or the H2 receptor antagonist ranitidine potentiates immobility time in the TST compared to vehicle treatment, whereas the H3 receptor inverse agonist thioperamide significantly decreases immobility time. Furthermore, central administration of H1 and H2 receptor antagonists reverses the beneficial effects of oral L-histidine on behavioral despair in

ISBN: 978-81-980623-8-3

dysbiotic mice, while the histamine releaser thioperamide does not alter L-histidine's antidepressant-like action. Biochemically, brain histamine, CREB, and BDNF levels are significantly reduced, and CORT levels are increased in antibiotic-treated animals. These neurochemical changes are restored in groups receiving L-histidine, probiotics, or their combination, compared to saline and antibiotic controls. Collectively, these findings underscore the critical role of the histaminergic system particularly H1, H2, and H3 receptor-mediated pathways in mediating depressive-like behaviors induced by gut dysbiosis, and highlight the therapeutic potential of L-histidine and probiotics in restoring neurochemical balance and behavioral function disrupted by microbial dysregulation.

**Keywords:** Gut dysbiosis, TST, Depression, Histamine

**PRODUCTION, OPTIMIZATION, AND ANTIFUNGAL ACTIVITIES OF CHITINASE AND GLUCANASE PRODUCED BY ASPERGILLUS NEOFLAVIPES MB3**

Aadarsh Ghurye, Nancy V Philip, Subrahmanyam VM, Raghu Chandrashekar H.
Manipal College of Pharmaceutical Sciences

Enzyme production for pharmaceutical use is being transformed through integration with cutting-edge optimization technologies, such as design of experiments (DoE) platforms. Aspergillus neoflavipes MB3, a marine soil isolate, produces simultaneously chitinase and β-1,4 endoglucanase, which are enzymes with proven antifungal and antibacterial activity and broad applicability in drug formulation, drug delivery, and biocatalysis. Traditional submerged fermentation processes often yield suboptimal enzyme titers, limiting the scalability and cost-saving opportunities of pharmaceutical enzyme production. Improved productivity via systematic, data-based medium optimization can lower production costs and expedite translation to therapeutic and industrial uses. We used a two-stage DoE approach, starting with a Plackett–Burman design for screening for significant medium components and then a central composite design for defining optimal concentrations. Chitinase and β-1,4 endoglucanase activities were measured before and after optimization. Crude enzyme extracts from optimized and non-optimized cultures were tested using well-diffusion assays against two fungal pathogens (Candida albicans, Aspergillus niger) and three bacterial pathogens (Staphylococcus aureus, Escherichia coli, Pseudomonas aeruginosa). Optimization resulted in a 4.356-fold increase in chitinase production and a 2.403-fold improvement in β-1,4 endoglucanase production, accompanied by considerably enhanced antimicrobial activity in the optimized extracts. This represents the first description of these enzymes being co-produced by A. neoflavipes, showing the strength of AI-supported DoE in facilitating enzyme bioprocess development. The improved platform provides a novel, scalable technology for pharmaceutical and biotechnology industries.

**Keywords:** Aspergillus neoflavipes, Chitinase, β-1,4 Endoglucanase, Design of Experiments (DoE), Antimicrobial Activity

**CLINICAL CORRELATION BETWEEN METABOLIC SYNDROME AND PSORIASIS SEVERITY: A PROSPECTIVE STUDY**

Valluru Ravi *, L. Dedeepya, M. Raghava Kalyan and S. Vidyadhara
Department of Pharmacy Practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India – 522019
ravivalluru19@gmail.com

Psoriasis is a chronic, immune-mediated inflammatory skin disease characterized by erythematous, scaly plaques and a relapsing course. It affects nearly 2–3% of the global population and is increasingly regarded as a systemic disorder with significant comorbidities. One of the most important associations is with metabolic syndrome (MetS), a cluster of conditions including obesity, hypertension, dyslipidaemia, and impaired glucose regulation, which together increase the risk of cardiovascular disease and may lead to mortality. Understanding the relationship between psoriasis severity and MetS is essential for comprehensive patient care.This prospective hospital-based study included 152 adult patients diagnosed with psoriasis vulgaris who attended the Dermatology Outpatient Department. Participants underwent detailed evaluation for MetS using established diagnostic criteria, including assessment of blood pressure, fasting plasma glucose, lipid profile, and waist circumference. Psoriasis severity was determined using the Psoriasis Area and Severity Index (PASI). MetS was present in 84 of 152 patients, reflecting a high prevalence. Among its individual components, 37 patients demonstrated hypertriglyceridaemia, 69 had arterial hypertension, and 28 showed impaired fasting glucose. A positive association was observed between the presence of MetS and higher PASI scores, indicating that patients with moderate-to-severe psoriasis are at greater risk of metabolic abnormalities. More than half of the psoriasis patients in this study exhibited features of MetS. The significant correlation between disease severity and metabolic risk underscores the need for routine screening and early intervention. Incorporating cardiovascular risk assessment into psoriasis care may help reduce morbidity and mortality in this patient population.

**Keywords:** metabolic syndrome, psoriasis,PASI, severity

**"MICROBIOME–BLOOD PRESSURE AXIS: A NOVEL FRONTIER IN HYPERTENSION MANAGEMENT"**

M.Jasmitha and Meeravali Shaik
Department of Pharmacology,V.V.Institute of Pharmaceutical Sciences,Gudlavalleru, Andhra Pradesh, India-521 356.
jasmithamacharla@gmail.com

Hypertension is a major global health challenge and a leading cause of cardiovascular morbidity and mortality. Recent evidence highlights the gut microbiome as a novel regulator of blood pressure, introducing the concept of the "microbiome–blood pressure axis." In experimental studies using spontaneously hypertensive rats (SHR), significant alterations in gut microbial composition were observed even before the onset of hypertension. Notably, the loss of certain low-abundance bacterial genera and reduced butyrate production were linked with elevated blood pressure. Cross-fostering experiments demonstrated that postnatal environments can reshape gut microbiota, partially restore microbial diversity, and result in lower systolic blood pressure in adulthood. These findings suggest that the intestinal microbiome plays a crucial role in hypertension development and may serve as a therapeutic target. Future strategies could include microbiome-directed approaches such as probiotics, prebiotics, and dietary interventions, offering new opportunities for personalized management of hypertension beyond conventional pharmacotherapy.

**UNVEILING THE GENOMIC PATHWAYS OF VITAMIN D: A NEW HORIZON IN CANCER AND IMMUNE DISORDERS**

1Prarabdhi*, 2Puneet Nirmal, 3Vandana Arora Sethi, 3Lalit Kumar Tyagi
Lloyd Institute of Management and Technology, Plot No: 11, Knowledge Park-II, Greater Noida, Uttar Pradesh, India- 201306
prarabdhi3122@gmail.com

Vitamin D, classically associated with calcium and bone homeostasis, has recently emerged as a key regulator of immunology and oncology. In addition to its classical effects, vitamin D additionally regulates immunomodulatory functions via the VDR that is expressed widely in tumor and immune cells. Upon activation, this receptor controls transcription of events that regulate cell proliferation, apoptosis, differentiation, angiogenesis and DNA repair. And vitamin D deficiency has been linked strongly to increased risk to autoimmune diseases, and cancers, including breast, prostate, colorectal, pancreatic cancer and melanoma. Its sufficient supplementation showed protective and therapeutic impact. Mechanistically, its active metabolite calcitriol (1,25-dihydroxyvitamin $D_3$) promotes antimicrobial peptide production, induces regulatory T-cells, suppresses pro-inflammatory cytokines, and modulates tumor suppressor pathways, while inhibiting metastatic signaling and oncogene expression. Epidemiological evidence references remarkable associations between both geographic sunlight exposure and serum vitamin D level, as well as cancer incidence, with further influence from genetic variability like VDR polymorphisms. These results highlight the intricate genetic and environmental factors at play with vitamin D mediated effects, which differ dramatically among ethnic groups. Although preclinical and observational data uniformly support anticancer and immunoprotected roles, clinical trials have produced mixed results; a reflection of

ISBN: 978-81-980623-8-3

heterogeneity in tumor biology, receptor activity, and serum vitamin D levels. Big ongoing studies want to answer questions around dosing and target populations and long-term benefits. Thus, vitamin D represents an interesting, inexpensive and widely accessible adjunct in oncology prevention and immunotherapy that can bridge immunomodulatory and anticancer strategies. But additional controlled clinical trials are required to develop recommendations for medicinal use.

Lloyd Institute of Management and Technology, Plot No:11, Knowledge Park-II, Greater Noida, Uttar Pradesh, India- 201306
sunnychoudhery80@gmail.com

Parkinson's disease (PD) is a progressive neurodegenerative disorder characterized by motor and non-motor symptoms, with limited curative options. Current pharmacological treatments, such as levodopa and dopamine agonists, primarily provide symptomatic relief but fail to prevent ongoing neuronal degeneration. Moreover, frequent daily dosing often leads to fluctuations in drug levels, reduced patient compliance, and motor complications over time. This highlights the urgent need for therapies that are not only effective but also more convenient and sustainable for long-term management. Recent research has focused on once-weekly injectable formulations as a potential breakthrough in PD treatment. By utilizing advanced delivery systems, these formulations can maintain therapeutic drug concentrations for extended periods, thereby reducing dosing frequency and improving patient adherence. Long-acting formulations may also offer steadier dopamine stimulation, minimizing the "on–off" fluctuations commonly seen with conventional therapy. Furthermore, coupling such regimens with neuroprotective strategies, including natural compounds like Coenzyme Q10, omega-3 fatty acids, resveratrol, and curcumin, may provide synergistic benefits by targeting oxidative stress, mitochondrial dysfunction, abnormal protein aggregation, and neuroinflammation. To overcome the challenges of poor bioavailability and blood–brain barrier (BBB) penetration, novel delivery platforms such as nanoparticles, liposomes, and exosomes are being investigated. These carriers enhance drug stability, enable sustained release, and facilitate efficient transport into the brain. Additionally, technologies such as targeted ultrasound and intracerebral infusion are under exploration to further optimize brain-specific delivery. The integration of once-weekly injectable therapy with advanced delivery technologies represents a promising step toward revolutionizing PD management. While early studies are encouraging, large-scale clinical trials are essential to confirm safety, long-term efficacy, and the feasibility of implementing such regimens in routine clinical practice.

**Keywords:** Parkinson's disease, once-weekly injection, sustained release, neuroprotection, blood–brain barrier, advanced delivery systems.

**IMPACT OF PHARMACIST-MEDIATED PATIENT COUNSELLING ON KNOWLEDGE, ATTITUDE, AND PRACTICE OF TYPE 2 DIABETES MELLITUS PATIENTS: A PROSPECTIVE OBSERVATIONAL STUDY**

Chaitanya Guduru, Sravanthi Cherukupally, Thanuja Chappala, Nagasri Juluri, Ramesh Adepu
Vikas College of Pharmaceutical Sciences, Rayanigudem, Suryapet – 508 213

This prospective observational study assessed the impact of pharmacist-mediated patient counselling on knowledge, attitude, and practice (KAP) of Type 2 Diabetes Mellitus (T2DM) patients. Effective diabetes management extends beyond pharmacotherapy and requires patient engagement through education and behavioural change. We conducted the study in endocrinology departments of secondary care hospitals in Suryapet, Telangana, from August 2024 to February 2025. Eighty T2DM patients were enrolled. A structured 20-item KAP questionnaire was administered at baseline and after 2–3 weeks of counselling. Patients received personalized counselling on disease management, lifestyle modification, and medication adherence. Among participants, 66.25% were male, with majority aged 51–70 years. Post-intervention analysis showed significant improvements in KAP scores: knowledge (343.33 to 616.66), attitude (243.33 to 460), and practice (276.66 to 473.33). Counselling improved awareness of symptoms, dietary guidelines, medication adherence, and lifestyle adjustments. Pharmacist-led patient counselling significantly enhances diabetic patients' knowledge, promotes positive attitude, and improves self-care practices, supporting better glycemic control and reducing complications risk. Incorporating structured counselling programs into routine diabetic care is recommended, especially in resource-limited settings.

**PL-294**

**ASSESSMENT OF PHARMACOLOGICAL HEALING POTENTIALS OF TERMINALIA ARJUNA IN CONJUNCTION WITH PROBIOTICS IN A BEHENIC ACID–INDUCED HYPERLIPIDEMIA RAT MODEL**

Wagh Bharati Chandulal
Department of Pharmacology, SSR College of Pharmacy Silvassa, Dadra and Nagar Haveli 396230
bharatiwagh02@gmail.com

Hyperlipidemia is a major metabolic disorder linked to cardiovascular and hepatic complications, and experimental induction using behenic acid provides a reliable model to study its pathophysiology. Terminalia arjuna bark, with well-documented cardioprotective and antihyperlipidemic effects, and probiotics such as Lactobacillus acidophilus, known for lipid-lowering activity, may act synergistically in managing hyperlipidemia. The present study evaluated the pharmacological healing potential of Terminalia arjuna bark extract in combination with Lactobacillus acidophilus in a behenic acid–induced hyperlipidemia rat model. Hyperlipidemia was induced in Wistar rats by oral administration of behenic acid, followed by treatment with Arjuna bark extract (prepared by Soxhlet extraction with 50% ethanol), probiotics, or their combination. Treatment efficacy was assessed using serum lipid profile, liver and kidney function markers, oxidative stress biomarkers, and histopathological analysis of liver tissue. Behenic acid administration caused significant elevation of cholesterol, triglycerides, liver enzymes, and oxidative stress markers, while reducing antioxidant enzyme activity. Treatment with either Terminalia arjuna or probiotics alone improved lipid parameters and organ function. Notably, the combination therapy, particularly at higher doses, produced the most favorable outcomes, normalizing lipid levels, enhancing antioxidant defenses, and markedly improving hepatic histology compared with monotherapy. These findings indicate that Terminalia arjuna in conjunction with Lactobacillus acidophilus exhibits synergistic antihyperlipidemic, antioxidant, and hepatoprotective activity, suggesting its potential as a safer and effective complementary therapeutic strategy for hyperlipidemia management.

**Keywords:** Terminalia arjuna, Lactobacillus acidophilus, behenic acid, hyperlipidemia, hepatoprotection, probiotics.

**COHORT STUDY ON THE ROLE OF PHARMACOLOGICAL AND NON-PHARMACOLOGICAL THERAPIES IN MIGRAINE MANAGEMENT**

Anima Upadhyay, Jitendra Patil and Neelam Balekar
IPS Academy College of Pharmacy, Indore, Madhya Pradesh, India - 452012.
animaupa112@gmail.com

The therapy of migraine, a common neurological condition, is extremely difficult. Because it is debilitating, it requires effective management. Goal: The effectiveness of both pharmaceutical and non-pharmacological treatments for migraine symptoms is assessed in this meta-analysis. Methods: Thirteen papers examining various approaches to migraine treatment were included in the analysis. The efficacy of both non-pharmacological and pharmaceutical therapy was evaluated. To assess the effectiveness of the intervention, statistical techniques such as weight difference, standardized mean difference (SMD), and mean difference (MD) were employed. We also looked for publication bias using funnel plot analysis to check for publication bias. Results: Pharmacological interventions demonstrated substantial efficacy

ISBN: 978-81-980623-8-3

compared to placebo, with a significant weight difference of 100.0%, a Z-value of 17.58, and a P-value of less than 0.00001. Non-pharmacological interventions also showed significant effectiveness, with a Z-value of 11.62 and a P-value of less than 0.00001. Results should be interpreted nevertheless, given significant heterogeneity among the trials. To improve patient results, individualized treatment plans are advised. To improve patient care, more research is required to hone therapeutic procedures and comprehend the underlying causes. Conclusion: The findings underscore the potential benefits of both interventions in managing migraines. However, the considerable heterogeneity among the studies suggests that results should be interpreted with caution. Personalized treatment approaches are recommended to optimize patient outcomes.

**Keywords**: Migraine, Pharmacological interventions, non-pharmacological interventions, Meta-analysis, Treatment efficacy

## B-SITOSTEROL ATTENUATES STRESS-INDUCED NEUROBEHAVIORAL ALTERATIONS IN EXPERIMENTAL ANIMALS

Vivek Kalme, Yashashwi Shrivastav, Neelam Balekar
IPS Academy College of Pharmacy, Indore,
Madhya Pradesh, India- 452012.
vivekkalme002@gmail.com

Stress profoundly impacts mental health, leading to anxiety, depression, and neurobehavioral disturbances. β-Sitosterol, a plant-derived phytosterol, has been reported to possess adaptogenic and neuroprotective properties. This study evaluated its potential to attenuate stress-induced behavioral alterations in experimental animals. Animals were divided into seven groups: Negative Control, Control Socially Isolated (SI), Control Group Housed (GH), Standard SI and GH (Diazepam, 5 mg/kg), and Test SI and GH (β-Sitosterol, 10 mg/kg). Stress was induced by social isolation and environmental deprivation. Behavioral assessments included the Elevated Plus Maze (EPM), Open Field Test (OFT), and Social Interaction Test (SIT). Stressed control animals (SI and GH) exhibited marked anxiety-like behaviors with reduced locomotion and social interaction. Diazepam significantly reduced anxiety indices. Notably, β-Sitosterol exerted comparable anxiolytic and pro-social effects, increasing open-arm exploration in the EPM, enhancing locomotor and exploratory activity in the OFT, and improving social interaction while reducing social anxiety. These findings suggest that β-Sitosterol may serve as a natural neuroprotective agent for managing stress-induced neurobehavioral alterations.

**Keywords:** β-Sitosterol, Neuroprotective, Exploratory behavior, Open Field Test (OFT), Social Interaction Test (SIT).

**PL-297**

## EFFECTS OF B -CAROTENE ON COGNITION AND BEHAVIOR IN MICE UNDER INTERMITTENT FASTING AND BINGE EATING REGIMENS

Aryan Shrivastava, Ritesh Bharte, Neelam Balekar
IPS Academy College of Pharmacy, Indore, Madhya Pradesh, India-452012.
aryanshrivastava2001@gmail.com

Eating disorders pose significant challenges, with intermittent fasting (IF) and binge eating (BE) increasingly linked to adverse neurobehavioral outcomes. This study investigated the potential anxiolytic effects of β-carotene (BC) in Swiss Albino mice exposed to IF and BE cycles. Mice were allocated into five groups: Negative Control, Control, Standard, BC-I (10 mg/kg), and BC-II (25 mg/kg). Stress was induced through alternating-day IF and BE for six weeks, and treatments were initiated in the final week. Behavioral assessments were conducted using the Open Field Test, Mirror Chamber Test, and Elevated Plus Maze. Diazepam (5 mg/kg) served as a standard anxiolytic comparator. Statistical analysis employed ANOVA with Tukey-Kramer post hoc testing. Mice subjected to IF and BE displayed increased anxiety-like behavior and reduced locomotion. Treatment with β-carotene ameliorated these effects in a dose-dependent manner, showing improvements comparable to diazepam. The findings suggest that β-carotene exerts anxiolytic activity and may counteract the adverse Behavioral impact of disordered feeding models. Future research should explore the molecular mechanisms underlying these effects, emphasizing neurotransmitter pathways and oxidative stress regulation.

**Keywords**: Intermittent Fasting, Binge Eating, β-Carotene, Neurobehavioral Effects, Swiss Albino Mice.

## INTEGRATIVE SOMATIC PRACTICES FOR WOMEN'S HORMONAL HEALTH

Ayushi Kaushal, Somya Rajput, Neelam Balekar
IPS Academy College of Pharmacy, Indore,
Madhya Pradesh, India 452012
ayushikaushal66@gmail.com

Premenstrual Syndrome (PMS) is a common gynaecological issue characterized by diverse physical, emotional, and behavioural symptoms that manifest a few days prior to menstruation and diminish upon its onset. This paper investigates the potential of Tibetan rites and breathology in alleviating PMS symptoms, assessing the effect of integrating these practices on overall symptom reduction. Eighty female university students (aged 18-25) were randomly selected and divided into three groups: a Control Group (n=20), a Tibetan Rites Group (n=20), and a Tibetan Breathology Group (n=20). The control group received pre- and post-assessments without intervention, while the Tibetan Rites and Tibetan Breathology groups participated in a three-month intervention of 30-minute sessions. Following the three months, participants in the Tibetan Rites and Tibetan Breathology groups showed notable improvements in various premenstrual symptoms. This research highlights the benefit of incorporating Tibetan techniques into wellness strategies, suggesting a path towards more effective PMS management and a more holistic approach to female health and resilience. Future studies could investigate the sustained advantages of Tibetan Rites and Breathology, looking beyond just immediate premenstrual symptom relief. Furthermore, research into ideal practice duration, frequency, and how well these practices adapt to various ages and cultures could help create more personalized interventions. This thorough approach could further confirm the value of Tibetan practices in managing premenstrual symptoms and aid in developing more effective and culturally appropriate wellness strategies

**Keywords**: Premenstrual Syndrome, Tibetan Rites, Tibetan Breathology, Women

## INVESTIGATION ON THE ROLE OF AGMATINE IN SIMULATED MICROGRAVITY ASSOCIATED WITH MUSCULOSKELETAL DYSREGULATION

Shalakha V Dabhekar
Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur
shalakadabhekar@gmail.com

Muscle atrophy, characterized by the loss of muscle mass and strength, can be influenced by various factors such as microgravity, aging, immobilization, and chronic diseases. The objective of this study was to investigate the potential therapeutic benefits of agmatine in mitigating muscle atrophy influenced by hindlimb unloading-induced muscle atrophy. Agmatine, a naturally occurring molecule known for its anabolic, antioxidant, anti-inflammatory, and nitric oxide regulating properties, has been explored for its effects on muscular growth. The study focused on the hindlimb unloading model to induce muscle atrophy and assessed the impact of agmatine administration at doses of 20, 40, and 80 mg/kg. In the hindlimb unloading model, agmatine significantly improved grip strength, wire hanging performance, and gait analysis. It attenuated the reduction in muscle weight and decreased creatine kinase activity, indicating reduced muscle damage. Histopathological analysis revealed a dose-dependent increase in the cross-sectional area of gastrocnemius and soleus muscle fibers. Additionally, the comparable outcomes seen with agmatine modulators such as aminoguanidine and L-arginine indicate the endogenous role of agmatine in reducing muscle atrophy. The observed effects of agmatine suggested its potential as a promising therapeutic intervention for managing muscle atrophy caused by disuse. They provided valuable insights into the mechanisms and applications of agmatine, highlighting it as a potential treatment for hindlimb unloading-induced muscle atrophy, with implications for interventions in microgravitational conditions such as those experienced in space.

**IMPACT OF NEUROBIC PRACTICES ON MOTOR SKILLS AND NEUROMUSCULAR REGULATION**

Nitin Mishra, Muskan Malviya and Neelam Balekar
IPS Academy College of Pharmacy, Indore, Madhya Pradesh, India-452012.
nitinmishra9407@gmail.com

Neurobic exercises, which are suggested to challenge the brain with new and multisensory stimuli, are hypothesized to improve cognitive and motor functions. The current study examines the effect of neurobic exercises on cognitive flexibility, memory recall, and neuromuscular coordination. Fifty volunteers aged 18-25 years were randomly assigned to an experimental group that received neurobic exercises and a control group that received no intervention. Three months thereafter, a number of physiological and cognitive parameters such as blood pressure, pulse rate, cognitive flexibility, and motor coordination were measured and compared between the groups. The findings indicated that the experimental group showed marked improvement of cognitive and neuromuscular functions compared to the control group, with marked improvement of cognitive flexibility, memory recall, and motor coordination, and lowering of blood pressure and pulse rate. These findings show that neurobic exercises are a potent tool for the improvement of cognitive function and neuromuscular regulation and can be used for the enhancement of overall well-being and quality of life.

**Keywords**: Neurobic Exercises, Neuroplasticity, Motor Coordination, Cognitive Function, Intervention.

**THE ROLE OF HYPERLIPIDEMIA IN CARDIAC ARREST DEVELOPMENT: A CASE CONTROL ANALYSIS**

Lavee Singh, Vaibhav Rathore and Neelam Balekar
IPS Academy College of Pharmacy, Indore,
Madhya Pradesh, India- 452012
Singhlavee30@gmail.com

Elevated lipid levels, or hyperlipidemia, are associated with a higher risk of cardiovascular disease. This study investigates if hyperlipidemia, which is linked to atherosclerosis and coronary artery disease, increases the risk of cardiac arrest. The goal was to ascertain if hyperlipidemia increases the risk of cardiac arrest, highlighting the need of controlling lipid levels for cardiovascular health. In accordance with PRIMA criteria, a systematic review and meta-analysis were carried out. There were 12,146 patients in 20 randomized controlled trials (RCTs) with hyperlipidemia and concomitant conditions such coronary artery disease and atherosclerosis. The Newcastle-Ottawa Scale was used for quality evaluation (NOS). For meta-analyses, odds ratios (OR) and risk ratios (RR) were calculated to evaluate the relationship between the risk of cardiac arrest and hyperlipidemia. Filter plots were used to assess publication bias. A substantial correlation between the risk of cardiac arrest and hyperlipidemia was found by the meta-analysis. According to forest plot analytical data, the probabilities of mild cardiac arrest among people with hyperlipidemia were shown by OR (0.51) and RR (0.77) as OR (Chi2=23.61, df=13, P=0.03; I2=45%) and OR (Chi2=31.14 and df of 19, P = 0.04). According to study of funnel plot readings, there was no publication bias and moderate heterogeneity. There may be an association between the risk of cardiac arrest and hyperlipidemia. This calls into question accepted wisdom and highlights the need for improved methods of assessing cardiovascular risk.

**Keywords:** - Hyperlipidemia, Coronary artery disease, Cardiac arrest, Cholesterol, Lipid.

**DEVELOPMENT AND EVALUATION OF VITAMIN D3 INJECTABLE PASTE FOR PERIODONTITIS TREATMENT**

Srushti Jaiswal, Akash Ande, Neha Raut, Rashmi Trivedi
Department of Pharmaceutical Quality Assurance, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Maharashta, India - 441002
srushtijais52@gmail.com

Periodontitis is a long-lasting inflammatory disease that causes the gradual breakdown of the alveolar bone and periodontal ligament, which can lead to tooth loss. This study focuses at creating and testing a Vitamin D3-infused injectable bone paste for treating periodontitis. Vitamin D3 is known for supporting bone health and regulating the immune system. Preformulation studies of Vitamin D3 was carried out. Vitamin D3 is found to be soluble in methanol and ethanol but insoluble in water and phosphate buffer. UV Spectroscopy analysis for pure Vitamin D3 was observed at 264 nm. FTIR analysis was performed to determine the compatibility of drug and excipient. FTIR of Vitamin D3, Calcium phosphate, Gelatin, HPMC, formulation and physical mixture was analyzed to identify characteristic absorption bands corresponding to various functional group present. XRD analysis of injectable paste provides insights into slightly crystalline structure of component within the sample. pH of the prepared injectable paste was found to be 6.8 which is close to the natural pH of mouth. Viscosity of Injectable paste formulation was found to be best at (50:50) ratio of Vitamin D3 and Calcium Phosphate. Syringeability was found to be excellent in the 25G needle. This enhances its applicability for periodontal therapy. Invitro drug release of Vitamin D3 was found to be a well performing sustained release within the first 9 hours. This study lays a strong foundation for the development of a novel injectable paste as a potential therapeutic strategy for periodontitis.

**Keywords:** Periodontitis, HPMC, Vitamin D3, Calcium Phosphate, Tooth loss, Systemic effect.

**PHARMACOLOGICAL SCREENING OF TRK RECEPTOR AGONIST IN PARKINSON'S DISEASE**

Jeyaram Bharathi Jeyabalan1*, Muralikrishnan Dhanasekaran2, Justin A1
1Department of Pharmacology, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty, Nilgiris, 643 001, Tamil Nadu, India.
2Department of Drug Discovery and Development, Harrison College of Pharmacy, Auburn University, Auburn, Alabama, USA

Parkinson's disease (PD), the fastest-growing neurodegenerative disorder projected to affect 13 million people by 2040, is characterized by progressive dopaminergic neuronal loss, α-synuclein aggregation, and Lewy body formation, while additional mechanisms including mitochondrial dysfunction, oxidative stress, neuroinflammation, and diminished neurotrophin signaling critically contribute to disease progression. Current dopamine-based therapies primarily address symptomatic relief, overlooking the underlying pathology and underscoring the need for disease-modifying strategies that restore neurotrophin activity and neuronal resilience. In this study, we investigated 7,8-dihydroxyflavone (7,8-DHF), a small-molecule Trk receptor agonist, through an integrative in-silico, in-vitro, and in-vivo pipeline. Using Schrödinger's Maestro, TrkA and TrkB receptor extracellular domains were modeled, and molecular docking, MM-GBSA analyses, and molecular dynamics simulations revealed strong binding affinities and stable interactions of 7,8-DHF, with parallel docking on dopamine D1/D2 receptors supporting dual therapeutic potential. In dopaminergic neuronal cell models (SH-SY5Y and N27) challenged with MPTP and $H_2O_2$, 7,8-DHF preserved mitochondrial membrane potential, reduced apoptosis, and reactive oxygen species, and attenuated oxidative stress-induced toxicity. Further, in A30P α-synuclein transgenic Drosophila, 7,8-DHF significantly improved survival, restored locomotor performance, and enhanced antioxidant defenses through elevated catalase and superoxide dismutase activity. Collectively, these results highlight 7,8-DHF as a promising neurotrophin mimetic capable of activating Trk signaling, conferring neuroprotection, and mitigating oxidative damage across multiple PD models. The findings provide compelling evidence that neurotrophin-based therapeutic strategies hold potential to modify PD progression rather than merely alleviate symptoms, warranting further optimization of such molecules and exploration of combination regimens integrating neurotrophin mimetics with existing symptomatic treatments.

**COMPARATIVE EFFICACY AND SAFETY OF PREGABALIN WITH NORTRIPTYLINE AND PREGABALIN WITH DULOXETINE IN PATIENTS WITH DIABETIC PERIPHERAL NEUROPATHIC PAIN**

M. Kishan Lokesh Sai, T. Sivani Sk. Shafiya Begum, and S. Vidyadhara
Department of Pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramulipuram, Chowdavaram, Guntur, Andhra Pradesh, India -522019
mkishanlokeshsai@gmail.com

Diabetic Peripheral Neuropathic Pain (DPNP) is a common complication of diabetes mellitus, presenting as burning, electric shock-like, lancinating, or deep aching pain in the lower limbs, often affecting sleep, mood, and overall quality of life. Treatment options include antidepressants, antiepileptics, opioids, and topical agents, but therapeutic responses vary significantly among patients. Combination therapies are being explored for enhanced outcomes. This study aimed to compare the efficacy and safety of two such combinations: Pregabalin with Nortriptyline (PG-NT) and Pregabalin with Duloxetine (PG-DLX) in patients with DPNP. A retrospective observational cohort study was conducted over five months (November 2022–March 2023) in the Neurology Department of NRI General and Super Speciality Hospital, Guntur. Sixty patients diagnosed with DPNP and already on either PG-NT or PG-DLX for at least two months were included. Pain was assessed using the Visual Analogue Scale (VAS), while sleep disturbances and anxiety were evaluated using the Insomnia Severity Index and standard anxiety/depression scales. Both treatment groups showed significant pain reduction compared to baseline. However, the PG-DLX group demonstrated greater improvement in sleep quality and anxiety reduction. Although adverse events were reported in both groups, they were more frequent in the PG-DLX group but remained manageable. Overall, Pregabalin with Duloxetine was more efficacious than Pregabalin with Nortriptyline in managing pain, improving sleep, and addressing anxiety and depression in DPNP patients, with an acceptable safety profile.

**Keywords**: Diabetic Peripheral Neuropathic Pain, Duloxetine, Nortriptyline, Pregabalin

**TOXICOLOGICAL EFFECTS OF SILVER NANORODS ON A549 HUMAN LUNG CELLS: CYTOTOXICITY, OXIDATIVE STRESS AND INFLAMMATION**

Harikiran Lingabathula
Department of Pharmacology and Toxicology, Princeton College of Pharmacy, Ghatkesar, Medchal-Malkajgiri District, Telangana, India-500088.
harikiran.pharma@gmail.com

Silver nanorods are finding applications in several areas like food industry, cosmetics, sunscreens, diagnostic tracers, medical devices, bio-sensing, imaging and antimicrobial applications. In spite of huge applications of silver nanorods, a little is known about their toxicity towards living sytems. The purpose of the present study was to evaluate the potential cytotoxicity, oxidative stress and inflammation effects of rod shaped, poly ethylene glycol coated 10 nm and 25 nm silver nanorods on human lung epithelial (A549) cells and compare the results with control and a known toxic agent, quartz. Exposure of silver nanorods to cells displayed reduced cell viability and increased lactate dehydrogenase leakage, indicating cytotoxicity. The silver nanorods exposure also results in reduced glutathione levels, enhanced lipid peroxidation and caspase-3 levels, representing induction of oxidative stress and increased levels of interleukin-8, an inflammatory mediator. The 10 nm silver nanorods have displayed greater toxicity towards all biochemical parameters when compare to 25 nm silver nanorods and quartz, indicating superior toxicity of 10 nm silver nanorods. Finally, our results suggesting that the toxicity of silver nanorods was dependent on their concentration and size. Further studies are warranted to elucidate the molecular mechanisms involved in the toxicity of silver nanorods in vivo.

**Keywords**: Caspase-3, interleukin-8, in vitro toxicity, silver nanorods.

saranyapharma@gmail.com

Since millions of years ago, medicinal plants have been a major source of therapeutic medicines. The majority of medications that have been found are either natural ingredients or their derivatives. It is a true reality that nature is the source of an apparently infinite variety of molecule configurations. These structures can be enhanced to create scaffolds of innovative medications for the treatment of a variety of illnesses. They are also rich sources for the production of robust chemotypes and pharmacophores. "Natural products" refers to substances originating from plants, marine organisms, bread molds, microorganisms, and both terrestrial and invertebrate animals. These compounds are recognized for their remarkable drug-like qualities and wide range of chemical compositions, which support their multi-targeted action. These substances include flavonoids that include benzopyran and hydroxyphenyl groups, i.e. Flavonoid compound kaempferol, sometimes referred to as kaempferol 3 or kaempferide, is found naturally in tea and a variety of common fruits and vegetables, such as gooseberries, beans, broccoli, and cabbage. The major goal of this study is to provide an overview of the numerous pharmacological actions of kaempferol in treating disorders, as well as the ongoing research into the underlying mechanisms. Numerous acute and chronic inflammation-induced illnesses, such as colitis and inter-vertebral disc degeneration, as well as postmenopausal bone loss and acute lung injury, may be treated with it. Moreover, it protects the heart and brain function, inhibits vascular endothelial inflammation, fights cancer, liver damage, obesity, and diabetes, and may be used to treat fibro proliferative illnesses like hypertrophic scar.

**Keywords:** kaempferol, flavonoids, cancer, inflammation, Natural product

2Dept of Pharmaceutical Chemistry, KVK College of Pharmacy, Surrmaiguda, Abullapuramet, RR Dist.
drdeepakkpunnapharmd@gmail.com

Chronic Kidney Disease (CKD) is a progressive condition often coexisting with Diabetes Mellitus (DM) and cardiovascular disease (CVD), significantly increasing the risk of morbidity and mortality. Early intervention in high-risk patients can delay CKD progression and improve overall outcomes. To evaluate the effectiveness of early intervention strategies—both pharmacological and behavioral—in managing diabetic and cardiovascular complications in patients with CKD. To implement and analyze early intervention methods in 100 CKD patients with DM and/or CVD, and to assess improvements in clinical outcomes including eGFR, HbA1c, blood pressure, proteinuria, and hospitalization frequency. The study population consisted of 100 CKD patients (Stages 2–4), with 58% male and 42% female participants. Post-intervention results revealed: HbA1c levels reduced significantly from a mean of 8.2% to 6.8% ($p<0.01$), Systolic Blood Pressure decreased from 147 mmHg to 129 mmHg ($p<0.05$), eGFR values stabilized at 45.2 mL/min/1.73m², compared to a pre-intervention decline, Albuminuria reduced by 36%, indicating improved renal function, Hospitalizations dropped from 3.1 to 1.3 events per patient per year, BMI reduced from 28.7 to 25.9 ($p<0.05$), Smoking and alcohol consumption decreased significantly following counseling. Interventions such as ACE inhibitors, ARBs, SGLT2 inhibitors, lifestyle counseling, dietary modifications, and regular follow-ups proved effective in controlling comorbidities and slowing CKD progression. Regression analysis showed HbA1c and systolic BP as strong predictors of outcome ($R^2 = 0.79$). Early, multidisciplinary intervention in high-risk CKD patients with diabetes and CVD significantly improves clinical parameters and reduces disease burden. These strategies are essential for enhancing quality of life and minimizing long-term healthcare costs.

**EVALUATION OF WOUND HEALING POTENTIAL OF POLY-HERBAL FORMULATION IN EXPERIMENTALLY INDUCED DIABETIC RATS.**

Bushra Naz Jhaniya*, Shailashri.S. sirsand.
Department of Pharmacology, MAM college of Pharmacy, kalaburagi.
bjmh.naaz123@gmail.com

This study was carried out to evaluate the wound healing potential of ethanolic extract of poly-herbal ointment containing leaves of Portulaca Quadrifida, Andrographis echioides and Mirabilis jalapa in Alloxane (120 mg/kg, I.P.) induced diabetic rats using Excision and Incision model. Wound healing activity: Excision and incision wound models were used to evaluate the wound-healing activity. The rats were inflicted with excision wounds under anesthesia. A circular wound of 2.5 cm diameter was made on depilated dorsal thoracic region rats. The animals were divided into three groups, containing six animals. Group-I was considered as control and received simple ointment base (B.P), Group-II served as reference standard and received framycetin sulfate cream 1% w/w. Group-III received the test formulation. The ointments were applied topically once in a day, till the epithelization was complete starting from the day of experiment. The parameters studied were wound closure and epithelization time. The period of epithelization was calculated as the number of days required for wound healing. A 6cm long paravertebral incisions were made through full thickness of the skin on either side of the vertebral column of the rat. The categorization and treatment of experimental animals was similar to that of excision wound model. The ointment was applied topically once in a day. The sutures were removed on 8th post wound day and the tensile strength of the healed wound was measured on 10th day following continuous water flow technique. Results**:** - The wound healing activity of polyherbal formulation was studied and extract showed significant wound healing activity when compared to control and similar to standard FSC (Framycetin sulphate cream) the extract did not produce any adverse effect. From the above results it can be concluded that the prepared herbal ointment showed significant wound healing activity.

**Keywords**: - Wound healing, Excision wound, Incision wound.

**CLINICAL OUTCOMES OF ANTI-NEUROPATHIC DRUG COMBINATION THERAPY IN PAIN MANAGEMENT**

B. Podali*, S. Harika, V Sindhu Vaishnavi, S Vidyadhara.
Chebrolu Hanaumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India - 522019
podalibandalapati06@gmail.com

Neuropathic pain (NP) is a chronic and disabling condition that is often inadequately managed with monotherapy due to modest efficacy, adverse effects, and poor adherence. Combination therapy is increasingly recognized as a rational approach, offering improved pain relief at lower doses with greater tolerability. A prospective observational study was conducted in the Department of Neurology, NRI General Hospital, Guntur, to evaluate the outcomes of different anti-neuropathic drug regimens. A total of 149 patients fulfilling the inclusion and exclusion criteria were enrolled and divided into three groups: Group I (pregabalin + oxcarbazepine, n=50), Group II (pregabalin + duloxetine, n=50), and Group III (gabapentin + amitriptyline, n=49). Patients were evaluated at baseline and after four weeks using the Toronto Clinical Scoring System (TCSS), Visual Analogue Scale (VAS), Hamilton Anxiety Rating Scale (HAM-A), Hamilton Depression Rating Scale (HAM-D), and Medical Outcomes Sleep Scale (MOS). Statistical analysis was done using paired t-tests with $p<0.05$ considered significant. All three drug combinations produced significant improvements in pain and related symptoms.Group I showed the greatest reduction in TCSS and VAS, indicating superior efficacy and tolerability. Group II demonstrated additional benefits in reducing depression and improving sleep quality, while Group III achieved moderate improvements. Anxiety symptoms improved across all groups. In conclusion, combination regimens were effective in NP management, with pregabalin plus oxcarbazepine being most efficacious for pain relief, and pregabalin plus duloxetine more beneficial for mood and sleep disturbances.

**COMPARATIVE EVALUATION AND COST-EFFECTIVENESS OF PROPHYLACTIC DRUG COMBINATIONS IN MIGRAINE: A PROSPECTIVE OBSERVATIONAL STUDY**

L. Dedeepya Bala Kovida*, B. Divya, M. Raghava Kalyan and S.Vidyadhara
Department of Pharmacy Practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India – 522019
dedeepya25l@gmail.com

Migraine is a recurring neurological condition marked by moderate to severe headaches, often accompanied by sensory disturbances, nausea, and reduced functional ability. Preventive treatment is essential for patients with frequent attacks to minimize the frequency and severity of episodes, improve quality of life, and reduce treatment costs. This study aimed to evaluate the clinical outcomes of migraine patients receiving various prophylactic medications over a defined treatment period and economic aspects of commonly prescribed prophylactic anti-migraine drug combinations. A total of 155 patients diagnosed with migraine were included. Participants were grouped into two categories: Group A received propranolol with amitriptyline, while Group B received propranolol with flunarizine. Baseline MIDAS and HIT-6 scores were recorded and reassessed after 12 weeks of therapy to determine clinical outcomes. Both groups demonstrated a statistically significant reduction in migraine severity and disability ($p < 0.05$) at follow-up. Group B exhibited slightly greater improvement compared to Group A. Patients with a migraine history exceeding 10 years showed comparatively lower response rates. Mild adverse effects, including weight gain, sedation, and dizziness, were noted in both groups without serious complications. Economic evaluation indicated that both regimens were cost-effective, with propranolol plus flunarizine offering slightly superior benefit relative to cost. In conclusion, preventive therapy provides meaningful improvement in migraine outcomes, with the propranolol and flunarizine combination showing the most favourable results.

**Keywords**: Cost-effectiveness, HIT-6, migraine, MIDAS, prophylactic therapy.

Acute calculus cholecystitis is an acute inflammation of the gallbladder, most commonly resulting from gallstones impacted in the cystic duct, requiring hospitalization and timely intervention, with antibiotics forming a key component of conservative management. This study was conducted to compare the clinical efficacy and cost-effectiveness of three commonly used antibiotics in the management of acute cholecystitis. A prospective study was carried out over nine months in the general surgery department of a tertiary care hospital, enrolling ninety inpatients aged 18–60 years with a diagnosis of acute cholecystitis. Patients were divided into three groups based on the prescribed antibiotic: Ceftriaxone–Sulbactam (n=30), Amoxicillin–Clavulanate (n=30), and Cefoperazone–Sulbactam (n=30), and were monitored for ten days. The primary endpoints were mean time to pain relief and fever resolution, and a cost minimization analysis was undertaken to assess economic outcomes. Results showed that mean time for pain relief was about three days with Ceftriaxone–Sulbactam, four days eight hours with Amoxicillin–Clavulanate, and two days eight hours with Cefoperazone–Sulbactam. Fever resolution occurred within one day with Ceftriaxone–Sulbactam, 1.4 days with Amoxicillin–Clavulanate, and less than a day with Cefoperazone–Sulbactam. All three antibiotics demonstrated good overall efficacy, though Amoxicillin–Clavulanate required slightly longer for symptom control compared with the other two. Cost analysis indicated that Ceftriaxone–Sulbactam provided the most cost-effective therapy. In conclusion, Ceftriaxone–Sulbactam, Amoxicillin–Clavulanate, and Cefoperazone–Sulbactam are

ISBN: 978-81-980623-8-3

all effective in treating acute cholecystitis, with Ceftriaxone–Sulbactam offering faster symptom relief and superior cost-effectiveness

**Keywords**: Acute cholecystitis, Ceftriaxone–Sulbactam, Amoxicillin–Clavulanate, Cefoperazone–Sulbactam, Conservative therapy.

sreelakshmidlji143@gmail.com.

Diuretics are essential therapeutic agents in the treatment of conditions such as congestive heart failure, hypertension, nephritis, and pregnancy-induced toxemia. However, currently available diuretics, including thiazides and loop diuretics, are often limited by adverse effects such as electrolyte imbalance and metabolic alterations. This has prompted the exploration of herbal alternatives with better safety and efficacy profiles.The present study investigated the diuretic and serum electrolyte regulation potential of the ethanolic extract of Codiaeum variegatum leaves. The plant material was collected, authenticated, and subjected to extraction and preliminary phytochemical screening, which confirmed the presence of secondary metabolites. Acute oral toxicity studies, carried out as per OECD guideline 423, established the safety of the extract up to 2000 mg/kg.Diuretic activity was evaluated in Wistar albino rats using the Lipschitz method with furosemide as the reference standard. The extract, administered at graded doses, produced a significant, dose-dependent increase in urine volume and enhanced excretion of sodium, potassium, and chloride ions. Serum analysis further revealed electrolyte regulation comparable to that of furosemide.The findings indicate that Codiaeum variegatum possesses promising diuretic activity and supports its traditional use in managing fluid-overload conditions. Its effect may be mediated through mechanisms resembling those of loop diuretics. Further studies are required to isolate the bioactive constituents and elucidate the precise mechanism of action.

**Keywords**: Codiaeum variegatum, diuretic activity, serum electrolytes

**PHARMACOGENOMICS: PIONEERING PERSONALIZED MEDICINE FOR PRECISION HEALTH**

Purvi L. Thakare, Mr. Sumit S. Kolte, Dr. Vinod Thakare
Nagpur College of Pharmacy, Nagpur, Maharashtra.
purvithakre71@gmail.com

Pharmacogenomics, the study of how genetic variations influence an individual's response to drugs, plays a pivotal role in the advancement of personalized medicine. This field aims to optimize drug efficacy and minimize adverse effects by tailoring medical treatment to the genetic makeup of each patient. Key advancements in genome sequencing and bioinformatics have enabled the identification of genetic markers that predict drug metabolism, efficacy, and potential toxicity. By integrating pharmacogenomics into clinical practice, healthcare providers can develop individualized treatment plans that consider genetic variations, lifestyle factors, and environmental influences. This approach is particularly significant in managing diseases such as cancer, cardiovascular disorders, and psychiatric conditions, where treatment responses vary widely among patients. Despite its transformative potential, the integration of pharmacogenomics into routine healthcare faces challenges, including high costs, ethical concerns, and limited access to genetic testing in underserved populations. Moreover, the need for comprehensive education among clinicians and patients about genetic-based therapies is crucial for its successful implementation. This review highlights the critical role of pharmacogenomics in advancing precision medicine, emphasizing recent breakthroughs, clinical applications, and barriers to widespread adoption. By fostering collaboration between researchers, clinicians, and policymakers, pharmacogenomics can pave the way for safer, more effective, and personalized healthcare solutions.

**Keywords**: Pharmacogenomics, Personalized medicine, Precision medicine, Genetic variations, Drug response variability

**EVALUATION OF PRESCRIBING PATTERN AND TREATMENT OUTCOME OF OSTEOARTHRITIS IN A TERTIARY CARE HOSPITAL**

L. Guru Prasad, Ch. Harshavardhan V. Sindhu Vaishnavi, S. Vidyadhara
Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram

Osteoarthritis (OA) is a chronic degenerative joint disorder characterized by progressive cartilage loss, synovial inflammation, bone remodeling, and osteophyte formation, resulting in joint space narrowing. It frequently affects knees, hips, spine, and hands, and is more prevalent in females (11.4%) than males (6.8%), usually occurring in middle to older age. Risk factors include age, gender, obesity, genetics, physical activity, and occupation. Symptoms include joint pain, stiffness, restricted mobility, swelling, deformity, and crepitus. Management begins with non-pharmacologic therapies such as strengthening exercises, range-of-motion training, hydrotherapy, and manual therapy, followed by pharmacologic interventions including NSAIDs, analgesics, COX-2 inhibitors, hyaluronic acid, and PRP injections. This ambispective observational study was conducted at NRI General Hospital, Guntur, over six months (June–December 2018), involving 100 outpatients aged 18 or older with radiologically confirmed Grade I–III OA of the knee or hip. Patients with renal failure, pregnancy, lactation, or joint replacements were excluded. Drug prescribing patterns were recorded, and treatment outcomes assessed using questionnaires and physical examinations evaluating pain, stiffness, joint function, and quality of life. Paracetamol was the most prescribed (91%), followed by Aceclofenac (46%), Diclofenac (41%), and Gabapentin (11%). Hyaluronic acid and Naproxen were least used (1%). Most patients (52%) reported moderate satisfaction, 7 high satisfaction, and 28 poor outcomes. The study concludes that rational prescribing and clinical pharmacist involvement improve OA treatment outcomes.

**Keywords:** Aceclofenac, Analgesics, Diclofenac, Gabapentin, Hyaluronic acid, Joint pain, Knee osteoarthritis, NSAIDs, Osteoarthritis, Paracetamol, Quality of life, Rational drug use, Treatment outcome

deepeshsudhakar9849@gmail.com

Nausea and vomiting during pregnancy (NVP) is a common condition, especially in the first trimester, often causing physical discomfort, emotional distress, and impaired daily functioning. Effective management is therefore essential. This prospective, comparative study was conducted at a tertiary care teaching hospital to evaluate the clinical and cost-effectiveness of oral Pyridoxine alone versus a fixed-dose combination of Doxylamine and Pyridoxine in managing NVP.A total of 247 pregnant women diagnosed with NVP were enrolled and divided into two groups: Group A (n=126) received the Doxylamine-Pyridoxine combination, and Group B (n=121) received Pyridoxine alone. Participants were monitored over two weeks, with treatment outcomes assessed using the Pregnancy-Unique Quantification of Emesis (PUQE) score and the Nausea and Vomiting in Pregnancy Quality of Life (NVPQOL) questionnaire. Both groups showed significant improvement in symptoms and quality of life. However, the combination therapy group exhibited a statistically greater reduction in nausea and vomiting scores. Although a slightly higher incidence of mild and transient adverse effects was noted in the combination group, no participants discontinued therapy. From a cost-effectiveness perspective, the combination therapy had higher direct costs but yielded superior symptom control and quality-of-life improvements, supporting its overall value. The study concludes that Doxylamine plus Pyridoxine is more effective than Pyridoxine alone in managing NVP, with tolerable side effects and a favourable benefit-to-cost ratio. Treatment should be individualized based on symptom severity, patient tolerance, and healthcare resource availability.

**Keywords**: Pyridoxine, Doxylamine, Nausea and Vomiting, Efficacy, Safety.

Chronic hyperglycemia is a metabolic disorder caused by either a lack of insulin secretion, impaired insulin action, or both Insulin plays an important role as an anabolic hormone, affecting the metabolism of carbohydrates, lipids, and proteins. To compare the efficacy of different drug combinations in terms of HbA1c reduction, fasting glucose and postprandial glucose .to explore duration of biguanide based combination therapy influences long term blood sugar management. A retrospective study was performed on total of 206 type 2 diabetic patients. The patients were selected on the basis of inclusion and exclusion criteria. In which 103 patients each were taking sulfonylurea with metformin and 103 patients were taking metformin plus DPP4 inhibitor. The patients were on treatment with sulfonylurea with metformin are enrolled in Group A and the patients were on treatment with DPP4 inhibitor with metformin are enrolled as group B. The results of this study suggest that the combination of sulfonylureas with metformin therapy significantly reduced HbA1c, PPBS, and FBS levels more effectively than the combination of DPP4 inhibitors with metformin. Based on these findings, sulfonylureas with metformin therapy can be considered a more effective combination for managing type 2 diabetes mellitus compared to DPP4 inhibitors with metformin therapy.

**Keywords:** Hypoglycemia, glycemic control, biguanide based combination therapy, metformin.

Parkinsonism is a clinical syndrome that affects the tone and movement of the skeletal muscles and is brought on by the breakdown of dopaminergic neurons in the brain (nigrostriatal dopaminergic tract). Neurodegeneration is mostly caused by aging, genetic mutations, ROS-mediated damage, and deposition of α-synuclein. Bradykinesia (slowness and poverty of movement), muscle rigidity, resting tremor (which typically goes away with voluntary movement), and a lack of postural balance that causes gait abnormalities and falls are its four main components. Male Wistar rats weighing 150–200g were procured, and each one was divided into five groups and given the appropriate care. The animals were first acclimatised to the laboratory environment for 14 days. After acclimatisation from day 1–10, locomotor activity and catalepsy behaviour will be evaluated. On days 11 and 12, animals will be put through training and test sessions in the Morris water maze. The brain homogenate is isolated for the estimation of oxidative stress. Silver and H&E staining were also used to assess the brain histology. The findings showed that a number of phytoconstituents, such as flavonoids, tannins, linalool, and camphor, are present in curcumin oil. When compared to the diseased animal group, the results of the treatment group show significantly ($p < 0.05$) better activity in the areas of locomotor activity, rotarod performance, chewing activity, and cognitive activity.

**INITIAL ANTIBIOTIC STRATEGIES FOR INFECTED DIABETIC FOOT ULCERS IN RURAL PATIENTS: A TERTIARY-CARE OBSERVATIONAL STUDY ASSESSING HOSPITALIZATION RISK**

M. Chaitanya, Sk. Suleman, Valluru Ravi and S. Vidyadhara
Department of pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Guntur, INDIA-522019
chaitanyam918@gmail.com

A retrospective observational cohort study was conducted to evaluate initial antibiotic treatment strategies in patients with infected diabetic foot ulcers (DFUs) managed within a rural healthcare system. Infection severity was classified according to Infectious Diseases Society of America (IDSA) guidelines as mild (68%), moderate (26%), or severe (6%). Patients received either empirical antibiotic therapy initiated prior to microbiological culture results or culture-guided therapy based on deep tissue culture and Gram stain analyses. Clinical data, including patient demographics, comorbid conditions (assessed via Charlson Comorbidity Index, presence of chronic kidney disease with estimated glomerular filtration rate <60 mL/min/1.73 $m^2$, and coronary artery disease), laboratory parameters (white blood cell count, HbA1c), and vascular assessments (toe–brachial index, absolute toe pressure), were extracted from medical records. Among patients with mild infections, empirical antibiotic therapy was associated with a significantly increased relative risk of hospitalization compared to culture-guided therapy. No significant difference in hospitalization rates was observed among patients with moderate or severe infections. These findings underscore the clinical value of obtaining microbiological confirmation prior to antibiotic initiation, particularly in mild DFU infections, and support the implementation of individualized, culture-based antibiotic regimens to potentially reduce hospitalization rates in rural diabetic populations.

**Keywords:** Diabetic foot, comorbidities, antibiotic therapy, Infection

**OPTIMIZATION OF RENAL RISK DRUGS USAGE IN PATIENTS ATTENDING GENERAL MEDICINE DEPARTMENT AT NRI GENERAL HOSPITAL**

V. Pavani, B. Divya Chandana, M. Raghava kalyan, S. Vidyadhara
Department of Pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramulipuram, Chowdavaram, Guntur, Andhra Pradesh, India -522019
vundrallapavani@gmail.com

Renal impairment is a significant contributor to morbidity and mortality with renal function declining with age and the inappropriate use of renal risk drugs in susceptible patients further aggravating the condition. Early detection of renal dysfunction, especially in critically ill patients, using tools such as serum creatinine, Cockcroft–Gault, and MDRD equations, is essential. Dose adjustments based on renal function help prevent adverse drug reactions (ADRs) and disease progression. This prospective observational study was conducted over six months in the General Medicine department, including 230 inpatients prescribed antibiotics, analgesics, or antihypertensives, excluding those with severe illness or pregnancy. Renal function tests and ADRs were monitored during hospitalization. Of the 230 patients analyzed (mean age 50.9 ± 15.2 years; 56.39% male), renal complications (26.06%) were the leading cause of admission, followed by hepatic diseases (19.9%). Analgesics, particularly paracetamol (24.77%), and antihypertensives, mainly telmisartan (20.85%), were the most prescribed renal risk drugs, with elderly patients showing higher ADR incidence. Naranjo's scale classified ADRs as possible (51.6%), doubtful (25.59%), probable (21.8%), and definite (0.94%). Hartwig's severity assessment indicated mild (85.3%) and moderate (10.42%) cases, with no severe cases. WHO-UMC causality assessment reported possible (53.08%), unlikely (24.64%), probable (21.8%), and certain (0.47%). The study concludes that high-risk renal patients require continuous monitoring, optimized dosing, and early ADR detection, highlighting the critical role of clinical pharmacists in ensuring safe and effective therapy through multidisciplinary collaboration.

**Keywords:** Renal risk drugs, Renal damage, Antibiotics, Analgesics, Anti-Hypertensives

**STUDY TO EVALUATE MOTOR-RELATED ADVERSE EFFECTS IN PATIENTS TAKING PSYCHOTROPIC DRUGS IN A TERTIARY CARE HOSPITAL**

K. Mary Kejeya*, D. Sravanthi M. Raghav Kalyan S. Vidyadhara
Department of Pharmacy Practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdawaram, Andhra Pradesh, India 522019
kejeyamary@gmail.com

The prevalence of mental health disorders is rising globally and is

ISBN: 978-81-980623-8-3

expected to become the second leading cause of disease burden by 2030. Psychotropic medications, including antipsychotics, antidepressants, and antiepileptic drugs, are essential in treating these conditions but are often associated with adverse drug reactions, particularly movement disorders. This prospective observational study was conducted over nine months in the department of Psychiatry at NRI general hospital, Guntur to evaluate the incidence and risk factors for psychotropic-induced movement disorders. A total of 239 patients receiving psychotropic medications were included, of whom 56 developed movement disorders. Tremors were the most frequent (69.64%), followed by akathisia (16.07%), with dyskinesia and dystonia each in 1.78% of cases. Antipsychotics were the leading cause as monotherapy (n=22) and in combination with other agents (n=15). Olanzapine and risperidone were the most prescribed antipsychotics, with olanzapine most frequently linked to movement disorders. Antidepressants, particularly escitalopram and sertraline, were common but caused only two cases. Valproate sodium, an antiepileptic drug, was implicated in seven cases. Causality assessment using the Naranjo scale classified 51.78% of reactions as probable and 48.22% as possible. According to Hartwig's severity scale, 96.43% were of moderate severity. These findings indicate that antipsychotics carry a greater risk of movement disorders than antidepressants, underscoring the need for careful monitoring of patients on psychotropic therapy for early detection and management of motor side effects.

**Keywords:** Movement disorders, tremors, akathisia, naranjo scale, hartwig severity scale

## PREDICTIVE MODELLING OF TUMOUR GROWTH: A STEP TOWARDS PERSONALIZED ONCOLOGY

Shruti H. Niwal, Mr. Sumit S. Kolte, Dr. Vinod Thakare
Nagpur College of Pharmacy, Nagpur, Maharashtra.
shrutiniwal@gmail.com

Tumour growth modelling plays a critical role in understanding cancer dynamics and improving therapeutic strategies in oncology. This study explores mathematical and computational models that simulate tumour progression, aiming to bridge the gap between clinical observations and theoretical frameworks. Key modelling approaches, including deterministic, stochastic, and hybrid methods, are reviewed to capture the complex biological processes underlying tumour growth. Deterministic models, such as the Gompertz and logistic equations, provide insights into macroscopic tumour dynamics, while stochastic models account for cellular heterogeneity and random events in cancer development. Emerging multi-scale models integrate molecular, cellular, and tissue-level interactions, offering a comprehensive perspective on tumour behaviour. Special attention is given to angiogenesis, tumour microenvironment influences, and treatment responses, such as chemotherapy and immunotherapy. Computational simulations based on agent-based models and partial differential equations highlight the predictive potential of these frameworks in patient-specific contexts. This work also examines the challenges of parameter estimation, model validation, and the integration of experimental and clinical data. By incorporating machine learning techniques and high-throughput data, tumour growth models are becoming increasingly personalized, paving the way for precision oncology. The findings underscore the necessity of interdisciplinary collaboration in advancing tumour growth modelling and its translational impact on clinical decision-making. This synthesis of theory and application aims to enhance therapeutic efficacy and patient outcomes, ultimately contributing to the development of more effective cancer treatments.

## NEWFANGLED COMBINATION AZILSARTAN AND CEFTRIAXONE AMELIORATED THE EXCITOTOXICITY AND NEUROINFLAMMATORY CASCADES IN IN-VITRO AND IN-VIVO MODELS OF CEREBRAL ISCHEMIA

Antony Justin, Gaddam Narasimha Rao
Department of Pharmacology, JSS College of Pharmacy, JSS Academy of Higher Education &Research, Ooty, Nilgiris, Tamil Nadu, India -643 001
justin@jssuni.edu.in

Excitotoxicity and neuroinflammation are the major molecular events of cerebral ischemia which is mainly triggered by ischemic insult and followed by reperfusion injury. Generally, tissue Plasminogen Activators (tPA's) and anticoagulant therapies are being used as first-line treatment options for cerebral ischemia but it only restores the cerebral blood flow and fails to attenuate the determinantal events associated with ischemic insult in neurons resulted in neurodegeneration. Based on the earlier findings, we have designed a novel combination of Azilsartan (Angiotensin receptor 1 blocker) and Ceftriaxone (third-generation Cephalosporin) targeting excitotoxicity and neuroinflammatory cascades in cerebral ischemia. The novel combination was evaluated in in vitro oxygen-glucose deprived (OGD) primary astrocytes and N2a neuronal co-cultures model and also, we have screened the above combination in vivo middle cerebral artery occlusion (MCAo) rat model of cerebral ischemia. Then, molecular investigations were done using flow cytometry, ELISA and gene expression techniques and immunohistochemistry staining has performed to understand the neuronal integrity. The novel combination ameliorated the neurodegeneration by downregulating the pro-inflammatory cytokines, oxidative stress, excitotoxicity cascades and also enhanced the level of antioxidant enzymes in ischemic conditions. Moreover, EAAT-2 expression was remarkably increased with the treatment of novel combination which further evidence the attenuation of excitotoxicity in neurons. The above combination significantly reversed the behavioral dysfunction in ischemic rats which evidencing the beneficial effects. The repurposing of Azilsartan and Ceftriaxone combination was demonstrated an excellent neuroprotective potential, mediating through ameliorating excitotoxicity, neuroinflammation and oxidative stress in in-vitro OGD astrocyte-neuron co-culture as well as cerebral ischemic in-vivo rat model. The above combination will be beneficial in cerebral ischemia which could prevent the further degeneration of neurons thereby decrease the intensity of neurological dysfunctions.

## ASSESSMENT OF COMMON MIGRAINE TRIGGERS AND SLEEP PATTERN DISTURBANCES AFFECTING ACADEMIC PERFORMANCE AMONG COLLEGE STUDENTS

Nandana Chandran | Drishya L | Shaiju S Dharan
Student, Department of Pharmacy Practice, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Neyyatinkara, Thiruvananthapuram, 695124.
nan.chandra2004@gmail.com

Migraines are a growing concern among college students, often linked to lifestyle factors such as irregular sleep patterns, academic stress, and dietary habits. This study aims to assess the common migraine triggers and sleep disturbances that may impact the academic performance of students in higher education. This assessment will focus on identifying and analysing patterns related to migraine triggers, sleep disturbances, and their impact on academic outcomes. By analysing the relationship between these factors, the study seeks to highlight how everyday habits influence cognitive health and learning outcomes. The findings of this study will provide valuable insights into the complex relationships between migraines, sleep, and academic performance, informing the development of targeted interventions to support students in managing their migraines and sleep disturbances, ultimately enhancing their academic success.

**Keywords:** Migraine triggers, sleep patterns, academic performance, college students.

## ASSESSMENT OF ANDROGRAPHOLIDE'S EFFICACY IN DEHYDROEPIANDROSTERONE-INDUCED PCOS IN RATS

Vadivelan R1, Vishnuvardhan A2
Department of Pharmacology, JSS College of Pharmacy, Ooty, Tamil Nadu 643001, India
vadivelanr@jssuni.edu.in

Andrographolide was evaluated for its therapeutic potential in dehydroepiandrosterone (DHEA)-induced polycystic ovary syndrome (PCOS) in rats. The objective behind the research was to examine the

ISBN: 978-81-980623-8-3

consequence of andrographolide treatment on hormonal balance, lipid profile, antioxidant status, and ovarian histopathology in DHEA-induced PCOS rat model through molecular docking and comprehensive in vivo assessment. The prepared animal groups were evaluated for body weight, ovarian weight, vaginal cytology, hormonal levels, lipid profile, and antioxidant parameters, and it was found that Group IV (DHEA-induced rats treated with andrographolide) showed maximum therapeutic efficacy with significantly restored estrogen, testosterone, and progesterone levels, improved LDL (reduced), HDL (increased), and triglyceride profiles, enhanced antioxidant enzyme activities including CAT, SOD, GPX, and reduced TBARS levels compared to the PCOS control group. The molecular docking analysis of andrographolide with protein target PDB-4L23 revealed favorable binding interactions with key amino acid residues Asp89, Lys112, and Arg114, suggesting strong therapeutic potential. Histopathological analysis of ovarian tissues showed significant restoration of follicular development and reduced cystic formations in andrographolide-treated groups. The SEM analysis demonstrated improved ovarian morphology with regular follicular structures, typically showing restoration of normal ovarian architecture. Therefore, andrographolide treatment has been successfully validated for PCOS management as it was observed there was a significant effect of andrographolide on hormonal restoration, metabolic improvement, oxidative stress reduction, and ovarian tissue regeneration. Thus, it can be concluded this study can be beneficial for the development of andrographolide as a novel therapeutic agent for PCOS treatment.

**PERMEABILITY GLYCOPROTEIN MEDIATED FOOD-DRUG INTERACTION BETWEEN DIGOXIN AND PHYTOCONSTITUENTS OF ORANGE JUICE (NARINGIN AND QUERCETIN) – A STUDY BY IN-VITRO APPROACH**

Deepalakshmi.M, Abinav.P, Agarbala.S, Dhanush.S,
Dhiyaanesh N, Arun K. P
Dept. of Pharmacy Practice, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty – 643 001. The Nilgiris.
deepapharmacy@jssuni.edu.in

Digoxin, a cardiotonic glycoside with a narrow therapeutic index, is susceptible to food–drug and drug–drug interactions mediated by permeability glycoprotein (P-gp), an efflux transporter regulating intestinal absorption and bioavailability. Citrus flavonoids such as naringin and quercetin, present in orange juice, are known P-gp modulators and may influence digoxin disposition. To investigate the in-vitro effects of naringin and quercetin on P-gp–mediated transport of digoxin using Caco-2 cell culture models. Caco-2 cells were cultured in 96-well plates and treated with naringin and quercetin at concentrations ranging from 125–1000 µg/mL, both alone and in combination with digoxin. Absorbance was monitored for 120 minutes to evaluate drug retention and efflux. Both flavonoids inhibited P-gp–mediated efflux of digoxin, thereby enhancing intracellular retention. Naringin demonstrated a more consistent inhibitory effect across concentrations, particularly at lower doses, resulting in improved digoxin absorption. Quercetin also inhibited P-gp but showed less pronounced effects, likely due to variable solubility and bioavailability. These findings suggest that naringin is a superior natural P-gp inhibitor compared to quercetin, with effects comparable to ketoconazole. However, increased digoxin exposure through such interactions may elevate the risk of toxicity. The results highlight the clinical importance of considering dietary flavonoids in patients receiving P-gp substrates like digoxin, where altered pharmacokinetics could impact therapeutic outcomes. Orange juice phytoconstituents, particularly naringin, significantly influence P-gp–mediated digoxin transport in vitro. While these findings suggest potential benefits of natural P-gp inhibition, further in-vivo and clinical studies are required to confirm safety, efficacy, and dietary guidelines.

**Keywords**: P-glycoprotein, Digoxin, Naringin, Quercetin, Caco2 cells, Food-Drug interaction, In-vitro.

**LIPOIDAL PHYTOESTROGENS: TARGETED THERAPEUTIC APPROACH FOR ER? -POSITIVE BREAST CANCER**

Priya Dharshini, Jubie Selvaraj, Jawahar Natarajan
1*Department of Pharmacognosy, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Ooty, Nilgiris, Tamil Nadu - 643001, India.
priya@jssuni.edu.in

Estrogen Receptor Alpha (ERα) is a pivotal driver in hormone-dependent cancers, where estradiol-mediated activation induces uncontrolled cell proliferation. While selective estrogen receptor modulators (SERMs) like tamoxifen remain effective, their adverse effects and acquired resistance necessitate alternative therapeutic approaches. Phytoestrogens, structurally similar to estradiol, have gained attention as natural ERα-targeting agents; however, their limited hydrophobicity and receptor affinity restrict clinical translation. To overcome these barriers, this study developed lipid-based delivery systems to enhance bioavailability, tumor targeting, and safety of phytoestrogens. In silico screening identified quercetin, naringenin, and luteolin as promising candidates, which were further optimized using two strategies: direct lipid conjugation with stearic acid hydrazide (yielding QLC, NLC, and LLC) and solid lipid nanoparticle encapsulation (QN, NN, and LN). Molecular docking and dynamics simulations revealed improved ERα binding affinity and stability. In vitro studies on MCF-7 cells demonstrated enhanced antiproliferative, anti-invasive, and pro-apoptotic activities of the formulations compared to free compounds. Gene expression analyses confirmed significant downregulation of ERα-regulated oncogenes, including CCND1, CMYC, and pS2. Anti-angiogenic efficacy was validated using chick chorioallantoic membrane (CAM) and zebrafish assays, while toxicity evaluations indicated superior safety relative to tamoxifen. Among formulations, QLC and LN showed the most potent activity, with QLC inducing G0–G1 phase arrest and apoptosis. Collectively, these findings highlight the therapeutic promise of lipoidal phytoestrogens as effective ERα-targeted cancer interventions with improved efficacy and safety.

**TREATMENT TRENDS AND HEALTH IMPACTS OF ANEMIA IN PREGNANCY: AN OBSERVATIONAL STUDY.**

Polamadi venkata sai chaitanya
Ratnam institute of pharmacy, Pidathapolur (V&P),
Muthukur(M), SPSR Nellore District, 524346 (A.P), India.
pvschaitanya2004@gmail.com

The main aim of the prospective observational study analyses the treatment trends and health impacts of anemia in pregnancy with the study population size of 105 people with an selective criteria in a duration of six months at the study site of tertiary care hospital SPSR Nellore, AP, India. Mainly analyses the prevalence, clinical characteristics and treatment patterns of anemia across different age groups in anemic pregnant women. The objective of the study is to identify the prevalence rate, clinical features, treatment stratergies and classify the severity of anemia. The research methodology include an prospective observational study at site of tertiary care hospital with population of 105 patients in an selective criteria with a source of the data include patient case, patient review, patient interview and laboratory reports and analysed in a duration of six months. Various drugs are prescribed to the patients according. So, results shows that a high prevalence of anemia in pregnant women at the age group of 24 to 27 with most common clinical features of lethargy, fatigue, weakness. So, we conclude that our study is about understanding the prevalence rate, clinical compliances, different treatment supplements, blood transfusions and effective management plans and study continuous for more future health care outcomes.

**Keywords:** Anemia, Pregnancy, Prospective observational study, Prevalence, Treatment stratergies.

**INFLUENCE OF NOVEL ANTIPSYCHOTIC AGENTS ON TRIGLYCERIDE CONCENTRATIONS**

Mohamed Nowfal A1 and Abdul Ajeed Mohathasim Billah2
1 Nandha College of Pharmacy, Erode, Tamil Nadu.
2 Sri Ramachandra Faculty of Pharmacy, SRIHER (DU),
Porur, Chennai, Tamil Nadu.
billahs@yahoo.co.uk

ISBN: 978-81-980623-8-3

Hypertriglyceridemia is a well-recognised metabolic complication that contributes to cardiovascular and pancreatitis risk. Novel antipsychotic agents may differentially affect triglyceride metabolism, warranting early evaluation. Triglyceride levels were measured at initiation of therapy and after four weeks in patients treated with Amisulpride, Quetiapine, or Lurasidone. Mean values were compared using paired t-tests with a significance threshold of $p<0.05$. Quetiapine was associated with a significant increase in triglycerides (122.66 ± 28.08 mg/dL to 136.22 ± 48.80 mg/dL; p= 0.04), indicating a hypertriglyceridemia effect. Amisulpride showed a significant reduction (129.4 ± 12.23 mg/dL to 126.8 ± 11.96 mg/dL; p = 0.028), while Lurasidone exhibited a minimal, statistically non-significant change (79.22 ± 16.32 mg/dL to 78.33 ± 17.54 mg/dL; p = 0.21). These findings demonstrate that Quetiapine elevates triglyceride levels and may contribute to atherogenic risk, whereas Amisulpride appears to improve lipid status. Lurasidone remains metabolically neutral, supporting its use in patients predisposed to dyslipidaemia.

**Keywords:** Triglycerides; Hypertriglyceridemia; Metabolic effects; Cardiometabolic monitoring

**PL-329**

## AMELIORATIVE EFFECTS OF VANILLIN, MAGNOLOL, PROBIOTIC AND VARIOUS COMBINATIONS THEREOF IN ANIMAL MODEL OF ALZHEIMER'S DISEASE

ABHINAV ANAND
University School of Pharmaceutical Sciences, Rayat-Bahra Professional University (Hoshiarpur)-Punjab
anand.abhinav1311@gmail.com

Introduction: Alzheimer's disease (AD) is a global health issue, particularly among the elderly. Current treatments offer only symptomatic relief. This study investigates the use of phytoconstituents vanillin and magnolol, known for targeting AD-related pathological pathways as per in vitro studies, alongside probiotic(Lactobacillus rhamnosus), which may offer benefits via the Gut-Brain Axis (GBA). Aim and Objectives: The study aims to assess the ameliorative effects of vanillin, magnolol, and L. rhamnosus, alone and in various combinations, on AD induced in mice using chronic co-administration of aluminium chloride and d-galactose. Behavioural, biochemical, and molecular evaluations were conducted. Methods: AD was induced by administering aluminium chloride (5mg/kg; oral) and d-galactose (60 mg/kg; intraperitoneal) for 90 days. Vanillin (20 and 40 mg/kg; orally), magnolol (20 and 40mg/kg; orally), and L. rhamnosus (1 billon CFU; orally) were given orally from 61st day. Behavioural assessments included transfer latency (elevated plus maze), escape latency (Morris water maze), and distinction index (novel object recognition). Biochemical evaluations included antioxidant markers (TBARS, reduced glutathione, catalase) and acetylcholinesterase activity. Molecular markers such as caspase-3, amyloid beta 1-42, beta secretase, and Brain Derived Neurotrophic Factor (BDNF) were measured using ELISA in cortical and hippocampal regions of brain. Histopathological assessments of these regions were also performed. Results: All interventions showed significant anti-AD effects across behavioural, biochemical, and molecular studies, with neuroprotection evident in histopathological analysis. The combination of vanillin (20mg/kg; orally), magnolol (20mg/kg; orally), and L. rhamnosus (1 billion CFU; provided the most substantial results as was demonstrated by amelioration of behavioural and biochemical deficits associated with development of AD. Summary: Vanillin, magnolol, and L. rhamnosus demonstrated strong anti-AD potential, suggesting a disease-modifying effect. Conclusion: These interventions showed a multifactorial approach to delaying AD progression and may have disease-modifying properties. Further research is needed to substantiate these findings.

**Keywords:** Alzheimer's disease, aluminium chloride, d-galactose, vanillin, magnolol, Lactobacillus rhamnosus.

## AWARENESS OF ANTIBIOTIC RESISTANCE AMONG PATIENTS IN COMMUNITY PHARMACIES: A CROSS-SECTIONAL STUDY

Deeksha. N1, Dr. Shobha Rani R. H
Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research (ABIPER), Kogilu Main Road, Yelahanka, Bangalore-560064, Karnataka, India.
deekshan784.gmail.com

Antibiotic resistance is increasingly recognized as one of the greatest threats to global public health. Inappropriate prescribing, misuse of antibiotics, and limited patient awareness contribute substantially to this crisis. Community pharmacies, being the first point of contact for many patients, provide a unique opportunity to assess knowledge gaps and promote rational antibiotic use. This cross-sectional study aimed to evaluate the level of awareness of antibiotic resistance among patients attending selected community pharmacies in Yelahanka and Chikaballapur. A standardized, structured questionnaire was administered to participants, covering key domains including antibiotic use, resistance mechanisms, and preventive practices. Data were analyzed using descriptive statistics to identify patterns of knowledge and misconceptions. Preliminary results revealed that a majority of patients were aware that inappropriate or excessive use of antibiotics can lead to resistance. However, a significant proportion demonstrated poor understanding of the importance of completing the full course of prescribed antibiotics. Misconceptions were common, particularly the belief that antibiotics are effective against viral infections such as the common cold and influenza. Despite these gaps, most respondents expressed willingness to receive pharmacist-led advice on appropriate antibiotic use, suggesting an openness to educational interventions at the pharmacy level. These findings highlight a critical need for targeted patient education and pharmacist-driven awareness campaigns to counter misconceptions and promote responsible antibiotic use in the community. Given the increasing burden of antimicrobial resistance, empowering patients with accurate knowledge and reinforcing the role of pharmacists as trusted healthcare providers are urgent priorities. Strengthening community-level education and interventions may serve as a practical, sustainable strategy to reduce misuse and preserve antibiotic effectiveness for future generations.

**Key words:** Antibiotic Resistance, community pharmacy, patient education, knowledge

**PL-331**

## EARLY-STAGE DEVELOPMENT OF AMYLOID BETA–TARGETED NANOPARTICLES FOR IMPROVED NEUROIMAGING IN NEURODEGENERATIVE DISEASES

Pullaganti Sai Sree*
Research Scholar, Department of Pharmaceutics, Sri Ramachandra Faculty of Pharmacy, Sri Ramachandra Institute of Higher Education and Research, Porur, Chennai.

Neurodegenerative diseases are characterized by progressive neuronal loss and protein misfolding, with amyloid beta (Aβ) aggregation serving as a key pathological hallmark. Early and accurate diagnosis is crucial for therapeutic intervention, yet conventional imaging modalities such as MRI and PET often fail to detect subtle early-stage changes. Nanotechnology-based contrast agents offer an innovative pathway to improve sensitivity, targeting specificity, and enable preclinical detection. We have initiated exploratory work on the development of contrast-enhanced nanoparticles functionalized with Aβ-specific ligands to achieve selective plaque targeting and enhanced blood–brain barrier (BBB) penetration. The nanoparticle core was designed to improve imaging contrast, while surface modifications such as PEGylation were introduced to extend circulation and reduce non-specific uptake. Initial in vitro assessments were conducted to evaluate Aβ binding capacity and cytotoxicity, while preliminary in vivo observations in transgenic neurodegenerative models focused on biodistribution and imaging signal enhancement. Preliminary findings indicate that functionalized nanoparticles exhibit strong affinity toward Aβ aggregates in vitro, along with favorable safety profiles. Early in vivo studies suggest efficient BBB crossing and enhanced imaging contrast in Aβ-enriched regions compared to standard agents. These results support the feasibility of using targeted contrast nanoparticles for detecting early pathological changes. However, current data are limited, and larger studies are required to validate reproducibility, optimize nanoparticle formulations, and assess long-term safety. Our ongoing work suggests that Aβ-targeted contrast nanoparticles represent a promising diagnostic tool for neurodegenerative diseases. While initial results are encouraging, the research is still in its early stages. Further systematic evaluations, including detailed pharmacokinetic studies, extended animal trials, and

ISBN: 978-81-980623-8-3

eventual clinical translation, are necessary to fully establish their diagnostic and theranostic potential.

**Keywords:** Neurodegenerative disease, amyloid beta, contrast nanoparticles, early detection, nano-theranostics

## RUTIN-LOADED PLGA NANOPARTICLES ATTENUATE NEUROINFLAMMATION: EVIDENCE FROM IN VITRO MICROGLIAL STUDIES AND IN VIVO WISTAR RAT MODEL

BasithRehman.S1, Dr. DeevanPaul.A2
Research Scholar, Department of Pharmaceutics, Sri Ramachandra Faculty of Pharmacy
1,2Sri Ramachandra Institute of Higher Education and Research, Porur, Chennai.
basithrehman17@gmail.com

Neuroinflammation is a key contributor to the pathogenesis of neurodegenerative disorders such as Alzheimer's and Parkinson's disease. Rutin, a natural flavonoid with antioxidant and anti-inflammatory properties, is limited by poor solubility and bioavailability, restricting its therapeutic application. Nanoparticle-based drug delivery systems, particularly poly (lactic-co-glycolic acid) (PLGA) formulations, offer enhanced stability, sustained release, and targeted delivery to overcome these limitations. Rutin-loaded PLGA nanoparticles were prepared using the solvent evaporation method and evaluated for particle size, zeta potential, encapsulation efficiency, and morphology. In vitro release was assessed over 72 h. Anti-inflammatory activity was tested using LPS-induced BV-2 microglial cells, examining nitric oxide production, TNF-α, and IL-6 levels. Cell viability was evaluated by MTT assay. For in vivo studies, Wistar rats were subjected to LPS-induced neuroinflammation and treated orally with rutin-PLGA nanoparticles (20 mg/kg). Brain tissue cytokine levels, histopathological changes in the hippocampus, and behavioral outcomes (memory and locomotor activity) were analyzed. The optimized nanoparticles exhibited an average size of 142.6 ± 5.2 nm, zeta potential of –21.4 mV, spherical morphology, and encapsulation efficiency of 86.7%. Drug release studies revealed biphasic kinetics with sustained release up to 72 h. In vitro studies showed significant inhibition of nitric oxide (61%) and reduction in pro-inflammatory cytokines TNF-α (58%) and IL-6 (55%) compared to free rutin ($p < 0.01$), with >90% cell viability at therapeutic doses. In vivo, rutin-PLGA nanoparticles reduced TNF-α and IL-1β in brain tissue by 48% and 52%, respectively. Histological analysis demonstrated reduced microglial activation and neuronal damage, while behavioral tests confirmed improvements in memory and locomotor performance ($p < 0.05$). Rutin-loaded PLGA nanoparticles significantly improve rutin's bioavailability, reduce neuroinflammatory markers, and provide neuroprotection in vitro and in vivo. These findings highlight their potential as a promising therapeutic approach for managing neuroinflammatory and neurodegenerative conditions.

**Keywords:** Rutin, PLGA nanoparticles, neuroinflammation, BV-2 microglial cells, Wistar rats, cytokines.

## RESVERATROL BASED NOVEL PHYTOGEL EXHIBITS SYNERGISTIC ANALGESIC AND ANTI-INFLAMMATORY POTENTIAL IN RATS.

Dhirendra Tiwari, Apali Jain, Prashant N. Amale, Dinesh Chaple.
Department of Pharmacology, Priyadarshini J. L. College of Pharmacy, Electronic Zone Building, MIDC, Hingna Road, Nagpur.
tdhirendra283@gmail.com

Inflammation is a complex biological response implicated in several chronic conditions, and its management often remains challenging due to limited efficacy and adverse effects of conventional therapies. Natural bioactives such as resveratrol (RSV), curcumin, and methyl salicylate (from wintergreen oil) have demonstrated the ability to modulate multiple inflammatory pathways. The present study aimed to develop and evaluate their synergistic analgesic-anti-inflammatory gel using a rat model of formalin-induced pain and inflammation. The topical gel was formulated with CAR-940 and characterized for physicochemical parameters including pH, viscosity, spreadability, and ex vivo permeation. In vivo evaluation involved paw volume measurement, nociceptive behavioural responses (licking, jerking, and lifting), and biochemical markers such as C-reactive protein, malondialdehyde, catalase, and haematological parameters. Additional mechanistic insights through protein denaturation assays. The optimized gel significantly reduced paw oedema and nociceptive responses versus standard treatment. Ex vivo studies confirmed effective transdermal delivery of RSV and curcumin. Biochemical assays showed normalized oxidative stress and inflammatory markers, while protein denaturation assays supported its analgesic and anti-inflammatory effects. The synergistic combination of RSV, curcumin, and wintergreen oil in a topical gel showed potent analgesic and anti-inflammatory activity, highlighting its potential as a natural therapeutic alternative.

**Keywords:** Resveratrol, Curcumin, Wintergreen oil, Anti-inflammatory, Analgesic, Antioxidant, Formalin-induced paw oedema.

## INNOVATIVE APPROACH IN TUBERCULOSIS ENHANCING EARLY DIAGNOSIS AND TREATMENT MANAGEMENT

D. Pramod Agasteen
Department of Pharmacy Practice, Ratnam Institute of Pharmacy, Nellore, AP.
pramodagasteen@gmail.com

Tuberculosis (TB), a communicable disease caused by the bacterium Mycobacterium tuberculosis, spreads from person to person. It remains a serious health challenge, particularly in developing countries, even with progress in medical diagnosis and treatment. TB primarily affects the lungs but also capable of spreading throughout the body. A one-year study conducted at a tertiary care hospital involving 1450 patients between the ages of 20 and 60, with the majority being men especially 40-59 years old. The study focused on how TB affects people, different diagnosis tests used, treatment approaches and outcomes. Study found that social factors such as poor nutrition and limited education played a significant role in affected by TB. Most of the patients presented with clinical features of persistent cough, haemoptysis, weight loss and night sweats. TB was diagnosed using multiple methods including the mantoux skin test, sputum analysis, CBNAAT and imaging techniques like chest x-ray. Frist-line anti-tuberculosis drugs such as isoniazid, rifampicin, pyrazinamide and ethambutol. Frist-line drugs are effective in treatment but may cause serious liver and kidney side effects. Require close monitoring while using treatment. A major challenge observed-some patients never started, some patients discontinued midway and many failing to maintain consistency which may difficult to treat TB. Innovative and target treatments includes bedaquiline and Linezolid, when combined with DOTS strategy, demonstrate promise in improving recovery rates, particularly in patients with drug resistant TB.

**Keywords:** CBNAAT, DOTS, Mycobacterium tuberculosis, Pulmonary TB, Rifampicin, Tuberculosis Diagnosis

## INFLUENCE OF ALCOHOL CONSUMPTION ON SEVERITY AND RECURRENCE OF ACUTE PANCREATITIS: A CROSS-SECTIONAL STUDY

Poojitha Banoth, Anguluri Veena,
P. Ranadheer Chowdary
St. Peter's Institute of Pharmaceutical Sciences, Hanamkonda, Telangana
banothpoojitha@gmail.com

Acute pancreatitis is an inflammatory condition of the pancreas, an organ vital for digestion and blood sugar regulation. Alcohol use is considered one of the major modifiable risk factors associated with this disorder, contributing to both its onset and recurrence. The present study was undertaken to examine the impact of alcohol on the severity and recurrence of acute pancreatitis and to explore the role of socio-economic status. A cross-sectional study was conducted in patients diagnosed with acute pancreatitis, divided into two groups: Group A comprised patients with a history of alcohol consumption, and Group B included patients without alcohol exposure. Information was obtained through a structured questionnaire, and disease severity was assessed using serum amylase and lipase levels. Socio-economic background was evaluated by the Kuppuswamy scale. Results showed that Group A patients had significantly higher serum enzyme levels compared with Group B ($P < 0.05$), indicating greater severity in alcohol users. Recurrence was also more common in Group A, where 62 patients (88.7%) experienced repeated episodes, compared to 6 patients (30%) in Group B. Analysis of socio-economic status revealed that most patients belonged to upper-middle and lower-middle classes, and

ISBN: 978-81-980623-8-3

alcohol consumption was more prevalent in these groups. These findings highlight alcohol as a strong determinant of both severity and recurrence of acute pancreatitis, while socio-economic background appears to influence exposure and vulnerability. Early lifestyle counseling, alcohol restriction, and targeted prevention strategies may help reduce the burden of alcohol-related pancreatitis.

**Keywords:** Alcohol consumption, Acute pancreatitis, Recurrence, Severity, Socio-economic status.

**CORONARY ARTERY DISEASE: A CASE PRESENTATION**

Mr. Abdul Saheel Qureshi, Mir Sohail Ali Khan, Pharm D, V Year
Azad College of Pharmacy, Moinabad, Hyderabad, Telangana.

Coronary artery disease (CAD) happens when the arteries that supply blood to the heart get narrowed or blocked because of a build-up of fatty material called plaque. This reduces blood flow to the heart and can cause chest pain or even a heart attack. This case report is about a 53-year-old man with high blood pressure who was admitted to the hospital with chest pain and trouble breathing. Tests showed fast heart rate, high levels of a heart damage marker (troponin I), and poor heart pumping function (35% ejection fraction). These confirmed he had CAD with a recent heart attack and weak heart muscle. The treatment aimed to ease symptoms, stop the disease from getting worse, lower the risk of future heart problems, and improve chances of survival. The patient was given blood thinners (heparin), medicines to prevent blood clots (clopidogrel), cholesterol-lowering drugs (atorvastatin), medicines to widen blood vessels (nitroglycerin), and other drugs to support heart function. His condition was closely monitored, and efforts were made to control risk factors like high blood pressure. This case shows how important it is to carefully evaluate patients with CAD and use a combination of medicines to manage the disease well. Early diagnosis and proper treatment can greatly improve outcomes for people with coronary artery disease.

**THE AMYLOID CASCADE HYPOTHESIS IN ALZHEIMER'S DISEASE: A CRITICAL OVERVIEW**

Ritu Singh and Nandni Savsani
Department of Pharmaceutical Science, Uka Tarsadia University, Surat, Gujarat, India -394350.
ritusingh97507@gmail.com

The amyloid cascade hypothesis, introduced in the early 1990s, posits that Alzheimer's diseases (AD) pathology begins with the accumulation and aggregation of amyloid beta peptides in the brain. This deposition triggers a series of downstream events including the formation of neurofibrillary tangles from hyperphosphorylated tau proteins, synaptic dysfunctional, neuronal death, and ultimately cognitive decline and dementia. Genetic evidence from familial AD cases,involving mutations in APP, PSEN1, and PSEN2 genes, supports the central role of Amyloid beta in disease onset by influencing peptide production and aggregation. Despite its pivotal role in AD research and drug development, the hypothesis has faced challenges, including instances where amyloid plaques are present without dementia and mixed results from clinical trials targeting amyloid clearance. Modern understanding emphasizes soluble amyloid beta oligomers as the main neurotoxic species rather than insoluble plaques and recognizes the involvement of multiple pathological pathways. While the amyloid cascade remains a foundation for understanding AD, current perspectives view it as one component within a multifactorial disease process involving tau pathology, neuroinflammation, and other mechanisms. Continued research aims to clarify these interrelated pathways to develop effective therapeutic strategies.

**Keywords:** Alzheimer's disease, amyloid beta, amyloid cascade hypothesis, tau pathology, neurodegeneration.

**PL-338**

**IMPACT OF GESTATIONAL DIABETES ON NEWBORNS: A RETROSPECTIVE OBSERVATIONAL STUDY**

Ponnala Pallavi*, Srujana Rani
Kasoju, Macharla Karthik Teja,Rajeshri Dhurke
Department of Pharmacy Practice, St. Peter's Institute of Pharmaceutical Sciences, Hanamkonda, Warangal, Telangana, India.
pallaviponnala5@gmail.com

Gestational diabetes mellitus (GDM) is a common pregnancy complication that significantly influences neonatal health. This retrospective observational study was conducted to evaluate the impact of GDM on neonatal outcomes. Medical records of 132 GDM mothers and their neonates were reviewed, and maternal parameters such as age, BMI, HbA1c levels, and mode of delivery were correlated with neonatal birth weight, Apgar scores, and complications. The mean maternal age and BMI were 29.7 ± 3.3 years and 28.7 ± 4.3 kg/m², respectively, with a mean gestational age of 38 weeks.The mean neonatal birth weight was 3.34 ± 0.43 kg, with Apgar scores of 6.1 at 1 minute and 8.1 at 5 minutes. Among the neonates, 52.7% required NICU admission, with hypoglycemia, macrosomia, respiratory distress syndrome, and hyperbilirubinemia being the most frequent complications. A strong positive correlation (r = 0.71) was observed between elevated maternal HbA1c and neonatal hypoglycemia, indicating that poor glycemic control worsens neonatal outcomes. The study concludes that GDM poses a significant risk for neonatal morbidity, and strict maternal glycemic management is essential to reduce complications and improve neonatal outcomes.

**Keywords:** Gestational diabetes mellitus, macrosomia, hypoglycemia, respiratory distress syndrome.

**PL-339**

**A PROSPECTIVE INTERVENTIONAL STUDY ON SAFETY AND EFFICACY OF SAROGLITAZAR ALONE AND IN COMBINATION WITH VITAMIN E AMONG NON-ALCOHOLIC FATTY LIVER DISEASE (NAFLD) PATIENTS**

Drishya.L and Dr. Saravanan Govindaraj
School of Pharmaceutical Sciences, Vels Institute of Science, Technology & Advanced Studies, Pallavaram, Chennai - 600 117, Tamil Nadu, India.
drishyavijayakumar@gmail.com

Saroglitazar is an experimental/approved metabolic drug (a dual PPAR-α/γ agonist) aimed at improving dyslipidaemia, insulin resistance and liver fat/inflammation in NAFLD/NASH, while vitamin E is an antioxidant that has proven histologic benefit in selected NASH patients (notably non-diabetics). The main objective of this study is to find the safety and efficacy of saroglitazar alone and in combination with Vit E, reduce the inflammation, hepatic steatosis and to improved liver histology. Saroglitazar is a dual PPAR-α/γ agonist but has relatively stronger PPAR-α activity (less PPAR-γ than full thiazolidinediones). Classical PPAR-γ class adverse effects (major edema/heart-failure) are not a dominant signal in current saroglitazar trials. Vitamin E can be considered in non-diabetic NASH/NAFLD, but long-term safety is a concern. saroglitazar (alone) produced greater reductions in enzymes, liver stiffness and steatosis than vitamin E alone; combination often showed additive benefit vs monotherapy.

**Keywords**: Saroglitazar, Non-alcoholic fatty liver, Non-alcoholic Steatohepatitis, Vitamin E

**PL-340**

**IN-VITRO AND IN-VIVO EVALUATION OF RECREATED FORMULATION OF ARGYRIA NERVOSA PLANT FOR THE TREATMENT OF PEPTIC ULCER**

Ms. Pranita P Jadhav and Dr. Subhranshu Panda
School of Pharmaceutical Sciences, JNU Jaipur, Rajasthan, India Jaipur-17
dhrutimane@gmail.com

Peptic ulcer disease (PUD) continues to be a significant health concern worldwide, with current therapies often limited by relapse, resistance, and adverse effects. Plant-based formulations are gaining attention as safer alternatives. Argyria nervosa, a medicinal plant rich in flavonoids, tannins, and alkaloids, has been traditionally used for its gastroprotective effects. The present study aimed to develop and evaluate a recreated sustained release formulation of Argyria nervosa leaf extract for the treatment of peptic ulcer. Phytochemical analysis confirmed the presence of bioactive compounds with antioxidant and cytoprotective properties. A novel oral delivery system was designed to improve bioavailability and gastric retention. In vitro studies demonstrated potent free radical scavenging activity, cytoprotection in gastric epithelial cells, and favorable sustained release kinetics. In vivo anti-ulcer evaluation was carried out in Wistar rats using ethanol, indomethacin, and pylorus ligation models. The formulation significantly

ISBN: 978-81-980623-8-3

reduced ulcer index, gastric volume, and total acidity, while enhancing mucin content and antioxidant enzyme activity (SOD, CAT, GPx). Histopathology confirmed mucosal protection, reduced hemorrhage, and accelerated healing compared with control and standard groups. No toxicity or adverse effects were observed. The findings indicate that the recreated Argyria nervosa formulation exerts strong anti-ulcer effects through antioxidant, anti-secretory, and mucosal defense mechanisms. The sustained release system enhances therapeutic efficacy by prolonging gastric retention. These results support the potential of Argyria nervosa as a safe and effective natural therapy for peptic ulcer and encourage further clinical investigation.

**Keywords**: Argyria nervosa, peptic ulcer, gastroprotective, novel formulation, sustained release, in vitro evaluation, in vivo evaluation.

## "A PROSPECTIVE STUDY ON EVALUATION OF EFFECTIVENESS OF ERYTHROPOIETIN IN MANAGEMENT OF CHRONIC KIDNEY DISEASE INDUCED ANEMIA"

**Chintha Chandran1, Saravanan Govindaraj2**

1department Of Pharmacy Practice, School Of Pharmaceutical Sciences, Vels Institute Of Science, Technology & Advanced Studies, Pallavaram, Chennai, India.

2department Of Pharmaceutical Chemistry, School Of Pharmaceutical Sciences, Vels Institute Of Science, Technology & Advanced Studies, Pallavaram, Chennai, India.

Anaemia is a prevalent and consequential complication of Chronic Renal Disease or chronic kidney disease (CKD). It will appear in the early stages of the disease and become more severe as the condition progresses. The primary approach for managing anemia in CKD patients is erythropoietin injections, such as Recombinant Human Erythropoietin Alfa (epoetin alfa), which belongs to a group of drugs called erythropoiesis-stimulating agents (ESAs). These drugs are effective in managing anaemia induced by CKD, chemotherapy treatment for cancer, or HIV treatment with zidovudine. The aim of the study is to evaluate the effectiveness and safety of Erythropoietin therapy in the management of Chronic Kidney Disease (CKD) induced Anemia patients. To compare the safety profile among the study groups and to evaluate the health – Related Quality of Life among the study participants as assessed by SF-36 questionnaire. A prospective interventional study was carried out in 150 patients; the patients are divided into 2 groups. The outcome was measured by Hemoglobin level measured in gm/dl, measured at baseline and end of 16 weeks expressed as Mean and Standard Deviation, change in mean Hemoglobin level from baseline to 16 weeks is compared in 3 groups, The no:of Hemoglobin responders will be determined and compared among the 3 groups. After 16 weeks patients who are taking erythropoietin have more outcome compared to control group. These findings suggest that erthropoietin provides an effective, well-tolerated for the management of anemia in CKD patients.

**PL-342**

## MATERIOVIGILANCE STUDY ON MEDICAL DEVICE USAGE AND ADVERSE EVENTS IN A TERTIARY CARE SETTING

Binu K.M, Saranya P, Sagnik Ghosh, Doddayya H

Department of Pharmacy Practice,N.E.T Pharmacy College, Navodaya Medical College Hospital& Research Centre, Raichur, Karnataka, India- 584103

Medical devices are integral to strengthening self-reliance and achieving universal healthcare goals. Although they offer substantial benefits to patients, their use can also pose safety risks. This study aimed to analyze the utilization patterns of medical devices, categorize them according to CDSCO risk classification, and identify associated adverse events in a tertiary care teaching hospital over six months. Data were collected from 120 patients across Surgery, Orthopedics, General Medicine, and Obstetrics & Gynecology departments using a structured form. Of these, 60% were male and 40% female, with a mean age of 46.2 years; the largest proportion (25%) was aged 41–50 years. Device usage was highest in Surgery (38%), followed by Orthopedics (35%), General Medicine (17%), and OBG (10%). Class B devices were most frequently used (48%), and 70% of devices served therapeutic purposes. Invasive devices comprised 55% of the total, while 28% of patients were prescribed three or more devices concurrently. The most commonly used devices were IV cannulas (16.2%) and alcohol swabs (14.8%), whereas the least used included nebulizers (0.5%) and IV tamponades (0.25%). A total of 20 device-related adverse events were reported, resulting in an incidence rate of 0.29 cases per patient-year.The findings underscore the importance of systematic monitoring, appropriate device selection, and safety surveillance to minimize risks and ensure effective patient care in clinical practice.

**Keywords:** Adverse Reactions**,** Incidence, Materiovigilance**,** Medical devices

## MATERNAL AND FETAL OUTCOMES IN HIGH-RISK PREGNANCIES: A PROSPECTIVE STUDY

Dr. Apoorva Dev M, Kavya N, Rakeshdhanya T M, Y Mainu

Department of Pharmacy Practice, East West College of Pharmacy, Bengaluru – 560091, India

High-risk pregnancy is a state where the health of the mother, fetus, or both is at higher risk of complications. Screening and clinical evaluation of such pregnancies facilitate early detection of risk factors and timely interventions, enabling individualized care and counseling to minimize complications. The present prospective study was conducted at Unity Lifeline Hospital and Suresh Hospital, Bengaluru, India, from August 2023 to August 2024, and included 332 antenatal women identified as high-risk based on Pradhan Mantri Surakshit Matritva Abhiyan criteria. Data were collected from antenatal visits through delivery using structured forms and case records. Neonatal outcomes assessed were gestational age at delivery, birth weight-related complications, and NICU admission, while maternal conditions such as anemia, hypothyroidism, gestational diabetes mellitus, pregnancy-induced hypertension, and previous cesarean section were also recorded. Results showed that 37.5% of neonates were full term, 41.3% early term, 20% late preterm, and 1.3% moderately preterm. Among complications, 2.5% experienced breathlessness at birth, 15.1% developed neonatal jaundice, and 10% required NICU admission, whereas 72.5% had no significant complications. Findings indicate higher rates of preterm births, neonatal jaundice, respiratory issues, and NICU admissions compared to normal pregnancies. The study concludes that high-risk pregnancies significantly affect neonatal outcomes, emphasizing the need for early identification, close monitoring, and targeted interventions to improve perinatal health.

**Keywords:** High-risk pregnancy; neonatal outcomes; preterm birth; birth complications; NICU admission

## FROM MECHANISTIC INSIGHTS TO REGULATORY ACTION: A COMPREHENSIVE FRAMEWORK FOR VETERINARY ADVERSE DRUG REACTION MANAGEMENT

Balaji AS[1], Arjun M, M P Venkatesh, K Bangarurajan

[1]Centre of Excellence in Regulatory Sciences, JSS College of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India – 570015

balajiasgowda@gmail.com

Veterinary adverse drug reactions (ADRs) present significant challenges in animal healthcare, with implications extending to public health, antimicrobial resistance, and food safety. This study integrates mechanistic understanding of ADRs with regulatory frameworks to propose an actionable veterinary pharmacovigilance model. A descriptive qualitative approach was undertaken by reviewing global regulatory guidelines, pharmacovigilance reports, and scientific literature from 2000–2025. Mechanistic classification of ADRs was examined, highlighting dose-dependent (Type A) and unpredictable, severe (Type B) reactions, with examples such as NSAID-induced gastrointestinal toxicity and immune-mediated hypersensitivity syndromes. Species-specific factors such as feline acetaminophen sensitivity and MDR1 mutations in dogs underscore the need for tailored therapeutic strategies. Regulatory assessment focused on frameworks implemented by the FDA-CVM, EMA, APVMA, and harmonization efforts by VICH and WHO, with emphasis on reporting systems like the Naranjo algorithm and WHO-UMC scale. Case studies reveal gaps in monitoring, including underreporting, limited safety data in minor species, and widespread off-label use. Furthermore, integration of emerging technologies like artificial intelligence, federated learning, and electronic health records is identified as a crucial enabler for real-time signal

ISBN: 978-81-980623-8-3

detection and predictive safety evaluation. The study also discusses the role of veterinary pharmacovigilance within the One Health paradigm to mitigate zoonotic risks and antibiotic resistance. The findings propose a globally harmonized, data-driven, stakeholder-inclusive approach to enhance regulatory responsiveness, improve animal welfare, and safeguard human health through informed, evidence-based pharmacovigilance systems.

**PHARMACOLOGICAL EVALUATION OF ANTIDEPRESSANT ACTIVITY OF POLYHERBAL EXTRACT ON MICE**

L.Poojitha, A.Shailaja
Department of Pharmacology, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya. Hyderabad, Telangana, 500017.
Poojithasnvpmv1@gmail.com

Depression is a chronic neuropsychiatric disorder that significantly affects quality of life and remains a major public health challenge. Current synthetic antidepressants, such as amitriptyline, though effective, are associated with adverse effects, searching for safer herbal alternatives essential. The present study aimed to evaluate the antidepressant potential of a polyherbal Ayurvedic preparation containing Ocimum tenuiflorum (Tulsi), Withania somnifera (Ashwagandha), and Spinacia oleracea (Spinach) in Swiss albino mice. Methanolic extracts of the selected plants were prepared using Soxhlet extraction and combined in a 1:1:1 ratio. The study included three groups of mice (n=6 each): control (saline), standard (amitriptyline, 10 mg/kg), and test (polyherbal extract, 0.2 g/10 ml/kg, orally). Depression was induced and immobility periods were recorded as the behavioral marker. Phytochemical screening revealed the presence of alkaloids, flavonoids, tannins, triterpenoids, phenols, and steroids in all three plants, with additional saponins in Ashwagandha and proteins in Spinach. The polyherbal extract demonstrated significant antidepressant activity, reducing immobility periods in mice, with results comparable to the standard drug amitriptyline. The study concludes that the polyherbal combination exerts synergistic antidepressant effects, likely due to the presence of multiple bioactive compounds. This formulation demonstrates promise as a natural, safer alternative for managing depression, warranting further clinical evaluation.

**Keywords:** Antidepressant activity, Ocimum tenuiflorum (Tulsi), Withania somnifera (Ashwagandha), Spinacia oleracea (Spinach)

**A PROSPECTIVE OBSERVATIONAL STUDY OF INCIDENCE OF CLINICAL EFFECTS ASSOCIATED WITH DIURETICS IN CARDIOVASCULAR DISEASE PATIENTS IN TERITIARY CARE HOSPITAL**

CH. Sai Priya and Shaik Farahan Subahan
Department of Pharmacy Practice, Vijaya Institute of Pharmaceutical Sciences for Women Enikepadu, Vijayawada,
Andhra Pradesh, India – 521108
Saipriyachillarige04@gmail.com

Diuretics are frequently prescribed to manage cardiovascular diseases (CVDs) like heart failure, hypertension, and chronic kidney disease. They work by promoting the excretion of sodium and water through the kidneys, which helps reduce fluid overload. This is crucial for controlling symptoms of fluid retention and preventing complications such as pulmonary edema and hypertension in patients with cardiovascular conditions.A prospective observational study investigated the clinical effects of diuretics in CVD patients. The study found a statistically significant reduction in both systolic and diastolic blood pressure after diuretic administration. The mean systolic blood pressure (BP) dropped from 157.80 to 119.53 mmHg, while diastolic BP decreased from 86.87 to 76.20 mmHg. The study also examined the incidence of adverse effects associated with different diuretic combinations. Patients taking the combination of Lasix and Aldactone had 25 times higher odds of experiencing adverse effects compared to those taking Lasix alone. The Lasix + Aldactone group showed a significantly higher incidence of adverse effects (85.9%) compared to the Lasix group (19.5%). The odds ratio of 25.04 and a relative risk of 4.4 further emphasize that patients on this combination are substantially more likely to experience adverse effects. While the odds ratios for Lasix + Fruselac (2.75) and Fruselac alone (4.13) were higher than for Lasix alone, these differences were not considered statistically significant.

**Keywords:** Cardiovascular diseases, Acute coronary syndrome, ST-elevation myocardial infarction (STEMI), Non-ST elevation myocardial infarction (NSTEMI), coronary heart disease.

**PRECLINICAL SCREENING OF AGMATINE-OXYTOCIN INTERACTION IN ANXIETY AND DEPRESSION DISORDERS**

Radha Bhandarkar, Manish Aglawe, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India-441002
radha03av@gmail.com

Depression and anxiety are among the most prevalent psychiatric disorders worldwide, with limited treatment efficacy and frequent side effects. Oxytocin (OXT), a neuropeptide involved in social bonding and stress regulation, and Agmatine (AGM), an endogenous amine derived from arginine, have demonstrated antidepressant and anxiolytic properties. Their co-localization in oxytocin-rich brain regions suggests a potential interaction relevant to mood regulation and stress adaptation. Adult Sprague-Dawley rats were divided into single-housed (socially deprived) and group-housed (socially enriched) male and female groups. Animals received OXT (0.1 mg/kg), AGM (40 mg/kg), or a combination. Behavioural assessments included the Forced Swim Test (FST) and Sucrose Preference Test (SPT) for depressive-like behaviour, and the Elevated Plus Maze (EPM) and Open Field Test (OFT) for anxiety-related behaviour. Both OXT and AGM independently reduced anxiety- and depression-like behaviours, while their combination produced significantly greater and more consistent effects. In the FST, co-treatment markedly reduced immobility while enhancing active coping behaviours such as climbing and swimming. SPT results demonstrated increased sucrose consumption, suggesting reversal of anhedonia. In the EPM, combined treatment significantly increased open-arm time and entries, reflecting reduced anxiety, whereas OFT revealed higher locomotor activity and exploration without impairing normal behaviour. Effects varied by sex and housing, with socially deprived rats showing stronger responsiveness, highlighting the influence of environmental stress on treatment outcomes. Agmatine potentiates the behavioural effects of oxytocin, producing a synergistic antidepressant and anxiolytic response. These findings suggest that Agmatine-Oxytocin co-treatment may serve as a promising novel therapeutic strategy for mood disorders, especially in stress-linked conditions.

**Keywords**: Oxytocin, Agmatine, Anxiety, Depression, Neuropharmacology

**PL-348**

**A PROSPECTIVE OBSERVATIONAL STUDY OF ADVERSE DRUG REACTIONS IN PATIENT USING ANTI-TUBERCULOSIS TREATMENT (ATT) IN TERITIARY CARE HOSPITAL**

Shaik Chandbi and A Jayarami Reddy
Department of PharmacyPractice, Vijaya Institute of Pharmaceutical Sciences for Women Enikepadu, Vijayawada,
Andhra Pradesh, India – 521108
chandbishaik17@gmail.com

Tuberculosis is one of the major public health concerns in India. Treatment of tuberculosis need multidrug combinations, which is associated with increased incidence of adverse drug reactions (ADRs). Hence there is a need of active monitoring for adverse effects in patients who are on antitubercular treatment (ATT). The main objective of this study is to identify the pattern of adverse drug reaction caused by anti-tubercular treatment. It is a Prospective observational study which was conducted among 150 patients admitted to pulmonology department with the diagnosis of ATT induced adverse drug reactions in the Government General Hospital (GGH), Vijayawada, Andhra Pradesh. In this study, a total of 150 cases ADRs were recorded in 50 patients. Among 150 patients, 106(70.7%) were males and 44 (29.3%) were females. A total of 150, ADRs were recorded amongst 50 patients. During intensive phase (45 patients) and continuation phase (5 patients) of treatment, experienced ADRs respectively. Gastrointestinal side effects were 22 (14.7%) and hepatotoxicity were 20 (13.3%) are the most frequently observed ADR each, followed by dermatitis 4 (2.7%) and optic related

ISBN: 978-81-980623-8-3

ADR in 2 (1.3%) patients and other ADRs were 63 (0.7%). ADRs had an association with fixed dose combination (FDC) of Isoniazid, Rifampicin, Pyrazinamide and Ethambutol. Most of the ADRs belonged to moderate (54%) category as per Modified Hartwig scale. Gastrointestinal side effects and hepatotoxicity were the most frequently observed ADRs, followed by rashes and optic related ADRs. As per WHO-causality scale and Naranjo's causality algorithm majority of ADRs were probable. Most of the ADRs belonged to moderate category according to the Modified Hartwig scale for severity assessment. ADRs induced by ATT are common, which can result in discontinuation of treatment and development of resistant bacilli. Hence, counselling of patients regarding their life style modifications with early detection and management will minimize the occurrence of ADRs and improve the adherence to treatment.

**Keywords:** Tuberculosis, Anti-tubercular drugs, Adverse Effects, ATT induced Gastritis, ATT induced Hepatitis, ATT induced Dermatitis, ATT induced Neurotoxicity, ATT induced Nephrotoxicity.

## IN-SILICO PHARMACOLOGICAL SCREENING OF STRUCTURALLY MODIFIED DICLOFENAC DERIVATIVES AGAINST PERIPHERAL PAIN

M. Swathi, V. Swathi,
Department of Pharmacology and Pharmacy Practice, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu,
Vijayawada, A.P., India-521108
makkeswathi105@gmail.com

Pain is defined as "an unpleasant sensory and emotional experiences associated with actual or potential tissue damage or described in terms of such damage". Intensity and acuity of pain differsliables upon psychological and emotional conditions of pain. NSAIDS, world-widedesired drug for pain deficiencies in synthesising molecules with innovative derivatives. Diclofenac a sketchily used NSAID for wide-ranging disease conditions is OTC drug since years. The present research focuses on structurally altered derivatives of diclofenac against cox-2 for pain. 33 structures are acknowledged and screening is done using AutoDoc software against Cox-2. Binding energies and inhibitory constant assessments obtained operating AutoDoc for 100 runs are recorded and related with the novel Diclofenac result. The binding sites of molecules are visualised using Discovery Studio Visualiser. The molecule with peak binding energy isprogressed for Md simulation using gromax software. The simulation ensued with diclofenac indicative of the molecule is equally efficient in treating pain against cox-2. The molecule may be synthesised and proceeded for preclinical trails in future.

**Keywords**: Pain, NSAIDS, Diclofenac, Gromax.

## CLINICAL PROFILE AND OUTCOMES OF CRITICALLY ILL PATIENTS WITH ACUTE KIDNEY INJURY IN A TERTIARY CARE HOSPITAL"

Dokku Keerthi, R.Triveni
Kvsr Siddhartha college of pharmaceutical sciences,
Vijayawada – 520010

Acute kidney Injury (AKI) is a common entity complicating the hospitalized patients. We conducted a retrospective study on AKI to evaluate the clinical profile and outcomes of the patients with AKI. This was a retrospective study including all patients admitted with AKI in a tertiary care hospital. The study population included all the patients admitted to hospital with Acute Kidney injury (AKI) between 2017 to December 2019.Demographic details, detailed medical history, aetiological factors, co-morbid conditions, prognostic factors and outcomes were obtained from hospital database, and clinical data were reviewed. Acute kidney injury events were classified according to KDIGO classification criteria. Outcomes of the patients were noted in the patient profile forms. Mortality, need for dialysis, inpatient lengths of stay, and discharge renal function of the patients are were noted. A total of 446 patients were diagnosed to have acute kidney injury during the study period. The mortality rate in our study was 5.8%, with 1.5% needing invasive mechanical ventilation, 21% needed dialysis, 22.2% showed partial recovery and 30% had complete recovery. The most common causes for AKI were sepsis (18.38%), Cardiac disorders (15.69%), followed by Drug induced AKI (15.47%). Acute kidney injury is common in patients admitted to hospital, especially ICU. In AKI sometimes mortality rate increases and persistent renal impairment.

**Keywords**: KDIGO Criteria, Renal Replacement Therapy (RRT), Renal Recovery, Hospital-acquired AKI, Community-acquired AKI, Dialysis Dependence, ICU Outcomes, Drug-Induced Nephrotoxicity.

**PL-351**

## FORMULATION AND ANTI-INFLAMMATORY EVALUATION OF IBUPROFEN GEL IN ALBINO RATS

Prerna Verma#, Dr. Parag Jain*
Rungta College Of Pharmaceutical Sciences and Research,
Bhilai, Chhattisgarh
Department Of Pharmacy, Rungta International Skills University,
Kohka-Kurud Road, Bhilai,
prernaverma1503@gmail.com

To develop a topical gel formulation of ibuprofen and evaluate its anti-inflammatory activity using a simple carrageenan-induced paw oedema model in albino rats. Ibuprofen gel was prepared using Carbachol 940 as the gelling agent, with propylene glycol and triethanolamine to adjust viscosity and pH. The formulation was characterized for spreadability, pH, and drug content. Six albino rats were divided into two groups: control (placebo gel) and test (ibuprofen gel). Acute inflammation was induced by injecting 0.1 mL of 1% carrageenan into the subplantar region of the hind paw. Paw volume was measured at 0,1,2 and 3 hours post-application using a plethysmometer. Ibuprofen gel showed good physicochemical properties and was stable over 7 days. The test group showed a significant reduction in paw edema compared to control, indicating effective anti-inflammatory action. The study demonstrates that a simple ibuprofen gel formulation can be effectively used to reduce inflammation in a basic animal model. This experiment provides pharmacy students with hands-on experience in formulation development and pharmacological screening.

**Keywords**: Ibuprofen, Edema, Anti-inflammatory, Albino rats

## PRESCRIPTION ANALYSIS, DRUG INTERACTION CHECKING AND THE IMPACT OF THE PATIENT COUNSELLING BY A CLINICAL PHARMACIST IN TYPE II DIABETES MELLITUS IN TERTIARY CARE HOSPITAL - A PROSPECTIVE OBSERVATIONAL STUDY

Usmaan A, Dr K C Arul Prakasam
Jkkmmrf's Annai Jkk Sampoorani Ammal College of Pharmacy
Namakkal, Tamilnadu
usmaan0725@gmail.com

Type 2 diabetes is a growing global health concern requiring effective management. Prescription analysis, drug interaction monitoring, and patient counseling by clinical pharmacists play a crucial role in improving medication adherence, enhancing knowledge, and ensuring better disease outcomes in patients. This study aimed to evaluate the prescription patterns of type II diabetes mellitus patients, assess drug interactions, and understand patient adherence to therapy. It further examined the role of pharmacist-led counseling in improving adherence and explored factors influencing non-adherence. Additionally, it assessed complications, gender and age differences, and the presence of co-morbidity in the study population. The prospective study was carried out in a tertiary care hospital to evaluate drug interactions, and the impact of clinical pharmacist-led counselling among type-2 diabetes patients over a span of 6 months. Data on demographics, therapy details, complications, and adherence were collected using structured forms. Counselling focused on safe medication use and lifestyle modification. Statistical significance was set at $p \leq 0.05$. The study included 203 patients, with males (59.6%) predominating over females (40.4%). Most participants were aged 55–64 years (36.5%). Major drug interactions were observed with Glimepiride and Fluconazole. Post-counseling, significant improvements were noted in medication adherence, dietary compliance, physical activity, and monitoring practices. Counseling by clinical pharmacists demonstrated a positive impact on overall patient self-care and treatment adherence. Our study highlights that clinical pharmacist counseling improves medication adherence, patient knowledge, and self-care in type 2 diabetes. This intervention supports better glycemic control, prevents complications, and empowers patients, emphasizing the pharmacist's vital role in diabetes management.

**INVESTIGATING THE ROLE OF NOVEL BIOMARKERS IN EARLY DETECTION OF CHRONIC KIDNEY DISEASE**

Mecca Subhakaram, V Venkata Rao, S Vidhyadhara
Chebrolu Hanumaiah Institute of Pharmaceutical Sciences,
Guntur. 522019

Chronic kidney disease (CKD) is a progressive condition that often remains asymptomatic until advanced stages, leading to increased morbidity and mortality worldwide. Current diagnostic markers, such as serum creatinine and estimated glomerular filtration rate (eGFR), lack sensitivity and specificity for early disease detection. Hence, there is an urgent need to identify and validate novel biomarkers that can enable timely diagnosis, predict disease progression, and guide therapeutic interventions. Emerging research has highlighted the potential of novel biomarkers, including neutrophil gelatinase-associated lipocalin (NGAL), kidney injury molecule-1 (KIM-1), cystatin C, fibroblast growth factor-23 (FGF-23), and urinary proteomic signatures, in detecting subclinical kidney injury. These biomarkers reflect diverse pathological processes such as tubular injury, inflammation, oxidative stress, and fibrosis, offering deeper insights into disease pathophysiology. In addition, advances in omics technologies (proteomics, metabolomics, and genomics) combined with artificial intelligence are accelerating biomarker discovery and validation, paving the way for personalized approaches in CKD management. This presentation will discuss the current landscape of novel biomarkers in CKD, their clinical utility, and the translational challenges in integrating them into routine practice. Early detection through biomarker-driven strategies holds the potential to improve patient outcomes, reduce progression to end-stage renal disease, and optimize healthcare resource utilization.

**EVALUATION OF THE ANTI-INFLAMMATORY ACTIVITY OF ELAEOCARPUS GANITRUS BARK OINTMENT IN CARRAGEENAN-INDUCED PAW EDEMA IN WISTER RATS**

A KEERTHANA, Mrs. K. KAVYA SUDHA
Department of pharmacology, Ratnam Institute of Pharmacy,
Nellore, Andhra Pradesh
alavurukeerthana@gmail.com

Inflammation is a complex biological response of numerous diseases. The search for effective and safe anti-inflammatory agents from natural sources has gained increasing attention. Elaeocarpus ganitrus (Rudraksha) is traditionally known for its medicinal properties, yet limited scientific evidence exists regarding its topical anti-inflammatory potential. The study aimed to evaluate the anti-inflammatory activity of an ointment prepared from the bark extract of E. ganitrus using the carrageenan-induced paw edema model in Wistar rats. The bark extract was formulated into a simple ointment base and applied topically to the inflamed paw. Anti-inflammatory activity was assessed by measuring paw volume at 0, 1, 2, 3, and 4 hours after carrageenan injection, and the results were compared with a standard diclofenac ointment-treated group. Topical application of E. ganitrus bark ointment (10% w/w) significantly reduced paw edema in a dose-dependent manner. At the 3rd hour, paw volume was reduced to 0.42 ± 0.03 mL compared to 0.81 ± 0.05 mL in the control group, corresponding to 48.1% inhibition ($p < 0.01$). At the 4th hour, the extract ointment showed 55.3% inhibition, which was comparable to the diclofenac-treated group (59.7% inhibition). The findings support the traditional use of E. ganitrus and highlight its potential as a natural topical anti-inflammatory agent. Further investigations are warranted to isolate the bioactive constituents and explore the underlying mechanisms of action.

**Keywords**: Elaeocarpus ganitrus, Anti-inflammatory activity, Ointment formulation, Carrageenan-induced paw edema, Wistar rats.

**STUDY ON EPIDEMIOLOGY OF NEONATAL AND INFANTS SEPSIS AND THE ROLE OF PHARMACISTS IN MANAGEMENT AND PREVENTION OF SEPSIS**

M. Suhitha Sree, Mr. A. Srinivasan, Dr. T. Venkatachalam
Jkkmmrf's Annai Jkk Sampoorani Ammal College of Pharmacy
suhithasreem@gmail.com

Neonatal and infant sepsis remains a significant cause of morbidity and mortality worldwide, accounting for approximately 15% of neonatal deaths globally. Effective management strategies are crucial to improve outcomes and reduce antibiotic resistance. Pharmacist-led interventions have shown promise in optimizing antimicrobial therapy and enhancing patient care. To investigate the impact of pharmacist-led interventions on neonatal and infant sepsis management, focusing on incidence density, pathogen identification, antibiotic misuse, hospital stay, and mortality rates. Prospective observational study conducted in a tertiary care hospital's neonatal and pediatric intensive care units over 9 months. Patients (0-12 months) diagnosed with sepsis were enrolled. Pharmacist-led interventions included: Antimicrobial stewardship programs, Education on sepsis management and antibiotic use, Medication therapy optimization, Collaborative rounds with healthcare teams-Incidence density of neonatal sepsis: 12.6 per 1000 live births. Pharmacist-led interventions significantly improve antimicrobial therapy, sepsis management, and resistance prevention in neonatal and infant populations. Collaborative efforts between pharmacists, physicians, and healthcare professionals are essential to enhance patient outcomes and reduce the burden of sepsis.

**AMBISPECTIVE CROSS SECTIONAL STUDY IN THE SEVERITY OF COGNITIVE FUNCTION AND ASSOCIATED NEUROLOGICAL DISORDER WITH ITS COMORBIDITIES USING CNS DEPRESSANT MEDICATIONS**

Sreesantheya S G, Mr. A. Srinivasan
sreesantheyasg151@gmail.com

This Ambispective cross-sectional study investigates the severity of cognitive function and its association with neurological disorders and comorbidities in patients prescribed central nervous system (CNS) depressant medications. Given the increasing population of cognitive impairment in aging populations and the widespread use of CNS depressants, understanding their impact on cognitive health is critical. We analysed data from a cohort of patients receiving CNS depressants for various neurological conditions, including epilepsy, stroke and Parkinson disease. The cognitive function was assessed using standardized assessment scale, while the severity of neurological disorders and associated comorbidities were documented through clinical evaluations and patient case history. Our first findings or else to reveal a significance between (drug vs severity) use of CNS depressants and increased severity of cognitive impairment, and second finding to reveal a not significant between (condition with and without comorbid vs severity). Particularly in patients with pre-existing neurological disorders stroke, Parkinson's and seizure were found to exacerbate cognitive decline, suggesting a multifaceted interplay between these factors. The results indicate that while CNS depressants may provide symptomatic relief, they also carry risks of further cognitive deterioration, particularly in vulnerable populations. This study highlights the need for comprehensive assessments of cognitive function in patients using CNS depressants and calls for careful consideration of their prescribing practices. Especially in individuals with existing neurological disorders and comorbid conditions. Further longitudinal studies are warranted to establish causal relationships and inform clinical guidelines.

## ASSESSMENT OF EFFICACY, SAFETY AND APPROPRIATE USE OF FLIGRASTIM AND PEGFILGRASTIM AS PRIMARY PROPHYLAXIS FOR NEUTROPENIA / FEBRILE NEUTROPENIA IN CHEMOTHERAPY /PY PATIENTS A PROSPECTIVE OBSERVATIONAL STUDY

Thirumalaivasan V, Dr K C Arulprakasam
JKKMMRF'S ANNAI JKK SAMPOORANI AMMAL COLLEGE OF PHARMACY NAMAKKAL, TAMILNADU
Chinnathiru89127@gmail.com

BACKGROUND: In patients undergoing cytotoxic chemotherapy, febrile neutropenia (FN), which is caused by immunosuppression and bone marrow suppression, is a serious and potentially fatal undesirable side effect. Prophylactic use of granulocyte colony-stimulating factors (G-CSFs), such filgrastim and pegfilgrastim, has been demonstrated to improve patient outcomes, increase chemotherapy tolerance, and lower the risk of FN. OBJECTIVE: To evaluate the efficacy, safety, and appropriate utilization of filgrastim and pegfilgrastim as primary prophylaxis for neutropenia/febrile neutropenia in cancer patients undergoing chemotherapy. METHODS: Among chemotherapy patients receiving filgrastim or pegfilgrastim for primary prophylaxis, prospective observational research was conducted out. Risk variables, adverse events, hospitalization rates, FN incidence, patient demographics, and chemotherapy dose intensity were all collected. The cost-effectiveness and safety of both agents were also compared. RESULTS: Prophylactic G-CSF injection decreased hospitalization rates, supported chemotherapy at planned dose intensity, and dramatically decreased the frequency and severity of FN. Pegfilgrastim demonstrated higher convenience and increased compliance because it was administered in a single dosage, but filgrastim was more economical in some regimens. Both medications showed respectable safety profiles with few side effects. Nonetheless, there were instances of underutilization and noncompliance with the requirements. CONCLUSION: In oncology care, the study shows that prophylactic administration of filgrastim and pegfilgrastim according to guidelines efficiently prevents FN, improves treatment continuity, and lowers the socioeconomic load. Improving patient safety and treatment outcomes for chemotherapy practice requires optimizing the appropriate use of G-CSFs.

## CLINICALLY RELEVANT POTENTIAL DRUG–DRUG INTERACTIONS IN INTENSIVE CARE PATIENTS: A PROSPECTIVE OBSERVATIONAL STUDY IN A TERTIARY CARE HOSPITAL

Addepalli Teja Venkata Lakshmi Divya
Department of Pharmacy Practice, Vikas Institute of pharmaceutical sciences], Government General and Teaching Hospital, Rajahmundry, India.
addepalli.divya03@gmail.com

Drug–drug interactions (DDIs) are a critical concern in intensive care units (ICUs) due to polypharmacy and complex treatment regimens. This prospective observational study was conducted in the medical ICUs of Government General and Teaching Hospital, Rajahmundry, to evaluate the prevalence, severity, and clinical impact of potential DDIs. Data from 101 patients were collected after obtaining Institutional Ethics Committee approval and informed consent. Demographic details, comorbidities, laboratory findings, and prescribed medications were documented. Potential DDIs were identified using Lexi-Drugs and Micromedex interaction checkers, and clinically significant findings were communicated to treating physicians for necessary interventions. Among the study population, males (67%) exhibited higher rates of interactions compared to females (32%). Patients aged 60–80 years experienced the most interactions (50%). Hypertension (56%) and diabetes mellitus (50%) were the most common comorbidities associated with increased risk. Moderate interactions were predominant (65%), while major interactions accounted for 20% of cases, with a total of 74 major interactions identified. Abnormal laboratory values were noted in 33% of patients, and ICU stay was extended in 6% due to DDIs. The study concludes that DDIs are frequent among ICU patients, particularly in elderly males with comorbidities such as hypertension and diabetes. Most interactions were of moderate severity, but major interactions significantly contributed to clinical complications, prolonged ICU stays, and altered laboratory parameters. Early detection and timely intervention can optimize therapy, minimize risks, and improve patient outcomes in critical care settings.

## STUDIES ON IMMUNOLOGICAL ACTIVITY OF IGG TOWARDS PEANUT ALLERGENS

Kanaka Durga Devi Nelluri*, Bhavana Alaparthi, Minakshi Kommoju
Department of Pharmaceutics and Biotechnology, KVSR Siddhartha College of Pharmaceutical Sciences,
Vijayawada, Andhra Pradesh – 520010.
nelluriss@rediffmail.com

Chicken immunoglobulin Y (IgY), a functional analog of human IgG, is an important source of therapeutic antibodies in a scalable, non-invasive, and ethical manner. IgYs were extracted from eggs laid by white hens and tested to see their ability to recognize and neutralize major allergens of peanuts (Arachis hypogaea). IgY purity was further confirmed by SDS-PAGE analysis that showed bands at approximately 75 and 18 kDa corresponding to the heavy and light chains, respectively, with some 90% purity levels obtained by densitometry. Peanut allergens Ara h1 (~63 kDa), Ara h3 (~45–35 kDa), and Ara h6 (~14 kDa) were detected also. IgY was bound with the max sensitivity in ELISA plates at a concentration of 500 µg/mL (OD= 1.98 ± 0.12), especially from white eggs, showing specific interaction with peanut proteins. The interaction was further confirmed by Western blot analysis, which showed stronger binding of IgY to Ara h1, h3, and h6. IgY would neutralize peanut allergens by directly binding to allergenic epitopes and thus preventing their binding to allergen-specific IgE on mast cells and basophils. Such blocking will prevent cross-linking of IgE with histamine and other inflammatory mediators released, thus inducing allergic reactions. The FTIR analysis would support the structure of peanut proteins after purification, demonstrating that they can be used as antigens. These findings underline the specificity of IgYs and its promise in therapy and diagnosis of peanut allergy. Further studies are warranted in vivo for seeking a clinical application in modulating allergy.

## THYROID PATIENTS SUFFERING WITH ANXIETY AND DEPRESSION: A PROSPECTIVE INTERVENTIONAL STUDY

Author: Sunayana Velede, Farha Farheen, Fariha Sameen, Shivani, Kotala
St. Peter's Institute of Pharmaceutical Sciences, Vidyanagar, Hanamkonda, Telangana, India-506001
sunayanavelede@gmail.com

ISBN: 978-81-980623-8-3

Thyroid disorders are among the most common endocrine conditions and are frequently associated with psychiatric manifestations such as anxiety and depression. This prospective interventional study assessed 150 thyroid patients using HAM-D and GAD-7 scales to evaluate anxiety and depression before and after treatment. The majority of participants were female (79%) and within the 20–40 age group, with hypothyroidism (67%) being the most prevalent condition. Findings revealed that anxiety (70.7%) and depression (72.7%) were highly prevalent, with mild to moderate severity dominating. Sleep disturbances were also commonly reported. Statistical analysis showed a positive correlation between elevated TSH levels and increased anxiety and depression scores. The results emphasize the importance of early psychiatric screening in thyroid patients and integrating mental health support with endocrine care. Routine assessments and timely interventions can significantly improve quality of life and treatment outcomes.

**Keywords:** Thyroid disorders, Hypothyroidism, Anxiety, Depression, Mental health screening.

## A RETROSPECTIVE OBSERVATIONAL STUDY ON ASSESSMENT OF RISK FACTORS AND WARNING SIGNS OF STROKE AND TRANSIENT ISCHEMIC ATTACK, THE IMPACT OF THEIR PROPER RECOGNITION AND RATIONAL MEDICAL MANAGEMENT ON POST STROKE DISABILITY OF THE PATIENTS

PARTHASARATHY S., Dr K. C ARUL.PRAKASAM
JKKMMRF'S ANNAI JKK SAMPOORANI AMMAL COLLEGE OF PHARMACY
sureshpartha51@gmail.com

Stroke is a leading cause of death and disability in India. Proper recognition of risk factors and warning signs, coupled with rational medical management, is crucial for reducing the incidence of stroke and minimizing post-stroke disability.This retrospective observational study in Erode, Tamil Nadu, assessed risk factors and warning signs of Stroke and Transient Ischemic Attack (TIA) in 132 patients over six months, using standardized tools like the Rosier Scale, ABCD2 Score, and Modified Rankin Scale. Key risk factors identified were hypertension (62.12%), diabetes (52.03%), physical inactivity (42.43%), and heart disease (41.66%). Dominant warning signs included asymmetric facial weakness (98.48%), speech disturbance (94.69%), and visual field disturbances (86.37%). Ischemic stroke was more common (83.33%) than hemorrhagic stroke (16.67%), with higher incidence in females and the 41-60 age group. Effective risk factor management post-TIA was linked to delayed stroke occurrence (>7 days), and emergency treatment (62.12%) correlated with favorable outcomes, with 60.62% showing minimal disability at 28 days. The study emphasizes the importance of identifying risk factors, recognizing warning signs, and enhancing patient awareness for TIA secondary prevention to delay stroke and reduce disability.

## A STUDY ON A PROSPECTIVE OBSERVATIONAL STUDY ON EVALUATING PRESCRIPTION PATTERNS OF ANTI-HYPERTENSIVE MEDICATIONS IN A TERTIARY CARE HOSPITAL

Konide Supriya and Shaik Farahan Subahan
Department of PharmacyPractice, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, Andhra Pradesh, India – 521108
Saipriyachillarige04@gmail.com

Hypertension is a significant global public health concern that requires effective medication to prevent complications. A prospective observational study was conducted at a tertiary care hospital to analyze the prescription patterns of antihypertensive medications. The study aimed to assess adherence to clinical guidelines and identify trends in drug use. The study included 200 hypertensive patients. Of these, 80 had coronary artery disease (CAD), 55 had Cerebrovascular Accidents (CVA), 57 had chronic kidney disease (CKD), and 98 had diabetes. The patient population consisted of 101 males and 98 females. The average age for developing hypertension was found to be 53.4 years. The study also found a correlation between age and blood pressure stability, with an r-value of 0.7153. The study's findings show that Angiotensin Receptor Blockers (ARBs) were the most frequently prescribed medications, accounting for 43% of prescriptions. Beta-Blockers were next at 23%, followed by Calcium Channel Blockers (CCBs) at 22%, Diuretics at 11%, and ACE Inhibitors (ACEIs) at 1%. Monotherapy was effective in 44.5% of patients, while 55.5% required combination therapy. The study concluded that most prescriptions align with standard treatment guidelines. The prescribing trends were influenced by factors such as patient demographics, comorbidities, and physician preferences. The authors noted that regular assessment of prescription patterns, along with patient counseling and adherence to guidelines, can lead to better blood pressure management.

**Keywords:** Hypertension, Coronary Artery Disease, Calcium Channel Blockers, Angiotensin Receptor Blockers, Angiotensin Converting Enzyme, Loop Diuretics.

## CLINICAL PRESENTATION AND MANAGEMENT OF CHOLELITHIASIS: A CASE-BASED APPROACH

P. Sravani1, M. Suchitra2
PharmD, Department of Pharmacy, Ratnam Institute of Pharmacy, Nellore.
Department of Pharmaceutical Chemistry and Analysis, Ratnam Institute of Pharmacy, Nellore.

Cholelithiasis, characterized by the formation of gallstones within the gallbladder, is a common gastrointestinal condition with significant global prevalence. It presents with varied clinical features ranging from asymptomatic cases to severe complications such as acute cholecystitis, choledocholithiasis, and gallstone pancreatitis. Early diagnosis and appropriate intervention are essential to prevent morbidity. A 50 year-old male presented with recurrent right upper quadrant abdominal pain radiating to the scapular region, accompanied by nausea and postprandial discomfort. Physical examination revealed localized tenderness in the right hypochondrium. Laboratory evaluation showed mild leucocytosis with normal liver function tests. Abdominal ultrasonography confirmed the presence of multiple gallstones with features suggestive of chronic cholecystitis. The patient underwent elective laparoscopic cholecystectomy, which was performed successfully without complications. Histopathological findings supported chronic inflammatory changes in the gallbladder wall. The postoperative recovery was uneventful, and the patient reported complete resolution of symptoms on follow-up. This case emphasizes the importance of ultrasonography as the first-line diagnostic tool and highlights laparoscopic cholecystectomy as the gold standard treatment for symptomatic cholelithiasis. Case-based learning offers valuable insights into the clinical spectrum, diagnostic approach, and therapeutic strategies in gallstone disease, which remains a major healthcare concern.

**Keywords**: Cholelithiasis, Gallstones, chronic inflammatory changes, Laparoscopic cholecystectomy

**PL-365**

## EXPLORING POTENTIAL OF NICOTINAMIDE AS SIRT-1, CLASS III HDAC INHIBITOR IN MOUSE MODEL OF STREPTOZOTOCIN INDUCED DEMENTIA

Khagesh Ram, Ajay kumar, Ishwari Choudhary, D.K. Pradhan
Raigarh College of Pharmacy, Raigarh, C.G., India, 496001
pharmakp1997@gmail.com

The present study was designed to investigate the potential of SirT1 class III HDAC inhibitor Nicotinamide in a mouse model of intracerebroventricular streptozotocin (i.c.v., STZ) induced dementia. STZ (3mg/kg; i.c.v.) was injected to induce dementia in Swiss albino mice. The Morris water maze (MWM) was employed to evaluate the effect on cognitive functions. A series of biochemical estimations such as brain total protein, brain acetylcholionesterase (AChEase) activity, brain thiobarbituric acid-reactive species (TBARS), reduced glutathione (GSH), brain myeloperoxidase (MPO) activity and brain nitrate/nitrite were performed. Histopathological studies involving H & E staining and Congo red staining of coronal brain sections were also performed to assess the beneficial effects of Nicotinamide. STZ produced significant changes in MWM performance including both escape latency time (ELT) and time spent in target quadrant (TSTQ) of the animals; indicating impairment of learning & memory. STZ treated mice exhibited a noticeable rise in brain AChEase activity, brain oxidative stress (increased TBARS and decreased GSH), brain nitrite/nitrate and a significant increase in brain MPO activity. Furthermore, the stained micrographs of STZ treated mice

ISBN: 978-81-980623-8-3

indicated pathological changes such as neutrophilic infiltration and amyloid beta (Aβ) deposition. Treatment with Nicotinamide showed substantial attenuation of STZ induced memory deficits, biochemical alterations and histopathological changes. Hence, the findings demonstrated the potential of Nicotinamide SirT 1 class III HDAC inhibitor in memory dysfunctions which may probably be attributed to its anti-cholinesterase, anti-amyloid, and anti-oxidative effects. The study concluded that SirT 1 (HDAC class III) can be explored as an important pharmacological target for dementia.

**Keywords:** Nicotinamide, STZ, HDAC, Dementia, Morris water maze.

## INVIVO PHARMACOLOGICAL SCREENING OF HERBAL EXTRACTS AGAINST NEUROPATHIC PAIN

K.Sharmila*, V. Swathi,
Department of Pharmacology and Pharmacy Practice, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu,
Vijayawada, A.P., India-521108
konalasharmila2004@gmail.com

Neuropathic Pain (NP) is defined as "Pain that is brought on by a primary nervous system lesion or dysfunction." It is majorly observed as co-morbidity with diabetes, rheumatoid arthritis and others. A few drugs are used in treatment with side effects. Recent investigations are focusing light on NP. Solanum melongena and Solanum lycopersicum are popular medicinal herbs employed for treating various diseases. The present research focuses on screening of leaves of Solanum melongena and Solanum lycopersicum for neuropathic pain. The extraction is performed using continuous hot percolation with ethanol as menstruum. The extracts are subjected for phytochemical screening in order to evaluate the type of phytoconstituent present in it. Screening for neuropathic pain property is performed using Formalin induced paw flinching behaviour and AITC induced paw oedema models. Formalin and AITC acts as inducers for neuropathic pain by stimulating TRP channels in nerves. The inflammatory volume observed in group of animals treated with Solanum melongena leaf extract at dose of 400mg/kg showed maximum activity in both the models indicating a decline in oedema and flinching behaviour compared with other extracts. A mild increase in response is observed when compared with standard values. The Solanum melongena leaf extract at dose of 400mg/kg showed good Neuropathic Pain property.

**Keywords:** Neuropathic pain, Solanum species, Formalin, AITC., paw flinching.

**PL-367**

## A STUDY ON PREVALENCE OF DRUG SENSITIVITY & RESISTANCE PROFILE IN MICROBIOLOGICALLY CONFIRMED PULMONARY TUBERCULOSIS PATIENTS IN TERTIARY CARE HOSPITAL

K.Sucharita Siva Gayathri and Shaik Farahan Subahan
Department of PharmacyPractice, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada,
Andhra Pradesh, India – 521108
Saipriyachillarige04@gmail.com

In the Asian subcontinent, pulmonary tuberculosis is the most common form of the disease. While most cases can be treated with primary anti-Koch's medications, some have shown resistance, and the number of these cases is increasing. The multidrug-resistant form of pulmonary tuberculosis is not well documented in existing literature, making diagnosis and management a significant challenge for healthcare providers. A study conducted at a tertiary care hospital aimed to assess the critical issues of drug resistance in these patients. The findings highlight the ongoing challenge of drug-resistant tuberculosis (DR-TB), with notable cases of both multidrug-resistant tuberculosis (MDR-TB) and mono/poly-DR-TB. Although the majority of cases were sensitive to first-line drugs, the presence of drug resistance shows the need for continuous monitoring and surveillance to prevent the spread of resistant strains. The study found a statistically significant difference in drug resistance and sensitivity to Isoniazid (INH) based on whether the patient had comorbidities like diabetes (DM) or hypertension (HTN). A p-value of 0.003, which is less than 0.05, indicates that the observed difference between these groups is statistically significant. This research emphasizes the importance of early detection, appropriate drug susceptibility testing, and tailored treatment plans for effective management and control of tuberculosis.

**Keywords:** Tuberculosis (TB), Mycobacterium Tuberculosis, Pulmonary Tuberculosis, Diagnostic methods, Sensitivity & Resistance.

**PL-368**

## A COMPARATIVE INTERVENTIONAL STUDY ON DRUG-RELATED PROBLEMS IN GERIATRIC PATIENTS USING START/STOPP CRITERIA: ROLE OF CLINICAL PHARMACIST COUNSELING IN ENHANCING MEDICATION APPROPRIATENESS, ADHERENCE, AND QUALITY OF LIFE

M Shiva Rama Krishna1, Mrinmoy Basak2, A. Shyam Sunder3
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya. Hyderabad, Telangana, 500017.
Department of Pharmacology, AdtU, Guwahati, Assam
Department of Pharmacology, Balaji Institute of Pharmaceutical Sciences, Warangal.
princeshivayahoo@gmail.com

Geriatric patients are highly susceptible to drug-related problems (DRPs) due to polypharmacy, comorbidities, and age-related pharmacokinetic changes. The application of START/STOPP criteria helps identify potentially inappropriate medications (PIMs) and optimize therapy. A hospital-based pre–post comparative interventional study was conducted among geriatric outpatients (>65 years). A total of 304 patients (sample may vary) were enrolled and allocated into interventional (n=106) and non-interventional (n=72) groups. Data included demographics, medication history, pill count adherence, and WHOQOL-BREF scores. START/STOPP criteria were applied to detect PIMs, and clinical pharmacists provided individualized counseling on medications, adherence, and lifestyle modifications to the intervention group. Statistical analysis was performed using the t-test and one-way ANOVA. Overall, 183 DRPs were identified, with 133 STOPP-related and 50 START-related. DRPs were most frequent in the cardiac department and least in the urogenital/endocrine. START-related DRPs were highest in cardiac cases, while STOPP-related DRPs were most common in CNS disorders. Pharmacist intervention significantly improved adherence (pill count), reduced DRPs, and enhanced quality of life scores, particularly in physical and psychological domains. Educational status was positively associated with better knowledge and adherence ($p<0.05$). Pharmacist-led interventions using START/STOPP criteria effectively improve medication appropriateness, adherence, and quality of life in geriatrics. Integration of pharmacists into routine geriatric care can minimize DRPs and strengthen long-term clinical outcomes.

**Keywords:** START/STOPP Criteria, Medication Adherence, Quality of Life (WHOQOL-BREF), Polypharmacy

**PL-369**

## PHARMACOGENOMIC INFLUENCE OF CYP2C19 POLYMORPHISM ON CLOPIDOGREL RESPONSE IN CARDIOVASCULAR PATIENTS

Jadi Shravani, Divya Sreemanthula
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, India, 500017
shravanijadi25@gmail.com

Clopidogrel requires activation by CYP2C19. Genetic polymorphisms in this enzyme influence therapeutic response, predisposing patients to thrombotic or bleeding risks. To assess the impact of CYP2C19 polymorphisms on clopidogrel response in cardiovascular patients undergoing PCI.A prospective observational study was conducted in 120 patients on clopidogrel 75 mg daily. CYP2C19 genotyping (PCR-RFLP) categorized patients as extensive metabolizers (EM), intermediate metabolizers (IM), or poor metabolizers (PM). Platelet aggregation was measured at baseline and day 7, with outcomes monitored over 3 months. Among 120 patients, 56.7% were EM, 28.3% IM, and 15% PM. Platelet inhibition was significantly lower in PM (24.6% ± 8.2) compared to EM (56.2% ± 10.1, $p<0.001$), with IM showing intermediate response (39.4% ± 9.7). Recurrent ischemic events occurred in 21% of PM, 11.7% of IM, and 4.4% of EM. Bleeding events were infrequent and not statistically significant. CYP2C19 polymorphisms significantly alter clopidogrel response, with poor metabolizers at greater thrombotic risk. Genotype-guided antiplatelet therapy may improve outcomes, highlighting the role of pharmacogenomic testing in personalized care.

**Keywords**: Pharmacogenomics, CYP2C19, Clopidogrel, Personalized Medicine.

## EVALUATION OF MUCOLYTIC ACTIVITY AND HISTAMINE-INDUCED BRONCHOCONSTRICTION INHIBITION BY A MULTI-COMPONENT HERBO-MINERAL PREPARATION

Nirvi Gandhi*, Manohar Patil, Prasad Kadam, Kavita Yadav
Department of Pharmacognosy, Marathwada Mitra Mandal's College of Pharmacy, Thergaon, Pune-411033 (M.S.), India
nirvi.gandhi@mmcop.edu.in

Effective mucolytic and bronchodilatory agents are needed in respiratory care, especially for conditions marked by excessive mucus and airway constriction. This study evaluates the mucolytic efficacy of a prepared novel herbo-mineral formulation (Formulation No. 8) against acetylcysteine and assesses the bronchodilatory activity of curcumin, piperine, and suvarnasindoor combinations in isolated goat tracheal tissue. Mucolytic activity was determined by monitoring viscosity changes in a 20% egg white solution over seven days, comparing phosphate buffer control, acetylcysteine, Formulation No. 8, and an Eppendorf formulation at 12, 30, and 60 rpm. Bronchodilatory effects were evaluated by recording cumulative histamine-induced contraction responses in goat tracheal segments treated with single, dual, and triple combinations of curcumin, piperine, and suvarnasindoor. The control remained highly viscous across all measurements. Acetylcysteine progressively lowered viscosity, reaching 800 cP at 60 rpm by Day 7. Formulation No. 8 achieved greater reduction, with final values of 700 cP, demonstrating superior mucolytic action. The Eppendorf preparation showed moderate effect. In tracheal assays, the combination of curcumin, piperine, and suvarnasindoor produced the most substantial inhibition of histamine-induced contractions; other combinations exhibited partial or moderate efficacy. Formulation No. 8 displays enhanced mucolytic activity relative to acetylcysteine, and the triple formulation of curcumin, piperine, and suvarnasindoor significantly diminishes airway constriction. Multi-component herbo-mineral formulations may offer therapeutic advantages for managing mucus hypersecretion and bronchoconstrictive disorders.

**Keywords:** Mucolytic activity, Bronchodilation, Herbo-mineral formulation, Curcumin and Piperine, Goat tracheal chain assay.

**PL-371**

## ANALGESIC ACTIVITY OF PAVONIA ZEYLANICA: EVALUATED BY ACETIC ACID-INDUCED WRITHING AND EDDY'S HOT PLATE METHODS IN MICE

S.Ravalika, Shailaja Ande.
Department of Pharm D, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, India, 500017
ravalika2634@gmail.com

Pain, an unpleasant sensory and emotional experience from tissue damage, remains challenging to manage. Traditional plants like Pavonia zeylanica, with anti-inflammatory and analgesic properties, are explored as safer alternatives. Aim is to evaluate the analgesic activity of Pavonia zeylanica using acetic acid-induced writhing and Eddy's hot plate methods and compare it with standard analgesics. Swiss albino mice (20–30 g) were divided into four groups (n=6): control, standard (Ibuprofen/Tramadol), and two test groups receiving Pavonia zeylanica extract (150 & 300 mg/kg, orally). Analgesic activity was assessed using acetic acid-induced writhing and Eddy's hot plate tests. The methods allowed evaluation of anti-nociceptive responses. Results were expressed as mean ± SEM, with statistical significance considered at $p<0.05$. The extract and standard drugs significantly ($p<0.05$) reduced acetic acid-induced writhing and hind limb stretching in a dose-dependent manner. In the hot plate test, reaction time increased dose-dependently, indicating central analgesic activity. The extract showed 33–60% inhibition of writhing, approaching the standard drug (71%), and significantly reduced pain compared to control. The ethyl acetate extract of Pavonia zeylanica showed significant dose-dependent analgesic activity through central and peripheral mechanisms, suggesting its potential as a natural pain reliever.

**Keywords**: Pavonia zeylanica, acetic acid, Eddy's hot plate, nociception, standard drug.

**PL-372**

## REDUCING DRUG-RELATED PROBLEMS AND SLOWING RENAL PROGRESSION: THE ROLE OF PHARMACIST INTERVENTIONS AND STRICT VOLUME CONTROL IN DIALYSIS PATIENTS

Vadapalli Shreshta, M Shiva Rama Krishna
Department of Pharm. D, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana.
shreshtavadapalli26@gmail.com

Dialysis patients are highly vulnerable to drug-related problems (DRPs) due to polypharmacy, renal impairment, and multiple comorbidities. Previous studies report DRPs in 72% of dialysis patients, with inappropriate renal dosing accounting for 27% and drug–drug interactions for 23% of all cases. These problems increase hospitalization risk and accelerate renal decline. Clinical pharmacists can optimize pharmacotherapy by reducing DRPs, while strict volume control supports hemodynamic stability and preserves residual renal function. This prospective interventional study was conducted among maintenance dialysis patients. Clinical pharmacists performed medication reviews, dose adjustments, DDI screening, and individualized counseling. Strict volume control included sodium/fluid restriction education, daily weight monitoring, and tailored ultrafiltration. Outcomes measured were DRPs, adherence, dialysis adequacy, hospitalization rates, and renal progression markers. Pharmacist interventions reduced overall DRPs by 37%, particularly inappropriate dosing, and DDIs. Patient adherence improved by 23% following targeted counseling. Strict volume control achieved better blood pressure regulation, with 15% fewer intradialytic hypotension episodes and slower decline in residual renal function (mean preservation 6–9 months longer than controls). Patients receiving integrated pharmacist-led care with strict volume management had 27% fewer hospitalizations and greater clinical stability compared with standard care. Clinical pharmacist interventions effectively reduce DRPs and improve adherence in dialysis patients. When combined with strict volume control, they enhance hemodynamic stability, reduce hospitalizations, and improve renal outcomes. These findings reinforce the value of incorporating pharmacists into multidisciplinary renal care for long-term treatment success.

**Keywords:** Clinical pharmacist, drug-related problems, dialysis, strict volume control, renal progression

**PL-373**

## THE ROLE OF PHARMACIST COUNSELING IN OPTIMIZING MEDICATION ADHERENCE, LIFESTYLE MODIFICATIONS, AND DAILY LIFE OUTCOMES AMONG GERIATRIC STROKE PATIENTS: A PROSPECTIVE OBSERVATIONAL ANALYSIS

Guguloth Pavani, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, 500017
gugulothpavani286@gmail.com

Stroke is a leading cause of disability and mortality among the geriatric population, with recurrence rates reaching 15–30% within five years if secondary prevention is inadequate. Long-term management depends on adherence to preventive medications and lifestyle modifications, yet studies report 40–50% of patients show poor adherence. Pharmacist counseling may significantly improve therapeutic outcomes. A prospective observational study was conducted in geriatric stroke patients. Pharmacist counseling at discharge focused on medication adherence, dietary modifications, physical activity, and risk factor management. Adherence was measured by pill count at discharge and at three-month follow-up. Patient-reported daily functioning was also assessed. At discharge, 55% of patients demonstrated low adherence (<60%), 30% moderate adherence (60–80%), and only 15% high adherence (>80%). After pharmacist counseling, knowledge scores improved by 35–40%, and awareness of lifestyle modifications increased by 45%. At three months, pill count analysis showed mean adherence rising from 62% at discharge to 82%. Medication errors declined by 30%, and the proportion of high adherence patients increased to 48%. Patient-reported outcomes indicated improvements in daily mobility (+20%), dietary compliance (+25%), and routine management (+22%) compared with baseline. Pharmacist-led counseling in geriatric stroke patients significantly improves adherence, reduces errors, and enhances functional outcomes. Routine follow-up with objective adherence monitoring highlights the pharmacist's essential role in stroke care teams.

**PL-374**

**EVALUATION OF ANALGESIC ACTIVITY OF ETHANOLIC EXTRACT OF Crossandra infundibuliformis LEAVES ON EXPERIMENTAL ANIMALS**

Mr. Shreyas P R, Ms. Manasa, Ms. Pruthvi Pratiksha Kotha, Ms. Raksha S
Department of Pharmaceutical Management, Institute of Health Management Research, Bangalore
Shreyaspr2001@gmail.com

This study aimed to evaluate the analgesic activity of the ethanolic extract of leaves of Crossandra infundibuliformis in experimental animals. The analgesic activity of ethanolic extract of Crossandra infundibuliformis in mice was investigated by using Eddy's hot plate and Acetic acid induced writhing method. The ethanolic extract of Crossandra infundibuliformis (200mg/kg and 400 mg/kg, p.o) was selected for boththe models. For eddy's hot plate the parameters like licking their fore or hind paws and jumping response, while in acetic acid induced model number of writhing responses were measured. The administration of the dose (200mg/kg and 400mg/kg) of ethanolic extract of Crossandra infundibuliformis produces significant reduction in the writhing response and increases basal hot plate latency period. Significant reduction in the writhing response and increase in the basal hot plate latency period of extract compared with control shows the significant analgesic activity of extract of Crossandra infundibuliformis. The extract (400mg/kg) significantly increased hot plate latency (up to 69.38% inhibition) and reduced writhings (up to 53.96% inhibition) compared to control ($P<0.001$). This dose-dependent pattern, almost equivalent to standard drugs, indicates both central and peripheral analgesic properties, likely due to detected alkaloids, flavonoids, and tannins.The outcome of the present study provides the evidence that the ethanolic extract of Crossandra infundibuliformis leaves reported to have dose dependent beneficial effect against pain.

**Keywords:** Acetic acid, Analgesic, Crossandra infundibuliformis, Eddy's hot plate

**PL-375**

**PREVENTING ACUTE MIGRAINE ATTACKS AND OPTIMIZING OUTCOMES THROUGH CLINICAL PHARMACIST INTERVENTIONS**

Lippishree Pattala, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, 500017
lippishreepattala823@gmail.com

Migraine is a chronic neurological disorder that significantly impairs daily functioning and quality of life, affecting nearly 15% of the global population. Poor adherence, inappropriate drug use, and lack of preventive strategies contribute to frequent acute attacks and medication overuse, which occurs in up to 30–40% of migraine patients. Clinical pharmacists, through structured interventions, have been shown to improve adherence by 20–25% and reduce drug-related problems in chronic neurological disorders. A prospective interventional study was conducted in migraine outpatients. Clinical pharmacists provided individualized care, including medication reviews, counseling on lifestyle modifications, education on avoiding medication overuse, and guidance on adherence to preventive therapy. Patients were reassessed at three months to evaluate adherence, frequency of acute attacks, use of rescue medications, and satisfaction with therapy. Pharmacist-led interventions improved adherence rates by nearly 25%, reduced medication overuse, and promoted rational drug use. Patients reported enhanced knowledge of migraine triggers and the importance of prophylaxis, leading to a 28% reduction in acute migraine episodes and fewer emergency visits. Quality of life assessments showed measurable improvement, particularly in psychological and social domains. Clinical pharmacist involvement in migraine management prevents medication overuse, reduces acute attack frequency, and improves quality of life. These findings emphasize the importance of pharmacist-led care as an integral component of comprehensive migraine management.

**Keywords:** Migraine, Clinical Pharmacist, Patient Counseling, Medication Adherence, Preventive Therapy

**PL-376**

**OPTIMIZING COPD, ASTHMA, AND COMORBIDITY CARE THROUGH PHARMACIST-LED INTERVENTIONS: IMPROVING SAFETY, REDUCING CARDIOVASCULAR RISKS, AND STRENGTHENING ADHERENCE**

V Nikita Shree, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana.
Nikkihappy0@gmail.com

Chronic respiratory diseases such as COPD and asthma remain major contributors to global morbidity and mortality. Patients frequently present with cardiovascular disease, frailty, or cancer, complicating management. Inhaled bronchodilators are essential but have been linked to a 1.5–2-fold increased risk of cardiovascular events in heart failure patients. Polypharmacy further elevates the likelihood of clinically significant drug–drug interactions (DDIs), reported in up to 30–40% of COPD cases. COPD also worsens lung cancer outcomes, with studies showing a 20–25% higher rate of treatment interruptions and reduced survival compared with patients without COPD. Frailty prevalence in COPD is estimated at 25–32%, correlating with frequent exacerbations. Asthma has shown an association with migraine, with a 1.3–1.5 times increased risk, while smokers demonstrate 15–20% lower adherence rates and more DDIs compared to non-smokers. To address these challenges, a mixed-methods study was conducted, including a randomized controlled trial in COPD and asthma outpatients. Patients receiving pharmacist-led care—comprising medication reconciliation, DDI screening, inhaler technique training, and adherence support—achieved25% improvement in adherence and 40% fewer DDIs compared with usual care. Among those with heart failure, pharmacist monitoring during bronchodilator therapy reduced cardiovascular complications by 35%. Pharmacist integration in pulmonology care significantly enhances safety, improves adherence, reduces cardiovascular risks, and offers critical insights into the management of complex comorbidities, ultimately optimizing respiratory patient outcomes.

**Keywords:** Pharmacist intervention, COPD, Asthma, Medication safety, medication reconciliation

**COMORBIDITIES IN GERIATRIC PATIENTS WITH LONG-TERM RHEUMATOID ARTHRITIS: A PROSPECTIVE CROSS-SECTIONAL STUDY**

Lakshmi Ganji, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, 500017
lakshmiganji6102@gmail.com

Rheumatoid arthritis (RA) is a chronic autoimmune disorder requiring lifelong therapy, commonly with disease-modifying antirheumatic drugs (DMARDs) and corticosteroids. With improved survival and treatment advancements, a growing population of geriatric patients now lived with RA for over three decades. In this population, prolonged disease activity and treatment exposure predispose patients to multiple comorbidities, significantly affecting quality of life and treatment outcomes. A prospective cross-sectional study was conducted among patients aged 60 years and above, who had a history of rheumatoid arthritis treatment for at least 30 years. Demographic data, clinical history, medication regimens, and comorbidities were collected through structured interviews and medical record review. The prevalence of comorbidities and their association with long-term therapy were analyzed. Comorbid conditions were observed in nearly 50% of participants. The most frequent were cardiovascular diseases (hypertension, ischemic heart disease, heart failure), metabolic disorders (type 2 diabetes, dyslipidemia), osteoporosis with fracture risk, renal impairment, and pulmonary complications such as interstitial lung disease and chronic obstructive pulmonary disease. Long-term corticosteroid use contributed to osteoporosis and diabetes, while methotrexate and other DMARDs were linked with hepatic and Hematological abnormalities. Psychological comorbidities such as depression and cognitive decline were also notable in this age group. Geriatric patients aged 60 years and above, with over 30 years of rheumatoid arthritis treatment, are highly susceptible to multiple comorbidities. Early screening, individualized therapy adjustments, and multidisciplinary care are essential to optimize outcomes in this vulnerable population.

**Keywords:** Rheumatoid Arthritis, Geriatrics, Long-Term Therapy, Comorbidities, Prospective Cross-Sectional Study

## REDUCING CARDIOVASCULAR RISK THROUGH PHARMACIST-LED CARE: EVIDENCE ON LDL-C REDUCTION, DRUG–DRUG INTERACTION MANAGEMENT, AND IMPROVED ADHERENCE

Adike Shravani, M Shiva Rama Krishna,
Department of Pharm.D, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya. Hyderabad, Telangana, 500017.
shravaniadike@gmail.com

Heart disease remains a leading cause of morbidity and mortality worldwide. Although lipid-lowering therapies are effective, many patients do not achieve target LDL-cholesterol levels due to harmful drug–drug interactions (DDIs) and poor adherence. Prior studies have shown pharmacist interventions can reduce LDL-C by 10–20%, lower DDI risk, and improve adherence by 15–25%. Evidence specific to cardiology outpatients, however, is limited. This randomized controlled trial included adults with elevated LDL-cholesterol (≥130 mg/dL) and at least one cardiovascular prescription. Participants were randomized into two groups: (1) pharmacist-led care, which involved medication review, systematic DDI screening with cardiologist feedback, personalized lifestyle and therapy counseling, and adherence tools such as pill organizers and reminder calls; and (2) routine physician care. Baseline demographics and comorbidities were comparable between groups. The primary outcome was the change in LDL-cholesterol at six months. Secondary outcomes included significant DDIs, adherence (refill records and validated self-report), LDL-C target achievement, and physician acceptance of pharmacist recommendations. Pharmacist-led care achieved an LDL-C reduction of 18–22% versus 8–12% in controls. Significant DDIs were nearly 40% lower, adherence improved by 20–25% compared with 10–12% in usual care, and two-thirds of intervention patients reached LDL-C targets versus fewer than half in controls. Physician acceptance was high (75–90%). Pharmacist-led care significantly improves cholesterol control, reduces DDIs, and enhances adherence, supporting its integration into cardiology teams.

**Keywords**: Pharmacist intervention, Cardiology, Cholesterol management, Drug–drug interactions

**PL-379**

## AN OBSERVATIONAL STUDY ON THE INCIDENCE, RISK FACTORS, AND CLINICAL CONSEQUENCES OF DRUG-RELATED PROBLEMS IN HOSPITALIZED PATIENTS RECEIVING CARDIOVASCULAR THERAPY

Miriyala Neha, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, 500017
nehamiriyala04@gmail.com

Cardiovascular diseases (CVDs) often require complex therapeutic regimens, making patients highly vulnerable to drug-related problems (DRPs). The reported prevalence of DRPs in CVD patients ranges between 45–60%, largely due to polypharmacy, advanced age, and multiple comorbidities. Understanding these risk factors in real-world clinical settings is critical for improving safety and outcomes. A prospective observational study was conducted in a tertiary care hospital among patients admitted with cardiovascular conditions. Data on demographics, comorbidities, prescribed medications, and clinical outcomes were collected. DRPs were identified and categorized, and their associated risk factors were analysed. Nearly 50% of the study population experienced at least one DRP. The most common problems were drug–drug interactions (28%), inappropriate dosing in renal/hepatic impairment (21%), and non-adherence (15%). Polypharmacy (>5 drugs) and advanced age (>65 years) significantly increased risk, with odds ratios of 2.1 and 1.8, respectively. Comorbidities such as diabetes, chronic kidney disease, and hypertension further raised the likelihood of DRPs by 32%. Frequently implicated drug classes included antihypertensives, anticoagulants, antiplatelets, and statins. Unrecognized DRPs were associated with longer hospital stays and delayed recovery. The high incidence of DRPs in cardiovascular patients highlights the need for targeted interventions. Incorporating regular clinical pharmacist reviews, dose optimization, and patient education can reduce preventable DRPs and improve therapeutic outcomes in this high-risk population.

**Keywords:** Cardiovascular Disease, Drug-Related Problems, Risk Factors, Polypharmacy.

## ENHANCING ADHERENCE, LIFESTYLE MODIFICATIONS, AND QUALITY OF LIFE IN ALCOHOLIC LIVER DISEASE: THE ROLE OF CLINICAL PHARMACIST INTERVENTIONS

Chandana Kandela, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, 500017
chandanakandela@gmail.com

Alcoholic liver disease (ALD) is a leading cause of morbidity and mortality worldwide, contributing to 30–50% of chronic liver disease hospitalisations. Patients frequently face polypharmacy, poor adherence (reported as low as 40–50%), and multiple drug-related problems (DRPs). Clinical pharmacist interventions, including hepatic dose adjustments, drug–drug interaction checks, and lifestyle counselling, have been shown to reduce DRPs by 25–35% and improve adherence by 20–30% in chronic liver disease populations. A prospective interventional study was conducted among ALD inpatients. Clinical pharmacists performed individualized medication reviews, hepatic dose calculations, and provided patient-centered counselling on adherence, alcohol cessation, diet, exercise, and sleep hygiene. Outcomes included changes in DRPs, adherence, and the WHO Quality of Life (QOL-BREF) domains at admission and discharge/follow-up.Pharmacist interventions reduced inappropriate dosing and prevented potential hepatotoxic drug use. Medication adherence improved by nearly 25% post-counselling, with patients demonstrating a stronger understanding of therapy and abstinence importance. Lifestyle modifications led to higher rates of dietary compliance and alcohol avoidance. WHO QOL scores improved across all four domains, with the greatest gains observed in psychological (+20%) and social well-being (+18%). Post-hospitalisation, patients showed fewer complications and better clinical stability. Clinical pharmacist interventions significantly optimise therapy, adherence, and lifestyle modifications in ALD. Integration of pharmacists into multidisciplinary liver care enhances safety, improves quality of life, and supports long-term recovery.

**Keywords:** Alcoholic liver disease, pharmacist intervention, medication adherence, lifestyle modification, hepatic dose calculation

## CHARACTERIZATION OF THE CYTOTOXIC AND ANTIOXIDANT ACTIVITIES OF WRIGHTIA TICTORIA EXTRACTS: AN IN VITRO STUDY USING NORMAL HUMAN CELL CULTURE

Anushiya S, Sunanda N, Mohammed Amin Yatoo, Vinutha S, Agilandeswari Devarajan
Department of Pharmaceutical Sciences, MVM College of Pharmacy, Bengaluru, Karnataka, India-560064
anushiyasakthivel2002@gmail.com

This study investigates the cytotoxic and antioxidant activities of Wrightia tinctoria extracts, focusing on their potential as natural therapeutic agents against cancer. Wrightia tinctoria, traditionally used in South East Asia and Africa was subjected to sequential extraction using hexane, ethyl acetate and methanol. Phytochemical analysis revealed the methanol extract to be particularly rich in flavonoids, alkaloids and phenolic compounds which including quercetin, gallic acid and rutin. In vitro cytotoxicity assays on normal human cell lines demonstrated that the methanol extract exhibited significant dose dependent antiproliferative effects with $IC_{50}$ values decreasing from 150 µg/mL at 24 hours to 75 µg/mL at 72 hours. Complementary assays such as Trypan Blue exclusion and Propidium Iodide staining, confirmed a substantial increase in non-viable and apoptotic/necrotic cells. Furthermore, the methanol extract displayed potent antioxidant activity, inhibiting 85% of DPPH radicals and 87% of ABTS radicals. Mechanistic investigations indicated that the cytotoxic effects were mediated through the induction of apoptosis, characterized by mitochondrial membrane depolarization, activation of caspase 3 and caspase-9 and DNA fragmentation. These findings suggest a multifaceted mechanism involving reactive oxygen species generation, mitochondrial dysfunction and caspase activation. While highlighting the promising therapeutic potential of Wrightia tinctoria as a source of novel anticancer agents, the study underscores the necessity for further in vivo studies and comprehensive toxicity assessments to validate its clinical applicability.

**CASE PRESENTATION OF DILATED CARDIOMYOPATHY: CLINICAL AND STRUCTURAL INSIGHTS.**

T. Aasritha1, Dr. M. Suchitra2
1PharmD, Department of Pharmacy, Ratnam Institute of Pharmacy, Nellore.
2Department of Pharmaceutical Chemistry and Analysis, Ratnam Institute of Pharmacy, Nellore.

Dilated cardiomyopathy (DCM) is characterized by dilation and impaired contraction of one or both ventricles, leading to systolic dysfunction and progressive heart failure. It may be idiopathic, familial, or secondary to ischemic, infectious, metabolic, or toxic causes. Clinical manifestations are often nonspecific and diagnosis requires echocardiographic and structural assessment. A 51 year old male presented with progressive exertional dyspnea, orthopnea, and episodes of palpitations for 3 months. General symptoms observed are shortness of breath for 4 months, ggeneralized weakness since 2 months and swelling of feet for 15 days. Past history revealed with no family history of cardiac disease. On examination, the patient had elevated jugular venous pressure, bilateral basal crepitations, and pedal edema. Electrocardiogram showed sinus tachycardia. Chest X-ray revealed cardiomegaly. Coronary angiography excluded ischemic heart disease. Laboratory parameters ruled out thyroid dysfunction and infectious causes. The patient was initiated on guideline-directed medical therapy including ACE inhibitors, beta-blockers, diuretics, and aldosterone antagonists. Lifestyle modification, alcohol cessation, and fluid restriction were advised. Symptomatic improvement was observed over 3 months with reduced hospital admissions. Regular follow-up was planned with repeat echocardiography. Dilated cardiomyopathy should be suspected in patients with progressive heart failure symptoms and cardiomegaly. Structural assessment via echocardiography is essential for diagnosis and management planning. Early detection, optimized medical therapy, and lifestyle modification play a crucial role in improving prognosis.

**Keywords:** Dilated cardiomyopathy, echocardiography, Coronary angiography, Lifestyle modification

**PL-383**

**CLINICAL PROFILE AND A COMPARATIVE STUDY ON THE EFFECTIVENESS OF NINTEDANIB AND CORTICOSTEROIDS IN INTERSTITIAL LUNG DISEASE AT A TERTIARY CARE TEACHING CENTRE.**

Rajeev P Thomas, Helma, Hawaz Mohammad K H, Nasrin Banu, Binuraj
National College of Pharmacy, Kozhikode, Kerala, India.

Objectives: To study the clinical profile and effectiveness of Nintedanib and corticosteroids in Interstitial Lung Disease (ILD). Methods: A prospective cross-sectional observational study was conducted on 58 patients who met the inclusion criteria, from December 2022 to June 2023. Results: Among the 58 patients, 52% were women, with a mean age of 59 years. Common symptoms included breathlessness and dry cough. Key risk factors were occupational exposure (12%), prior tuberculosis (12%), and COVID-19 infection (10.3%). Comorbidities included rheumatoid arthritis (14%) and diabetes mellitus (17%). High-resolution computed tomography (HRCT) findings commonly revealed honeycombing with traction bronchiectasis (9%) and ground-glass opacities with honeycombing (9%). The most frequent ILD diagnoses were idiopathic pulmonary fibrosis (IPF, 29.3%) and nonspecific interstitial pneumonia (NSIP, 25.8%). IPF was the most prevalent ILD and had a worse prognosis and higher mortality rate compared to NSIP. Patients on corticosteroid therapy demonstrated a better trend in forced vital capacity (FVC) and forced expiratory volume in one second ($FEV_1$) on spirometry than those on Nintedanib. The six-minute walk test (6MWT) indicated greater improvement in the Nintedanib group (11.6 meters). Therapy response varied with ILD subtype. Conclusions: This study shows that Nintedanib is effective in fibrotic ILDs, while corticosteroids benefit inflammatory types. The findings highlight the complexity of ILD management and the need for further research to optimize treatment strategies. This work lays a foundation for evidence-based, personalized ILD care.

**PL-384**

**ROLE OF VITAMIN B12 SUPPLEMENTS IN MITIGATING PACLITAXEL – BASED CHEMOTHERAPY – INDUCED PERIPHERAL NEUROPATHY**

YERRAVELLY VENKATA SAI SUDHA RANI, NIHARIKA BANDI, AKSHITHA JARATHI, PRAVEEN. D
Department of Pharmacy Practice, St. Peter's Institute of Pharmaceutical Sciences, Hanamkonda, Telangana, India, 506370.
saisudharani37801@gmail.com

Background: Chemotherapy-induced peripheral neuropathy (CIPN) is a frequent and debilitating side effect of paclitaxel. Vitamin B12 deficiency has been linked to worsened neuropathic symptoms, suggesting a potential therapeutic role for supplementation. This study evaluated the efficacy of Vitamin B12 in reducing CIPN severity in cancer patients undergoing paclitaxel-based chemotherapy. In this prospective, randomized, placebo-controlled study, 132 cancer patients receiving paclitaxel were assigned to receive either oral Vitamin B12 (1000 mcg daily) or placebo for six weeks. CIPN severity was assessed using the National Cancer Institute-Common Terminology Criteria for Adverse Events (NCI-CTCAE) and the Total Neuropathy Score (TNS). Vitamin B12 status was evaluated via methylmalonic acid (MMA) and homocysteine levels. Quality of life was measured using the EORTC QLQ-CIPN20 questionnaire. At 12 weeks, the Vitamin B12 group showed a significant reduction in CIPN severity compared to placebo ($p < 0.05$), with improvements in both TNS and NCI-CTCAE scores. Patients also exhibited significant decreases in MMA and homocysteine, indicating correction of subclinical B12 deficiency. Additionally, quality of life scores were significantly better in the treatment group based on EORTC QLQ-CIPN20 outcomes. Vitamin B12 supplementation significantly reduced the severity of paclitaxel-induced peripheral neuropathy and improved quality of life. These findings support its potential as an adjunctive therapy in managing CIPN.

**Keywords**: Paclitaxel, Vitamin B12, efficacy, neuropathy severity, quality of life.

**PL-385**

**THE EFFECT OF SILDENAFIL/ GLYCINE/COMBINATION OF SILDENAFIL AND GLYCINE AGAINST CISPLATIN AND GENTAMICIN INDUCED NEPHROTOXICITY IN RATS**

Ismail Zabiulla
Aditya Bangalore Institute of Pharmacy Education and Research

The study was designed to investigate the effect of sildenafil/ glycine and the combination of sildenafil and glycine against cisplatin and gentamicin induced nephrotoxicity in rats. Albino Wistar rats were used in this study; cisplatin was given for 7 days i.p (7.5mg/kg) to induced kidney damage. Sildenafil, glycine and combination of sildenafil and glycine were administered continues 7th days on the 8th day animal were sacrificed; serum was separated and used for the estimation of kidney damage markers. The study was carried out the similar way were gentamicin (60mg/kg) instead of cisplatin. The study revealed the elevation in serum creatinine, serum urea and MDA. And the decrease in the level of CAT, GSH, SOD, total protein in the animal treated with cisplatin and gentamicin when compare to the normal control group. Increased in the kidney weight and decrease in the body weight was also observed in the disease control model. In tissue parameter Elevation of LPO level and decrease in the level of CAT, GSH, SOD and total protein also observed in disease control group. The histopathological findings also indicated the protection offered by sildenafil/glycine/sildenafil and glycine against cisplatin/gentamicin nephrotoxicity. In the treatment group sildenafil offered good protection. Serum urea and serum creatnine are concerned, whereas the protein content was decreased when compare to the normal control group. Glycine also offered good protection against cisplatin and gentamicin induced damage as for as serum creatnine, serum urea and total protein parameters are concerned. The combination of sildenafil and glycine also offered good protection against cisplatin induced nephrotoxicity. In the gentamicin induced nephrotoxicity also moderate protection was offered by sildenafil and glycine combination. Overall the sildenafil and glycine showed moderate protection against cisplatin and gentamicin induced nephrotoxicity. However it was interestingly to note treat the combination of sildenafil and glycine did not offer better protection when compare to them individuals effect.

**Keywords:** nephrotoxicity, cisplatin, gentamicin, sildenafil and glycine.

ISBN: 978-81-980623-8-3

**PL-386**

## INCIDENCE AND RISK FACTORS OF SURGICAL SITE INFECTIONS IN ONCOLOGIC PATIENTS: THE ROLE OF ANTIBIOTICS AND EVALUATION OF RESISTANCE

Venu Talla, Minnekanti Jahnavi, Afsha Tabassum, G. Ramya Sri, P. Jyothsna, S.Hasmitha Rajeswari
Department of Pharm.D., Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana India 500017

Surgical site infections (SSIs) remain a significant complication in oncologic surgeries, contributing to increased patient morbidity and mortality. This prospective study aimed to investigate the incidence of SSIs among cancer patients, identify associated risk factors, and evaluate the impact of antibiotic usage and resistance patterns on clinical outcomes. The analysis included cancer patients who underwent surgery between January and June 2024, utilizing electronic health records for data on SSI incidence, comorbidities, antibiotic prophylaxis, and microbial resistance. Statistical tools such as chi-square tests and logistic regression were employed to identify significant associations. The overall incidence of SSIs was 16%, with the highest rates observed in patients with head and neck cancers, particularly carcinoma of the tongue. Common comorbidities among patients who developed SSIs included hypertension and diabetes. Key risk factors identified were advanced T-stage of tumors, substantial intraoperative blood loss, and prolonged surgery duration. Antibiotic usage analysis revealed that patients receiving Cefoperazone/Sulbactam had higher SSI rates compared to those administered Cefixime. Notably, 16% of the patients treated with Cefoperazone/Sulbactam exhibited antibiotic resistance.Microbiological evaluation of wound cultures demonstrated a range of resistant pathogens, including MRSA, Klebsiella pneumoniae, and Pseudomonas aeruginosa, highlighting the complex bacterial etiology of SSIs in oncology settings. The findings emphasize the need for improved antibiotic stewardship and selection protocols to counter rising antimicrobial resistance. The observed resistance to commonly used antibiotics such as Cefoperazone/Sulbactam further underscores the necessity of exploring alternative agents. Further large-scale studies are recommended to validate and expand upon these findings.

**Keywords:** SSI, antibiotic, Cefoperazone, Sulbactam, MRSA, oncologic surgeries

## PHARMACOLOGICAL EVALUATION OF CHRYSIN LOADED PHYTOSOMES IN THE TREATMENT OF COLORECTAL CANCER IN WISTAR RATS

Namit Kudatarkar and Sunil Jalalpure
Department of Pharmaceutical Sciences, KLE University, Belagavi, Karnataka, India- 590010.
namitkudatarkar18@gmail.com

Chrysin is a phytoconstituent which has shown potential in anticancer activity. The study aims to formulate, characterize and evaluate the cytotoxic effect of chrysin loaded phytosomes using Dimethyl hydrazine induced colorectal cancer model. Chrysin loaded phytosome was prepared by Antisolvent precipitation method. Particle size, polydispersity index, zeta potential, entrapment efficiency, melting point analysis, crystallography, scanning electron microscope and Fourier transform infrared spectroscopic analysis were carried out for the characterization to confirm the production of chrysin loaded phytosomes. Invivo parameters such as polyps count, colon weight by length ratio, haematological, biochemical estimation and histopathological examination was carried out. Chrysin loaded phytosomes displayed particle size of 93.91nm with polydispersity index of 0.29 and zeta potential -1.33 mV. The entrapment efficiency was 65.35 %. Melting point and amorphous state was revealed using Differential scanning calorimeter and X ray diffraction. Scanning electron microscopy revealed the surface morphology of chrysin loaded phytosomes and fourier transform infrared spectroscopy showed that there was no change in the molecular state in chrysin loaded phytosomes. Significant changes in polyps count, colon weight by length ratio, haematological, biochemical and histological findings was observed. This research provided indicative evidence for the therapeutic application of Chrysin loaded phytosomes in the treatment of colorectal cancer in experimental animals. Hence further investigation is required focusing on the clinical aspects of the prepared nanoformulation in the treatment of colorectal cancer.

**Keywords:** Colorectal cancer, phytosomes, nanoformulation, chrysin.

**PL-388**

## TO ASSESS THE EFFECT OF SODIUM BICARBONATE TREATMENT IN NON-DIALYSED CHRONIC KIDNEY DISEASE PATIENTS

SOMISETTI VENKATA SHANMUKHA SRINIVASARAO
Shri Vishnu College of Pharmacy, Bhimavaram

Metabolic acidosis is a frequent complication of chronic kidney disease (CKD) and is associated with faster progression of renal dysfunction, muscle wasting, bone disease, and poor clinical outcomes. Sodium bicarbonate supplementation is commonly used to correct metabolic acidosis, but its effect on kidney function and related outcomes in non-dialyzed CKD patients remains an area of ongoing research. Objective: To assess the effect of sodium bicarbonate treatment on kidney function, metabolic parameters, and clinical outcomes in non-dialyzed CKD patients. This study evaluates non-dialyzed adult patients with CKD who received oral sodium bicarbonate therapy. Key outcomes assessed include changes in estimated glomerular filtration rate (eGFR), serum bicarbonate levels, progression to end-stage kidney disease (ESKD), and metabolic markers. Safety outcomes such as blood pressure, edema, and electrolyte imbalance were also considered. Results: Sodium bicarbonate therapy was associated with significant improvement in serum bicarbonate levels, reduced progression of metabolic acidosis, and slower decline in eGFR compared with controls. Patients receiving therapy showed a lower risk of progression to dialysis and improved nutritional markers. Adverse effects such as hypertension and volume overload were minimal and manageable with standard care. Conclusion: Sodium bicarbonate treatment in non-dialyzed CKD patients effectively corrects metabolic acidosis and may slow the progression of kidney disease while improving metabolic outcomes. Routine use, with careful monitoring, could be considered as a safe and cost-effective adjunct in CKD management.

**Keywords**: Chronic kidney disease, Sodium bicarbonate, Metabolic acidosis, Non-dialyzed patients, eGFR, Kidney function.

**PL-389**

## ASSESSMENT AND EVALUATION OF LUTEOLIN FOR ANTIOXIDANT AND ANTICANCER ACTIVITIES: IN VITRO AND IN VIVO STUDIES IN HUMAN CERVIX ADENOCARCINOMA (HELA) MODEL

Niranjani C K and Mahasakthi A
Department of Pharmaceutical biotechnology, Vellalar college of pharmacy, Erode
Affiliated to Tamil Nadu Dr. MGR. Medical University
niranjanick999@gmail.com

Cancer is the second leading cause of death worldwide; this occurs when normal cells grow uncontrollably and spread to other parts of the body. Cervical cancer, which affects the cervix in women, remains a major health concern, especially in developing countries. There is a continuous need for new, effective, and safer treatments. Luteolin, a flavonoid compound found in many plants have gained attention for their potential therapeutic applications due to their antioxidant and anticancer properties. This study aimed to investigate the antioxidant potential, in vitro anticancer effects, and in vivo acute oral toxicity of luteolin using human cervix adenocarcinoma (HeLa) cell lines and animal models. Antioxidant activity was assessed using the DPPH free radical scavenging assay. In vitro anticancer activity was evaluated by treating HeLa cells with graded concentrations of luteolin, followed by MTT assay to measure cell viability, cell cycle analysis, and apoptosis induction. For in vivo safety evaluation, acute oral toxicity testing of luteolin was carried out in rodents according to OECD guidelines. Animals were monitored for mortality, behavioural changes, body weight, and organ histopathology. The results showed that luteolin exhibited strong antioxidant activity and a significant, dose-dependent reduction in HeLa cell viability in vitro. It induced cell cycle arrest and apoptosis confirmed by gene expression modulation. The acute oral toxicity study revealed no mortality or major toxicological signs at tested doses, indicating a favourable safety profile. This research demonstrates that luteolin shows potent antioxidant and anticancer activity in vitro, along with good safety margins in acute oral toxicity studies. These findings suggest that

ISBN: 978-81-980623-8-3

luteolin could serve as a promising natural therapeutic candidate against cervical cancer, warranting further preclinical and clinical investigations.
**Keywords**: Luteolin, Cervical cancer, HeLa cells, Antioxidant, Apoptosis, Acute oral toxicity.

**PL-390**

## HEPATOPROTECTIVE ACTION OF SELENICEREUS UNDATUS METHANOLIC EXTRACT IN PARACETAMOL INDUCED MALE ALBINO WISTAR RATS

Ms. Mohammedi Begum1, Mr. Koppala R V S Chaitanya1
Department of Pharmacology, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya1
zoyashaik796@gmail.com

Background: Paracetamol overdose is a well-recognized cause of drug-induced hepatotoxicity, often leading to severe hepatic injury. Exploration of natural plant sources offers promising alternatives for hepatoprotection. Objective: This study investigated the hepatoprotective potential of methanolic extracts of Selenicereus undatus in paracetamol-induced hepatotoxicity using male albino Wistar rats. Methods: Hepatic injury was induced by oral administration of paracetamol (2 g/kg). Treatment groups received S. undatus extract at low (150 mg/kg) and high (300 mg/kg) doses for seven consecutive days. Biochemical assays (SGOT, SGPT, ALP, bilirubin, glucose), hematological indices, and histopathological examinations were performed. Results: Paracetamol administration produced marked elevation of SGOT, SGPT, ALP, bilirubin, and glucose, confirming liver damage. Post-treatment, both doses of S. undatus significantly reduced these parameters in a dose-dependent manner. The high-dose group showed near-normalization of liver enzymes, bilirubin reduction to 0.1–0.9 mg/dL, and glucose decrease from ~190 mg/dL (disease control) to ~120 mg/dL. Histopathological analysis further supported biochemical results, revealing severe necrosis and vacuolization in the disease control group, while treated groups demonstrated improved hepatocyte integrity and reduced cellular degeneration. Conclusion: Methanolic extract of Selenicereus undatus exhibits potent hepatoprotective activity against paracetamol-induced toxicity, likely mediated by phenolic and flavonoid constituents. The findings establish its therapeutic promise as a natural hepatoprotective agent and provide a basis for further research on bioactive compound isolation and mechanism elucidation.
**Keywords:** Selenicereus undatus, hepatoprotection, paracetamol, Wistar rats, liver injury

**PL-391**

## EPIDEMIOLOGICAL PROFILE, RISK FACTORS, AND OUTCOMES OF STROKE PATIENTS: EVIDENCE FROM A HOSPITAL-BASED OBSERVATIONAL STUDY

Nadikudi Shailaja, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya. Hyderabad, Telangana, 500017
nadikudishailaja16@gmail.com

Stroke remains a leading cause of mortality and long-term disability worldwide, accounting for nearly 12% of all deaths and affecting 15–20 million people annually. The burden is particularly high in low- and middle-income countries, where delayed diagnosis, limited awareness, and inadequate access to preventive care contribute to poor outcomes. Understanding the epidemiological profile of stroke patients is essential for planning effective preventive and therapeutic strategies. A prospective observational epidemiological study was conducted in a tertiary care hospital. Data were collected on demographics, stroke subtypes, risk factors, comorbidities, and outcomes in patients diagnosed with ischemic or haemorrhagic stroke. Clinical outcomes such as hospital stay, recurrence, and mortality were analysed. Among 250 stroke patients enrolled, ischemic stroke was most common (72%), followed by haemorrhagic stroke (28%). The majority were aged >60 years (65%), with a male predominance (58%). Hypertension (70%), diabetes (45%), and dyslipidaemia (40%) were the leading risk factors. Tobacco use (30%) and alcohol consumption (25%) were also significant contributors. The mean hospital stay was 8 days, with an in-hospital mortality rate of 12%. Recurrent strokes were documented in 15% of cases, predominantly among those with poor medication adherence. The study highlights hypertension, diabetes, and dyslipidaemia as major modifiable risk factors for stroke. Epidemiological insights underscore the need for early risk factor control, patient education, and continuous follow-up. Incorporating clinical pharmacists into stroke care may further reduce recurrence and improve long-term outcomes.
**Keywords:** Stroke, Epidemiology, Risk Factors, Clinical Outcomes

**PL-392**

## THE ROLE OF CLINICAL PHARMACIST COUNSELING IN ENHANCING MEDICATION ADHERENCE AMONG PAEDIATRIC EPILEPSY PATIENTS: A COMPARATIVE STUDY OF VALPROATE AND LEVETIRACETAM

Srija N, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana,India - 500017.
sreejagoud1045@gmail.com

Epilepsy in children requires long-term antiseizure medications (ASMs), where adherence is crucial for therapeutic success. Valproate and levetiracetam are among the most commonly prescribed ASMs, but adherence may be affected by adverse effects, regimen complexity, and caregiver understanding. Studies indicate that non-adherence in paediatric epilepsy ranges from 30–50%, often leading to breakthrough seizures and hospitalizations. Clinical pharmacists can play a key role by counseling parents, monitoring adherence, and addressing drug-related problems. A prospective observational study was conducted in the neurology department among paediatric epilepsy patients prescribed valproate or levetiracetam. Parents received individualized pharmacist counseling on administration techniques, the importance of adherence, seizure first aid, and adverse effect recognition. Adherence was assessed at discharge and at follow-up using validated adherence scales and pill counts. Pharmacist intervention significantly improved adherence scores in both groups. Mean adherence increased from 68% at baseline to 85% at follow-up overall. Levetiracetam patients showed higher adherence (from 70% to 88%) compared with valproate (from 66% to 82%), likely due to favourable tolerability and simpler dosing. Parents reported improved understanding, reduced missed doses, and greater confidence in home seizure management. Valproate patients required closer monitoring for dose-related adverse effects, yet counseling still yielded substantial improvement. Clinical pharmacist-led parental counseling enhances adherence in paediatric epilepsy. Both valproate and levetiracetam benefit from pharmacist involvement, though levetiracetam demonstrates relatively higher adherence post-counseling. Incorporating pharmacists into paediatric neurology teams optimizes long-term epilepsy management and improves quality of life.
**Keywords:** Paediatric epilepsy, Clinical pharmacist, Valproate, Levetiracetam, Adherence, Parental counseling

**PL-393**

## EPIDEMIOLOGICAL STUDIES AND EVALUATION OF ADVERSE DRUG REACTIONS CAUSED BY INJECTION PEGFILGRASTIM

G Sarayu, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, India – 500017.
sarayuguthula24@gmail.com

Pegfilgrastim, a long-acting granulocyte colony-stimulating factor (G-CSF), is commonly prescribed to cancer patients receiving chemotherapy to lower the risk of febrile neutropenia. However, real-world evidence regarding its safety and adverse drug reactions (ADRs) remains limited. The present study aimed to assess the epidemiological profile, safety, efficacy, and ADRs of pegfilgrastim in cancer patients. A prospective observational study was conducted at Omega Super Specialty Hospital, Banjara Hills, for six months (August 2019 – January 2020). A total of 150 cancer patients were enrolled: 50 with breast cancer, 50 with colon cancer, and 50 with rectal cancer. Patients were followed from the first to the eighth chemotherapy cycle. Data on demographics, laboratory findings, treatment history, and ADRs were recorded using structured case report forms. Among breast cancer patients, the most frequent ADRs were leukocytosis (37%), weakness (22%), and body pains (8%). Colon cancer patients experienced leukocytosis (38%), weakness (20%), and body pains (16%), while rectal cancer patients presented leukocytosis (47%), weakness (12%), and loss of appetite (8%). ADRs typically appeared within a few days of administration and resolved within 3–4 days. No life-threatening complications were identified. Pegfilgrastim showed a favourable safety profile and effectively prevented neutropenia across cancer types. Mild to moderate ADRs

ISBN: 978-81-980623-8-3

were common but manageable and transient. Nutritional support and vigilant monitoring are recommended to optimize therapeutic outcomes.

**Keywords:** Pegfilgrastim, Adverse Drug Reactions (ADRs), Safety and Efficacy, Cancer Chemotherapy, Breast Cancer

**PL-394**

## IMPACT OF CLINICAL PHARMACIST COUNSELING ON LIPID CONTROL, MEDICATION ADHERENCE, AND QUALITY OF LIFE IN CARDIAC PATIENTS WITH HYPERLIPIDEMIA

R Nivedita, M Shiva Rama Krishna
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, India-500017.
niveditarajesh960@gmail.com

Hyperlipidemia is a key modifiable risk factor for cardiovascular disease, yet many patients struggle with sustaining lifestyle modifications and adhering to lipid-lowering therapies after discharge. Studies show that 30–40% of cardiac patients demonstrate poor adherence within three months, and only 50–60% achieve LDL targets with routine care. Clinical pharmacist counseling may bridge these gaps through structured education and monitoring. A prospective interventional study was conducted in cardiac patients with hyperlipidemia. At discharge, patients and caregivers received structured pharmacist counseling on diet, exercise, medication adherence, and adverse drug effect awareness, supported by diet charts and lifestyle reminder tools. Adherence was monitored using validated scales, while quality of life (WHO-QOL) was assessed at discharge and three-month follow-up. Pharmacist interventions significantly improved adherence, with mean scores rising from 65% at baseline to 85% at follow-up. Missed doses decreased by 30%, and active engagement in diet and exercise increased by 25–30%. WHO-QOL scores improved across domains, with the largest gains in psychological (+18%) and physical (+20%) well-being, reflecting reduced anxiety about cardiac risk and stronger self-care confidence. Lipid profiles showed favourable trends, with LDL-C reductions of 19% in actively counselled patients compared with minimal change in routine care. Clinical pharmacist counseling at discharge and reinforcement during follow-up enhances adherence, lifestyle compliance, lipid control, and quality of life. Integration of pharmacists into cardiac care teams supports improved outcomes and patient empowerment in hyperlipidemia management.

**Keywords:** Hyperlipidemia, Lipid control, WHO-QOL, Cardiac patients, Clinical Pharmacist.

## GASTROPROTECTIVE ACTIVITY OF COUROUPITA GUIANENSIS FLOWER PETAL AQUEOUS EXTRACT AGAINST ETHANOL-INDUCED GASTRIC LESIONS IN RATS.

D. N. SATWIKA, K. KAVYA SUDHA
Department of pharmacology, Ratnam Institute of Pharmacy, Nellore, Andhra Pradesh.

Gastric ulcers are a prevalent gastrointestinal disorder linked to alcohol intake, stress, and oxidative injury. Even though conventional medications for ulcers work, they have side effects, so safer plant-based alternatives are needed. The traditional treatment for inflammatory and gastrointestinal conditions with Couroupita guianensis (Cannonball tree) has not been extensively examined for its gastroprotective potential. An aqueous extract of C. guianensis flower petals was tested in Wistar rats using the ethanol-induced gastric ulcer model. Animals were divided into four groups: normal control, ethanol-induced ulcer control, standard (omeprazole 20 mg/kg), and treatment groups receiving C. guianensis extract at graded doses (100, 200, and 400 mg/kg, p.o.). Measurements included the ulcer index, gastric volume, pH, and total acidity. Additionally, the gastric mucosa was histopathologically examined. Ethanol administration produced severe gastric lesions with a high ulcer index (7.8 ± 0.5). Treatment with C. guianensis extract significantly ($p < 0.01$) reduced the ulcer index in a dose-dependent manner (100 mg/kg: 4.2 ± 0.3; 200 mg/kg: 2.8 ± 0.4; 400 mg/kg: 1.9 ± 0.2), comparable to omeprazole (1.6 ± 0.3). In addition, the extract raised pH while decreasing gastric volume and total acidity. A histological examination showed that the gastric mucosa was protected well, with less edema, bleeding, and necrosis. Probably through antioxidant and cytoprotective mechanisms, the aqueous extract of Couroupita guianensis flower petals protects rats' stomachs from ethanol-induced gastric lesions. These results lend credence to its potential as a natural remedy for treating gastric ulcers.

**Keywords**: Couroupita guianensis, Gastroprotective activity, Aqueous extract, Ethanol-induced gastric lesions, Ulcer index, Wistar rats.

## ENDOMETRIOSIS BEYOND THE PELVIS: VICARIOUS MENSTRUATION AS EXTRAPELVIC PRESENTATION

Sonali Maiti, Prakriti Diwan
Department of Pharmacology, Danteswari College of Pharmacy Borpadar, Raipur Road, Jagdalpur, C.G.,494221

Vicarious menstruation refers to cyclical bleeding outside the uterine cavity during the menstrual cycle. Extrapelvic endometriosis is a rare form of endometriosis, characterized by the presence of endometrial tissues in sites outsides the uterus, most commonly the pelvic cavity. When this tissue occurs in more distant parts of the body such as lungs, diaphragm, abdominal wall or even the brain and peripheral nerves it is referred to as extrapelvic endometriosis. Haemolacria or blood in tears, is a rare medical phenomenon that can occur with menstruation or in association with endometriosis defined by the presence of endometrial-like tissue in extra-uterine sites, affects around 10% of fertile women; the ocular system is one of the rarest sites it can be present in. Endometriosis usually requires a biopsy for diagnosis, and the anatomic difficulty of obtaining a biopsy of the ocular system makes ocular endometriosis diagnosis more obscure. However, few cases have been described in the literature and due to the psychological, physical, and social implications of haemolacria on the patient, treatment is of utmost importance. We reviewed the literature on ocular endometriosis and ocular vicarious menstruation with the aim to discuss the clinical presentation, necessary workup and various treatment modalities, while also shedding light on the connection between the eyes and endometriosis in general. It is hypothesised that uterine endometrial cells can travel lymphatically or haematogenously and deposit extra-uterine endometriotic lesions that bleed in response to hormonal changes in the menstrual cycle. Additionally, the conjunctival vasculature has been found to be responsive to hormonal changes due to the presence of oestrogen and progesterone receptors, causing bleeding at the corresponding sites, even without endometriotic lesions. Clinical correlation of the haemolacria with the menstrual cycle can suffice for a diagnosis of vicarious menstruation, and thus opens the possibility of treatment to provide symptomatic treatment for the patient. Evidence-based approaches to diagnosis and treatment of extra-pelvic endometriosis remain immature given the low prevalence and limited quality of research available in the literature. To gain a better understanding of extra pelvic endometriosis we reviewed the literature on ocular endometriosis and ocular vicarious menstruation with the aim to discuss the clinical presentation, necessary workup and various treatment modalities, while also shedding light on the connection between the eyes and endometriosis in general.

**Keywords:** Vicarious menstruation, endometriosis, extrapelvic, haemolacria, conjunctival vasculature, haematogenously, modalities

## COST-EFFECTIVENESS ANALYSIS OF PHARMACEUTICAL CARE IN GERIATRIC PATIENTS WITH TYPE 2 DIABETES MELLITUS-A RANDOMIZED CONTROLLED TRIAL

Manju C S, Anny Mathew, Chandni R
College of Pharmaceutical Sciences, Govt Medical College, Kozhikode-673008
manjusreeniajith@gmail.com

Pharmaceutical care is the responsible provision of drug therapy to achieve definite outcomes. From the literature review, it is found that the prevalence of diabetes and the number of older people with diabetes are high. The high prevalence of uncontrolled diabetes increases negative outcomes, such as complications, comorbidities, hospital stay, and early death; the negative outcome increases both direct and indirect costs15. Quality of life is also affected, so it is helpful to society to have any intervention that can provide a positive outcome. So, it is decided to explore the outcome of pharmaceutical care, in terms of cost of therapy, effectiveness, and quality of life in the management of type 2 DM in older people. The aim was to evaluate the effectiveness

ISBN: 978-81-980623-8-3

and cost-effectiveness of pharmaceutical care in older persons with Type 2 DM relative to usual care who are living at home and receiving repeat prescriptions, in a tertiary care Govt hospital. The objectives were to evaluate the health care expenditure by evaluating the direct costs and indirect costs in T2DM geriatric patients in a tertiary care hospital, and to evaluate the effectiveness of pharmaceutical care in terms of HbA1C, Glucose level (FBG, PPBG). The study was a randomized controlled trial registered in CTRI, with a calculated sample size of 38 in the intervention group and control group. The intervention was structured pharmaceutical care for nine months. Statistical Analysis of the results of the study revealed that structured pharmaceutical care can reduce the cost of therapy, impart a reduction in HbA1C, FBG, and PPBG. At the same time, the quality of life is also improved. At the beginning of the study, the expected outcome was a reduction in HbA1C by 0.5 to 1% in the intervention group, and we were able to obtain a reduction of 1.2%. The cost of therapy was also reduced, and a cost saving of 49 rupees per patient and a statistically significant improvement in quality of life were also obtained. By using this per-patient cost reduction of 49 Rs, we can calculate the total cost reduction of the entire state. In this study, it is proven that, in addition to a clinically effective strategy, pharmaceutical care is an economically viable strategy in the public health system. That is, pharmaceutical care is cost-effective.

## REPURPOSING MICONAZOLE FOR ANTI-DEPRESSANT TREATMENT: A PRECLINICAL INVESTIGATION

Riya Verma, Mayur Lohi, Shilpa Deshpande
Department of Pharmacology, Priyadarshini J. L. College of Pharmacy, Electronics zone building, MIDC, Hingna Road, Nagpur - 440016
riyarajeev2002@gmail.com

Depression is one of the most common neuropsychiatric diseases believed to cause imbalances in neurotransmitters like serotonin, norepinephrine & dopamine, which regulates mood, emotions & motivation. The present study aims to repurpose the antifungal drug Miconazole for its observed neuroprotective and anti-inflammatory properties, in the olfactory bulbectomy (OBX) induced depression in experimental animals, observing histopathological changes and biochemical parameters. OBX causes depression by inducing oxidative stress and disruption of HPA axis which leads to neuroinflammation and neurodegeneration resulting in decrease in the level of serotonin, norepinephrine, dopamine. The OBX rats showed the behavioral symptoms for depression like hyperlocomotion, anxiety, behavioral despair and anhedonia using actophotometer, open field test and sucrose preference test respectively. Miconazole was given orally at a dosage 5mg/kg and 10mg/kg, among which the 10mg/kg dosage was observed to be significantly effective and reduced the depression like symptoms in the OBX rats; the results were compared to the standard Fluoxetine. In the biochemical estimation, the dopamine and catalase levels were increased and lipid peroxidase levels decreased in the treatment group when compared with the induction and standard group. The histopathological examination showed improvement in the pyramidal cell necrosis in the treatment group when compared with the induction and standard group. In-silico study of Miconazole was performed to assess the binding affinity on 5HT and BDNF with receptors MAO-A and TrkB respectively. Miconazole showed good binding affinity towards both the receptors when compared with Fluoxetine. Thus, Miconazole can be reprofiled as a beneficial treatment for depression like condition.

**Keywords:** Depression, repurposing, olfactory bulbectomy, miconazole.

## IN-VITRO AND IN-VIVO HEPATOPROTECTIVE ACTIVITY OF BIOACTIVE FRACTION OF LUDWEGIA HYSSOPIFOLIA AGAINST ETHANOL INDUCED HEPATOTOXICITY

B. Oormila Preethu and P. Praneetha
Department of PharmD, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka, Secunderabad, Telangana, India -500017.
oormilapreethu24@gmail.com

Among the several degenerative diseases, liver disorders have become one of the serious health troubles worldwide. In the absence of reliable hepatoprotective drug in this current modern system of medicine, traditional herbal medicine has begun to gain its popularity worldwide. The objective of the study is to evaluate the in-vitro and in-vivo hepatoprotective activity of fractions of methanolic extract of Ludwigia hyssopifolia (LHME) against ethanol induced oxidative damage in HepG2 cell lines and Wistar rats respectively. Results: The in-vitro hepatoprotective activity of different fractions of the extract, LHME, was assessed by estimating the cell supernatant for hepato specific parameters viz., Alanine aminotransferase (ALT), Lactate dehydrogenase (LDH) and Aspartate aminotransferase (AST) while the in-vivo hepatoprotective activity of the fractions of methanolic extract, LHME, was estimated on the basis of enhancement in the varied level of various serum biochemical parameters and in the alterations occurred in the histology of liver of the rats. The most effective fraction was evaluated for its in-vivo anti-inflammatory activity against Carrageenan induced inflammation in rats. Among all the fractions of LHME, butanol fraction of LHME (BF-LHME) at 50 µg/kg and 100 mg/kg were found to be the effective doses in in-vitro and in-vivo hepatoprotective methods respectively.

**Keywords:** Ludwigia hyssopifolia, HepG2 cell lines, Wistar rats, Ethanol-induced hepatotoxicity, Anti-inflammatory activity.

## TECHNOLOGY-BASED APPROACHES TO TAILORED CANCER TREATMENT

M. Manoj kumar, M. Prasada Rao
Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India
mmanoj8994@gmail.com

Cancer remains a leading cause of mortality worldwide, demanding innovative strategies that extend beyond conventional one-size-fits-all therapies. Recent advances in medical technology have transformed cancer management by enabling personalized and patient-cantered treatment approaches. Precision oncology, driven by genomic profiling, biomarker identification, and pharmacogenomics, facilitates the selection of therapies tailored to an individual's molecular and clinical characteristics. Artificial intelligence (AI) and machine learning algorithms are increasingly applied to analyse complex datasets, predict drug responses, and optimize chemotherapy regimens while minimizing toxicity. Additionally, companion diagnostics and next-generation sequencing (NGS) technologies support the identification of actionable mutations and resistance mechanisms, allowing oncologists to choose the most effective targeted therapies. Digital health tools, including clinical decision support systems, electronic health records, and predictive analytics, further enhance treatment planning and monitoring. These technology-based approaches not only improve therapeutic outcomes but also reduce adverse effects, improve quality of life, and promote cost-effective cancer care. Despite these advancements, challenges remain in terms of accessibility, cost, data integration, and ethical considerations. Continued research, global collaborations, and investment in digital oncology platforms are essential for the widespread implementation of technology-driven personalized cancer therapy. Overall, integrating technological innovations into oncology represents a promising paradigm shift toward more precise, effective, and patient-specific cancer treatment.

**Keywords:** Cancer treatment, precision oncology, genomic profiling, artificial intelligence, pharmacogenomics, biomarkers, targeted therapy, clinical decision support, personalized medicine.

## EVALUATING MEDICAL DEVICE SAFETY AND BENEFITS IN POST-OPERATIVE GERIATRIC AND AMBULATORY PATIENTS

Nivetha. B and Jainaf Nachiya. R. A. M
School of Pharmacy, B. S. Abdur Rahman Crescent Institute of science and Technology University, Chennai, India.
nivipharma1992@gmail.com

Medical devices are very important in post-operative patient care because they improve clinical outcomes. However, they can also lead to negative effects, especially in vulnerable groups like older patients and those who are ambulatory. This study aimed to assess the risk-benefit ratio of medical devices by looking at adverse effects in post-operative patients, focusing on older patients (aged 65 and over) and ambulatory subgroups. We conducted a retrospective analysis of 75 patients who

ISBN: 978-81-980623-8-3

received interventions involving medical devices. We collected information on demographics, existing health conditions, types of surgeries, device usage, adverse events, recovery time, readmission, and mortality. Adverse events were reported in 16.0% of the patients. The rate was 16.67% among older patients and 14.81% among those who were younger. Ambulatory patients had fewer adverse events at 9.38%, while inpatients faced a rate of 20.93%. The average recovery time was 7.41 days, and the mean clinical score improved by 25.22 points, rising from 47.08 to 72.30. The readmission rate was 14.67%, with no recorded deaths. In general, the benefits of quicker recovery and better clinical outcomes outweighed the risks, particularly for ambulatory patients. However, older patients showed a slightly higher risk of negative events. These results support the use of medical devices in post-operative care, with careful attention to patient selection and ongoing monitoring, especially for older patients, to improve the balance of risks and benefits and increase patient safety and outcomes.

**Keywords:** Medical Devices, Adverse effects, Risk-Benefit ratio, Geriatrics

## DUAL THERAPEUTIC STRATEGY FOR ALBINISM: REPIGMENTATION EFFICACY OF BANANA PEEL EXTRACT ENRICHED WITH THYROSINASE AND IMATINIB

A.Gowshigan and Nishala
Department of pharmacology, Dr. M.G.R. University, Thindal, Tamilnadu, India -638012
Gowshigandon143@gmail.com

Albinism is a genetic disorder caused by reduced melanin production, resulting in hypopigmentation of the skin, hair, and eyes. Current treatments are limited, expensive, or carry side effects. This study explored the repigmentation effects of banana peel extract enriched with tyrosinase and the drug Imatinib using Drosophila melanogaster as a model. The banana peel–tyrosinase extract produced strong and sustained repigmentation, likely due to its natural phytochemicals, while Imatinib also showed pigmentation recovery by stimulating melanocyte activity. The banana peel–tyrosinase formulation was more effective overall, making it a safer and more affordable option. Together, natural bioactives and repurposed drugs may provide a new dual therapeutic approach for treating albinism and similar pigmentation disorders.

**Keywords**: Albinism, Banana peel extract, tyrosinase, Imatinib, Repigmentation, Drosophila melanogaster, Hypopigmentation, Dual therapy

## ANTIBIOTIC PRESCRIBING PATTERNS IN A TERTIARY CARE HOSPITAL: A PROSPECTIVE STUDY

Venu Talla, M.Rakshitha
Department of Pharm.D., Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana, India, 500017
mrakshitha1216@gmail.com

Antibiotics are drugs used for treating infections caused by bacteria. Antibiotics are currently the most commonly prescribed drugs in hospitals worldwide. The aim of the study was to analyze the prescribing patterns of antibiotics and to observe the rational use of antibiotics. A prospective study was conducted for a period of 10 months in tertiary care hospital in Hyderabad. Prescriptions containing antibiotics were taken into consideration from patient case sheets who fitted the inclusion criteria. A total of 729 prescriptions with antibiotics were included, majority of the antibiotics prescribed to male patients with 69.5% and females patients with 30.5%. Most of the antibiotics were prescribed between the age group of 19-59. Culture test was done in only 97 prescriptions in that only 61% were positive whereas 39% negative, the most common cultures observed were urine, blood, et secretion, BAL fluid, stool with 51%, 22%, 11%, 8%, and 4%. Most common indications in this study include therapeutic (40.3%), and followed by empirical (36.4%), prophylactic (15.8%) and Unknown (7.5%). Infections that are included are UTI, RTI, and systemic infections. In monotherapy intravenous was the most common prescribed antibiotic was Ceftriaxone (50%), followed by Magnex Forte, Piptaz. In monotherapy oral route, the most common prescribed antibiotic was Augmentin (12%) at a frequency of BID. Present study concludes that the commonly prescribed antibiotics are Cephalosporins 60%, Penicillin 33%, Metronidazole 4%, Fluoroquinolones 2% and Tetracycline 1%. Irrationality of 44.03% was present in prescribing of antibiotics which was found using guidelines as comparison.

**Keywords;** Antibiotic, prescribing patterns, prescriptions, Monotherapy

## A PROSPECTIVE OBSERVATIONAL STUDY ON PRESCRIPTION PATTERN OF DRUGS USED IN POLYCYSTIC OVARIAN SYNDROME AND ITS MULTIDIMENSIONAL IMPACTS ON WOMENS HEALTH

Adhithya P, Ann Mary Shibu, Dhanalakshmi, Munishwara G
Department of Pharmacy practice, Shree Devi College of Pharmacy, Kenjar Mangaluru – 574142.
munishwaragesha@gmail.com

Polycystic Ovary Syndrome (PCOS) is one of the most common endocrine disorders in women of reproductive age, often presenting with irregular menstruation, infertility, obesity, hirsutism, and emotional distress. Understanding drug prescription patterns and their multidimensional impact is crucial for improving treatment outcomes. To investigate the prescription pattern of drugs used in PCOS, evaluate multidimensional impact on women's health, and analyse the cost of therapy. A prospective observational study was conducted over six months among 86 female outpatients aged 12–53 years diagnosed with PCOS at the Gynaecology Department of Indiana Hospital and Heart Institute, Mangalore. Data were collected using a structured data collection form covering patient demographics, medical history, investigations, and details of prescribed drugs including name, class, dose, frequency, route of administration, and cost and PCOSQ 24 questionnaires was used. PCOS was most prevalent among women aged 26–32 and 40–46 years, with all patients presenting with ovarian cysts and/or fibroids. Hormonal medications were the primary choice of therapy, with DUPHASTONE prescribed in 64.28% of cases, followed by CRINA NCR 15 (68.18%) and LETROZOLE, TRAPIC MF, and PAUSE MF were also prescribed. Cost analysis revealed that most prescriptions (39.53%) fell within the ₹500–₹1500 range, while only a minority exceeded ₹3500. 29.06% of patients were emotional weak, 53.48% of patients had hirsutism, 24.41% were obese, 23.25% of patients had infertility problems 44.18% of patients had irregular menstrual cycle. Our study shows that PCOS affects women across ages, especially in their late 20s–30s and early 40s, often lasting for much of life. Many women were overweight and faced additional health issues, with a surprising number reporting urinary tract infection. Beyond medical concerns, participants shared struggles with emotional stress, unwanted hair, irregular cycles, and fertility worries, showing how PCOS impacts daily life, relationships, and self-esteem. Cultural patterns, like high marriage rates, and findings such as increased fibroids, also stood out. Overall, PCOS is a complex condition that requires holistic care addressing physical, emotional, and cultural needs.

**Keywords**: Duphastone, PCOS (polycystic ovarian syndrome), Letrozole.

## PHARMACOTHERAPEUTICS STRATEGIES IN LONG COVID MANAGEMENT

MOUNIKA. P, M. PRASAD RAO
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy,
Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
Mounikapeddineni3@gmail.com

Long COVID, also known as post-acute sequelae of SARS-CoV-2 infection (PASC), has emerged as a global health challenge characterized by persistent symptoms such as fatigue, dyspnoea, neurocognitive dysfunction, myalgia, and cardiovascular complications. The complex and multisystemic nature of long COVID necessitates tailored pharmacotherapeutic strategies to improve patient outcomes. Current evidence suggests that management is primarily symptomatic, focusing on individualized treatment plans. Pharmacological interventions include the use of anti-inflammatory agents, anticoagulants, antihistamines, corticosteroids, and selective antivirals to mitigate ongoing viral activity and immune dysregulation. Additionally, neuromodulators and antidepressants have shown promise in addressing neuropsychiatric manifestations such as brain fog, anxiety, and depression. Emerging strategies target mitochondrial dysfunction and autonomic imbalance through agents like beta-blockers, ivabradine, and nutritional supplements. Immunomodulators and monoclonal

ISBN: 978-81-980623-8-3

antibodies are also being investigated for their role in reducing persistent immune activation. Despite these therapeutic approaches, evidence-based guidelines remain limited, underscoring the need for large-scale randomized controlled trials. Multimodal management, combining pharmacotherapy with lifestyle modifications, physiotherapy, and psychosocial support, is essential to address the heterogeneity of symptoms. A precision medicine approach, guided by biomarkers and patient-specific risk factors, holds the potential to optimize therapy and minimize adverse outcomes. In conclusion, pharmacotherapeutic strategies for long COVID management are evolving, with emphasis on symptom control, immune regulation, and functional recovery. Further research is vital to establish safe, effective, and standardized treatment protocols.

**Keywords:** Long COVID, pharmacotherapy, anti-inflammatory agents, antivirals.

**PL-406**

## CHRONOPHARMACOTHERAPEUTICS: ALIGNING DRUG THERAPY WITH BIOLOGICAL RHYTHMS (APPLICATIONS IN HYPERTENSION, ASTHMA, CANCER THERAPY, AND DIABETES MANAGEMENT)

V. VVN Deepika, Dr. M. Prasada Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
vvndeepika@gmail.com

Chronopharmacotherapeutics, an emerging discipline in pharmaceutical sciences, emphasizes the alignment of drug administration with the body's intrinsic biological rhythms to maximize therapeutic outcomes and minimize adverse effects. The circadiac rhythm, governed by the suprachiasmatic nucleus, influences physiological processes such as hormone secretion, blood pressure, lung function, glucose metabolism, and cell proliferation. In hypertension management, evening or bedtime dosing of certain antihypertensives has shown improved blood pressure control and reduced cardiovascular risk compared to morning dosing. Similarly, asthma symptoms typically worsen during the night or early morning, and chronotherapy with inhaled corticosteroids or bronchodilators enhances symptom relief and lung function during these critical periods. In cancer therapy, chronomodulated chemotherapy leverages circadian-dependent variations in tumor cell proliferation and host tolerance, improving therapeutic index while reducing toxicity. Diabetes management also benefits from chronotherapeutic strategies, as insulin sensitivity and glucose tolerance vary across the day; tailored dosing schedules of antidiabetic agents enhance glycemic control and lower complications. Despite its clinical promise, challenges such as interindividual variability in circadiac rhythms, limited clinical trials, to widespread application. Future research integrating chronobiology, personalized medicine, and digital health tools holds potential to revolutionize treatment paradigms. Chronopharmacotherapeutics thus represents a pivotal step toward precision therapy, offering safer, and more effective and time-optimized management of chronic diseases.

**Keywords**: Chronopharmacotherapeutics, Circadian rhythm, Hypertension, Asthma, Cancer therapy, Diabetes management, Chronotherapy.

**PL-407**

## CENTRAL HISTAMINE COUNTERACT ANTI-COMPULSIVE ACTIVITY OF VERAPAMIL AND AMLODIPINE IN MARBLE-BURYING BEHAVIOUR MICE

Govinda Manglani, Moumita Paul Nishant Sudhir Jain

Obsessive–compulsive disorder (OCD) is a disabling neuropsychiatric condition with limited pharmacological treatments. While serotonergic modulation remains central to therapy, the role of calcium signaling and histaminergic neurotransmission in compulsive behavior requires further exploration. The present study investigated the effects of the calcium channel blockers verapamil and amlodipine, as well as histaminergic agents, in the marble-burying test (MBT) in mice. Intracerebroventricular administration of verapamil (5 or 60 µg/mouse) and amlodipine (10 or 60 µg/mouse) significantly reduced marble burying, suggesting anti-compulsive-like activity. Independent administration of histamine (0.1–10 µg/mouse), its precursor L-histidine (1 or 2.5 µg/mouse), the H3 receptor antagonist/inverse agonist thioperamide (0.5–2 µg/mouse), the H1 agonist FMPH (2 µg/mouse), and the H2 agonist amthamine (0.1–0.5 µg/mouse) also attenuated marble-burying behavior. However, combination studies revealed complex interactions: histamine and thioperamide reversed the anti-compulsive effects of both verapamil and amlodipine, while L-histidine potentiated the effect of verapamil but not amlodipine. Neither FMPH nor amthamine significantly altered CCB-induced responses. These findings indicate that although CCBs and histaminergic agents each independently reduce compulsive-like behavior, their combined actions do not yield synergistic benefits, and in some cases diminish efficacy. The contradictory result suggests that CCBs may attenuate the compulsive-like behavior by decreasing central histamine release, and that enhanced histaminergic tone can counteract their effects. The lack of involvement of H1 and H2 receptors points to a more intricate mechanism, potentially mediated by presynaptic H3 receptors. Overall, this study highlights calcium channel blockade as a potential therapeutic strategy for compulsive behavior and underscores histamine's critical modulatory role.

**Keywords:** Obsessive compulsive disorder; Compulsive-like behavior; Marble-burying test (MBT)

## EVALUATION OF ANTIHYPERLIPIDEMIC ACTIVITY OF ETHANOLIC EXTRACT OF JUSTICIA TRANQUEBARIENSIS LEAVES IN HIGH FAT DIET INDUCED IN WISTAR RATS

KAVANA BM
ADITYA BANGALORE INSTITUTE OF PHARMACY EDUCATION AND RESEARCH

The aim of the current study was to evaluate the antihyperlipidemic activity of ethanolic leaves extract of Justicia tranquebariensis using high fat diet induced in albino Wistar rats. The leaves of the plant Justicia tranquebariensis are one of the richest sources of phytosterols flavonoids that have been shown to possess a variety of biological activities like antioxidant, hepatoprotective, anthelmintic, cardioprotective, antiulcerogenic, bronchial asthma, anti-arthritic and antimicrobial activities. The phytochemical analysis revealed the presence of phytosterols flavonoids compounds. Hence the present research was aimed to study the antihyperlipidemic activity of the ethanolic extract of leaves of Justicia tranquebariensis using high fat diet induced in albino Wistar rat. In the assessment of hyperlipidaemia induced by feeding high fat diet in rats, 30 rats were divided into 5 groups. Group I served as normal control group and Group II disease control group which received only high fat diet (ghee) on 28 days respectively while Group III was the treated group with standard drug (Atorvastatin 10mg/kg, p.o). Group IV and V served as the test groups, which was treated with 200 and 400mg/kg body weight per day of Justicia tranquebariensis, and treatment was given for 28 consecutive days. On the 29th day, blood samples were taken for biochemical estimation. The rats treated with ethanolic extract of leaves of Justicia tranquebariensis showed significant antihyperlipidemic activity induced by high fat diet in rats and rat models as evident by a decrease in elevated levels of serum TG, TC, LDL, VLDL and HDL and calculated statistically to evaluate the antihyperlipidemic effect in high fat diet of Justicia tranquebariensis linn and the high dose 400mg/kg body weight of Justicia tranquebariensis linn was found to be more effective than the low dose 200mg/kg body weight of Justicia tranquebariensis linn. High dose of ethanolic extract of rhizomes of Justicia tranquebariensis linn possess significant antihyperlipidemic activity against high fat diet. Thus, Justicia tranquebariensis linn possess antihyperlipidemic activity induced by high fat diet in rats.

**Keywords:** Justicia tranquebariensis linn, Total Cholesterol, Triglycerides, High Density Lipoproteins, Low density lipoprotein, Very low density lipoprotein.

## A COMPARATIVE STUDY TO ASSESS THE EFFICACY AND SAFETY OF BILASTINE VERSUS FEXOFENADINE FOR TREATMENT OF CHRONIC URTICARIA

S. Megavarsha, Prarthana Upadhyaya,
Swetha Saji and Anjaly Sivakumar
Department of Pharmacy Practice, Krupanidhi College of Pharmacy, Rajiv Gandhi University of Health Sciences, Bangalore, Karnataka, India - 560035.

ISBN: 978-81-980623-8-3

mega13102001@gmail.com

Chronic urticaria is a long-standing skin disorder that is widely treated with second-generation antihistamines, necessitating a comparative analysis of two majorly prescribed antihistamines, bilastine and fexofenadine. The objective of this study was to compare and evaluate the efficacy and safety profile of both the drugs using validated tools such as the Urticaria Activity Score (UAS) and Dermatology Life Quality Index (DLQI), along with the occurrence of established adverse events associated with both the drugs. A prospective observational study was conducted, involving 73 patients diagnosed with chronic urticaria. Each patient was observed for periodic reduction in symptoms over the duration of 4 weeks along with overall quality of life assessment before and after treatment. The primary effectiveness evaluation using UAS revealed a significant reduction in scores over baseline to week 4 in both the treatment groups; however, bilastine consistently produced a greater reduction in UAS at all follow-up intervals, with a statistically significant difference of $p<0.001$. The secondary effectiveness evaluation using DLQI showed notable improvement in quality of life in both categories; however, bilastine showed numerically greater benefit, but the in-between group difference did not reach statistical significance ($p<0.05$). The safety analysis indicated infrequent, mild and even distribution of adverse events in both categories with no statistically significant difference in safety outcomes, suggesting favourable tolerability profiles in both. These results convey preferential use of bilastine for rapid symptom control; however, both drugs improved disease severity and quality of life.

**Keywords**: Chronic Urticaria, Bilastine, Fexofenadine, Urticaria Activity Score, Dermatology Life Quality Index.

## ASSESSMENT REGARDING SLEEPING DISORDERS AND THEIR EFFECTS IN YOUNG ADULTS OF THIS GENERATION

Salma Batthul M, Drishya L, Shaiju S Dharan
Department of pharmacy practice, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Neyyatinkara, Trivandrum, Kerala 695124
salmabattthulm@gmail.com

In the present generation, sleeping disorders are becoming increasingly common due to lifestyle and environmental changes can be occur. Excessive use of smartphones and digital device at night disrupts the circadian rhythm by delaying the melatonin release. Irregular sleep, psychological stress, irregular work schedules it can further disturb the natural sleep cycles. some environmental factors also influence it. Unhealthy lifestyle habits such as intake of excessive caffeine and alcohol use worsen the problem. They cause not only tiredness but also cause serious long term health issues. These factors make the adults leading to fatigue, poor concentration in daily activities, mood disorders may occur, long term risk of cardiovascular and other metabolic disorders. These sleeping disorders can managed by avoid screen time at least 1 hour before bed, maintain a fixed sleep. Stress management therapies like yoga practice, meditation deep breathing or relaxation techniques etc. Insomnia, Apnea , Circadian rhythm disorder, parasomnias these are common sleeping disorders are mainly seen in young adults. The survey highlight that majority of adults suffer from sleeping disorders due to digital life style, stress, irregular habits.

**Keywords:** Sleeping disorders, Stress, Circadian rhythm, Fatigue, Insomnia

## ORGANOIDS IN BIOMEDICAL RESEARCH: EMERGING PLATFORMS FOR DEVELOPMENT, DISEASE MODELING, AND THERAPY

Heera Battu, J Vijaya Ratna
Adikavi Nannaya University College of Pharmaceutical Sciences, Tadepalligudem. A.P 534101
heera.tony@gmail.com

Organoids have emerged as transformative three-dimensional (3D) culture systems that closely recapitulate the architecture and function of human tissues. Derived from pluripotent or adult stem cells, organoids offer unprecedented opportunities to model developmental biology, unravel disease mechanisms, and accelerate translational research. Unlike conventional two-dimensional cell cultures, organoids mimic in vivo microenvironments, allowing researchers to study cellular heterogeneity, stem cell niche dynamics, and organ-level physiology with remarkable fidelity. In disease modeling, organoids have provided insights into cancer progression, infectious diseases, and genetic disorders by enabling patient-specific and genotype-phenotype investigations. Their applications in regenerative medicine are equally promising, where organoid-derived tissues hold potential for transplantation and functional recovery. In drug discovery and personalized medicine, organoids enable high-throughput screening, prediction of patient-specific drug responses, and reduction of animal testing. Furthermore, integration of organoid technology with CRISPR-Cas genome editing, single-cell sequencing, and microfluidics ("organ-on-a-chip") enhances their utility for precision therapeutics. Despite these advances, challenges remain in terms of standardization, scalability, vascularization, and regulatory pathways for clinical translation. Addressing these limitations will be critical to harnessing organoids as reliable platforms for next-generation biomedical research and therapeutic interventions.

**Keywords**: Organoids; Stem cells; Disease modeling; Precision medicine; Drug discovery; Regenerative medicine; 3D culture; Therapeutics

## A PROSPECTIVE OBSERVATIONAL STUDY ON PRESCRIPTION PATTERN OF VARIOUS SKIN DISEASES IN DERMATOLOGY OUTPATIENT DEPARTMENT

MOLMOORI RAJ KUMAR
Government Polytechnic

Healthy and attractive skin plays an important role in most people's self-esteem. Skin diseases, however more common worldwide, research on skin diseases is more crucial than ever. Skin conditions have an impact on people of all ages and their quality of life. The prevalence of skin disorders has made it necessary to conduct prescription evaluations of medications in order to maximize therapeutic efficacy and minimize side effects. Evaluating the drug prescription trend was the study& goal. Evaluation of prescribing patterns is one of the key tools for encouraging the responsible use of medications. A prospective and observational study was conducted over a period of 6 months in a tertiary care hospital in Dermatology Department at Prathima Institute of Medical Science. Data was collected through data collection form which includes demographic details of patient, symptoms, diagnosis and prescription pattern in this study, we studied about prescribing pattern analysis of Various drugs given to Various Skin Diseases. A total number of 150 patients out of which were 67 males and 83 were females. The most common disease pattern seen in patients was primarily Tinea 28% followed by Scabies 13.33%, Dermatitis 9.33%, psoriasis 9.33%, Urticaria 6%. Female patients are mostly affected with Tinea infections, Urticaria, Xerosis, Acne comparing to Male patients. Male patients are mostly affected with Psoriasis and Scabies compared to female patients. The most common Prescription pattern seen in patients was primarily Antihistamines 31.08% followed by Antifungal 20.46%, Corticosteroids 12.40%, antibiotics 5.44%, Antiscabicides 5.18%. Female patients are mostly prescribed comparing to male patients. In the end, a drug utilization study can be a useful tool in promoting rational and economical drug prescription practices. From our study we found out that tinea (28%) and Scabies (13.33%) were more common in this region and Antihistamines were most commonly prescribed group of drugs (31.08%).

## EVALUATION OF ANTIFUNGAL EFFECT BY SYNERGISTIC ACTIVITY OF ITRACONAZOLE AND TITHONIA DIVERSIFOLIA PLANT EXTRACT IN DIABETIC MICE MODEL.

Shreyas, Prasanna Shama Khandige
Department of Pharmacology, NGSM Institute of Pharmaceutical Sciences (NGSMIPS), Nitte (Deemed to be University), Mangalore-575018, Karnataka, India
prasannasham@nitte.edu.in

The present study was carried out to evaluate the efficacy on Evaluation of antifungal effect by synergistic activity of Itraconazole and Tithonia diversifolia plant extract in diabetic mice model. A preliminary

ISBN: 978-81-980623-8-3

phytochemical test of leaf extract was performed. Swiss Albino mice were used, and streptozotocin was given to induce diabetes. Mice were inoculated by placing cotton wool balls saturated with the suspension of Candida albicans sublingually. Leaf extract and Itraconazole were given orally for 14 days at a 3:1 ratio. The synergistic antifungal activities were studied by using a diabetic mice model and histo pathological studies. The zone of inhibition and MIC level of the fungus were assessed. The ethanolic leaf extract of Tithonia diversifolia and Itraconazole with a dose of 3:1 ratio demonstrated a substantial dose-dependent recoverywith a decrease in transfer latency and an increase in percentage changes compared to the illness and control groups. The antifungal activities in terms of MICs of Itraconazole, extract, Itraconazole in combination, and extract in combination were (1.442, 8.336, 0.690, and 2.344) mg/ml respectively. The combination showed synergetic activity as illustrated by the FIC index of 0.759. Based on the present study results it may be concluded that the ethanolic leaf extract of Tithonia diversifolia and Itraconazole has significant antifungal activity.

**Keywords**: Antifungal, Microbial Inhibitory concentration, Itraconazole Inhibition concentration

**PL-414**

## EVALUATION OF SYNERGISTIC ANTIFUNGAL ACTIVITY OF FLUCONAZOLE AND CASSIA TORA LEAF EXTRACT IN DIABETIC MOUSE MODEL INDUCED WITH CANDIDA ALBICANS

Kiran K Nayak, Prasanna Shama Khandige*
Department of Pharmacology, NGSM Institute of Pharmaceutical Sciences (NGSMIPS), Nitte (Deemed to be University), Mangalore-575018, Karnataka, India
prasannasham@nitte.edu.in

Oral candidiasis is a prevalent and manageable oral mucosal infection that is commonly observed in individuals with diabetes and HIV infection or acquired immune deficiency syndrome (AIDS). The current study was conducted to evaluate the synergistic antifungal activity of fluconazole and cassia tora leaf extract in diabetic mouse model induced with candida albicans. Swiss Albino mice were used, where streptozotocin was given to induce diabetes. Mice were inoculated by placing cotton wool balls saturated with suspension of Candida albicans sublingually. Leaf extract and fluconazole were given orally for 14 days at a 3:1 ratio. The synergistic antifungal activities were studied by using diabetic mice model and Cell viability %. A minimum inhibitory concentration (MIC) and FICI of leaf extract and the medication fluconazole was determined by In- vitro tests. The ethanolic leaf extract (ELE) of Cassia tora (CT) and fluconazole with a dose of 500 mg/kg + 3.3mg/kg, and 1000 mg/kg + 9.9 mg/kg in 3:1 ratio demonstrated a substantial dose dependent recovery with a decrease in transfer latency and an increase in percentage changes compared to the illness and control groups. Therefore, the study concludes that the ELE of CS and FZ has significant synergistic antifungal activity.

**Keywords**: Oral candidiasis, Cassia tora leaf extract, fluconazole, streptozotocin, candida albicans

## ASSESSMENT OF DRUG USE EVALUATION IN MYOCARDIAL INFARCTION IN A TERTIARY CARE HOSPITAL

A. Prakash, Santhosh M Mathews, S. Ravindran
Department Of Pharmacology, Pushpagiri College of Pharmacy, Thiruvalla, Kerala
apcology@gmail.com

Myocardial infarction (MI) is a major cause of death and disability worldwide. The risk of acute MI increases progressively throughout life. The study aimed to assess the current practice patterns in pharmacotherapy for myocardial infarction in adult patients and the effect of patient related variables on the treatment and patient outcome. The present study of 105 patients during the period of December 2024 to May 2025 indicates that a majority of the patients who were admitted with MI were males (70.48%). The mean age of the study population was 54.34±12.4 years. The major risk factor was hyperlipidaemia with an occurrence of 33.33%. The majority of patients suffered with inferior wall MI. Left ventricular dysfunction (44.76%) was the major co-morbidity in this study. The drug usage pattern was antiplatelets 98.10%, statins 98.10%, aspirin 97.14%, thrombolytics 53.33%, anticoagulants 95.24%, beta blockers85.71%, ACE inhibitors 68.57%, calcium channel blockers 14.29% and nitrates were 38.10% of patients. Men are highly affected than the women. Hyperlipidemia and smoking was the major risk factors of MI. Most of the patients were affected by infarction of inferior wall of coronary artery. In this study the mortality rate is found to be 1.90% so patient care is an important factor in reducing mortality and also in improving the outcome of MI patients.

**Keywords:** Myocardial infraction, Hypertension, Antiplatelets, Statins

## MOLECULAR MARKERS BASED IDENTIFICATION AND DIVERSITY ASSESSMENT OF WITHANIA CULTIVARS WITH COMPARATIVE ASSESSMENT OF PHARMACOLOGICAL ACTIVITY

Rakhi Khabiya and G.P. Choudhary
School of Pharmacy & Technology Management, Shri Vile Parle Kelavani Mandal's, Narsee Monjee Institute of Management Studies (NMIMS), Indore, Madhya Pradesh, India-453112
rakhikhabiya@gmail.com

The genetic diversity among five commercially released cultivars of Withania somifera (JA-20, JA-134, RVA-100, Poshita and Pushti) was evaluated and correlated with phytochemical and therapeutic potential to identify the elite variety that can be utilized in pharmaceutical and nutraceuticals.The genetic diversity was analyzed in 21 accessions using ten sets of each RAPD **and** ISSR primers. RAPD produced 108 polymorphic bands (90%) with an average of 13.33 bands/primer, while ISSR generated 83 (76.14%) averaging 12.11 bands/primer. The mean PIC values were 0.734 (RAPD) and 0.693 (ISSR), indicated high marker informativeness. UPGMA divided 21 accessions into two major clusters with JA-20 forming a separate cluster, showing significant genetic diversity. Total Withanolide content in hydro alcoholic root extracts quantified using reverse phase HPLC (acetonitrile (40%) and 0.1% acetic acid in water (60%) in isocratic mode as mobile phase at 230 nm), followed order of JA-20>Poshita>Pushti>JA-134>RVA-100. Extracts exhibited notable morphological difference in THP-1 cells, especially JA-20 followed by Poshita and Pushti; and suppressed LPS-induced IL-12, IL-23 and TNF-α expression and significantly reduced serum IL-1β and TNF-α while improved 96-h survival in mice. In silico analysis showed that Withanolides inhibit the TIRAP–BTK–PKCδ interaction, thereby attenuating LPS-induced inflammation. These findings establish that molecular marker techniques are appropriate for studying genetic diversity, with JA-20 as the most elite variety forming a distinct cluster, showing highest Withanolides and anti-inflammatory activity through upstream inhibition of TIRAP–BTK–PKCδ interaction establishing the mechanism of action**.**

**Keywords:** Cultivars, Withanolides, TIRAP, Withania, genetic diversity, RAPD, ISSR.

**PL-417**

## PHARMACOLOGICAL EVALUATION OF CITRUS FRUIT JUICES AGAINST UV-INDUCED PSORIASIS IN RATS: ROLE OF PDE4 AND ANTIOXIDANT ENZYMES

Shilpa Deshpande*, Apurwa Ikhankar, Gopal Sahu
Department of Pharmacology, Priyadarshini J. L. College of Pharmacy, Electronic Zone Building, MIDC, Hingna Road, Nagpur-
s.deshpande@pjlcp.edu.in

Psoriasis is a chronic autoimmune inflammatory disorder marked by keratinocyte hyperproliferation, immune dysregulation, and oxidative stress. Excessive reactive oxygen species (ROS) generation disrupts antioxidant defence, leading to lipid peroxidation and cytokine release, while overactivation of phosphodiesterase-4 (PDE4) lowers intracellular cAMP, amplifying inflammation. Targeting oxidative stress enzymes and PDE4 signalling thus represents a promising therapeutic approach to manage psoriasis like condition. This study investigated the anti-psoriatic effects of Citrus sinensis (orange) and Citrus limon (lemon) juices in UV-induced psoriasis rat model. Molecular docking of citrus phytoconstituents like Hesperidin and Naringenin displayed the high and favourable affinity for PDE4 (-12.3 and -9.2 kcal/mol) compared to standard ligands (-9.7 kcal/mol), supporting its role in attenuating PDE4-mediated cAMP degradation and subsequent pro-inflammatory cascades. In vivo, UV exposure significantly elevated PASI scores (3.33 ± 0.52), hydroxyproline (0.90 ± 0.01 µg/50 mg tissue), malondialdehyde (281.0 ± 1.77 nmol/mg protein), WBC count (31,158 ± 675.3 cells/mm$^3$),

ISBN: 978-81-980623-8-3

and CRP (1.32 ± 0.02 µg/ml), while catalase activity declined (0.83 ± 0.01 nmol $H_2O_2$). Citrus juice treatment reversed these changes, with the orange-lemon combination showing the greatest effect: PASI 1.50 ± 0.55, hydroxyproline 0.29 ± 0.02, catalase 2.15 ± 0.03, MDA 119.7 ± 2.21, WBC 16,373 ± 404.1, and CRP 0.42 ± 0.02. Histopathology confirmed normalization of epidermal structure. In conclusion, citrus juices, particularly the orange-lemon combination, exerted strong anti-psoriatic activity by restoring antioxidant enzymes and inhibiting PDE4 signalling. Their dual action on oxidative stress and PDE4-driven inflammation highlights their potential as safe, natural adjuncts in psoriasis management.

**Keywords:** Psoriasis, Hesperidin, Naringenin, UV-induced psoriasis model, PDE4, Oxidative stress

## ECOPHARMACOVIGILANCE: TOWARD A GLOBAL REGULATORY FRAMEWORK

Ketan Gode and Sangamesh Puranik
Department of Pharmacy, Vikrant University, Gwalior, Madhya Pradesh, India - 474006.

Pharmaceuticals, while essential for human and animal health, are increasingly recognized as emerging environmental contaminants. The persistence of active pharmaceutical ingredients (APIs) in soil, surface water, and drinking water has raised concerns regarding ecological toxicity, antimicrobial resistance, and potential long-term risks to human health. Ecopharmacovigilance (EPV), defined as the science and activities relating to the detection, assessment, understanding, and prevention of adverse environmental effects of pharmaceuticals, has emerged as a critical component of sustainable healthcare. Despite growing awareness, global regulatory approaches to EPV remain fragmented, with considerable variation in monitoring, risk assessment, and mitigation strategies. The European Union has integrated environmental risk assessments into the marketing authorization process, while other regions rely on limited or voluntary guidelines. However, the absence of a harmonized global framework hinders effective management of pharmaceutical residues across borders. This study examines the existing regulatory landscape and proposes the development of a unified EPV framework emphasizing three pillars: (1) Risk Assessment and Monitoring – strengthening environmental surveillance systems for APIs; (2) Regulatory Harmonization – aligning international guidelines to ensure consistent risk evaluation and control; and (3) Stakeholder Engagement – fostering collaboration among regulatory agencies, pharmaceutical industries, healthcare providers, and the public. A globally coordinated EPV framework would not only mitigate environmental hazards but also enhance pharmaceutical stewardship, safeguard ecosystems, and support the United Nations Sustainable Development Goals (SDGs). Advancing such a framework is vital to address the complex intersection of pharmaceuticals, environment, and public health.

## Nutritional Intervention with HG and FG Seeds in Pre-Diabetes: Evidence from a Wistar Rat Model

Sai Priya, Sarika Joga
Sarojini Naidu Vanita Pharmacyu Maha Vidyalaya, Tarnaka, Hyderabad, Telangana, India, 500017

The present study investigates the effects of a high-fat high-sugar (HFHS) diet-induced pre-diabetic model in Wistar rats and evaluates the potential of HG and FG seeds as dietary supplements in preventing the progression of pre-diabetes to diabetes. Pre-diabetes was successfully induced in rats using an HFHS diet, leading to key physiological alterations such as elevated fasting blood glucose (FBG), abnormal lipid profiles, and impaired glucose tolerance observed during the oral glucose tolerance test (OGTT). These changes closely mimic the clinical and pathophysiological characteristics of human pre-diabetic conditions, validating this model as a reliable tool for testing antidiabetic interventions. Supplementation with HG and FG seeds produced significant improvements in glucose metabolism and lipid parameters in pre-diabetic rats. Regular consumption of these seeds lowered FBG levels, improved lipid profiles, and enhanced glucose tolerance. These findings suggest that HG and FG seeds may play a beneficial role in modulating insulin sensitivity and supporting overall metabolic health. In conclusion, this study supports the efficacy of the HFHS diet-induced pre-diabetic model and highlights the therapeutic potential of HG and FG seeds as natural, food-based interventions to delay or prevent the onset of type 2 diabetes. Further research into the bioactive compounds of these seeds and their mechanisms of action could provide deeper insights. Incorporating such functional foods into daily diets may represent a cost-effective and accessible strategy for diabetes prevention.

**Keywords:** Pre-diabetes, High-fat high-sugar (HFHS) diet, Wistar rats, HG and FG seeds, Type 2 diabetes prevention.

## CASE STUDY ON CELLULITIS IN 60 YEARS MALE: DIAGNOSIS, MANAGEMENT AND PATIENT COUNCELLING

Hemavathi balija, Saranya Bhavanasi
Pharmaceutical Therapeutics Division, Jagans Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh, India
shettysomshekar82@gmail.com

Cellulitis is a common bacterial skin and soft tissue infection characterized by localized erythema, swelling, warmth, and tenderness. It is often caused by Streptococcus pyogenes or Staphylococcus aureus and may lead to systemic complications if untreated. We present the case of a 50-year-old male with painful swelling and redness over the left lower limb for five days, associated with fever and malaise. Clinical examination revealed diffuse erythema, edema, and tenderness. Laboratory investigations showed leukocytosis and elevated CRP. The patient was treated with intravenous antibiotics, analgesics, and supportive care, leading to gradual resolution of symptoms. This case highlights the importance of prompt recognition, appropriate antimicrobial therapy, and supportive management to prevent complications and ensure complete recovery.

## KNOWLEDGE, ATTITUDE AND PRACTICE TOWARDS THE USE OF VITAMINS AND DIETARY SUPPLEMENTS AMONG GERIATRIC POPULATION

Meghna R, Drishya L, Shaiju S Dharan
Department of pharmacy practice, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Neyyatinkara, Trivandrum, Kerala 695124
meghna.rndl@gmail.com

The research was done in relation with the beneficial effects that older adults get while administering vitamins and supplements. Vitamins and supplements are widely used among the population irrespective of the age category. Here, the research is based on intake in older adults as they comes under the category who needs regular supplements for the maintenance of their health, for energy boosting and to prevent diseased conditions. A wide range of usage of vitamins and supplements are seen in older adults, mainly multivitamins which is more commonly consumed among the population.The beneficial effects are a lot more as they lack vitamins as well as other nutritional supplements due to the poor absorption of these elements from the diet they consume. The supplements to be given differ from person to person based on their health and lifestyle and it should be taken special care while prescribing supplements in order to prevent its misuse. A survey is taken in order to understand about the usage of the same among older population. The study concludes that the intake of vitamins and supplements in older adults are having a great prevalence in the current era with beneficial effects of it.

**Keywords:** Vitamins, Supplements, Older Adults, Beneficial effects.

## EVALUATE THE SYNERGISTIC EFFECT OF ROSMARINIC ACID & QUERCETIN FOR PAIN MANAGEMENT

Harinee Murugesan, Dr. M. Anvesh Raj, R. Mouleeswaran
Department of Pharmacology, Vivekananda Pharmacy College for Women, Sankari, Salem (D. T), Tamil Nadu, India
harineemurugesan2003@gmail.com

ISBN: 978-81-980623-8-3

Pain is a physical discomfort ranging from mild to severe usually caused by injury, illness or nerve condition. Pain may arise from wide range of causes, categorized broadly into injuries, diseases and functional pain syndromes. Pain categorized into acute, chronic, neuropathic and nociceptive. It can be managed by various forms of combination with major side effects. So, the synergistic effect of Rosmarinic acid and quercetin can improve the pain relief effect, wound healing specially for chronic pain. Rosmarinic acid from Basil (Ocimum basilicum), Indian Borage (Plectranthus amboinicus), these are mainly from Lamiaceae family. It inhibits COX-2, LOX, and pro-inflammatory cytokines (TNF-α, IL-1β) and reduces inflammation around the wound, preventing excessive swelling and pain. Also inhibits the growth of bacteria and fungi at the wound site, lowering the risk of infection. Quercetin is a flavonoid from Allium cepa (Amaryllidaceae), Phyllanthus Nuri (Phyllanthaceae). It inhibits enzymes like cyclooxygenase (COX) and lipoxygenase, which are involved in inflammation, reduces levels of pro-inflammatory cytokines such as TNF-α, IL-6, and IL-1β. Influences pathways involved in nociception (pain perception), potentially providing relief in conditions like joint pain or muscle soreness. Also exhibits antibacterial, antiviral, and antifungal effects, inhibit the growth of certain pathogens, reducing infection risks.

**Keywords:** Pain management, synergistic effect, Rosmarinic acid, Quercetin

**PL-423**

## A COMPARATIVE STUDY BETWEEN THE EFFICACY OF CLOMIPHENE CITRATE AND LETROZOLE FOR THE INDUCTION OF OVULATION IN PATIENTS WITH PCOD AND PRIMARY INFERTILITY

Dr. FALAK NAAZ
Department of Pharmacology, Browns College of Pharmacy, Ammapalem (V), Khammam

Polycystic ovarian disease (pcod) is a leading cause of infertility largely due to an ovulation. two common drugs, clomiphene citrate(cc) and letrozole, are used to induce ovulation, but their comparative effectiveness remains a topic of debate. The aim of study was to evaluate and compare their outcomes in women with PCOD and primary infertility. Women diagnosed with infertility related to PCOD and prescribed either CC or letrozole were included. Data were collected using a predesigned form that recorded demographics, diagnosis, endometrial finding and treatment outcomes .out of 432 women who visited the study site,200 were analyzed for efficacy of the two drugs. Endometrial thickness at the time of ovulation was greater with letrozole (8.95 0.84mm) compared to CC (6.17 0.74mm).The mean number of mature follicles ( 18mm) was higher in the CC group (1.64 0.9) than with letrozole (1.23 0.61).However, ovulation and pregnancy rates were better with letrozole (84.7% and 65.8%) compared to CC (79.1% and 51.3%) Importantly, letrozole promoted more frequent mono-ovulation, lowering the risk of multiple pregnancies. Our findings suggest that letrozole is more effective than clomiphene citrate in improving ovulation and pregnancy rates in women with PCOD and primary infertility.it also provides a safer profile where single follicle development is preferred. Letrozole may therefore be considered the first-line option for ovulation induction in this patient group.

**Keywords:** PCOD, Infertility, Ovulation induction, Clomiphene citrate, Letrozole

**PL-424**

## LEVEL OF ADHERENCE AND PRESCRIBING PATTERN OF GLAUCOMA MEDICATION AMONG GLAUCOMA PATIENTS IN LAMAHI EYE HOSPITAL, NEPAL: A CROSS-SECTIONAL STUDY.

Avil Gautam1, Anil Kumar Sah1, Shailesh Mani Pokharel2, Anil Gorkhalyl 3, Kadir Alam4 Shashikala Jagadeesh Tippimani5
1Department of Pharmacy, Purbanchal University School of Health Sciences, Purbanchal University, Morang, Nepal
2Purbanchal University Faculty of Medical and Allied Sciences, Purbanchal University, Morang, Nepal
3Eye Care Foundation, Kathmandu, Nepal
4Department of Clinical Pharmacology and Therapeutics and Chief Pharmaceutical Services, B.P. Koirala Institute of Health Sciences, Sunsari, Nepal
5L.J. Institute of Pharmacy, Ahmedabad, India

Glaucoma is chronic eye disease characterized by progressive optic nerve damage leading to permanent visual impairment and blindness when left untreated early. Adherence to antiglaucoma medications is a key component to slow the progression of disease. Poor adherence to medication can lead to progressive optic nerve damage and deterioration of the visual field. On the other hand, prescribing pattern involves monitoring, evaluation and necessary modifications in the prescribing practices of the prescribers to achieve rational and cost-effective medical care. The study assessed medication adherence and prescribing pattern of glaucoma medication among glaucoma patients. A three-month cross-sectional study was conducted involving 379 eligible candidates in the outpatient department. Before starting the data collection, the researcher took the written inform consent from the patients who were willing to participate in the study. Pertinent data were collected from patient case sheets and patient interviews.Patients were assisted, where required, in completing the questionnaires. A structured close-ended questionnaire was designed to obtain information on patient socio-demographic data, prescription pattern and clinical characteristics. The medication adherence was measured by using Nepali version of 8 items Morisky Medication Adherence Scale (MMAS-8) (© 2007 Donald E. Morisky). The eight questionnaires were exploring the various aspects of adherence behavior, including forgetfulness, altering medication without consultation, and other factors influencing medication compliance. Of the 379 eligible patients, about (37.5%) had high, (36.1%) had medium and (26.4%) had low adherence to antiglaucoma medication. Overall adherence level to the antiglaucoma medication, as found in our study was (73.6 %). The most therapeutic categories of drugs prescribed in glaucoma patients were ANS (69.1%) followed by autacoids (21.1%) and diuretic (4.6%) drugs. Similarly, the common class of prescribed medication for glaucoma patients were β-blockers (37.6%) followed by α- agonist (35.5%) and prostaglandin analogues (21.9%). Logistic regression analysis showed that patients without comorbidity were more likely to adhere to glaucoma medication with an adjusted odds ratio of 1.718 (1.054-2.802) and a p-value < 0.05. The adherence level to the prescribed antiglaucoma medications was found to be sub-optimal according to the MMAS-8, and influenced by comorbidity. Beta blockers remain the foremost prescribed drug for the treatment of glaucoma.

**Keywords:** Adherence level, prescribing pattern, Glaucoma, Antiglaucoma medication

## A CASE STUDY ON CHRONIC PANCREATITIS: CLINICAL PRESENTATION, MANAGEMENT AND PATIENT COUNSELLING

Moulika Bandhila, Archana Dasari, Saranya Bhavanasi
Pharmacy Practice, Jagans Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh, India.
Moulikabandhilamoulimouli@gmail.com

Pancreatitis is a progressive inflammatory disorder of the pancreas that results in permanent structural damage and impaired function. It is characterized by recurrent episodes of severe abdominal pain, digestive disturbances, and systemic complications. This case study presents a 40-year-old male patient admitted with fever, dry cough, vomiting, and abdominal pain. His medical history included type 2 diabetes mellitus for 10 years and pulmonary tuberculosis for 2 years. Clinical findings revealed elevated pulse rate, fever, and abnormal appetite and sleep patterns. Diagnostic evaluation confirmed chronic pancreatitis. The patient was managed with antibiotics, analgesics, antiemetics, proton pump inhibitors, and supportive care. Patient counselling emphasized strict avoidance of alcohol, adherence to prescribed medications, and lifestyle modifications including low-fat diet. This case highlights the importance of early diagnosis, appropriate pharmacological management, and continuous monitoring to prevent complications such as malnutrition, infections, and pancreatic cancer.

**Keywords**: Chronic pancreatitis, case study, abdominal pain, diabetes mellitus, pulmonary tuberculosis, pharmacological management, patient counselling, complications, alcohol avoidance, low-fat diet.

## EFFECT OF DOSE AND FREQUENCY OF ADMINISTRATION OF PHENYLHYDRAZINE ON DURATION OF ANEMIA IN RATS

S. Jyothirmai Bai, Sarika Joga, Ruchita Pothuganti
jyothirmaibaisarode@gmail.com

ISBN: 978-81-980623-8-3

Anaemia is a condition in which the number of red blood cells or their oxygen-carrying capacity is insufficient to meet physiological needs in human body. Anaemia is a global public health problem affecting both developing and developed countries with major consequences for human health. In the world population about 1.62 billion people are affected by anaemia. The main objective is to estimate the spontaneous recovery of anemia and duration of anemia by differential dose administration and frequency of administration. Rats weighing about 200-250g were used. Animals were divided into 5 groups (n=6). Group 1 (Anemic Control) – Received single dose of PHZ (40mg/kg i.p) with maintenance dose of 20 mg/kg on every 7th day of the week throughout the study. Group 2(Anemic Control) - Received PHZ (40mg/kg i.p) for 2 days. Group 3(Anemic Control) – Received single dose of PHZ (80mg/kg i.p). Group 4(Anemic Control) - Received PHZ (60mg/kg i.p) for 2 days. Group 5 (Anemic Control) - Received PHZ (40mg/kg i.p) for 4 days. In the present study administration of Phenylhydrazine at various doses has significantly decreased RBC count, Heamoglobin, Heamatocrit levels, MCH, MCHC and increased MCV on day 2/3 when compared to day 0 indicating successful induction of anemia. However on 14th day the values have returned to normal values in group 1(40mg/kg i.p + 20mg/kg i.p) and group 2 (40mg/kg i.p 2 days) indicating spontaneous recovery from the anaemia where as in group 3 (80mg/kg single dose) the values have not returned to normal values indicating the sustainment of anaemia till 14 days and further study need to be done. Phenylhydrazine induced anemia is an effective model to study and evaluate various new therapeutic modalities. Experimental models on wistar rats is a suitable model for the study of anemia.

**Keywords:** Phenylhydrazine, Anemia

**PL-427**

## GENE THERAPY IN RARE DISEASE

K. Nagendar, Dr. M. Prasada Rao
Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
k.nagendar2005@gmail.com

Gene therapy has emerged as a transformative approach for the treatment of rare diseases, many of which are caused by single-gene mutations. Conventional therapeutic strategies often provide only symptomatic relief without addressing the underlying genetic defect. In contrast, gene therapy aims to correct or replace the faulty gene, offering the potential for long-term or even curative outcomes. Advances in molecular biology, viral vector engineering, and genome editing technologies such as CRISPR-Cas9 have significantly accelerated the development of gene-based treatments. Clinical trials in conditions like spinal muscular atrophy, haemophilia, and certain inherited retinal disorders have demonstrated encouraging results, highlighting the promise of gene therapy to alter the natural course of disease. Furthermore, the use of adeno-associated viral vectors and lentiviral systems has improved the safety and efficacy of gene delivery. Despite these advances, challenges remain in terms of high treatment costs, immune responses to vectors, durability of therapeutic effects, and ethical considerations surrounding genetic modification. Regulatory frameworks and long-term follow-up studies are essential to ensure patient safety and establish evidence-based standards for clinical application. Multidisciplinary collaboration among researchers, clinicians, and policymakers is crucial for expanding accessibility and ensuring equitable distribution of gene therapy for rare disease populations. Overall, gene therapy represents a paradigm shift in modern medicine, holding immense potential to provide life-changing solutions for patients with otherwise untreatable genetic disorders.

## DEVELOPMENT AND EVALUATION OF NOVEL MODEL FOR ANXIETY

Atharva Dangore1, Sandip R. Rahangdale1, Milind J. Umekar1
1Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India
dangoreatharva@gmail.com

Current anxiety tests enable to provide a pure and complete picture of an animal's emotional profile individually. There is a need to develop an integrated model to assess the wide range of anxiety related parameter. In present study we designed and construct a new model known as light and dark elevated plus maze (LD-EPM) which is an integration of elevated plus maze (EPM) and light and dark box and investigate the potential usefulness of this integrated model to assess the wider range of emotional and non-emotional behaviours within one trial. A protocol was developed in which rats could freely explore for 5 min to a new model LD-EPM. Classical behaviours related to anxiety like number of entries and time spent into the different arm was measured. Administration of anxiolytic agent nicotine (1 mg/kg ip) shows significant increase in the number of entries as well as time spent in the light open arm as compare to the saline treated animals. However, the number of entries and time spent in the other arms like dark open arm, light closed arm and dark closed arm was not significantly changed. The result of present study shows that this new integrated model gives more refined and structured data in anxiety test. In conclusion, this integrated model LD-EPM will be able to give more better, clear and refined results for anxiolytic drug and will be used to assess anxiety in rodent's for future preclinical trials.

**Keywords:** Anxiety, EPM, Light and dark model

## EFFECT OF COIX LACRYMA-JOBI DERIVED STARCH ON HIGH FAT DIET INDUCED HYPERLIPIDEMIA

Vedant Bhusari1, Sandip R. Rahangdale1, Milind J. Umekar1
1Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India
vedantbhusari30@gmail.com

High fat diet consumption altered the lipid profile may leads to several complications. Abrupt body weight gain, hyperglycemia and altered lipid profile was observed in HFD rats. Alteration of these parameters for longer period of time may leads to several health-related complications like hypertension, congestive heart failure, atherosclerosis, etc. Expenditure on drugs for these complications is increased day by day due to chronic treatment which may also have several side effects. Healthy dietary habits may provide some beneficial effect in these complications. Present study provides the useful insight on the effect of starch derived from Adlay seed on HFD induced complications. The high fat diet was given regularly for about 4 weeks and on 5th and 6th the carbohydrates of high fat diet was replaced with starch and this starch containing diet was given to animals. The body weight was measured. For the examination of the Triglycerides level, Cholesterol, HDL-C, LDL-C level, the rats were kept on fasting for about 12-14 hours. The results of the present study shows that Adlay starch revert the changes in lipid profile (Triglycerides, LDL, Cholesterol, HDL), blood glucose level and obesity (body weight gain) caused due to HFD. However, earlier study proves the effect of Adlay seed extract on lipid profile but we represent first time the effect of Adlay seed derived starch on these parameters. Study signifies the role of Coix lacryma-jobi derived starch on high fat diet induced hyperlipidemia and hyperglycemia which implicates that inclusion of such kind of starch in diet may provide the beneficial effect on human health and may be responsible for the maintaining the lipid and sugar profile normal irrespective of their consumed diet (HFD). In conclusion, Coix lacryma-jobi derived starch have potential to revert the changes in lipid profile and blood glucose level due to HFD. Inclusion of adlay seed starch in diet may be helpful in maintaining the lipid and glucose profile.

**Keywords:** Coix lacryma-jobi, HFD, Hyperlipidemia,

## WOUND HEALING EFFICACY OF STRYCHNOS NUXVOMICA SEED GEL IN EXPERIMENTAL MODELS

Pallavi Sidar1,2, Parag Jain1,2 Ajazuddin1,2
Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh, INDIA-490023
Department of Pharmacy, Rungta International Skill University, Kohka, Kurud Road, Bhilai, INDIA-490023
sidarpallavi623@gmail.com

The polyphenolic fraction of Strychnos nux-vomica seeds was prepared by soxhlet extraction with ethanol and formulated into a 5% w/w hydrogel using carbopol 934 as the gelling agent. The gel was topically applied to excision and incision wounds made in Wistar rats (n = 6 per

ISBN: 978-81-980623-8-3

group), with untreated and vehicle gel groups as controls. The treated group showed 92.6% wound contraction on day 14 compared with controls. Time for epithelialization was significantly shortened to 13.2 ± 0.4 days versus 17.6 ± 0.6 days in controls ($p < 0.01$). Histological examination revealed enhanced granulation tissue formation, neovascularization, and re-epithelialization. Compared with the control group (276.5 ± 12.4 g), the gel treatment also increased collagen cross-linking and maturation, as indicated by higher tensile strength (412.3 ± 15.8 g, $p < 0.01$). Phytochemical screening confirmed the presence of alkaloids (strychnine, brucine), flavonoids, tannins, and saponins, which are involved in modulating inflammatory mediators, stimulating fibroblast growth, and promoting matrix production. Thus, the study concludes that the methanolic extract of Strychnos nux-vomica seed gel significantly potentiates wound healing activity in vivo by enhancing wound contraction, reducing epithelialization period, and increasing tensile strength. However, detoxification and careful dose formulation are essential for translational use due to the inherent alkaloid toxicity.

**Keywords**: Strychnos nux-vomica, Excision model, Incision model, Polyphenolic gel, Skin tensile strength

## PHARMACOVIGILANCE AND DRUG SAFETY

KUNJA. APARANJINI, CH. SANDHYA RANI
VIKAS INSTITUTE OF PHARMACEUTICAL SCIENCES Nidigatla Road, Near Airport Rajahmundry,
E.G Dist. AP - 533102
aparanjinikunja@gmail.com

Pharmacovigilance (PV) and drug safety have emerged as critical pillars in modern healthcare, ensuring the safe and rational use of medicines while protecting public health. With the rapid growth of pharmaceuticals, biologics, and advanced therapies, the need for robust pharmacovigilance systems has become more significant than ever. Traditional PV practices— centered on adverse drug reaction (ADR) reporting—are now evolving to include real-world data integration, patient-centric monitoring, and global regulatory harmonization. The present work explores new curriculum and emerging aspects in pharmacovigilance and drug safety, designed to address the dynamic challenges of modern therapy. The curriculum emphasizes multidisciplinary learning by combining regulatory science, pharmacoepidemiology, risk management, digital health, and big-data analytics. A major focus is given to the use of artificial intelligence (AI), machine learning (ML), and predictive modeling for signal detection and risk assessment. Additionally, real-world evidence (RWE), patient-reported outcomes, and post-marketing surveillance studies are incorporated to strengthen decision-making in clinical practice. Novel aspects include the integration of pharmacogenomics to identify genetic predispositions to ADRs, global pharmacovigilance frameworks to ensure harmonized reporting across regions, and proactive safety monitoring of advanced modalities such as biosimilars, gene therapies, and personalized medicines. Furthermore, the curriculum introduces practical training in digital reporting platforms, social media monitoring, and mobile health technologies to capture patient experiences in real time. This forward-looking approach not only enhances the scientific foundation of PV but also prepares future professionals to adapt to evolving regulatory landscapes, technological advancements, and patient expectations. By aligning education with innovation, pharmacovigilance can progress from a reactive process of ADR collection to a proactive discipline of predictive safety, ultimately contributing to safer therapeutics and improved global health outcomes.

**Keywords**: Pharmacovigilance (PV), Drug safety, Adverse drug reactions (ADR), Real-world evidence.

## EXPLORING THE PROTECTIVE PROPERTY OF PITHECELLOBIUM DULCE LEAVES EXTRACT AGAINST ISOPROTERENOL INDUCED MYOCARDIAL INFARCTION IN ANIMALS

Nanjappaiah H.M., Niravaneppa A Patil and V.P. Patil.
Dept. of Pharmacology, BLDEA's SSM College of Pharmacy and Research Centre,
Vijayapur – 586103, Karnataka, India.
nanjupharma143@gmail.com

Cardiovascular diseases (CVDs) are the leading cause of death in developed and developing countries. Myocardial infarction (MI) is one of the most alarming. MI also called heart attack. The current research was designed to evaluate the cardioprotective activity of methanolic extract of Pithecellobium dulce leaves extract against isoproterenol induced MI in experimental rats. The protective property of methanolic extract of Pithecellobium dulce leaves (MEPDL) extract was carried out in isoproterenol induced MI in experimental rats. The Blood pressure, ECG, cardiac marker enzymes, tissue GSH and LPO and histopathological studies of hereat were studied. The different doses of MEPDL significantly and dose dependently attenuated the altered levels of blood pressure in dose dependent manner, ECG pattern has been brought back to normal level, the serum enzymes were decreased, attenuated the tissue GSH and LPO and exhibited the normal architecture of heart. The current investigation concludes that administration of MEPDL at graded doses against ISO-exposed myocardial infarcted rats demonstrated cardio protective property. This observed cardioprotective activity may be due to the presence of flavonoids and tannins in the test extract and also linked to its antioxidant property.

**Keywords:** AST, LDH, CK-MB, GSH, MDA, Cardioprotective.

## PHARMACOLOGICAL MECHANISMS AND ANTIDIABETIC POTENTIAL OF ALLIUM PORRUM L.: INSIGHTS INTO PHYTOSOME FORMULATION AND PRECLINICAL EVALUATION

Shiv Kumar Bhardwaj1, Trilochan Satapathy1.
1Columbia Institute of Pharmacy, Tekari, Near Vidhansabha, Raipur-493111, C.G., India
shivbhardwaj011991@gmail.com

Allium porrum L. (commonly known as leek) is a traditional medicinal plant belonging to the Amaryllidaceae family, widely utilized for its nutritional and therapeutic properties. Increasing scientific evidence indicates its role in metabolic disorders, particularly diabetes mellitus, owing to its rich phytochemical profile including flavonoids, saponins, and organosulfur compounds. However, limited data exist on its mechanistic pathways and advanced delivery systems such as phytosomes for enhanced bioavailability. This review/experimental overview aims to elucidate the pharmacological mechanisms underlying the antidiabetic activity of Allium porrum L., evaluate its efficacy in animal models, and explore phytosome-based formulations to enhance therapeutic potential. Phytochemical constituents of A. porrum were analyzed with emphasis on bioactive compounds. Pharmacological mechanisms were assessed through reported in vitro and in vivo studies, including enzyme inhibition assays (α-amylase, α-glucosidase), oxidative stress modulation, and insulin-sensitizing pathways. Experimental evidence was compiled from streptozotocin- (STZ) and alloxan-induced diabetic rodent models. Literature on phytosome technology was integrated to highlight improvements in solubility, stability, and targeted delivery of active constituents. Allium porrum L. exhibits antidiabetic activity via multiple mechanisms: inhibition of carbohydrate-hydrolyzing enzymes, improvement of pancreatic β-cell function, reduction of oxidative stress, and modulation of key metabolic enzymes such as glucose-6-phosphatase and sorbitol dehydrogenase. In animal models, administration of aqueous and ethanolic extracts demonstrated significant reductions in fasting blood glucose, improvement of lipid profiles, and restoration of hepatic antioxidant enzyme levels. Phytosome formulations of Allium porrum were found to enhance bioavailability and therapeutic efficacy by facilitating better absorption of flavonoids and saponins compared to conventional extracts. Allium porrum L. holds promising antidiabetic potential through multi-target pharmacological mechanisms. Its efficacy in animal models supports its role as a functional food and herbal therapeutic agent. Incorporation into phytosome delivery systems may overcome bioavailability challenges and pave the way for future clinical applications.

**Keywords:** Allium porrum L., antidiabetic activity, pharmacological mechanisms, phytosome, animal models, oxidative stress, bioavailability.

## EVALUATING THE BURDEN OF ADVERSE DRUG REACTIONS IN THE GERIATRIC POPULATION: A HOSPITAL-BASED OBSERVATIONAL STUDY

Dr. Shashikala Wali

ISBN: 978-81-980623-8-3

Department of Pharmacy Practice, KLE College of Pharmacy, Belagavi,
KLE Academy of Higher Education and Research,
Belagavi, Karnataka, India.

Elderly individuals are particularly vulnerable to adverse drug reactions due to factors such as multiple medications, age-related physiological changes, and chronic health conditions. This study aimed to evaluate the severity and causality of Adverse Drug Reactions in geriatric subjects. A prospective observational study was conducted over six months involving 250 patients aged 60 years and above. Data on suspected ADRs were collected through patient interviews, clinical records, and physician inputs. Each ADR was assessed using WHO-UMC Causality Assessment Scale**,** and severity was graded with the Modified Hartwig and Siegel Severity Assessment Scale**.** Among 250 patients, 40.4% were on monotherapy and 59.6% on polytherapy. A total of 62 adverse drug reactions (ADRs) were reported, with most classified as "probable" (67.7%) and mild (69.8%). At the time of assessment, 59.7% were recovering, 37.1% had recovered, and 3.2% had not recovered. ADRs remain a major concern in the elderly due to age-related changes, comorbidities, and polypharmacy. Using tools like the WHO-UMC and Hartwig scales in routine care can enhance ADR detection and management, ensuring safer medication use in geriatric patients.

**Keywords:** Adverse drug reactions, Geriatric population, Polypharmacy, Drug safety, Causality assessment

## IN-VITRO EVALUATION OF ANTI - ASTHMATIC POTENTIAL OF EMBLICA OFFICINALIS SEED EXTRACT IN RAW 264.7 CELL LINES

1Dr. Elango K, 2Mrs. Mumtha.L
1Faculty of Pharmacy, Karpagam Academy of Higher Education,
Coimbatore 641021
2Department of Pharmacognosy, JSS College of Pharmacy, Ooty 643001

This study aims to explore the anti-asthmatic potential of Emblica officinalis seed extract by assessing its effect on inflammatory markers in RAW 264.7 cell line. The preliminary evaluation of Emblica officinalis seed extract performed and characterized by UV, HPLC and GCMS. Molecular docking was carried out using Schrodinger. DPPH, ABTS, Nitric Oxide production determined to study antioxidant effect and cytotoxicity effect by MTT assay. The expression of IL-4, IL-13, TNF-alpha on LPS induced RAW 264.7 cell lines by FACS method. The hydroalcoholic extract produced an extractive and ash values of 2.85% w/w and 3.47 ± 0.15% w/w respectively. The determination total phenolic and flavanoid content was good. The characterization of the extract was performed and analysed through HPLC chromatogram. The GCMS chromatogram showed peaks at various retention times indicating the presence of phytoconstituents. In-silico studies showed good interaction between selected ligands and the target proteins. The antioxidant studies proved that the extract possess free radical scavenging activity; reduce nitric oxide production and MDA levels. The extract proved to be non-toxic by MTT assay. In LPS induced RAW 264.7 cells the expression of the target proteins that actively involved in the asthma pathogenesis was decreased.

**Keyword**: Antiasthmatic activity, Emblica officinalis, Seed Extract, RAW 264.7 cell line, LPS induced

## COMPUTATIONAL RATIONALITY: CURRENT ADVANCES IN DPRE2 INHIBITORS FOR MYCOBACTERIUM TUBERCULOSIS

Ekta Singh, Sonal Dubey, Sakshi Bhardwaj
Department of Pharmaceutical Chemistry, ABIPER, Bengaluru,
Karnataka, India-650064.
pharma.ekta@gmail.com

One of the most common infectious agents to cause chronic illness is Mycobacterium tuberculosis (Mtb). DprE2, a crucial enzyme in the production of arabinogalactan and decaprenylphosphoryl-β-d-arabinofuranose (DPA), is a significant novel therapeutic target for tuberculosis. The survival of Mtb depends on the enzymes decaprenylphosphoryl-β-D-ribose oxidase (DprE1) and decaprenylphoryl-β-D-ribose-2-epimerase (DprE2), which catalyse the epimerization of decaprenylphosporyl ribose (DPR) to decaprenylphosporyl arabinose (DPA). In recent investigations, DprE2 has been discovered as a possible target of delamanid and pretomanid. To find possible inhibitors that target DprE2, computer aided drug design in this investigation. Binding affinities were assessed using molecular docking after high-throughput virtual screening. Drug likeness and pharmacokinetic characteristics were evaluated by incorporating ADMET predictions. The promising hits were assessed for general stability by a 100 ns simulation. After that, the selection was further refined using binding free energy calculations. These compounds offer a novel approach to combating drug-resistant tuberculosis and exhibit great promise for future development as DprE2 inhibitors.

**Keywords:** Mycobacterium tuberculosis, drug design, drug resistance, DprE2 inhibitors.

## EFFECT OF SUB-ACUTE TREATMENT OF SEROTONERGIC AGONIST AND ANTAGONIST ON CLONIDINE INDUCED CATALEPSY IN MICE

G SRIDHAR PATWARI, M VAISHNAVI, M BHAVITA & M VIJAY KUMAR.
TEEGALA KRISHNA REDDY COLLEGE OF PHARMACY,
MEDBOWLI, MEERPET, BALAPUR (M), HYDERABAD-500097,
TELANGANA STATE.

Parkinson's disease (PD) is increasing day by day in elders, catalepsy is an animal models for Parkinsonism, which can be induced in Albino mice. Which is evaluated by wooden bar test, which is placed at 4 cm from floor,where forepaws are placed on bar which were injected by clonidine (1 mg/kg), Trihexyphenidyl (Standard Anti-parkinsonism drug, 10mg/kg), Buspirone (5 mg/kg), Cyproheptadine (1 mg/kg), which were treated for 14 days & on 15 th day clonidine was injected for all groups evaluated at 30 mins, 60 mins, 90 mins, 120 mins, 150 mins & 180 mins, H. Dunnet test was used for comparison of experimental groups against control group.(n=6). P<0.001significant for Buspirone group at 90 mins Buspirone has reduced catalepsy, Cyproheptadine has increased catalepsy, when compared with std drug. So we conclude that serotonergic agonist can be used in treatment to alleviate Parkinsonism symptoms. The research protocol was approved with no. IAEC/TKRCOP/ 2025/01.

**Keywords**: Catalepsy, Bar test, clonidine, Buspirone, Cyproheptadine

**PL-438**

## EVALUATION OF PHARMACOLOGICAL ACTIVITY AND LCMS ANALYSIS OF FLAVONOIDS IN COCONUT EMBRYO

R. Rajakumari, S. Lydiasmily
Department of Biotechnology, (Department of Pharmaceutical Analysis), PPG College of Pharmacy, Coimbatore,
Tamil Nadu, India– 641035.

The present research investigated the pharmacological potential and phytochemical profile of Cocos nucifera L. (coconut) embryo extracts. Methanol and chloroform extracts were subjected to LC-MS analysis, which revealed 27 phytoconstituents, including flavonoids such as apigenin, myricetin, baicalein, and resveratrol. Antioxidant activity of the methanolic extract was evaluated using the DPPH assay, showing 73.3% inhibition at 500 µg/ml, whereas the chloroform extract exhibited negligible activity. Anticancer activity was assessed on human colorectal adenocarcinoma (HT-29) cells by MTT assay and AO/EB staining, confirming apoptosis and cytotoxic potential of the methanolic extract. Antibacterial screening against Bacillus subtilis, Staphylococcus aureus, E. coli, and K. pneumoniae showed no significant inhibition compared to ciprofloxacin. Overall, the study highlights coconut embryo as a nutritive source possessing notable antioxidant and anticancer properties.

**Keywords:** Coconut embryo, LC-MS, Flavonoids, Antioxidant, Anticancer, HT-29.

Heart illness encompasses a number of disorders that impact the heart and blood arteries, including coronary heart disease.
due to obstructions in the arteries.Heart failure symptoms primarily include dyspnea and fatigue, leading to exercise intolerance, along with

ISBN: 978-81-980623-8-3

orthopnea and tachypnea. Diuretics, once the only treatment, advanced in the 1950s with acetazolamide, spironolactone, and thiazides, offering better tolerance and fewer side effects like hypotension and electrolyte imbalances. Loop diuretics provide rapid, potent effects and are often used in combination for managing fluid overload, a key cause of heart failure hospitalizations. However, diuretic resistance, driven by factors like high sodium intake, electrolyte imbalances, and renal system activation, is a major challenge, increasing the risk of rehospitalization and death in chronic heart failure. Side effects such as electrolyte disturbances, renal failure, and hypersensitivity highlight the importance of careful therapeutic management. An ambispective study spanning six months (October 1, 2023, to March 31, 2024) was conducted. It involved retrospective data from April to September 2023 and prospective data from October 2023 to March 2024. Patient records and in-patient data were analyzed, adhering to inclusion and exclusion criteria. This study evaluated clinical effectiveness, adverse effects, and cost of therapy to identify optimal therapeutic outcomes in cardiovascular patients. The results highlight that torsemide offers superior benefits for cardiovascular patients, including improved clinical outcomes, fewer hospitalizations, and reduced costs.

**Keywords**: Torsemide, furosemide, clinical benefits, adverse effects, cost effectiveness

## ANTI-ARTHRITIC AND ANTIOXIDANT EFFECTS OF ß-SITOSTEROL ENRICHED FRACTION FROM THE METHANOLIC LEAF EXTRACTS OF MALLOTUS PHILIPPINENSIS (LAM.) MUELL. ARG AGAINST COMPLETE FREUND'S ADJUVANT ARTHRITIC RAT MODELS

G. Nagalakshmi1*, A. Puratchikody2, S. Sathya3 and S. Rajasekaran4
1Department of Pharmaceutical Chemistry, The Oxford College of Pharmacy, Bengaluru 560068, Karnataka, India
nagalakshmipharma@gmail.com

Mallotus philippinensis (Lam.) Muell. Arg, a shrub growing in high altitudes is found to contain various phytochemicals including phenols, diterpenoids, steroids, flavonoids, triterpenoids etc., in its various parts like fruits, bark and leaves. It has been found to exhibit anti-filarial, antiviral, antifertility and antimicrobial activity. Traditionally the leaf paste has been used to treat a variety of skin conditions in humans which lack scientific confirmation. Arthritis is a common chronic joint disorder, with general symptoms including stiffness and joint pain. Hence the aim of the present study is to evaluate in vivo anti-arthritic and antioxidant effects of ß-sitosterol enriched fraction (ß-SEF) (30 mg/kg) from the methanolic leaf extract of Mallotus philippinensis (Lam.) Muell. Arg in Complete Freund's adjuvant (CFA) induced rheumatoid arthritis in rats. Acute toxicity study was performed as per OECD guidelines 423. CFA-induced arthritis in rats was used as disease model. Diclofenac sodium (5 mg/kg) was used as standard. Measurement of inflammatory nociception, hind paw swelling, arthritic score and body weight were made to assess the anti-arthritic activity. Alterations in hematological parameters (red blood cell (RBC), white blood cell (WBC), hemoglobin (Hb) and lymphocytes (LYM)) parameters were carried out to ascertain the disease progression. The inflammatory mediators tumour necrosis factor-alpha (TNF-a) were measured in blood serum by enzyme-linked immune sorbent assay (ELISA) method. The oxidative stress parameters (Nitrite (NO), Catalase (CAT)) were evaluated in tissues of liver. Spleen index was also assessed. The histological and radiological changes in the knee joint of rats were also studied. ß-sitosterol enriched fraction (ß-SEF) from the methanolic leaf extract of Mallotus philippinensis (Lam.) Muell. Arg significantly alleviated arthritic progression with regards to paw swelling, arthritic score, immune organ indices, hyperalgesic effect and body weight. The anomalous alterations in hemtological parameters were remarkably restored. The phenomenon was correlated with significant suppression of overproduction of inflammatory cytokines (TNF-a), oxidative stress markers (NO and CAT) and spleen index versus arthritic rats without treatment. The histological study revealed decrease in synovial hyperplasia, pannus formation, and cartilage and bone erosion. The X-ray analysis showed decrease in soft tissue swelling, bone resorption and osteophyte formation upon the treatment with β-SEF.

**Keywords**: Mallotus philippinensis, Complete Freund's adjuvant (CFA), Anti-arthritic activity, Antioxidant, Cytokines.

**PL-441**

## EVALUATION OF THE EFFECT OF NATURAL COMPOUNDS IN DEHYDROEPIANDROSTERONE INDUCED POLYCYSTIC OVARY SYNDROME IN MICE

Venu Talla, Udutha Bharathi, Miryala Srilekha, Pinky Devi Chaudhary
Department of Pharmacology, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka Hyderabad, Telangana, India 500018
bharathiyadav31@gmail.com

Polycystic Ovary Syndrome (PCOS) is a common hormonal disorder affecting women of reproductive age. It is characterized by symptoms such as irregular periods, excess androgen levels, and the presence of small cysts on the ovaries. This study investigates the therapeutic potential of Fenugreek extract on Dehydroepiandrosterone (DHEA)-induced PCOS in female Swiss albino mice. A total of 36 mice were randomly divided into six groups of six animals each. The control group received sesame oil, while the PCOS model was induced by DHEA 100mg/kg P.O. Subsequent groups were co-treated with DHEA (100mg/kg, P.O.) and varying doses of Fenugreek extract (100, 200, and 300 mg/kg, P.O.) for 21 days to assess a dose-dependent effect. An additional group received only the mid-dose of Fenugreek. The results of the study demonstrated a significant improvement in the Fenugreek-treated groups compared to the DHEA-induced PCOS group. A steady increase in ovary weight and the number of ovarian cysts as well as uterine weight and thickness in DHEA treated group. Fenugreek treatment led to a normalization of hormonal profiles, including a reduction in elevated testosterone levels and a restoration of the LH/FSH balance. Furthermore, the extract improved metabolic parameters by enhancing insulin sensitivity and correcting dyslipidemia by improving the HDL levels and decreasing the LDL. Histological analysis of the ovaries revealed a dose-dependent reduction in the number of follicular cysts and a more regular ovarian morphology. The findings suggest that Fenugreek extract holds promise as a natural therapeutic agent for managing the symptoms of DHEA-induced PCOS by targeting both hormonal and metabolic aspects of the condition.

**Keywords:** PCOS, DHEA, Fenugreek, FSH, LH

## DEVELOPMENT OF A DYSBIOSIS-INDUCED HEPATOTOXICITY MODEL USING CEFIXIME AND BILE DUCT LIGATION IN WISTAR RATS

Priya Shukla1, Chirag Patel2
Department of Pharmacology, SSR College of Pharmacy, Sayli
Department of Pharmacology, LM College of Pharmacy, Ahmedabad
priya.pharmaoffical@gmail.com

The gastrointestinal tract hosts a complex microbial community, the gut microbiota, which regulates metabolic, digestive, and immune functions. Alterations in its composition, known as intestinal dysbiosis, have been linked to the onset and progression of liver disorders, yet standardized preclinical models that replicate these interactions remain limited. In the present study, an experimental model was developed to establish the relationship between dysbiosis and hepatotoxicity. Wistar rats were divided into five groups: Negative Control, Cefixime, Sham Surgery, Bile Duct Ligation (BDL), and Cefixime + BDL. Animals in the BDL and Cefixime + BDL groups received cefixime (40 mg/kg/day), with surgery performed on day 7 and treatment continued for 14 days. The combined model induced significant microbial imbalance, a three-fold increase in endotoxin levels, marked elevation of TNF-α and IL-6 ($p<0.01$), higher ALT, AST, and ALP activities, reduced antioxidant enzymes, and elevated MDA content. Histopathology revealed hepatocellular degeneration, inflammatory infiltration, bile duct proliferation, and collagen deposition. These findings confirm that the combination of cefixime and BDL successfully produces a reproducible and stable preclinical model of dysbiosis-induced hepatotoxicity, closely mimicking gut–liver axis pathology observed in human liver diseases, and provides a valuable platform for mechanistic exploration and therapeutic evaluation.

**Keywords**: Bile duct ligation, Cefixime, Dysbiosis, Gut–liver axis, Hepatotoxicity, Preclinical mode

## NEXT GENERATION CANCER CARE: THE IMPACT OF THERANOSTICS

PANCHADA.VINEELA, G. SASIKAR
VIKAS INSTITUTE OF PHARMACEUTICAL SCIENCES Nidigatla Road, Near Airport Rajahmundry,

ISBN: 978-81-980623-8-3

E.G Dist. AP – 533102 533102 (NAAC Accredited, Approved by AICTE & PCI, New Delhi, Affiliated to Andhra University, Vizag)

Cancer, often called a “silent enemy,” spreads through the body like wildfire, making it one of the most challenging diseases to treat. Traditional treatments often take a broad approach, hitting both good and bad cells in the hope of striking the cancer. But theranostics brings a new weapon to the fight—it combines diagnosis and treatment in one powerful move, like a key unlocking a personalized treatment plan for each patient. This advanced approach is like turning a scattergun into a sniper rifle, offering precise and tailored care. For example, Herceptin in breast cancer and PSMA-targeted therapy in prostate cancer use this method to target only the cancerous cells, minimizing damage to healthy tissue. As theranostics continues to evolve, it holds the promise to change the face of cancer therapy—treating it not as a one-size-fits-all solution but as a highly personalized fight, much like "knowing the enemy before the battle begins." With theranostics, the future of cancer care looks brighter, offering hope and precision in a way we’ve never seen before.

**PHARMACIST-LED INTERVENTIONS TO RESOLVE DRUG-RELATED PROBLEMS IN DIABETIC HYPERTENSIVE PATIENTS: A PROSPECTIVE STUDY USING PCNE V9.1**

Kanuri Veera Madhava Lakshmi and Ramakrishna Gummadi
Department of Pharmacy Practice, School of Pharmacy, Aditya University, Surampalem, Kakinada -533437
madhavikanuri93@gmail.com

Diabetes mellitus and hypertension frequently coexist, requiring multidrug therapy and predisposing patients to drug-related problems (DRPs). Pharmacist-led care may reduce these risks, but prospective Indian data are scarce. To identify and classify DRPs in diabetic hypertensive patients, and to evaluate the impact of clinical pharmacist interventions on their resolution, adherence, blood pressure (BP) control. A Prospective observational study was conducted among 150 adults at a tertiary care hospital. Prescriptions were reviewed by a clinical pharmacist and DRPs classified using PCNE V9.1. Medication adherence was assessed with MMAS-8. Associations between polypharmacy (≥5 drugs) and DRPs were analysed using Chi-square; predictors of DRPs were evaluated with logistic regression. Pharmacist interventions focused on therapy modification, patient counselling, and prevention of drug-drug interactions. A total of 268 DRPs were identified (mean 1.78 per patient). Polypharmacy was significantly associated with DRPs ($\chi 2$=12.4, p20.01). Regression identified insulin use (OR 2.1, 95% CI: 1.2-3.8) and cardiovascular polytherapy (OR 1.9, 95% CI:1.1-3.3) as predictors. Following interventions, 81% of DRPs were resolved, adherence improved (MMAS-8 score +1.6, p<0.0), mean systolic BP reduced by 12mmHg (clinically meaningful for cardiovascular risk), and average monthly medication cost decreased by 14%. Although single-centre, this first Indian study using PCNE V9.1 provides preliminary evidence that pharmacist-led interventions significantly improve DRP management, adherence.

**Keywords:** Diabetes mellitus, hypertension, drug-related problems, clinical pharmacist.

**NEONATAL SEPSIS MANAGEMENT IN NICUS: EFFECTS OF HYGIENE LAPSES AND LATE DIAGNOSIS – A CASE STUDY**

P.B. Kiranmai*, K. Kavyasudha M.Pharm
1. Pursuing Pharm-D at Ratnam Institute of Pharmacy, SPSR Nellore, Andhra Pradesh, India
2.Department of Pharmacology, Associate Professor in Ratnam Institute of Pharmacy, Nellore, Andhra Pradesh, India

Neonatal sepsis continues to be a significant cause of newborn mortality and morbidity, particularly in resource-constrained NICUs. This case study examines the impact of hygiene lapses and delayed diagnosis on neonatal sepsis outcomes in a tertiary care NICU in India. Over 3 months, 30 neonates aged 0–28 days, including both preterm and full-term infants, were monitored for clinical signs of sepsis, laboratory parameters, and treatment outcomes. In several cases, empiric antibiotic therapy was initiated too late because early sepsis symptoms like fever, lethargy, poor feeding, and respiratory distress were missed. Inadequate hand hygiene, overcrowding, delayed blood culture collection, and subpar sterilization of medical equipment were all contributing factors. These lapses resulted in prolonged hospital stays, progression to severe sepsis in 5 neonates, and 2 fatalities during the study period. Supportive care (IV fluids, oxygen therapy, temperature regulation) and reinforcement of strict infection control practices, such as hand hygiene, equipment sterilization, and staff training, were some of the management strategies. Following these interventions, the majority of neonates recovered fully, highlighting the critical role of early diagnosis and stringent hygiene practices in reducing sepsis-related complications. This case study underscores the urgent need for standardized protocols, continuous monitoring, and resource optimization in NICUs to improve neonatal outcomes and prevent avoidable mortality.

**Keywords:** Neonatal Sepsis, NICU, Hygiene, Delayed Diagnosis, Infection Control, Neonatal Mortality

**PL-446**

**AN EFFECTIVE APPROACH OF BUTEA MONOSPERMA FLOWER EXTRACT IN METHOTREXATE INDUCED HEPATOTOXICITY IN WISTER ALBINO RATS**

Mousumi Besan1, Bhabani Shankar Mahapatra2, Geetanjali Amat3, Surya Narayan Das4
Department of Pharmacy, Gayatri group of Institutions, Sambalpur, Odisha, India, 768200
mousumibesan@gmail.com

Synthetic drugs have many side effects as compared to the traditional herbs used in health benefit. Methotrexate is a disease modifying anti-rheumatic drug & used to treat auto immune disease and some type of cancer. It is having potential side effects of liver & Kidney toxicity. In this current research, as a hypothesis the flower extract of Butea monosperma was used and gave significant result on methotrexate induced hepatotoxicity. The well-Known meditational herb Butea monosperma is an evanescent tree. It is used to treat variety of Illness including cancer, diabetes and Jaundice. The chemical constituents include flavonoids, glycosides, saponins, tannins, phenolic acids are much effective therapeutic agents. The flower extract of Butea monosperma were used against Hepatotoxicity induced by methotrexate. Wistar albino rats were divided into 5 groups. Except the normal control group all the other groups like two treatment groups, one negative control group and one standard drug group, all of them were pretreated with the flower extract orally with dose of 400mg/kg & 600mg/kg for 21 consecutive days. Methotrexate 20mg/kg was administered on day 18. The Rats under standard groups were treated by standard drug Silymarin with the dose of 100mg/kg. Then on day 21st blood samples were collected to determine LFT & KFT. Then histopathological studies were succeeded. The result shows promising response showing 600mg/kg dose to be best. Thus, it can be concluded that this study can be beneficial for the treatment of hepatotoxicity.

**Keywords:** Methotrexate, Butea monosperma, Hepatotoxicity, Flavonoids, Silymarin

**PROTECTIVE ROLE OF MICHELIA NILAGIRICA LEAF PHYTOCONSTITUENTS AGAINST PARACETAMOL- INDUCED OXIDATIVE DAMAGE IN WISTAR RATS**

Deepika and Dr. Aminabee
Department of Pharmacology, V.V.Institute of Pharmaceutical Sciences, Seshadri Rao Knowledge Village, Gudlavalleru – 521356, Andhra Pradesh, INDIA
bhagyamoka04@gmail.com

Paracetamol overdose is a leading cause of acute liver injury, primarily driven by oxidative stress and the generation of reactive metabolites. This study evaluates the hepatoprotective potential of Michelia nilagirica leaf extract in mitigating paracetamol-induced oxidative damage in Wistar rats. Liver injury was induced using a single high dose of paracetamol, followed by oral administration of the methanolic leaf extract of M. nilagirica for seven days. Biochemical analysis revealed significant reductions in serum liver enzymes (ALT, AST, ALP) and lipid peroxidation marker (MDA), alongside increased activities of antioxidant

ISBN: 978-81-980623-8-3

enzymes such as superoxide dismutase (SOD), catalase (CAT), and glutathione peroxidase (GPx) in the treated group. Histopathological observations confirmed substantial preservation of liver architecture in extract-treated rats compared to the paracetamol-only group. The findings suggest that phytoconstituents present in Michelia nilagirica leaves confer protection against paracetamol-induced hepatic injury by modulating oxidative stress and enhancing endogenous antioxidant defenses.

**Keyword:** Antioxidant enzymes, Paracetamol-induced hepatotoxicity, Paracetamol-induced hepatotoxicity, Reactive oxygen species (ROS)

## FORMULATION AND EVALUATION OF PROPOLIS SOLID DISPERSION LOADED ANTI-INFLAMMMATORY CREAM WITH MOLECULAR DOCKING AND IN VIVO ANIMAL STUDY

Swati D. Kshirsagar, Mukesh P. Ratnaparkhi
Department of Pharmaceutics, Savitribai Phule Pune University, Pune, Maharashtra, India 411033
swatisdk31@gmail.com

A deficiency in drug solubility limits the therapeutic potential of pharmaceutical formulations. Solid dispersion (SD) is a multifaceted strategy to enhance solubility, particularly for BCS Class II compounds. In this study, SDs of propolis were prepared using Kollisolv PEG-8000 (1:2 ratio) via the melting method. Two independent variables were optimized using central composite design. The optimized SD was incorporated into a cream formulation by the fusion method. Additionally, molecular docking was performed to evaluate the interaction of propolis constituents with TNF-α, supporting their anti-inflammatory potential. Drug release, viscosity, and spreadability of the optimized batch were 98.7%, 35,786 cPs, and 16.82 cm/s, respectively, with a 340-fold increase in aqueous solubility. In vivo studies using a carrageenan-induced paw edema model in rats showed significant suppression of inflammation and TNF-α level by the propolis SD cream, comparable to diclofenac gel. Molecular docking revealed strong binding affinities of quercetin, gallic acid, and galangin with TNF-α, reinforcing the biological relevance of the formulation. This investigation demonstrates that SD technology effectively addresses solubility and dissolution challenges of propolis. The integration of molecular docking further validates the mechanistic basis of its anti-inflammatory action, positioning SD-loaded propolis cream as a promising natural topical alternative to conventional therapies.

**Keywords:** Propolis, solid dispersion, central composite design, molecular docking, anti-inflammatory activity.

## STUDY OF RIBAVIRIN AND PYRAZOMYCIN IN HPV TREATMENT: A PERSPECTIVE TOWARDS DRUG REPURPOSING

Priyanka H. Jadhav and Shitalkumar Shivgonda Patil
Dr. J. J. Magdum Pharmacy College, Jaysingpur, Kolhapur (Maharashtra), India
gaikwad.priyankajjmph@gmail.com

Human papillomavirus (HPV) is a virus that infects skin or mucosal cells. The choice of antiviral medication for HPV treatment is generally based on established treatments such as topical agents, surgical interventions, and immunotherapies. This study focused on analysing the binding interactions of Ribavirin and Pyrazomycin with Inosine Monophosphate Dehydrogenase (IMPDH) using docking simulations, as both compounds showed structural resemblance to each other. The protein structure 1AK5 was selected and prepared by removing heteroatoms and water molecules to ensure accurate docking results. The docking scores revealed that Pyrazomycin exhibited a slightly better binding affinity compared to Ribavirin. In conclusion, the docking studies indicate that Pyrazomycin holds greater potential as an antiviral agent for HPV compared to Ribavirin. These findings suggest that said drug can be repurposed as a potential treatment for HPV infections. Further research, including experimental validation, formulation development & clinical trials, are necessary to confirm these findings and fully explore the therapeutic benefits of Pyrazomycin in HPV treatment.

**Keywords**: HPV, interactions, Ribavirin, Pyrazomycin, drug repurposing

## BEHENIC ACID AS A NOVEL TOOL FOR DEVELOPING DYSLIPIDEMIA IN RODENTS: A PRECLINICAL ADVANTAGE OVER CONVENTIONAL DIETS

Gunjan Patil and Pooja Patel
Department of Pharmacology, SSR College of Pharmacy Saily Silvassa 396230 (Savitribai Phule Pune University)
gunjanpatil2003@gmail.com

Hyperlipidaemia is a significant risk factor for cardiovascular diseases, necessitating reliable and efficient animal models to study lipid metabolism and evaluate potential therapeutic interventions. Traditional high-fat diet (HFD) models, while widely used, are time-consuming and require extended durations to produce consistent dyslipidemic. This study aimed to develop and evaluate a time-efficient hyperlipidaemia model using behenic acid and to compare its effectiveness with the conventional HFD model in rats. Sprague Dawley rats were randomly divided into three groups: control, behenic acid-treated (1800 mg/kg orally for 28 days), and HFD-fed (90 days). Biochemical analyses were performed to measure serum lipid parameters, including total cholesterol, triglycerides, and high-density lipoprotein (HDL) cholesterol. Physical observations and changes in body weight were also recorded. Results demonstrated that behenic acid administration significantly elevated total cholesterol and triglyceride levels within 28 days, achieving comparable dyslipidemic profiles to those observed in the HFD group, which required a 90-day feeding period. Notably, HDL cholesterol levels remained unaffected in both models. These findings suggest that behenic acid induces hyperlipidemia more rapidly and effectively than traditional HFD models, providing a valuable and time-efficient alternative for preclinical studies investigating lipid metabolism and potential lipid-lowering therapies.

**Keywords:** Behenic acid, hyperlipidemia, rodent model, high-fat diet, cholesterol.

## SYNEPHRINE AND ALZHEIMER'S: BRIDGING THERAPEUTICS THROUGH ZEBRAFISH MODELS

Chayanika Talukdar, Ashoka Babu VL, Parasuraman P, Damodar Nayak
Faculty of Pharmacy, M S Ramaiah University of Applied Sciences, Bengaluru- 560054, Karnataka

Alzheimer's disease (AD) is a neurological condition that worsens with time and is characterized by behavioral abnormalities, memory loss, and cognitive impairment. Current pharmacological interventions provide only symptomatic relief and are often associated with limited efficacy and adverse effects. The present study explored the therapeutic potential of synephrine, a naturally occurring alkaloid, in mitigating Alzheimer's-like symptoms using zebrafish (Danio rerio) models Molecular docking ADMET and dynamic simulation studies were conducted to evaluate the interaction of synephrine with key Alzheimer's targets. Neurotoxicity was induced through scopolamine and aluminum chloride, followed by direct exposure of zebrafish to synephrine dissolved in aquatic medium. Subsequently, Behavioural experiments, including the radial arm maze, T-maze, light-dark, and novel object recognition tests, acetylcholine level analysis, and histopathological evaluations were carried out to determine the neuroprotective efficacy of synephrine. The molecular docking and dynamics studies revealed that synephrine exhibits favourable binding affinities and stable interactions with key Alzheimer's disease targets, suggesting its potential as an effective acetylcholinesterase inhibitor. ADMET analysis supported these findings, demonstrating acceptable pharmacokinetic and safety profiles, reinforcing synephrine's drug-likeness. Behavioural experiments showed that synephrine treatment significantly improved cognitive and memory performance in zebrafish subjected to scopolamine and aluminium chloride-induced neurotoxicity. These results were further supported by biochemical assays, where synephrine exhibited notable antioxidant activity, as demonstrated by the DPPH assay method indicating its ability to mitigate oxidative stress, a key contributor to Alzheimer's pathology. Histopathological analysis of zebrafish brains revealed that synephrine offered protection against neuronal degeneration, evidenced by reduced vacuolization, better-preserved neuronal structures, and decreased pyknotic nuclei compared to untreated diseased groups. This study highlights synephrine as a promising neuroprotective and antioxidant agent, bridging the gap between natural compound research and therapeutic intervention for Alzheimer's disease.

**Keywords:** Synephrine, Scopolamine, ADMET, T-Maze

**VOICE AS A DIAGNOSTIC TOOL: NON-INVASIVE DETECTION OF POLY CYSTIC OVARIAN CONDITION USING PRAAT ACOUSTIC FEATURES**

Dr. K. Padma Priya, Dr. V. Radhika, Dr. B. Bhavani
1Jawaharlal Nehru Technological University Kakinada-533003, Andhra Pradesh, India
kesaripadmapriya@gmail.com

Polycystic Ovarian Condition (PCOD/PCOS), a hormonal imbalance, may affect vocal function due to potential alterations in laryngeal physiology. This study aims to analyze voice changes associated with Polycystic Ovarian Condition by extracting acoustic features using Praat software and evaluating their significance in a case-control framework. Voice recordings were obtained from 20 individuals diagnosed with Polycystic Ovarian Condition and 20 age-matched controls. Participants phonated sustained vowels /a/, /i/, and /u/, and acoustic parameters—Fundamental Frequency ($F_0$), Jitter (local), Shimmer (local), and Harmonics-to-Noise Ratio (HNR)—were extracted using Praat. Mean values across vowels were calculated per participant, followed by group-wise comparison using independent samples t-tests. Significant differences were observed in all measured parameters between the Polycystic Ovarian Condition and control groups. Individuals with Polycystic Ovarian Condition exhibited higher jitter and shimmer values, suggesting increased perturbation in frequency and amplitude, and lower HNR values, indicating increased noise components in the voice signal. Acoustic analysis using Praat effectively distinguished voice alterations in individuals with Polycystic Ovarian Condition. The results support the feasibility of using non-invasive voice measures as early indicators for Polycystic Ovarian Condition. This method offers a promising and accessible tool for screening and monitoring. Further studies with larger sample sizes and multilingual populations are recommended to enhance generalizability and diagnostic precision.

**ROLE OF SLEEP QUALITY IN SHAPING HEALTHCARE PERFORMANCE: EVIDENCE FROM PRACTICING AND STUDENT HEALTH PERSONNEL**

Kanamala Arun Chand Roby*, Jada Naga Lakshmi, P. Srinivasa Babu
Assistant Professor, Department of Pharmacy Practice, Vignan Pharmacy College, Vadlamudi, AP, India 522213.
arunchandroby@gmail.com

Sleep quality is a crucial determinant of the physical, emotional, and cognitive performance of healthcare personnel, whose efficiency directly impacts the quality of healthcare services delivered to the population. Poor sleep is hypothesized to negatively influence daily functioning, concentration, and well-being. This study aimed to evaluate sleep quality among healthcare personnel and students to analyze its relationship with professional and academic performance, mood, and the use of substances affecting sleep. A cross-sectional study was conducted in June 2025 among 68 participants, including active healthcare personnel and trainees from hospitals, clinics, health centers, and educational institutions in the region. Data were collected using structured questionnaires consisting of 18 items addressing sleep duration, rest quality, mood, and lifestyle factors. Findings revealed that 36.8% of participants reported sleeping only 6 hours during workdays, while only 11.8% achieved the recommended 8 hours of rest. Upon waking, 55.9% described themselves as “tired but functional,” and only 4.4% reported feeling “very rested and energized.” These results indicate a prevalent perception of fatigue and accumulated stress among healthcare workers and students. Sleep deprivation is common among healthcare personnels with most experiencing inadequate rest and associated fatigue. The findings highlight the urgent need for interventions and institutional strategies that promote healthy sleep habits as part of comprehensive healthcare workforce support and training.

**Keywords:** Sleep quality, healthcare personnel, fatigue, performance, stress.

The present study was to test the effect of Liriodendron tulipifera seed extract on biochemical markers of brain in amnesic rats (streptozotocin induced amnesia). Streptozotocin (STZ) is a glucosamine-nitrosourea compound which was originally identified as an antibiotic. It is toxic to beta cells of pancreas and usually transported through glucose transporter 2 and commonly used to induce experimental diabetes in animals. STZ administration through route such as intracebroventricular or intraperitoneal injection produces reduced cognition and increased cerebral aggregated Aβ fragments, total tau protein, and Aβ deposits. These changes were accompanied with decreased glycogen synthase kinase (GSK-3) alpha/beta ratio (phosphorylated/total) in the brain. The extract of Liriodendron tulipifera seed extract was administered in two doses (100 and 200 mg/kg) for 7 days. Piracetam (120 mg/kg) was used as a standard agent. Orally supplementation of Liriodendron tulipifera seed extract showed significant elevated brain antioxidant enzymes CAT (15.5 ± 2.8**and 14.0 ± 1.12**), SOD (13.5 ± 1.4**and 18.3 ± 1.7**) GSH (203.3 ± 15.3**and 218.0 ± 13.5**), TBARS (200.3 ± 7.3** and 208.0 ± 11.0**) for Liriodendron tulipifera seed extract 100 mg/kg and 200mg/kg respectively. Orally supplementation of Liriodendron tulipifera seed extract also showed significant inhibited AChE activity 4.907±0.31** and 4.967±0.31** respectively.

**Keywords:** Liriodendron tulipifera seed extract, Superoxide dismutase (SOD), catalase (CAT), contents of thiobarbituric acid reactive substances (TBARS) and reduced glutathione (GSH)

**A STUDY OF COMPLICATIONS IN PATIENTS UNDERGOING MAINTENANCE HAEMODIALYSIS: AN EXPERIENCE IN TERTIARY CARE HOSPITAL**

Rameshwar S. Rathod and Pankaj S. Patil
Department of Pharmaceutical Science MGV’S Pharmacy College Nashik Panchavati, Maharashtra India 422003
ramrrathod1137@gmail.com

Haemodialysis is a good choice when the kidneys are unable to remove harmful compounds (wastes or impurities) from the blood. The continuous process of haemodialysis takes about four hours to finish. It is unable to continuously monitor bodily functioning like regular kidneys can.On the other hand, it can eliminate waste and restore electrolyte and pH levels following a haemodialysis session. During the surgery, the fluid and mineral compartment undergoes numerous changes, leading to a variety of problems for patients, ranging from minor to potentially lethal. The study’s goals are to determine the prevalence of issues.The study was prospective in nature. Demographic information, surgical information, comorbidities, and the self-designed severity rating to record during haemodialysis were all gathered using a data collecting form. Findings: Of the total 190 patients, 120 (63.15%) were men and 70 (36.6%) were women. An arterio venous fistula (AVF) was the venous access used for haemodialysis in 166 (88%) of the patients who were interviewed. The dialyser used to administer F6HPS was given to 82 individuals (43.15%). According to the results of our own assessment tool, 30 patients (15.78%) had mild difficulties, 23 patients (12.105%) had moderate complications, and 141 patients (74.21%) had severe complications. In a separate study, 12.5% of patients had cramps, while 37.5% had An arterio venous fistula (AVF) was the venous access used for haemodialysis in 166 (88%) of the patients who were interviewed. The dialyser used to administer F6HPS was given to 82 individuals (43.15%). According to the results of our own assessment tool, 30 patients (15.78%) had mild difficulties, 23 patients (12.105%) had moderate complications, and 141 patients (74.21%) had severe complications. In a separate study, 12.5% of patients had cramps, while 37.5% had hypotension.In our study, 18 patients (28%) experienced cramps, and 25% of patients experienced hypotension as an intra-dialytic consequence. These two problems were the main difficulties in our research of patients with CKD and AKI. Age and the distribution of

ISBN: 978-81-980623-8-3

sexes do not appear to be related in our study. Our study's conclusions indicate that muscle cramps (43.6%), hypotension (47.8%), and hypertension (30.5%) are common occurrences and that, in the event of an emergency, appropriate precautions must be taken. 3.6% fever, 1.57% hypoglycemia, and 12.6% nausea and vomiting. While there was no significant correlation between sex and type of access, there was a strong correlation between problems and age and renal failure.

## PROMPT RECOGNITION AND EVIDENCE-BASED MANAGEMENT OF ACUTE EXACERBATION OF COPD COMPLICATED BY MULTIDRUG-RESISTANT ACINETOBACTER INFECTION

Mr. Abdul Saheel Qureshi, Rumaan Anwar
Azad College of Pharmacy, Moinabad, Hyderabad, Telangana.

A 71-year-old man with a decade-long history of chronic obstructive pulmonary disease (COPD) and hypertension presented with worsening breathlessness, cough with yellow expectoration, mild fever, and features of hypoxemia. Physical examination revealed tachypnea and low oxygen saturation. Investigations showed leukocytosis, neutrophilia, elevated liver enzymes, and sputum culture positive for Acinetobacter species. The patient received oxygen supplementation, combined inhaled bronchodilators (formoterol, budesonide, glycopyrrolate), dexamethasone, and targeted antimicrobial therapy (cefoperazone-sulbactam, levofloxacin), alongside supportive management for constipation and urinary symptoms. Pharmacist involvement ensured monitoring for adverse effects, review of drug interactions, and patient education on inhaler use, adherence, and lifestyle changes. The patient's clinical status improved with this comprehensive, multidisciplinary approach. This case underlines the importance of early recognition, prompt, evidence-based intervention, and the role of pharmacists in managing acute COPD exacerbations, particularly when complicated by multidrug-resistant bacterial infection.

**Keywords:** COPD, Case Report, Acute Exacerbation, Acinetobacter, Pharmacist Intervention

## SYNERGISTIC STUDIES ON THE COMBINED ACTION OF S-ALLYL CYSTEINE AND TAURINE IN STREPTOZOTOCIN-NICOTINAMIDE INDUCED TYPE-II DIABETIES

Rizwan Ahmad, Saurabh Sharma, Vishal Kumar, Darakhshan Gazala Bari
School of Pharmacy, Vivek University, Bijnor Uttar Pradesh, India 246701
drrizwanvcte@gmail.com

Diabetes mellitus (DM) is one of the common metabolic disorders affecting worldwide population. In the modern system of medicine, there is still no satisfactory effective therapy available to cure diabetes mellitus. However, there are so many medicines available in the market (like insulin & OHAs) for the treatment of DM but they have several drawbacks/side effects in their usage. To overcome the evil consequences of these drugs some phyto-nutrients and bio-nutrients are being investigated for possible use in the treatment of DM and related complications. S-Allyl cysteine (SAC, a phyto-nutrient) and Taurine (TAU, a bio-nutrient) have been reported to have not only antioxidant and anti-inflammatory activities but also multiple beneficial effects in combating several metabolic disorders in both human and animals. Despite numerous pharmacotherapeutic properties of SAC and TAU, their combined beneficial effects against type 2 DM using STZ/NA model has not been explored and scientific data is also lacking to be exposed as yet. This study is comprised of an attempt to explore the anti-diabetic & antioxidant effects of combined action of SAC and TAU in in vitro & in vivo models. As a result, the investigations confirmed that SAC/TAU combination had potential antioxidant and anti-diabetic properties.

**Keywords:** Diabetes mellitus, Garlic, Streptozotocin, Nicotinamide, Taurine.

bbhavanamadipoju@gmail.com

N-acetylcysteine (NAC) is a potent antioxidant and hepatoprotective agent, but its clinical use is limited by poor bioavailability and rapid clearance. Solid lipid nanoparticles (SLNs) provide a promising nanocarrier system to enhance stability, sustain release, and improve cellular uptake. NAC-SLNs were prepared using glyceryl monostearate (GMS) as lipid and Tween 20 as surfactant by the hot homogenization method. The formulation was evaluated for particle size, zeta potential, polydispersity index (PDI), entrapment efficiency, and in vitro drug release. Hepatoprotective activity was assessed in HepG2 cells exposed to [toxicant] to induce oxidative stress. Cell viability (MTT assay), reactive oxygen species (ROS), lipid peroxidation (MDA), and antioxidant enzyme activities (SOD, catalase, GSH) were measured. The optimized NAC-SLNs exhibited a mean particle size of <220 nm, PDI of 0.25, zeta potential of −30 mV, and entrapment efficiency of 75%. In vitro release studies revealed an initial burst of 25% followed by sustained release up to 75% over 24 h. In HepG2 cells, NAC-SLNs preserved cell viability up to 84% under oxidative stress, compared with 55% for free NAC. ROS generation was reduced by 62% relative to toxicant controls, while MDA levels decreased by 45%. Antioxidant enzyme activities were significantly restored toward normal levels ($p < 0.05$). NAC-loaded SLNs demonstrated favorable physicochemical characteristics, controlled release, and superior hepatoprotective efficacy compared to free NAC in cell-based models. These findings highlight the potential of NAC-SLNs as a novel nanotherapeutic approach for the management of oxidative stress–mediated liver disorders.

**Keywords:** N-acetylcysteine, solid lipid nanoparticles, hepatoprotection, oxidative stress, HepG2 cells, antioxidant therapy

## TOPICAL APPLICATION OF DEXAMETHASONE ENHANCES WOUND HEALING IN RAT EXCISION MODEL

Nandini Dewangan1,2 Parag1,2 Ajazuddin1,2
Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh, INDIA-490023
Department of Pharmacy, Rungta International Skill University, Kohka, Kurud Road, Bhilai, INDIA-490023
nandinidewangan292@gmail.com

Wound healing is a complex biological process involving inflammation, proliferation, and tissue remodeling. This study investigates the effect of topical dexamethasone—a well-established corticosteroid—on wound healing in a standardized rat excision model. Male Wistar rats (n=24) were randomly assigned to control and treatment groups. Full-thickness excision wounds were created under anesthesia, and topical dexamethasone (0.1%) was applied once daily for 14 days. Parameters assessed included wound contraction rate, epithelialization time, and histopathological features such as collagen deposition, fibroblast activity, and inflammatory cell infiltration. Dexamethasone-treated wounds exhibited significantly faster contraction and reduced epithelialization time compared to untreated controls ($p<0.05$). Histological analysis revealed enhanced collagen alignment, reduced neutrophil infiltration, and improved granulation tissue organization. These findings suggest that dexamethasone promotes a favorable microenvironment for tissue regeneration by modulating local inflammation and accelerating the transition to the proliferative phase. This study supports the therapeutic potential of topical corticosteroids in wound management and provides a foundation for further exploration of their mechanisms in skin repair. The results may inform formulation strategies for clinical use in chronic or delayed-healing wounds.

**Keywords:** Dexamethasone, wound, epithelization period, contraction, inflammation

## PRESCRIPTION PATTERN OF IMMUNOSUPPRESSANT USED IN POST TRANSPLANT PATIENTS

Ashly Ann Varghese, Geeta Moger, Biswajit Haldar

ISBN: 978-81-980623-8-3

Department of Pharmacy Practice, Oxbridge College of Pharmacy, Bangalore, India 560091
ashlyannvarghese1@gmail.com

Organ transplantation is a life-saving procedure where a diseased or failing organ is replaced with a viable graft from a donor. This study aimed to systematically assess and document prescription patterns of immunosuppressant medications in post-transplant patients, identifying common practices and variations, as well as analyzing dosing regimens and combinations used. A retrospective observational study was conducted over 6 months with a sample size of 107. Patients included were 18 years or older and had undergone a transplant (e.g., kidney, liver, heart, lung) or were on maintenance immunosuppressive therapy, with or without acute rejection episodes. Dual and triple therapy regimens were observed. The study found that triple therapy was more prevalent among participants. The most common combination was Tacrolimus, Prednisolone, and Mycophenolate Mofetil, prescribed to 24 patients (22.4%). Another common regimen was Tacrolimus, Mycophenolate Sodium, and Prednisolone, prescribed to 20 patients (18.7%). The incidence of transplantation was more common in males. This study contributes valuable insights into the evolving prescription patterns of immunosuppressants in post-transplant care, highlighting the importance of regimen selection to ensure optimal outcomes and minimize complications.

**Keywords:** Immunosuppressants, prescription pattern, maintenance therapy, organ transplantation.

## INCIDENCE AND CLINICAL PROFILE OF CARDIAC AND ENDOCRINE DISORDERS IN PREGNANT WOMEN: A PROSPECTIVE HOSPITAL-BASED STUDY

K.Sreya, Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
sreyakoti99@gmail.com

Cardiac and endocrine complications during pregnancy, such as hypertensive disorders, gestational diabetes mellitus (GDM), thyroid dysfunction, and cardiomyopathy, are rising contributors to maternal and fetal morbidity. Early recognition and multidisciplinary management are crucial to improving outcomes.To evaluate the incidence, clinical profile, and outcomes of cardiac and endocrine disorders in pregnant women, and to identify risk factors influencing maternal and neonatal health. A prospective, observational study was conducted at SCCL Main Hospital, Kothagudem, with 300 pregnant women diagnosed with or suspected of cardiac and/or endocrine complications. Data on demographics, clinical features, maternal and neonatal outcomes were collected and analyzed. The majority of participants were aged 26–35 years, with 97.7% having normal BMI. Primiparous women accounted for 52.8%. Hypertensive disorders were the most common cardiac complication, showing progressive increases in systolic and diastolic BP across gestational hypertension to eclampsia. Endocrine disorders were dominated by thyroid dysfunction and GDM. Hypothyroidism was more prevalent than hyperthyroidism, with typical biochemical alterations (↑TSH, ↓T3/T4). Diabetes was observed in 18% of cases. Hypertensive pregnancies had higher rates of preterm birth (48.8%) and renal complications compared to non-hypertensive groups. Family history of hypertension was present in nearly 50% of cases, suggesting genetic predisposition. Hypertensive and endocrine disorders are significant threats to maternal and neonatal health. Early screening, integrated antenatal care, and guideline-driven interventions are essential to reduce complications and improve outcomes.

## INFLUENCE OF CO-MORBIDITIES ON THE PRESCRIBING TRENDS AND UTILIZATION OF ANTI-HYPERTENSIVE DRUGS IN HOSPITALIZED PATIENTS

K.Komali, Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
komaliammulu2@gmail.com

Hypertension frequently coexists with diabetes, chronic kidney disease (CKD), and dyslipidemia, which strongly influence therapeutic choices. Evaluating prescribing patterns and adherence to international guidelines is essential for optimizing outcomes. To assess the impact of co-morbidities on anti-hypertensive prescribing, evaluate guideline adherence, and analyze outcomes including blood pressure control and adverse drug reactions (ADRs). A prospective, observational study was carried out for six months in a tertiary care hospital. Hospitalized patients aged ≥18 years with hypertension and at least one comorbidity were included. Data on demographics, comorbidities, prescriptions, and outcomes were collected from medical records. Statistical analysis employed Chi-square tests, ANOVA, and logistic regression. A total of 210 patients were enrolled (mean age 58 ± 12 years; 56% male). The most common comorbidities were diabetes (42%), CKD (28%), and dyslipidemia (24%). ACE inhibitors (35%) and calcium channel blockers (30%) were most frequently prescribed, followed by ARBs (22%) and diuretics (18%). Combination therapy was used in 62% of patients. In diabetes, ACE inhibitors/ARBs were significantly preferred ($p<0.01$), whereas CKD patients often received CCBs. Overall, 78% of prescriptions adhered to guidelines. Blood pressure control improved in 70% of cases, with ADRs reported in 6%. Co-morbidities significantly shape anti-hypertensive prescribing trends. While guideline adherence was generally high, deviations remain in specific populations. Continuous monitoring is necessary to ensure safe and effective hypertension management.

**Keywords:** Hypertension, Comorbidities, Prescribing patterns, Anti-hypertensive drugs

## EMPOWERING MATERNAL HEALTH THROUGH CLINICAL INNOVATION: PREVALENCE, DETERMINANTS, AND OUTCOMES OF ANAEMIA IN PREGNANCY – A HOSPITAL-BASED STUDY

L. Tejasri, Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
lakavathtejasri999@gmail.com

Anaemia in pregnancy remains a critical public health concern in India, with profound maternal and neonatal implications. This prospective, hospital-based study was conducted over six months among 300 antenatal women to assess the prevalence, incidence, determinants, and outcomes of anaemia. Findings revealed a 100% prevalence of anaemia, with mild (60–66%), moderate (30–38%), and severe (up to 8.9%) cases across trimesters. The incidence of new anaemia cases was 12.8%, peaking in the 2nd trimester (28.6%). Major risk factors included younger age (≤20 years, $p<0.05$), short interpregnancy interval (<18 months, $p=0.02$), vegetarian diet ($p=0.014$), and irregular IFA compliance ($p=0.002$). Iron-deficiency anaemia (40%) was the most common subtype, followed by megaloblastic (25%) and anaemia of chronic disease (15%). Maternal consequences included preterm delivery (32.3%), miscarriage (29.3%), and gestational complications (9%), while neonatal outcomes showed low birth weight (38.7%), NICU admissions (22.7%), and low Apgar scores (14%). This study underscores the urgent need for early antenatal registration, routine haemoglobin/ferritin screening, and pharmacist-led counselling to improve compliance and nutritional practices. Aligning with IPC-2025's theme, integration of AI-driven risk prediction, mobile health tools, and digital education platforms can enhance anaemia surveillance, empower patients, and strengthen evidence-based maternal care.

**Keywords**: Anaemia in pregnancy, Iron deficiency, Maternal outcomes, AI in healthcare, Pharmacist intervention

## ANTIBIOTIC PROPHYLAXIS IN SURGERY: UTILIZATION, EFFECTIVENESS, AND IMPLICATIONS FOR ANTIMICROBIAL STEWARDSHIP

M.Sowjanya and Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
mannamsowjanya867@gmail.com

Surgical site infections (SSIs) are a major cause of postoperative morbidity, prolonged hospitalization, and increased healthcare costs. Rational and timely administration of antibiotic prophylaxis plays a key role in infection prevention while minimizing antimicrobial resistance. To

ISBN: 978-81-980623-8-3

evaluate the prescribing patterns, appropriateness, and effectiveness of antibiotic prophylaxis in surgical patients admitted to a tertiary care hospital. A prospective observational study was conducted in the surgical wards of a tertiary care teaching hospital. Patients aged 10–60 years undergoing general and gynecological surgeries were included. Pediatrics, ophthalmic surgeries, and topical antibiotic use were excluded. Data on demographics, type of surgery, wound classification, and antibiotic prophylaxis were collected and analyzed using descriptive statistics. The study included patients with a mean age of 38 years, of whom 54% were female. The majority of cases were from gynecology and general surgery departments. Clean wounds were the most common, and over 50% of surgeries lasted less than one hour. Ceftriaxone was the most frequently prescribed antibiotic, either alone or in combination with metronidazole or sulbactam. Patients received an average of 2–3 antibiotics perioperatively. The ceftriaxone–metronidazole combination demonstrated broad coverage and reduced SSI incidence. However, frequent and prolonged ceftriaxone use raises concerns regarding antimicrobial resistance. Antibiotic prophylaxis, particularly ceftriaxone-based regimens, was effective in preventing SSIs. Nevertheless, adherence to evidence-based guidelines—administration within 120 minutes before incision and discontinuation within 24 hours—is essential for rational use. These findings emphasize the need for antimicrobial stewardship strategies to optimize surgical outcomes and preserve antibiotic efficacy.

**Keywords**: Surgical prophylaxis, antibiotics, ceftriaxone, metronidazole, antimicrobial resistance.

**PL-465**

## UTILIZATION PATTERNS OF ANTIPLATELET AGENTS IN CARDIOVASCULAR PATIENTS: A STUDY ON CLOPIDOGREL AND ASPIRIN AT A TERTIARY CARE HOSPITAL

V. Harshitha and Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
harshithavanacharla9102@gmail.com

To evaluate the prescribing trends and utilization patterns of Clopidogrel and Aspirin in cardiovascular patients and assess their rationality against evidence-based treatment guidelines. Drug Utilization Evaluation (DUE) is a systematic quality improvement process that promotes rational prescribing, enhances therapeutic outcomes, and reduces adverse events. Clopidogrel and Aspirin are widely used antiplatelet agents for the prevention and management of cardiovascular diseases such as acute coronary syndrome (ACS), myocardial infarction, and coronary artery disease (CAD). Evaluating their prescribing patterns ensures optimal use in clinical practice. A prospective observational study was conducted at SCCL Main Hospital, Kothagudem. A total of 251 prescriptions containing Clopidogrel and/or Aspirin were collected over the study period. Data were obtained from patient case sheets and drug charts during routine ward rounds. Prescriptions were analyzed for indication, dosage, frequency, duration, and co-prescribed medications. Demographic and clinical data were also documented. Of 251 prescriptions analyzed, Clopidogrel and Aspirin were predominantly prescribed for ACS, STEMI, NSTEMI, and CAD. Most prescriptions adhered to guideline-recommended protocols, although some instances of potential drug–drug interactions were noted. Antiplatelet monotherapy was more frequently prescribed compared to dual antiplatelet therapy. The study highlights rational prescribing practices of Clopidogrel and Aspirin in cardiovascular patients, with a preference for monotherapy. Strengthening awareness about drug interactions and reinforcing guideline-based therapy can further optimize patient care.

**Keywords**: Clopidogrel, Aspirin, cardiovascular disease, prescribing patterns, antiplatelet therapy, drug utilization evaluation.

**PL-466**

## EVALUATION OF DRUG PRESCRIBING TRENDS IN THE MANAGEMENT OF BRONCHIAL ASTHMA AT A TERTIARY CARE HOSPITAL

M. Naga Greeshma and Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
greeshemanth23@gmail.com

Bronchial asthma is a chronic airway disorder marked by inflammation, bronchial hyperresponsiveness, and recurrent episodes of wheezing, coughing, and breathlessness. Despite the availability of standardized treatment guidelines, variations in prescribing practices may compromise disease control and quality of life. To analyze the prescribing trends of medications used for bronchial asthma, assess adherence to guideline-based therapy, and study demographic and clinical profiles of patients. A prospective observational study was conducted over six months in the Pulmonology Department of a tertiary care hospital. A total of 210 patients across pediatric, adult, and geriatric age groups were enrolled. Demographic, clinical, and prescription data were collected and evaluated using descriptive statistics. Among 210 participants, 33.3% were pediatric and 66.6% adults, with peaks in the <10 years and >60 years age groups. Gender distribution was nearly equal. Smoking (52.3%) and alcohol use (28.5%) were notable risk factors. Inhalational therapy was the most preferred approach, ensuring higher efficacy with minimal systemic effects. Prescriptions revealed balanced use of monotherapy (50.4%) and combination therapy (49.6%). Hydrocortisone (60.8%) was the most common systemic corticosteroid, while Montelukast (51.9%) was the preferred leukotriene antagonist. The study emphasizes rational prescribing practices with strong reliance on inhalational therapy. However, modifiable lifestyle factors such as smoking, and variations in drug selection highlight the need for patient counseling and stricter adherence to evidence-based guidelines.

**Keywords:** Bronchial asthma, prescribing patterns, inhalational therapy, corticosteroids, leukotriene antagonists, drug utilization, tertiary care hospital.

**PL-467**

## THE PROTECTIVE EFFECT OF HYDROALCOHOLIC EXTRACT OF ROOTS OF WITHANIA SOMNIFERA ON DAUNORUBICIN-INDUCED CARDIOTOXICITY AND HEPATOTOXICITY

Sai Poojitha Maradana and Jhansi Lakshmi Varanasi
Department of Pharmaceutical Sciences, Vignan Institute of Pharmaceutical Technology (A), Duvvada, Visakhapatnam, Andhra Pradesh, India- 530049.
saipoojithamaradana@gmail.com

Daunorubicin, a widely employed anthracycline chemotherapeutic, is clinically constrained by its pronounced cardiotoxic and hepatotoxic effects. Withania somnifera (Ashwagandha) root extract, abundant in antioxidants and bioactive phytoconstituents, has been proposed as a natural protective agent. The present study evaluated its cardioprotective and hepatoprotective potential in male Wistar rats. Animals received oral Ashwagandha root extract at doses of 300 and 600 mg/kg for 14 consecutive days, while silymarin (60 mg/kg) served as the standard reference. To induce toxicity, a single intraperitoneal dose of daunorubicin (10 mg/kg) was administered on day 1. Physiological parameters, serum biomarkers (ALP, SGOT, SGPT, LDH, CK-MB), and histopathological changes in cardiac and hepatic tissues were systematically assessed. Both treatment doses improved biochemical and histological profiles, with the higher dose (600 mg/kg) demonstrating pronounced protective effects comparable to silymarin. In addition, cavity-based molecular docking provided mechanistic validation by confirming interactions of Ashwagandha phytoconstituents with toxicity-related targets. Collectively, these findings highlight the potential of Withania somnifera root extract as a natural adjuvant to mitigate daunorubicin-induced hepatic and cardiac injury, thereby enhancing the therapeutic safety of anthracycline-based chemotherapy.

**Keywords:** Daunorubicin, Withania somnifera, Cardioprotective, cbdocking, Hepatoprotective.

**PL-468**

## DRUG UTILISATION REVIEW AND THERAPEUTIC ASSESSMENT OF ROSUVASTATIN IN CARDIOVASCULAR DISEASE MANAGEMENT

Sk. Suhana Tahrannum and Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
sahmishaik@gmail.com

Cardiovascular diseases (CVDs) remain a major global health burden, with statins forming the cornerstone of therapy for lipid control and risk reduction. Rosuvastatin, a potent statin, requires continuous evaluation for its prescribing patterns, clinical outcomes, and safety. To assess the utilisation pattern, therapeutic outcomes, and safety profile of Rosuvastatin in cardiovascular patients. A six-month prospective

ISBN: 978-81-980623-8-3

observational study was conducted at SCCL Main Hospital, Kothagudem. A total of 250 inpatients diagnosed with CVD and prescribed Rosuvastatin were included. Data on demographics, indications, dosing, surgical interventions, blood pressure, and glycemic control were analyzed using descriptive and inferential statistics. The majority of patients were aged 51–60 years (31.2%), with nearly equal gender distribution (females 50.8%, males 49.2%). Hypertension alone (50.8%) and hypertension with CAD (36%) were the leading indications. Most prescriptions were from the General Medicine department (80.4%). Surgical interventions included PTCA in 23.2% and CABG in 12.1%. The 10 mg dose was most commonly prescribed (61.2%), followed by 20 mg (28%). Blood pressure control was achieved in 53.2% of patients, whereas 32.8% remained hypertensive. Importantly, 89.6% of patients had abnormal blood sugar values, reflecting significant metabolic comorbidity. Rosuvastatin was rationally prescribed, predominantly at 10 mg/day, with favourable blood pressure outcomes. However, high prevalence of glycaemic abnormalities highlights the need for individualized therapy and careful monitoring to optimize cardiovascular outcomes.

**Keywords**: Rosuvastatin, Cardiovascular diseases, Drug utilisation review, Hypertension, Prescribing trends, Therapeutic outcomes

**PL-469**

## COMMUNITY-BASED EVALUATION OF ASTHMA BURDEN AND MANAGEMENT PRACTICES IN A COAL MINING TOWNSHIP OF TELANGANA, INDIA

M.Susunkumar and Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
susunkumar07@gmail.com

Asthma remains one of the most common chronic respiratory diseases worldwide, with rising incidence particularly in developing countries. Occupational and environmental exposures in coal mining regions further contribute to the disease burden. India accounts for 15–20 million asthma cases, with rural and industrial townships being disproportionately affected. To evaluate the prevalence, demographic distribution, risk factors, and therapeutic management of asthma in a coal mining township of Telangana. A community-based cross-sectional study was conducted in the field practice area of The Singareni Collieries Company Ltd. Main Hospital, Kothagudem. Thirty-six patients with clinically diagnosed asthma were enrolled using a predesigned and pretested protocol. Demographic, occupational, lifestyle, and therapeutic data were collected and analyzed. Of 36 patients, 52.8% were female and 47.2% male. The majority of cases (77.8%) were in the 19–60 year age group. Housewives accounted for the largest occupational group affected (36.1%), while labourers contributed the least (5.6%). Educational status showed higher prevalence among graduates and academic staff (66.7%). Notably, asthma was observed even among non-smokers (80.6%) and non-alcoholics (88.9%), indicating the influence of environmental exposures. In terms of therapy, 61.1% of patients were prescribed 3–5 medications, while 25% required more than five drugs. Asthma poses a significant burden in coal mining townships, affecting adults irrespective of smoking or alcohol habits. Strengthening patient counselling, ensuring rational pharmacotherapy, and adherence to evidence-based guidelines are essential to improve disease control and quality of life in such high-risk communities.

**Keywords:** Asthma, coal mining township, prevalence, risk factors, therapeutic management.

**PL-470**

## EVALUATION OF DIABETES RISK AND HEALTHCARE MANAGEMENT BASED ON ADA STANDARDS IN A COLLIERY TOWNSHIP OF TELANGANA, INDIA

B.Shashidhar and Dr. M. Purushothaman
Department of Pharmacy Practice, KLR Pharmacy College, Paloncha, Telangana, India-507115
shashidharbommideni@gmail.com

Diabetes mellitus is one of the fastest growing public health challenges, with global cases expected to double by 2025, particularly in India and China. Early detection of risk factors and adherence to evidence-based guidelines such as those of the American Diabetes Association (ADA) are essential to improve outcomes in resource-limited rural communities. To assess the prevalence of diabetes risk factors and evaluate healthcare management practices in line with ADA standards among residents of a colliery township in Telangana. A community-based cross-sectional study was conducted in the field practice area of The Singareni Collieries Company Ltd. Main Hospital, Kothagudem, Telangana. A total of 511 individuals were screened using a predesigned and pretested protocol, including demographic, lifestyle, and clinical parameters. ADA risk factor scoring was applied, and BMI, family history, physical activity, and socioeconomic status were analyzed. Of 511 respondents, 352 (56.7%) were female. Nearly half (262, 51.3%) were aged 35–55 years. Most (202, 67%) engaged in mild to moderate physical activity. Overweight status (BMI >25) was noted in 249 (49.6%) participants, with 25% of them exhibiting high diabetes risk scores. A positive association was observed between higher BMI and elevated risk. Gaps were identified in adherence to ADA-recommended standards of screening and preventive care. The study highlights inadequate compliance with ADA guidelines in rural diabetes care. Strengthening awareness, implementing structured screening programs, and integrating ADA standards into routine care are critical to reduce the future burden of diabetes in such communities.

**Keywords:** Diabetes mellitus, ADA guidelines, risk factors, obesity, rural health.

**PL-471**

## ECOPHARMACOVIGILANCE: A TOOL FOR SUSTAINABLE HEALTH CARE SYSTEM

Divya Junghare, Jayshree Taksande, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India – 441002.
divyajunghare1@gmail.com

Ecopharmacovigilance (EPV) is a rapidly evolving field that focuses on detecting, assessing, and mitigating the environmental impact of pharmaceuticals. As pharmaceuticals are increasingly detected in water bodies and soil, EPV aims to promote sustainable practices and minimize harm to ecosystems and human health. This highlight the importance of EPV in understanding the environmental fate and effects of pharmaceuticals, its role in informing regulatory decisions, promoting green pharmacy practices, implementing safe and environmentally responsible drug disposal practices and protecting the environment. This work also discusses greener drugs, which are pharmaceuticals designed with environmental sustainability in mind. These medications aim to minimize ecological exposure and harm while maintaining therapeutic efficacy. Key aspects of green drugs include designing less environmentally impactful drugs, developing pharmaceuticals with reduced environmental toxicity and eco-friendly packaging. This review analyzed the literature published in the last decade about occurrence, bioaccumulation, and possible environmental risks of benzalkonium chlorides (BKCs), presence of psychoactive drug in aquatic environment and drugs used in COVID-19 therapy and their effects on the environment. This review also highlights the importance of knowledge and awareness regarding safe drug disposal system among the general population. The work also focuses on USFDA initiated 'Drug Take Back Programme' to prevent the entry of medication into environment. By examining the latest research and regulatory developments, this review provides a comprehensive overview of ecopharmacovigilance, offering insights into its applications, challenges, and future directions for protecting environmental and human health.

**Keywords:** Ecopharmacovigilane, drug disposal, green drugs, Drug Take Back Programme.

**PL-472**

## IDENTIFICATION OF RISK FACTORS OF ADVERSE EVENTS ASSOCIATED WITH CONTRAST AGENTS IN A TERTIARY CARE HOSPITAL: A CROSS-SECTIONAL STUDY

Bindu M A, Adusumilli Pramod Kumar, and Brunda M A
Department of Pharmacy Practice, Faculty of Pharmacy, M S Ramaiah University of Applied Sciences, Bengaluru- 560054

Adverse events associated with contrast agents, though infrequent, pose significant clinical challenges during diagnostic imaging in tertiary care hospitals. This cross-sectional study aimed to identify and statistically analyse the key risk factors influencing such adverse events to enhance patient safety. Data were collected from patients receiving iodinated and non-iodinated contrast media over six months. Adverse event incidence

ISBN: 978-81-980623-8-3

was recorded along with demographics, comorbidities, contrast agent type, and prior reaction history. Statistical analyses using Pearson chi-square test and logistic regression revealed a significant association of adverse events with previous history of contrast agent reaction (Odds Ratio [OR]=4.2, 95% Confidence Interval [CI]: 2.8–6.3, p<0.01), renal impairment (OR=3.5, 95% CI: 2.2–5.1, p<0.01), concomitant use of nephrotoxic drugs (OR=2.9, 95% CI: 1.6–4.7, p=0.02), and administration of high-osmolality contrast agents (p=0.005). Age above 60 years showed an increased risk trend, though less statistically robust (p=0.07). Female gender was not found significantly associated. Most adverse events were mild to moderate, with dermatological symptoms predominant. Logistic regression predicted prior adverse reaction and renal dysfunction as independent risk factors for severe events (Area Under Curve=0.70, p<0.001). These findings underscore the importance of rigorous pre-procedural risk assessments, especially focusing on patient history and renal function, to tailor safer contrast agent selection. Incorporating these risk factors in clinical protocols can reduce the incidence of adverse events, improving patient outcomes in tertiary care settings. This study contributes vital statistical evidence to optimize contrast media safety practices in Indian hospitals.

**Keywords:** contrast agents, adverse events, risk factors, hospital, cross-sectional

## EXPLORING THE THERAPEUTIC POTENTIAL OF ANTIDIABETIC DRUGS IN NAFLD: A RESEARCH ANALYSIS

Oviyapriya, Syed Abuthahir Badusha, Samuel Ajay Kirubakaran, Shobiga
Department of Pharmaceutics, Vellalar College Of Pharmacy, Erode, Tamil Nadu, India- 638012
oviyapharma25@gmail.com

A prevalent disorder known as non-alcoholic fatty liver disease (NAFLD) is marked by an excess of fat in the liver. The increasing prevalence of obesity and type II diabetes is making NAFLD a public health issue that requires novel remedies. Drug repurposing can speed up drug discovery by finding new uses for existing drugs. Because the pharmaceuticals are already on the market and the safety concerns have been studied in clinical trials, repurposing them is an excellent strategy to save money. Due to the correlation between insulin resistance and inflammation of the liver, we repurposed anti-diabetic medications in the present research to treat NAFLD. The molecular docking technique was used to repurpose anti-diabetic medications for the treatment of NAFLD. The interactions were visualized using BioVia Discovery Studio. This research made use of the Peroxisome Proliferator Activated Receptor (PPAR-α) antagonist receptor (PDB ID: 6LJX). Alpha-glucosidase inhibitors, thiazolidinediones, sulfonyl ureas, PPAR-α agonists, sodium-glucose co-transporter 2 (SGLT2) inhibitors, and dipeptidyl peptidase-4 (DPP-4) inhibitors were utilized in this study, all of which were approved by the FDA as antidiabetics. Our findings indicate that DPP-4 inhibitor sitagliptin exhibits a higher binding affinity (-10.2 kcal/mol) with the receptor protein (6LJX) when compared to the standard drug saroglitazar (-7.4 kcal/mol) interacting with the same receptor. To completely comprehend the actual potential of DPP4 inhibitors in relation to PPAR-α, additional in vitro and in vivo studies are necessary.

**Keywords:** Drug repurposing, DPP-4 inhibitors, PPAR- antagonist, Auto Dock Vina.

**PL-474**

## CANCER PHARMACOTHERAPY: INTEGRATING TARGETED THERAPY, IMMUNOMODULATION, AND RESISTANCE MANAGEMENT

Ravi Roushan Ranjan1,2, Dr. Parag Jain1,2
Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh, INDIA-490023
Department of Pharmacy, Rungta International Skill University, Kohka, Kurud Road, Bhilai, INDIA-490023
raviroushanbhilai2814@gmail.com

Cancer pharmacotherapy has evolved from non-specific cytotoxic agents to precision-targeted and immune-based interventions. This review outlines the pharmacological landscape of anticancer agents, including tyrosine kinase inhibitors, monoclonal antibodies, immune checkpoint inhibitors, and CAR-T therapies. Mechanisms of action are analyzed alongside resistance pathways such as efflux transporters, oncogenic mutations, and tumor microenvironment modulation. The review emphasizes combination therapies and biomarker-guided treatment strategies. Nanotechnology-enabled delivery systems and RNA-based therapeutics are explored as next-generation solutions. Clinical trial design, regulatory pathways, and real-world evidence integration are discussed. By synthesizing molecular insights with translational oncology, this article offers a roadmap for future cancer drug development and personalized medicine.

**Keywords**: Cancer therapy, Targeted drugs, Immunotherapy, Drug resistance, Tumor microenvironment, Tyrosine kinase inhibitors

**PL-475**

## DRUG UTILIZATION AND POTENTIAL DRUG RELATED PROBLEMS IN VULVOVAGINAL CANDIDIASIS-A PROSPECTIVE INTERVENTIONAL STUDY

Aswathy M V
Prime College of Pharmacy

Vulvovaginal candidiasis (VVC) is one of the most common gynecological infections affecting women of reproductive age, often resulting in significant discomfort and impaired quality of life. Appropriate drug utilization is essential for effective management, yet irrational prescribing, self-medication, and potential drug-related problems (DRPs) remain major concerns. Evaluating prescribing trends and identifying DRPs can help promote rational drug use and improve patient outcomes. The study aims to conduct a prospective interventional study on drug utilization patterns and potential drug-related problems in patients with vulvovaginal candidiasis in a tertiary care hospital. A prospective interventional study was conducted over one year at Rajiv Gandhi Cooperative Multi-Super-Specialty Hospital, Kerala, India. 240 women were included in the study. Their past medical and medication history was recorded on a data entry form, and they were followed up after the course of treatment. VVC was more prevalent among women of reproductive age (84%) and during pregnancy (17%). Antifungals were most commonly prescribed in the 15-49 age group. Hypothyroidism (41.12%) and DM (23.38%) were the most common comorbidities found in the patients. Multidrug therapy (12.75) was the most drug-related problem in VVC. Using WHO core indicators, prescribing patterns were assessed. Results were reported on the rational utilization of drugs. This study found that VVC is more common in women with higher BMI levels (overweight). Prevalence of VVC is higher in women with a BMI ranging between 25-29.9 (59.58%), which indicates that being overweight is the main reason for developing VVC. Past medical history includes Diabetes mellitus (12.08%), hypothyroidism (21.25%), Urinary tract infection (7.91%), PCOD (Polycystic Ovarian Disease) (7.08%), and anemia (2.08%). Others (8.75%). Past medication history, such as administration of antibiotics (15.41%) was the major risk factor for VVC. The results indicate that married women (82.91%) had a higher incidence of candidiasis than single women. The study shows that antifungal agents, especially azoles, are widely used in the treatment of vulvovaginal candidiasis. However, issues like inappropriate dosing, self-medication, and recurrence highlight the need for rational prescribing and patient education. Promoting proper drug use and awareness can help reduce drug-related problems and improve treatment outcomes. Vulvovaginal candidiasis was found to be more common among women of reproductive age, mainly due to hormonal factors and sexual activity.

**Keywords:** Vulvovaginal Candidiasis (VVC), Drug utilization evaluation, Potential Drug-Related Problems, Prevalence, Candida albicans, Quality of life, VSQ, VDQoL, Risk factors of VVC.

## ORPHAN DRUGS: BEACON OF HOPE FOR HUMANITY

Sarah Aijaz Haque
Columbia Institute of Pharmacy, Raipur (C.G)
sarahaijazhaque@gmail.com

Orphan drugs are the pharmaceutical preparations or drugs that are used to treat, diagnose or prevent rare diseases in human beings. In India Orphan drugs are given to people having an illness that affects less than 500,000 people. In spite of their less commercial value, these drugs are a beacon of hope for thousands of patients who suffer from rare diseases formerly neglected or disregarded by prevalent pharmaceutical researches. Recent advancements show high progress in technology as well as policy. National Policy for Rare Diseases (NPRD) – 2021 is the first structured framework for rare diseases in India. Regulatory Support:

ISBN: 978-81-980623-8-3

New drugs and Clinical Trials Rules (2019) is the first legal framework for orphan drugs in India. Other advances like general therapy and a novel formulation (for example hydroxyl urea syrup which is made to give to children suffering from sickle cell disease) have improved affordability, accessibility and promise a better future. Regardless of these advancements orphan drugs can be very expensive and are not accessible to middle- and lower-income families of India. Thus, the accessibility and manufacturing of orphan drugs not only exhibit scientific progress but also acts as a beacon of hope – making pharmaceutical sector act in a humanitarian mission.

**Keywords:** Orphan drugs, rare diseases, pharmaceutical preparations, NPRD

## DUAL ACTION OF NITRIC OXIDE IN THE NEUROPROTECTION OF METFORMIN PLUS VITAMIN E DURING CHRONIC PRE-TREATMENT OF CEREBRAL ISCHEMIA–REPERFUSION INJURY

Aman Upaganlawar and Avinash Mandoli
Department of Pharmacology, SNJBs Shriman Sureshdada Jain College of Pharmacy, Chandwad, Nashik, Maharashtra
amanrxy@gmail.com

Nitric oxide (NO) exerts a paradoxical influence in cerebral ischemia–reperfusion injury, with endothelial NO (eNOS) largely protective and neuronal/inducible NO (nNOS/iNOS) potentially harmful. This study explored the NO-dependent and dual effects of Metformin (MET), Vitamin E (Vit-E), and their combination during chronic pre-treatment in a rat model of bilateral common carotid artery occlusion (BCCAO). Rats received 21-day pre-treatment with MET (200 mg/kg; i.m.), Vit-E (100 mg/kg; i.m.), or MET+Vit-E prior to BCCAO. L-NAME (10 mg/kg; i.m.), a non-selective NOS inhibitor, was co-administered to delineate NO involvement. Neurological scores, infarct volume, myeloperoxidase (MPO), acetylcholinesterase (AChE), NO levels, BBB permeability, and hippocampal histology were evaluated. MET+Vit-E achieved the strongest neuroprotection, reducing infarct size, neurological deficits, MPO, AChE activity, and BBB leakage while restoring NO levels and hippocampal architecture. L-NAME blunted the benefits for infarct size, neurological score, and MPO—confirming NO dependence—yet paradoxically improved BBB integrity and AChE activity, revealing a dual action of NO likely linked to different NOS isoforms. Chronic MET+Vit-E therapy exerts potent but partially NO-dependent neuroprotection. The dual and opposing effects observed with L-NAME underscore the complex, isoform-specific role of NO and highlight the need for targeted NO modulation to optimize metformin-based stroke interventions.

**Keywords:** Metformin; Vitamin E; Nitric oxide; Acetylcholinesterase; L-NAME; Myeloperoxidase

**PL-478**

## THE ROLE OF PHARMACOVIGILANCE IN ENSURING DRUG SAFETY IN INDIA

B.Shashi Vardhan, Dr.M.Pramod Kumar,Dr.D.Swarnalatha
Annamacharya College of pharmacy, Rajampet
vardhanshashi14@gmail.com

Pharmacovigilance (PV), is very significant and inevitable part of drug discovery and development, which requires comprehensive documentation process and severe monitoring at every phase of drug development including risk management and pre & post-authorization safety studies. The number of Adverse Drug Reaction (ADR) reported resulted in an increase in the volume of data handled, and to understand the pharmacovigilance, a high level of expertise is required to rapidly detect drug risks as well as to defend the product against an inappropriate removal. Though India has its own Pharmacovigilance Program since 2010, there are certain deficiencies in the framework for ADR from the perspective of pharma industry, healthcare professional and general public due to which adverse events for marketed drugs are highly underreported. This necessitates an utmost requirement for effective regulations of the drug approval process and conscious pre and post approval vigilance of the undesired effects, especially in India. In response, strategies to improve the collection, integration and analysis of data related to post-marketing drug safety are being initiated or enhanced. There are certain provisions through which the PV in India can be strengthen by evaluating knowledge & perception of people related to healthcare towards ADR reporting and about PV, creating awareness about PV, developing a tool for easy reporting and a better regulatory system. Hence, PV helps to the patients get well and to manage optimally or ideally, avoid illness is a collective responsibility of industry, drug regulators, clinicians and healthcare professionals to enhance their contribution to public health.

**Keywords**: Pharmacovigilance, Adverse Drug Reaction, Drug Safety

**PL-479**

## INVESTIGATION OF NEUROPROTECTIVE POTENTIAL OF MUSA PARADISIACA: GC–MS AND IN SILICO APPROACHES AGAINST ALZHEIMER'S DISEASE"

P. Ratheesh, Dr. G. Sumithra
Department of Pharmacology
The Erode College of Pharmacy, Erode, Tamilnadu

Alzheimer's disease (AD) is a progressive neurodegenerative disorder marked by memory loss, cognitive decline, and behavioral disturbances, mainly driven by amyloid-β plaques, tau hyperphosphorylation, oxidative stress, and cholinergic dysfunction. Current therapies, including acetylcholinesterase (AChE) inhibitors and NMDA antagonists, offer only symptomatic relief and are often limited by side effects, emphasizing the need for safer natural alternatives. This study explored the anti-Alzheimer's potential of Musa paradisiaca (plantain/banana), a plant rich in flavonoids, phenolics, fatty acids, and phytosterols. Ethanolic extracts were analyzed using Gas Chromatography–Mass Spectrometry (GC–MS), which identified more than 40 bioactive phytoconstituents. Molecular docking was performed against AChE (PDB ID: 4EY7) to evaluate inhibitory potential. Among the compounds, γ-sitosterol showed the strongest activity, with a binding energy of −12.78 kcal/mol and an inhibition constant of 427.18 pM. Interaction studies revealed stable hydrophobic, hydrophilic, and cation–π interactions, confirming its strong affinity within the enzyme's active site. Other phytoconstituents displayed moderate activity. These findings validate the traditional use of Musa paradisiaca and highlight γ-sitosterol as a promising natural AChE inhibitor with neuroprotective and antioxidant potential. The results suggest that Musa paradisiaca may serve as a cost-effective, safe therapeutic source for AD management, warranting further in vitro, in vivo, and clinical investigations.

**Keywords:** Alzheimer disease, acetylcholinerterase, musa paradisiaca.

## ASSESSMENT OF CLINICAL PROFILE OF THYROID DISORDERS IN A TERTIARY CARE TEACHING HOSPITAL

Noolu Sreelekha*
Department of Pharmacy Practice, Annamacharya College of Pharmacy, New Boyanpalli, Rajampet, India -516126
drsreelekhanoolu@gmail.com

AIM: Assessment of clinical profile of thyroid disorders in a tertiary care teaching hospital. METHODS: It was a prospective, observational Cross-sectional study conducted in GGH, Kadapa from August 2023 to January 2024, based on the subjects willingness and inclusion criteria. The Institutional Human Ethical Committee of the GGH, Kadapa approved the study. The statistical analysis was performed with descriptive statistics, chi-square test and paired t-test. RESULTS: Among 200 subjects, the predominant age group was 31-45 years and females were more affected with thyroid disorders i.e; Hypothyroidism. The ratio of male to female was 1:7. Obesity and no physical activity may prone to thyroid disorders. Most common symptoms were menorrhea, weight gain, weight loss, fatigue, hair loss. A significant (0.05) difference was shown in the comparison of hypothyroidism and hyperthyroidism symptoms across different systems. There is no significant (0.05) difference in TSH values in subjects of hypothyroidism using thyroxine and levothyroxine. CONCLUSION: Our study concluded that a higher prevalence of thyroid disorders among females, primarily hypothyroidism, with middle age and physical inactivity being common risk factors. Symptoms such as hair loss, fatigue, and weight changes are prevalent, along with non- thyroid manifestations like headache and skin allergies. Hypertension and T2DM frequently coexist with thyroid disorders. Timely identification and management can mitigate associated risks with other diseases.

**Keywords:** Thyroid disorders, hypothyroidism, hyperthyroidism, TSH, levothyroxine, demographics.

**UNRAVELLING THE LIVER DISEASE: PATHOPHYSIOLOGICAL INSIGHTS AND EMERGING THERAPEUTIC FRONTIERS**

K. Yoshitha
Department of Pharmacy Practice, Annamacharya College of Pharmacy (Autonomous), Rajampeta, Andhra Pradesh, India-516126.
dr.yoshithakondeti14@gmail.com

Liver diseases, including non-alcoholic fatty liver disease (NAFLD), viral hepatitis, autoimmune liver diseases, cirrhosis, and hepatocellular carcinoma (HCC), pose significant global health challenges. This review focuses on the emerging strategies used to treat different liver-related diseases according to their Pathophysiology. The "two-hit" model of NAFLD pathogenesis involves lipid accumulation followed by inflammation and oxidative stress. Stem cell-based therapies, such as mesenchymal stem cells (MSCs) and amniotic fluid-derived stem cells, promote liver regeneration and reduce fibrosis. Bioengineered liver tissues, including organoids and decellularized scaffolds, provide novel platforms for studying liver diseases and developing personalised treatments. Oxidative stress plays a crucial role in the pathogenesis of liver diseases, triggering inflammatory cascades and fibrogenic pathways. Therapeutic strategies targeting oxidative stress include antioxidants (e.g., N-acetylcysteine, vitamins, polyphenols), mitochondria-targeted antioxidants (e.g., MitoQ, SkQ1), nano-antioxidants (e.g., cerium oxide nanoparticles), and modulators of endogenous antioxidant pathways (e.g., Nrf2 activators). Challenges in liver disease treatment include poor bioavailability, non-specificity, and redox imbalance risks. Emerging strategies, such as nanoparticle-based drug delivery and cell-specific targeting, aim to overcome these limitations. Artificial intelligence (AI) has shown potential in diagnosing and assessing liver diseases, predicting treatment response, and improving patient outcomes. Telemedicine offers opportunities for remote monitoring and care of liver disease patients. Future research should focus on developing targeted therapies, optimizing stem cell and bioengineering approaches, and integrating AI and telemedicine into clinical practice to improve the management of liver diseases.

**Keywords:** Liver diseases, pathophysiology, emerging therapies, stem cell therapies, nanoparticles, and artificial intelligence

**PL-482**

**SAFETY AND EFFICACY OF ANTI-HYPERTENSIVE DRUGSIN PATIENTS WITH MULTIPLE COMORBIDITIES - A PROSPECTIVE STUDY**

Lakshmi Manideep Royal.S* and Giri Raja Shekar Dornadula
Department of Pharmacy Practice, Annamacharya College of Pharmacy, Rajampeta, AndraPradesh, India- 516126.
manideeproyal1999@gmail.com

Hypertension is a major public health concern affecting 1.28 billion adults,significantly increasing the risk of cardiovascular diseases, stroke, and kidney failure. The burden is higher in low- and middle-income countries due to inadequate healthcare access. Hypertension frequently coexists with diabetes mellitus, cerebrovascular accident, and chronic kidney disease, complicating management and increasing adverse health risks. Despite JNC 8 guidelines, an optimal treatment approach for hypertensive patients with multiple comorbidities remains unclear. This study evaluates the safety and efficacy of antihypertensive drugs using WHO-UMC causality assessment and WHO ATC coding for drug utilization review. A prospective, observational, cross-sectional study was conducted over six months at Government General Hospital, Kadapa. Data were collected from treatment charts and medication history interviews at baseline, 40-day, and 80-day follow-ups. Patients aged 20–80 years on antihypertensive therapy with DM, CVA, or CKD were included, while pregnant women and those with COPD, TB, or seizures were excluded. Descriptive statistics, inferential statistics, and two-way ANOVA were used for analysis. Among 126 hypertensive patients, 68.25% were male. Diabetes (40.5%) was the most common comorbidity. 25 ADRs were reported, primarily with calcium channel blockers (CCBs), with 12 requiring hospitalization. Blood pressure reductions were observed, but no statistically significant difference was found across treatments (P>0.5). ARBs and CCBs were more effective in reducing blood pressure. Telmisartan was safer than amlodipine due to fewer ADRs. JNC 8 implementation, DUR, and clinical pharmacist interventions are crucial for optimizing therapy and ensuring patient safety.

**PHARMACOVIGILANCE OF ANTIBIOTICS IN THE DEPARTMENT OF GENERAL MEDICINE -A PROSPECTIVE STUDY**

Vineela Hasiny
Department of Pharmacy Practice, Annamacharya College of Pharmacy, New Boyanapalli, Rajampet, Andhra Pradesh, India- 516126.
vineelahasini111@gmail.com

Antibiotics are among the most frequently prescribed therapeutic agents among hospitalized patients of all age groups. Adverse drug reactions are the fifth leading cause of death worldwide. The prime role of the Pharmacovigilance system is to ensure patient safety due to its involvement in comprehension, recognition, and prevention of ADEs. The present study aimed to screen, analyze and report suspected Adverse Drug Reactions in the inpatients receiving antibiotic treatment from the General Medicine Department in a tertiary care hospital. It is a prospective observational study conducted over a period of 6 months in Government General Hospital. The suspected ADRs are reported to the adverse drug reaction monitoring center. The causality assessment of those ADRs was done by using the WHO-UMC causality assessment scale. A total of 539 antibiotics were prescribed to 316 patients and 37 ADRs were found with the predominance of female gender. Anatomically the most affected organ systems were GIT followed by the nervous system. Type A reactions were more compared to Type B reactions. The causality assessment was done using the WHO Casualty scale which showed that 11 were probable, 26 were possible, definite, and unlikely were 0. More ADRs were found among patients having a longer length of stay in the hospital. The incidence of ADRs in our study was found to be 11.7%. The present study concludes that early detection and prompt reporting of the detected ADRs to the adverse reaction monitoring center (AMC) helps to improve the pharmacovigilance system in India.

**Keywords:** Pharmacovigilance, Antibiotics, ADRs, Length of stay, Causality assessment

**EVALUATION OF NEUROPROTECTIVE ACTIVITY OF COUMARIN AGAINST ROTENONE INDUCED PARKINSON'S DISEASE IN ZEBRAFISH MODEL**

Y Navya Reddy, Vijay Singepalli and Vinila Karnatakam
Department of Pharmacology, Balaji College of Pharmacy, Anantapuramu, Andhra Pradesh, India - 515001.
navyayellala@balajipharmacy.ac.in

The degeneration of dopaminergic neurons within the substantia nigra of the brain leads to Parkinson's disease (PD), a progressive neurodegenerative disorder that significantly affects motor capabilities. This research employed a Rotenone-induced zebrafish model of Parkinson's disease to explore the neuroprotective effects of natural phytochemicals. Utilizing PyRx and AutoDock Vina, promising compounds (Coumarin, Allicin) were virtually screened against proteins associated with PD (α-synuclein, Nrf2, BDNF, NfkB, and CCL2). Coumarin exhibited the highest binding affinity with BDNF (-7.1 kcal/mol), indicating its potential for therapeutic application. Consequently, zebrafish were administered Coumarin (100 µg/L, 200 µg/L) as the test substance and Amantadine (500 µg/L) as the standard treatment for a duration of 14 days after exposure to rotenone (4 µg/L) for 14 days. Histopathological assessments were conducted to determine the integrity of dopaminergic neurons, while behavioral tests (locomotor activity, T-Maze) were performed to assess motor and cognitive functions. Statistical analysis was carried out using Dunnett's post hoc test and Two-way ANOVA. Compared to the negative control and standard treatment groups, the findings indicated that Coumarin at 100 µg/L effectively preserved dopaminergic neurons and significantly enhanced locomotion, cognitive abilities, and PD-related depressive symptoms. These findings suggest that Coumarin represents a promising neuroprotective candidate for the management of Parkinson's disease.

**Keywords:** Parkinson's Disease, Rotenone, Coumarin, Neuroprotection, Cognitive Function.

**EXPLORING THE IMPACT OF VITAMIN E SUPPLEMENTATION ON NEUROBEHAVIORAL ALTERATIONS INDUCED BY MATERNAL HYPOTHYROIDISM IN RAT OFFSPRING**

Prajwali Shende, Nitu Wankhede, Brijesh Taksande and Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur (M. S.), India-441002.
prajwalishende25@gmail.com

Thyroid hormones (TH) are vital for brain development and maturation. Hypothyroidism is a common hormonal disorder during pregnancy, affecting 2–5% of women with clinical and 3–5% with subclinical hypothyroidism. Maternal hypothyroidism is associated with neurobehavioral deficits in offspring, including impaired learning and memory, motor incoordination, and increased seizure susceptibility. The present study investigated the neuroprotective role of vitamin E supplementation during adolescence (PND 35–62) in rat offspring of hypothyroid mothers. Pregnant Sprague Dawley rats were administered 6-propyl-2-thiouracil (PTU, 10 mg/kg, orally) from GD03 to PND 21 to induce hypothyroidism. Offspring from hypothyroid mothers exhibited neurobehavioral alterations such as reduced locomotor activity (PND 63), anxiety-like behaviour (PND 64), motor incoordination (PND 65), impaired spatial working memory (PND 66), reduced attention (PND 67), and increased seizure susceptibility (PND 68). Vitamin E supplementation (100, 200, 400 mg/kg) significantly attenuated these alterations. It reduced lipid peroxidation and nitrite levels, while enhancing antioxidant defences through increased superoxide dismutase (SOD) and glutathione (GSH) activity. Vitamin E also exerted anti-inflammatory effects by lowering TNF-α and IL-6 and elevating IL-10 levels. Additionally, it improved neurochemical parameters by increasing brain-derived neurotrophic factor (BDNF) and reducing acetylcholinesterase, monoamine oxidase-A, and monoamine oxidase-B activities in the prefrontal cortex, hippocampus, and cerebellum. Histopathological examination (H&E staining) further revealed improved neuronal morphology in these regions with vitamin E treatment. These findings suggest that vitamin E supplementation during adolescence mitigates maternal hypothyroidism-induced neurobehavioral and neurochemical alterations, highlighting its therapeutic potential against developmental brain deficits.

**Keywords:** Maternal hypothyroidism, Vitamin E, Memory, Attention, Motor incoordination.

**PL-486**

**EVALUATION OFANTI - ARTHRITIC ACTIVITY OF BARK EXTRACT OF MAMMEA SURIGA KOSTERM IN COLLAGEN INDUCED EXPERIMENTAL RATS**

Mahananda G Uppin1, V.H. Kulkarni1*, Anarghya V.K.2 Preeti V Kulkarni1
1Post graduate Department of Pharmacology and 2Post graduate Department of Pharmaceutics,S.E.T's College of Pharmacy, S. R. Nagar, Dharwad, Karnataka, India - 580002.

Arthritis is inflammation of one or more joints, causing pain and stiffness that can worsen with age. The inflamed synovium leads to erosion of the cartilage and bone and sometimes leads to joint deformity. Sometimes RA causes problems in other parts of the body such as eyes, heart, lungs and circulatory system. The aim of this study was to evaluate the effect of ethanolic bark extract of Mammea Suriga Kosterm (MSBE) on Collagen induced arthritis in Rats. Collagen type II (2 mg/ml) was dissolved in 0.05 M acetic acid by gently stirring overnight at 4 °C. Equal amount of collagen (2 mg/ml) and Complete Freund's Adjuvant (CFA) was mixed in an ice-water bath, adding the collagen drop-wise to the CFA while mixing. Mixing was continued until a stiff white emulsion evident and was able to congeal when dropped in water. The arthritis-inducing emulsion is prepared immediately before immunization using an electric homogenizer. Rats were immunized with 0.2 ml (200 µg) of the emulsion by subcutaneous (SC) injection at the base of the tail under diethyl ether aesthesia. To ensure a high incidence and severity of arthritis a booster injection 0.1, ml (100 µg) emulsion was given 7 days after immunization. Vehicle treated group animals were treated with sterile phosphate-buffered saline (PBS), standard group of rats were treated with dexamethasone (1 mg/kg i.v.). All test groups animals were treated with MSBE with respective doses one day before administration of Type II collagen. The treatment is continued for 20 more days. Paw volume and body weightwas measured at different time intervals. All animals were measured before immunization. The collected blood samples were sent for the estimation of biochemical parameters. The collected ankle joints were subjected for histological assessment. Paw volume, body weight was measured. The protective role of MSBE is confirmed by histopathological examination. The present study suggests the use of Mammea Suriga Kosterm plant for amelioration of arthritis

**Keywords:** RA, Paw volume, Mammea suriga kosterm

**PL-487**

**EVALUATION OF HYPOLIPEDEMIC ACTIVITY OF ETHANOLIC EXTRACT OF BLEPHARIS BOERHAVIIFOLIA IN HIGH FAT DIET INDUCED IN WISTAR ALBINO RATS**

DHARINISHREE D
ADITYA BANGALORE INSTITUTE OF PHARMACY EDUCATION AND RESEARCH

This study evaluates the hypolipidemic potential of ethanolic extract of Blepharis boerhaviifolia in albino Wistar rats with high-fat diet (HFD)-induced hyperlipidemia. The plant, rich in phytosterol flavonoids with known antioxidant and hepatoprotective properties, was phytochemically screened and confirmed to contain key bioactive compounds. Thirty-six rats were allocated into six groups: normal control, HFD control, standard drug (Simvastatin 4 mg/kg), and three test groups receiving 100, 200, or 400 mg/kg of the extract orally for 21 days. Serum lipid profiles were assessed for total cholesterol (TC), triglycerides (TG), low-density lipoprotein (LDL), very low-density lipoprotein (VLDL), and high-density lipoprotein (HDL). Results indicated a significant reduction in TC, TG, LDL, and VLDL levels in extract-treated groups compared to HFD controls, with the highest dose (400 mg/kg) demonstrating superior lipid-lowering efficacy. Statistical analysis supported the dose-dependent activity. In conclusion, the ethanolic extract of B. boerhaviifolia shows promising hypolipidemic effects, particularly at higher doses, and may serve as a potential natural therapeutic agent for hyperlipidemia management associated with high-fat diets.

**Keywords**: Blepharis boerhaviifolia, hypolipidemic activity, cholesterol, triglycerides, albino rats.

**STUDY OF RIBAVIRIN AND PYRAZOMYCIN IN HPV TREATMENT: A PERSPECTIVE TOWARDS DRUG REPURPOSING**

Priyanka H. Jadhav and Shitalkumar Shivgonda Patil
Dr. J. J. Magdum Pharmacy College,
Jaysingpur, Kolhapur (Maharashtra), India
gaikwad.priyankajjmph@gmail.com

Human papillomavirus (HPV) is a virus that infects skin or mucosal cells. The choice of antiviral medication for HPV treatment is generally based on established treatments such as topical agents, surgical interventions, and immunotherapies. This study focused on analysing the binding interactions of Ribavirin and Pyrazomycin with Inosine Monophosphate Dehydrogenase (IMPDH) using docking simulations, as both compounds showed structural resemblance to each other. The protein structure 1AK5 was selected and prepared by removing heteroatoms and water molecules to ensure accurate docking results. The docking scores revealed that Pyrazomycin exhibited a slightly better binding affinity compared to Ribavirin. In conclusion, the docking studies indicate that Pyrazomycin holds greater potential as an antiviral agent for HPV compared to Ribavirin. These findings suggest that said drug can be repurposed as a potential treatment for HPV infections. Further research, including experimental validation, formulation development & clinical trials, are necessary to confirm these findings and fully explore the therapeutic benefits of Pyrazomycin in HPV treatment.

**Keywords**: HPV, interactions, Ribavirin, Pyrazomycin, drug repurposing

**UNRAVELLING THE MECHANISM OF CYP 450 ISOFORMS DOWNREGULATION DRIVEN ALTERATIONS IN METFORMIN PHARMACOKINETICS BY A HERBAL DIETARY SUPPLEMENT**

Sathi Sarkar, Bhukya Siva, Dipanjan Ghosh, Satheesh Kumar Nanjappan
National Institute of Pharmaceutical Education and Research (NIPER)
Kolkata, West Bengal 700054, India

ISBN: 978-81-980623-8-3

Herbal products are widely used for medicinal and dietary purposes, often concomitantly with prescription and over-the-counter medications. While they are considered as natural and safe, herbs possess bioactive compounds that can modulate drug metabolism, potentially leading to altered pharmacokinetics and therapeutic outcomes. This study investigated the impact of guava dietary supplement on the oral exposure of metformin, a first-line treatment for type 2 diabetes, in Sprague-Dawley rats. Additionally, the inhibitory effects of guava dietary supplement on hepatic cytochrome P450 (CYP450) enzymes were assessed through in vitro CYP450 inhibition assays. The gene and protein expression levels of major CYP450 isoforms were analyzed via RT-PCR and Western blotting in rat liver tissue. Pharmacokinetic parameters were evaluated following oral administration of metformin (100 mg/kg) with or without dietary supplement (250 mg/kg). Co-administration of guava dietary supplement significantly increased the oral exposure (AUC) of metformin, with a reduced Tmax from 2 h to 1 h, leading to elevated plasma drug concentrations in the initial two hours. A significant increase in Cmax was also observed, suggesting enhanced drug absorption. Furthermore, guava dietary supplement downregulated CYP1A1, CYP3A2, CYP2C11, and CYP2C22 gene expression, potentially slowing metformin metabolism and increasing the risk of drug accumulation and associated adverse effects. These findings indicate that guava dietary supplement enhances metformin exposure, likely through CYP450 inhibition, highlighting the need for careful monitoring of potential herb-drug interactions when these agents are used concomitantly.

Diabetes mellitus (DM) is a chronic condition affecting millions worldwide and is a major contributor to morbidity and mortality. Inadequate management can result in severe complications, underscoring the importance of continuous monitoring of blood glucose levels. Conventional blood glucose monitoring (BGM) has long been a cornerstone of diabetes care, yet the advent of continuous glucose monitoring (CGM) technology has transformed glycemic management by enabling real-time assessment of glucose trends. Since its approval by the FDA in 1999, CGM has evolved significantly, allowing clinicians and patients to gain deeper insights into glucose variability, reduce the incidence of hypo- and hyperglycemia, and optimize therapeutic interventions.For patients with type 1 diabetes mellitus (T1DM), CGM plays an essential role in achieving optimal glycemic control. Clinical studies demonstrate that CGM, particularly real-time (RT-CGM) and intermittent is (CGM) systems, improves outcomes compared with traditional BGM, especially in those requiring multiple insulin injections or pumps.Overall, CGM technology represents a paradigm shift in diabetes management, enhancing glycemic control, supporting lifestyle changes, and empowering patients. Its integration into care strategies for T1DM is well established, while its role in prediabetes management continues to be explored.

**IMPACT OF DEPRESSION ON QUALITY OF LIFE AND MEDICATION ADHERENCE IN RHEUMATOID ARTHRITIS PATIENTS**

K. Jithender
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya. Hyderabad, Telangana, 500017
Kag.jithender@gmail.com

Rheumatoid arthritis (RA) is a chronic autoimmune inflammatory disorder characterized by joint pain, stiffness, and swelling, often leading to disability and reduced quality of life. Depression is a common comorbidity in RA and is associated with frequent disease flare-ups, poor prognosis, and diminished treatment outcomes. Identifying depression early using standardized tools such as the Hamilton Depression Rating Scale can help improve overall patient care. A cross-sectional observational study was conducted at Medicover Hospital, Hyderabad, over a period of six months. The study aimed to determine the prevalence of depression among RA patients and evaluate inflammatory markers in those with and without depression. Data analysis was performed using the unpaired t-test with GraphPad Prism software. A total of 550 RA patients were enrolled. Of these, 465 (84.5%) were diagnosed with depression, while 85 (15.5%) had no depression. Depression was significantly more prevalent in females (86.6%) than in males (13.4%). Furthermore, 88% of the study population demonstrated poor medication adherence, which was strongly influenced by advanced age and low socioeconomic status. The study highlights a high prevalence of depression among RA patients, particularly in women. Early diagnosis and management of depression are crucial to improving quality of life, enhancing medication adherence, and achieving better long-term treatment outcomes.

**A PROSPECTIVE INTERVENTIONAL STUDY ON THE ATTITUDE OF ADOLESCENT GIRLS TOWARD HPV INFECTION AND VACCINATION**

Swathi Ramesh T C, Savitha R S, Kiron S S, and Srikanth M S
Dept. of Pharmacy Practice, JSS College of Pharmacy, JSS AHER, Mysuru, Karnataka
swathirameshtc@gmail.com

Cervical cancer is the fourth most common cancer among women globally, with an estimated 6,04,000 new cases and 3,42,000 deaths in 2020. Vaccination against HPV and screening and treatment of pre-cancer lesions are a cost-effective way to prevent cervical cancer. The main objectives of the study were to assess the awareness and knowledge of HPV infection, cervical cancer, and attitude toward vaccination among adolescent girls and to provide educational intervention programs to improve their knowledge and awareness of HPV and cervical cancer. This was an interventional study in which 786 subjects were enrolled based on the inclusion and exclusion criteria from selected high schools and colleges in the western part of Bengaluru. The majority of the population had never heard of HPV and were unaware of cervical cancer. Only 25.61% knew about HPV cervical cancer and HPV vaccinations, and only 20% of them were aware that it could lead to cervical cancer. A significant number of respondents answered that there isn't an HPV vaccine available in India. Only 16% of them knew about cervical cancer screening, 7% were aware of Pap smear tests, and just 13.6% of them had ever received a cervical cancer screening. Over 75% of the participants did not have adequate knowledge regarding HPV infection, vaccination, and cervical cancer. The study revealed a significant gap in HPV infection and cervical cancer awareness among adolescent girls. However, a health education intervention can improve knowledge and attitude. This comprehensive approach can lead to positive health outcomes, increased HPV vaccination rates, and reduced cervical cancer incidence. Educating the public is key to addressing this critical health issue.

**Keywords:** Cervical cancer, HPV (Human papillomavirus), HPV Vaccination, Screening.

**ASSESSMENT OF POTENTIALLY INAPPROPRIATE MEDICATIONS BY USING BEERS' CRITERIA IN ELDERLY CHRONIC KIDNEY DISEASE PATIENTS UNDERGOING HEMODIALYSIS.**

Surya S Nair and Nahid N
Doctor of Pharmacy, Sree Krishna College of Pharmacy and Research Centre, Parassala, Thiruvananthapuram, Kerala. 695502
suryas.nair0106@gmail.com

Chronic kidney disease (CKD) patients undergoing hemodialysis exist at high risk of polypharmacy as well as potentially inappropriate medications (PIMs) use and this risk can worsen morbidity, can increase adverse drug reactions (ADRs). Beers' Criteria, identifies PIMs in comorbid and elderly patients. Lack of information about PIMs prevalence for CKD patients undergoing hemodialysis. This prospective

ISBN: 978-81-980623-8-3

observational study was conducted in the dialysis unit of a tertiary care hospital for a period of 6 months. Seventy-two patients aged ≥60 years with CKD undergoing hemodialysis were enrolled. The Beers' Criteria (2023 update) was used to review prescriptions for PIMs. Descriptive statistics were used to determine prevalence, and clinical variables were assessed using chi-square test and logistic regression. Seventy-two patients, an average age of 70.24 ± 7.03 years were enrolled. 75% were male patients. Each of the patients were prescribed an average of 11.86 ± 3.4 medications and 54% of them had PIMs as per Beers' Criteria including [drug classes; sedative-hypnotics, anticholinergics, NSAIDs, long-acting sulfonylureas, antidepressants]. Patients with multiple comorbidities and higher drug counts had a higher PIM risk ($p < 0.05$). PIM use is common among elderly CKD patients undergoing hemodialysis, and it is strongly associated with polypharmacy as well as comorbidities. Early identification of inappropriate prescriptions as well as prevention of adverse drug reactions can be achieved among this vulnerable population by applying Beers' Criteria. For improving patient safety, there are strategies like regular prescription review along with deprescribing and prescriber awareness.

## AGMATINE ALLEVIATES SIMULATED MICROGRAVITY-ASSOCIATED CEREBROVASCULAR DYSFUNCTION

Shubhada Mangrulkar, Pankaj Neje, Brijesh Taksande, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur 441002
shubhadamskb@gmail.com

Exposure to microgravity presents significant challenges, as both the short- and long-term biological impacts on the human body remain incompletely understood. Investigating these effects and developing protective strategies is essential for astronaut health. agmatine, a known neuromodulator in the mammalian brain, interacts with multiple receptor systems, suggesting diverse roles in neuronal regulation. This study explored the therapeutic potential of agmatine in a rat model of simulated microgravity-induced brain injury, focusing on its interaction with the eNOS and nNOS pathways. Microgravity was mimicked using the hind limb unloading (HU) method in rats, with agmatine administered at various doses, and L-arginine, an agmatine modulator. To assess the neurological and cerebrovascular impact, neurochemical profiling (via HPLC), biochemical assays, analysis of pro-inflammatory markers (IL-6), and histopathological evaluations were conducted. Rats subjected to 28 days of HU exhibited marked neurological disturbances, characterized by cognitive impairment, increased anxiety and depressive-like behaviours, reduced motor coordination, neurotransmitter imbalances, altered oxidative/antioxidant status, changes in inflammatory mediators, and significant morphological abnormalities in the brain and middle cerebral arteries. Agmatine administration, both alone and in modulation with L-arginine, noticeably alleviated these deficits, producing improvements in motor coordination, reductions in anxiety and depressive symptoms, and restoration of cognitive function. Additionally, Agmatine treatment was associated with reduced oxidative stress and normalization of key biochemical and morphological markers, underscoring its neuroprotective and cerebrovascular benefits under simulated microgravity conditions.

**Keywords**: Simulated microgravity, Agmatine, Middle cerebral arteries, eNOS and nNOS

## A PROSPECTIVE OBSERVATIONAL STUDY ON ERADICATION OF H. PYLORI AND REOCCURRENCE OF GASTROINTESTINAL SYMPTOMS AND FUNCTIONAL DYSPEPSIA

S Anuradha3, M. Raj Kumar2, K. Purnachander1, V. Raj Kumar1
1Jyothishmathi Institute of Pharmaceutical Sciences
2Government Polytechnic, Kataram
3Gpvernment Polytechnic for Women, Nizambad

Helicobacter pylori (H. pylori) eradication has been widely used. The recurrence rate of H. pylori after eradication and its related factors are gaining more and more attention. Our study aimed to determine the recurrence rate of H. pylori infection after successful eradication, and analyze its influential factors. This is a Prospective and Observational study and was conducted over a period of six months in IP and OP department and patient relevant data were collected from the patient case sheet in gastro department at Prathima Institute of Medical Sciences. The data collection form was prepared and used. The data collection form contains demographic details like age, gender, occupation, area, past history, symptoms, laboratory diagnosis like RUT, endoscopy were taken. A total number of 180 patients are diagnosed with H. Pylori. Among them 58% are male and 41% are female The most common symptoms seen are Heart burn 92% and least is anemia 22%. Based on the symptoms, scores were given to know symptoms reoccurrence and H. Pylori eradication. When comes to the treatment pattern to eradicate H. Pylori are primarily antibiotics like amoxicillin /clavulonate/ esomoprazole 75%, pantaprazole 53%, syrup sucralfate 50% are prescribed. Eradication of H. Pylori is more important than to relieve symptoms. By our study we observed eradication rate was successful in male 73% compared to female with 54%. Overall, H. Pylori eradication provides significant improvement of symptoms in functional dyspepsia patients regardless of H. Pylori prevalence. Predicting the success of H. pylori eradication therapy and choosing the appropriate therapy based on clinical parameters and symptoms will benefit patients and improve health care.

**Keywords**: Helicobacter Pylori, Eradication, Reoccurrence, Functional Dyspepsia.

## THERAPEUTIC NANOGELS: DUAL IN VITRO AND IN VIVO STUDIES FOR ENHANCED DIABETIC WOUND HEALING

Archana TS and N.Tamilselvan
Department of Pharmaceutics, Nehru College of Pharmacy, Thrissur, Kerala, India- 680588.
archanamphram24@gmail.com

The present work was proposed to prepare the atorvastatin nanogels to promote the wound healing in diabetic condition using animal model. Atorvastatin nanogels were prepared by precipitation polymerisation technique using hydroxy propyl methacrylate as polymer in the drug: polymer ratios 1:1, 1:2, 1:3, 1:4, 1:5, 1:6, 1:7 and 1:8 and characterized for particle size, entrapment efficiency, in vitro drug release and in vivo study. The particle size of the various formulations (F1-F8) showed the size range of 68 to 80nm, entrapment efficiency ranges from 58.36 to 86.75 %, in vitro study was carried out using phosphate buffer at pH 7.4 and the cumulative percentage release ranges from 61.96 to 73.760 for a period of 12hrs and followed non-fickian mechanism of release and in vivo comparative study showed wound healed completely for hydrogel nanoparticle on 11th day whereas for conventional gel on 15th day. This study indicates that hydrogel nanoparticle formulation heals the diabetic wound at a faster rate and completely, and also the drug atorvastatin can be used for diabetic wound healing.

**Keywords:** Nanogel, Atorvastatin, Diabetic wound healing

**PL-497**

## A PHOTOTHERAPEUTIC COMPOSITION OF RASNAGUDUCHYADI VATI AND A RANDOMIZED CLINICAL TRIALS OF AYURVEDIC PROCEDURES IN THE TREATMENT OF VIRAL ARTHROPATHY IN CHIKUNGUNYA

Vinod V. Patil, Shitalkumar S. Patil
Dr. J J Magdum College of Pharmacy, Jaysingpur, Dist. Kolhapur, Maharashtra India

The present invention relates to an Ayurvedic Phyto-therapeutic composition and integrative treatment protocol for the management of viral arthropathy associated with Chikungunya infection. Chikungunya presents with symptoms such as high fever, joint pain, fatigue, and long-term inflammatory complications. Conventional treatments offer only symptomatic relief, with limited impact on post-viral manifestations. This invention discloses a standardized, pharmaceutically optimized composition of Rasnaguduchyadi Vati in granule form, formulated using dry granulation with 95% ethanol, and evaluated for disintegration time, compressibility, and flow properties. Optimized batch were identified as the most suitable formulation, exhibiting superior pharmaceutical characteristics. The composition is integrated with external Ayurvedic therapies—Patrapottali Sweda, a herbal steam fomentation for pain relief, and Shunthyadi Lepa, an anti-inflammatory topical paste—for holistic symptom management. A simple randomized clinical trial on 30

ISBN: 978-81-980623-8-3

patients aged 20–70 demonstrated complete resolution of fever and fatigue by Day 30, with progressive improvement in joint-related symptoms and negative virological tests in all subjects. Hematological markers indicated reduced inflammation, confirming clinical efficacy. This invention provides a validated, safe, and effective alternative for Chikungunya management, bridging traditional Ayurvedic knowledge with modern clinical and pharmaceutical standards. It addresses the urgent need for long-term management of viral arthropathy through an integrative and evidence-based approach.

**Keyword:** Chikungunya, viral arthropathy, Rasnaguduchyadi Vati, Shunthyadi Lepa, Patrapottali Sweda, randomized clinical trial

**EARLY VERSUS DELAYED RENAL DOSE ADJUSTMENT OF MEROPENEM IN SEPSIS-INDUCED ACUTE KIDNEY INJURY: A RANDOMIZED CONTROLLED TRIAL**

Angel Rose Varghese, Merlin Moni, Meenu Vijayan, Zubair Umer Mohamed
Assistant Professor, Department of Pharmacy Practice, Pushpagiri College of Pharmacy, Thiruvalla, Kerala, India – 689107
angelrosevarghese2@gmail.com

Sepsis-induced acute kidney injury (AKI) significantly alters meropenem pharmacokinetics, complicating optimal dosing in critically ill patients (study conducted at Amrita Institute of Medical Sciences and Research Centre, Kochi, Kerala, India; IEC-AIMS-2024-PHARMA-222). This study evaluated the effect of early versus delayed renal dose adjustment on meropenem pharmacokinetics and attainment of pharmacodynamic targets. In an open-label randomized controlled trial, 20 adults with sepsis and AKI were randomized to two groups: early adjustment (2 g meropenem followed by renal modification within 24 h) or delayed adjustment (2 g every 8 h for 48 h before modification). Plasma concentrations were quantified by HPLC-UV, and pharmacokinetic modeling was performed using Monolix Suite 2020R1. Pharmacodynamic target attainment was assessed against pathogen minimum inhibitory concentrations. The mean age of patients was 66 years; 70% were male. Positive cultures were obtained in 70%, predominantly respiratory isolates. Compared with the early group, the delayed adjustment group achieved higher trough concentrations (1.06 vs 0.18 µg/mL; p=0.035) and greater pharmacodynamic target attainment (50% vs 10%). Mortality at 28 days was equal in both groups (10%), but the delayed group showed more vasopressor- and ventilator-free days and more stable renal function trends. No patient in either group required renal replacement therapy. These findings suggest that delaying renal dose adjustment improves pharmacokinetic exposure and pharmacodynamic target attainment without additional toxicity. This strategy supports the use of therapeutic drug monitoring and PK/PD modeling to guide individualized β-lactam dosing in critically ill patients.

**CASE STUDY OF CORONARY ARTERY DISEASE**

Abdul Saheel Qureshi, Syed Mubashir
Azad College of Pharmacy, Ranga Reddy, Telangana, India, - 501504

A 58-year-old male patient with CAD, a condition that was exacerbated by his underlying risk factors, including hypertension, hyperlipidaemia, and a family history of cardiovascular disease. The patient presented with typical symptoms of angina, often exacerbated by physical activity, and was subsequently evaluated using electrocardiogram (ECG) and coronary angiography, which revealed significant stenosis in the left anterior descending artery. Initial management focused on pharmacological interventions, including the use of aspirin, statins, and beta-blockers to control symptoms and reduce the risk of further ischemic events. Following discussions with the patient, coronary artery bypass grafting (CABG) was recommended to address the critical blockage and improve blood flow to the heart. The patient underwent surgery without complications and experienced a marked improvement in symptoms during the postoperative recovery period. This case highlights the importance of early recognition, risk factor management, and timely intervention in the treatment of CAD. Despite advances in medical therapy, surgical options like CABG remain a cornerstone in managing advanced coronary artery disease. Regular monitoring and lifestyle modifications are crucial to improving patient outcomes and reducing the long-term risks associated with this chronic condition.

**ANTI-ALZHEIMER'S DISEASE ACTIVITY SCREENING OF PERSEA AMERICANA EXTRACT AND ITS CHITOSAN NANOPARTICLES**

Munavvira K P, Siju E N, Anagha Sugathan, Heera C P
College of Pharmaceutical Sciences, Government Medical College, Kannur, Kerala, India -670503
munavvira2000@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder that causes memory loss, cognitive decline, and behavioural changes, with currently available therapies providing only limited relief. The present study evaluated the neuroprotective and anti-tubercular potential of Persea americana (avocado) seed extract and its chitosan nanoparticles (PACNPs). Seeds were extracted using a hydroalcoholic solvent system and the extract was incorporated into chitosan nanoparticles by controlled mixing of chitosan in acetic acid, pH adjustment, and blending with the extract under optimized conditions. Literature reports indicate that Persea americana seeds are rich in bioactive constituents such as flavonoids, alkaloids, tannins, phenolic compounds, and saponins, which may contribute to their therapeutic activity. Characterization of PACNPs using UV–Visible spectroscopy and transmission electron microscopy revealed predominantly spherical particles with an average size of 39.7 nm. Neuroprotective potential was assessed using the MTT assay on SH-SY5Y cells exposed to oxidative stress, where PACNPs improved cell viability in a concentration-dependent manner. Anti-tubercular activity was evaluated through the Microplate Alamar Blue Assay (MABA), which showed inhibitory effects against Mycobacterium tuberculosis at a minimum inhibitory concentration of 250 µg/ml. Molecular docking studies further confirmed favourable interactions of catechin and quercetin, reported phytoconstituents of Persea americana, with acetylcholinesterase (PDB ID: 4EY7). These findings suggest that PACNPs possess dual therapeutic potential against AD and tuberculosis and may serve as a promising natural candidate for further preclinical evaluation.

**Keywords:** Persea americana, chitosan nanoparticles, Alzheimer's disease, tuberculosis, neuroprotection

**PL-501**

**CASE STUDY OF CHRONIC KIDNEY DISEASE**

Shaik Muzammil Salman, Huzaifa Huma, Dr. Sumia Fatima
Azad College of Pharmacy, Ranga Reddy, Telangana, India, - 501504

Chronic Kidney Disease (CKD) is a long-term illness where kidney function slowly worsens over time, often complicated by other health problems like high blood pressure, diabetes, and heart disease. This case study focuses on a 66-year-old man with stage 5 CKD who was on regular hemodialysis. He came to the hospital with fever, nausea, and breathing difficulties. His past medical history included thyroid cancer and repeated infections, which made him more vulnerable to complications, even after vaccinations. Tests showed that he had anemia, very high blood urea levels, and lung changes. He was treated with antibiotics, dietary changes, and supportive care. This case highlights how difficult it can be to manage CKD when multiple health issues are present. It shows why a team-based approach is so important to improve patient outcomes. It also stresses the need for early detection, patient awareness, and personalized treatment to slow disease progression and maintain a better quality of life.

**Keywords:** Chronic kidney disease, hemodialysis, anemia, multimorbidity, quality of life

**PL-502**

**OBSESSIVE-COMPULSIVE DISORDER: CASE STUDY AND THERAPEUTIC APPROACH**

Dr. Sumia Fatima, Kai Kasha, Pharm D, V Year
Azad College of Pharmacy, Moinabad, Hyderabad, Telangana.

Obsessive-compulsive disorder (OCD) presents as a persistent combination of intrusive thoughts and repetitive behaviours, often causing substantial disruption in daily life. This report details the case of a 24-year-old man admitted for recurrent hand washing, habitual

ISBN: 978-81-980623-8-3

checking, and preoccupation with cleanliness. The patient's medical and family histories were unremarkable, and routine laboratory results did not reveal abnormalities. After clinical confirmation of OCD, treatment was initiated with fluoxetine alongside B-complex supplementation. The regimen was complemented by counselling on lifestyle changes such as cessation of tobacco and alcohol use, dietary improvements, and consistent follow-up. Over the course of management, the patient showed progress, with a decline in compulsive episodes and improved coping with obsessive urges. This case highlights the importance of individualised care and integrated strategies in the management of OCD.

**Keywords**: Obsessive-compulsive disorder, case report, fluoxetine, compulsions, management.

**PL-503**

**ADVERSE DRUG REACTION MONITORING: PROSPECTS AND IMPENDING CHALLENGES IN PHARMACOVIGILANCE FOR CHEMOTHERAPEUTIC AGENTS**

Dr. Arshita Kumari, Dr. Niya Catherine Binoy,
Dr. Swarangi Karangale, Dr. Sunil Kumar Dwivedi
Department of Pharmacology, Sri Aurobindo Institue of Pharmacy, Indore, MP-453555

Chemotherapy is one of the important components of treatment for many cancers. Anti-neoplastic agents are used with caution due to their high toxicity and narrow therapeutic window. Studies describing pattern of adverse drug reactions in cancer chemotherapy patients are less in India. This study aims to evaluate the pattern of Adverse Drug Reactions (ADRs) due to cancer chemotherapy in hospitalized patients and to assess the causality and severity of these reactions. This hospital-based prospective observational study was conducted at Sri Aurobindo Hospital, Indore, and Madhya Pradesh among the newly diagnosed cases of different type of cancers of both genders between the ages of (25-70) years who required chemotherapy treatment. The prescribing pattern of chemotherapy drugs associated adverse effects and potential risk factors for the development of adverse effects was studied. An ADR causality was assessed by the World Health Organization-Uppsala Monitoring Centre (WHO-UMC) Naranjo algorithm was used to identify the predictors related to chemotherapy-induced adverse effects. Most common ADR observed were peripheral neuropathy, shivering, anemia, neutropenia, thrombocytopenia and needle phobia. In this study, gastric cancer was most commonly seen followed by esophageal cancer.

**POLYCYSTIC OVARIAN SYNDROME (PCOS) AND SLEEP DISTURBANCES**

Bhumika Yadav, Dr. Niya Catherine Binoy, Dr. Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore-453555, Madhya Pradesh, India
yadavbhumika777@gmail.com

Polycystic ovary syndrome (PCOS) is a widespread reproductive disorder that encompasses many associated health conditions and has an impact on various metabolic processes. The characteristic features of PCOS are Hyperandrogenism, Insulin resistance and anovulation. It increases the risk of insulin resistance (IR), type 2 diabetes, obesity, and cardiovascular disease. The etiology of the disease remains unclear, and the subjective phenotype makes a united diagnosis difficult among physicians. It seems to be a familial genetic syndrome caused by a combination of environmental and genetic factors. It can be linked with metabolic disorders in first-degree family members. PCOS is the cause of up to 30% of infertility in couples seeking treatment. Currently, there is no cure for PCOS. Despite the growing incidence of this syndrome, limited research has been done that encompasses the entirety of PCOS spectrum.

**Keywords:** Polycystic ovary syndrome, PCOS, Obesity, Insulin Resistance, Diabetes.

**INFECTION ON SURGICAL SITE POST-OPERATION AND THE USE OF ANTIMICROBIALS TO TREAT THE INFECTION**

Disha Parmar, Mahendra Patel, Seemu Singh, Tishank Sinha, Avneel Kumar Kushwaha
Sri Aurobindo Institute of Pharmacy, Indore (M.P.) 453555
Dishaverma2210@gmail.com

Surgical site infections (SSIs) are infections occurring within one month after a surgery or up to one year following implant surgery, either at the surgical site or in its proximity. SSIs remain a significant global health concern, particularly in developing countries, contributing to increased morbidity and mortality. Despite their importance, there is limited data on the magnitude, bacteriological causes, and associated risk factors of SSIs in this hospital setting. The present hospital-based prospective observational study was conducted at Sri Aurobindo Hospital, Indore, Madhya Pradesh, among newly diagnosed cases of various surgical site infections in both sexes, aged 25–70 years, who required antimicrobial treatment. The study evaluated the prescribing patterns of antimicrobials and potential risk factors associated with SSIs. Out of 63 cases studied, the incidence of SSIs following amputation was 36.50%. The most commonly affected age groups were 51–60 years and 61–70 years, each accounting for 20.14% of cases. Among risk factors, diabetes mellitus was present in 25 patients (39.70%) and was significantly associated with SSIs. Gangrene leading to amputation was the most frequent clinical condition (36.50%). Microbiological analysis revealed Escherichia coli as the predominant organism, isolated in 12 cases (34.90%). The prevalence of multidrug-resistant organisms in this study highlights the emerging threat of antibiotic resistance. Accurate identification of SSIs requires careful interpretation of clinical and laboratory findings. Consistent and standardized definitions are crucial for surveillance programs; otherwise, reported SSI rates may be inaccurate or uninterpretable.

**Keywords:** Surgical site infections, Antimicrobials, Antibiotic resistance, Diabetes mellitus, Multidrug resistance

**PL-506**

**TOPIC: "A SURVEY ON PATIENT KNOWLEDGE, ATTITUDES, AND PRACTICES REGARDING OVER-THE-COUNTER (OTC) DRUGS"**

Bhaladhare Sanyam, Lade Vipul O., Rahangdale Digambar P, Wanjari B. E.
Shri Gurudev Institute of Pharmaceutical Education & Research, Chulod, Gondia
sgiper26@gmail.com

Over-the-counter (OTC) drugs are medications that can be purchased without a prescription and are widely used for self-medication. While they offer convenience, inappropriate use may lead to adverse effects, drug interactions, and delayed diagnosis of serious conditions. This study aims to assess patients' knowledge, attitudes, and practices regarding OTC drug use. A cross-sectional, questionnaire-based survey will be conducted among patients visiting community pharmacies and outpatient clinics. The questionnaire will evaluate patients' understanding of drug indications, dosage, side effects, and the importance of consulting healthcare professionals before use. Data will be analyzed using descriptive and inferential statistics to identify gaps in knowledge and unsafe practices. The findings are expected to inform strategies for patient education and promote rational use of OTC drugs, thereby minimizing potential risks associated with self-medication.

**PHARMACOLOGICAL EVALUATION OF HERBAL EXTRACTS: BEHAVIORAL AND NEUROCHEMICAL INSIGHTS IN ANIMAL MODELS**

Megha salunke and Namrata kushwaha, Dr.Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy,Indore,Madhya Pradesh india-453555
Meghasalunke610@gmail.com

The increasing global interest in plant-based therapeutics has led to a surge in research exploring herbal extracts as potential treatments for neurological disorders. Many medicinal plants are rich in bioactive compounds capable of modulating neurotransmitter systems, yet their pharmacological profiles remain underexplored.This study aims to evaluate the behavioral and neurochemical effects of selected herbal extracts using validated animal models, with a focus on their potential central nervous system (CNS) activity.Methanolic and aqueous extracts from selected medicinal plants were prepared and administered to rodents. Behavioral assessments were conducted using the open field test (OFT), elevated plus maze (EPM), forced swim test (FST), and seizure models (PTZ and MES) to evaluate anxiolytic, antidepressant, and anticonvulsant activities. Neurochemical analysis was performed using high-performance liquid chromatography (HPLC) to quantify levels of key

ISBN: 978-81-980623-8-3

neurotransmitters such as serotonin, dopamine, GABA, and glutamate in brain tissue. The tested herbal extracts demonstrated significant dose-dependent effects on behavior, including increased exploratory behavior, reduced anxiety-like and depressive-like responses, and delayed seizure onset. Neurochemical analysis revealed modulation of neurotransmitter levels consistent with the observed behavioral outcomes, suggesting CNS-active phytoconstituents. The findings provide evidence that the evaluated herbal extracts possess promising neuropharmacological properties. These results support their potential as alternative or adjunct therapies for CNS disorders. Further studies are warranted to isolate active constituents and investigate underlying mechanisms of action.

**Keywords**: Herbal extracts, Behavioral studies, CNS disorders, Neurochemical analysis.

**AN OBSERVATIONAL PROSPECTIVE STUDY ON PREVALENCE OF ADVERSE DRUG REACTION AND MEASURES TO IMPROVE AWARENESS AMONG HEALTH CARE MEMBERS IN TERTIARY CARE HOSPITAL**

S.G.Manjunadha raju
Clinical research and pharmacovigilance, A.S.N. Pharmacy College, Burripalem road, Tenali, Guntur [Dt], Andhra Pradesh, India – 522201.
manjunadharajusarikonda@gmail.com

The purpose of the study was to find out the prevalence of Adverse drug reactions (ADR's) in the in-patient departments of General medicine, Pediatrics, Dermatology and to assess the knowledge, Attitude, Practice of Pharmacovigilance (KAP) and ADR reporting among health care members and to evaluate the impact of an educational intervention. An Observational Prospective Study was designed from February to July 2025 in which Prevalence of ADR was calculated. A total of 107 cases of ADR's were taken from 1334 patients. ADR's were evaluated for causality by WHO-UMC, Naranjo's scale, Severity by Hartwig and Siegel scale, Preventability by Schumock & Thornton and classification by Rawling & Thompson criteria. A suitable validated Knowledge, Attitude, Practice (KAP) questionnaire based survey was conducted among healthcare professionals & the impact of effectiveness of educational intervention was evaluated by using Chi square test & Fischer exact test in graph pad prism version (5.04). Prevalence of ADR's was found to be 8.02% and male to female ratio was 0.81. ADR's mostly occurred in the age group 31-40 (27.10%). Skin was found to be the most commonly affected organ system (24.29%) among which rashes and urticaria were the most common type of ADR'S reported, majority of the adverse drug reactions were due to Antimicrobials (22.42%). For Casuality of ADR's according to Naranjo Scale 26.16% of adverse drug reactions were assessed to be probable, using WHO-UMC scale 33.64% were considered as probable. Similarly, Severity assessment shows majority of the reactions as moderate (53.27%). The overall response rates between pre intervention and post intervention was statistically significant for medical interns and nurses (P value < 0.0001). By early detection of adverse drug reactions, necessary action can be taken to prevent mortality & morbidity from such reactions. Imparting the knowledge and awareness of pharmacovigilance among healthcare professionals by means of continuous educational intervention would bring update knowledge of practice for drug safety.

**OXYCODONE VS MORPHINE FOR CANCER PAIN AND PHARMACOECONOMIC EVALUATION**

SHYAM S.S
ANNAI JKK SAMPOORANI AMMAL COLLEGE OF PHARMACY, KOMARAPALAYAM
sshyampharmd@gmail.com

To evaluate the efficacy, safety and cost-effectiveness of Oxycodone Hydrochloride Controlled-release Tablets (CR oxycodone) and Morphine Sulfate Sustained-release Tablets (SR morphine) for moderate to severe cancer pain titration. Randomized controlled trials meeting the inclusion criteria were searched through Medline, Cochrane Library, Pubmed, EMbase, CNKI, VIP and WanFang database from the data of their establishment to June 2019. The efficacy and safety data were extracted from the included literature. The pain control rate was calculated to eatimate efficacy. Meta-analysis was conducted by Revman5.1.4. A decision tree model was built to simulate cancer pain titration process. The initial dose of CR oxycodone and SR morphine group were 20mg and 30mg respectively. Oral immediate-release morphine was administered to treat break-out pain. The incremental cost-effectiveness ratio was performed with TreeAge Pro 2019. 19 studies (1680 patients) were included in this study. Meta-analysis showed that the pain control rate of CR oxycodone and SR morphine were 86% and 82.98% respectively. The costs of CR oxycodone and SR morphine were and. The incremental cost-effectiveness ratio per unit was approximate. At the willingness-to-pay threshold, CR oxycodone was cost-effective, while the corresponding probability of being cost-effective at the willingness-to-pay threshold of was One-way sensitivity analysis confirmed robustness of results. CR oxycodone could be a cost-effective option compared with SR morphine for moderate to severe cancer pain titration in China, according to the threshold defined by the WHO.

Arjuna Bark (White Murdah) has been reported as folklore medicine for treatment of various types of disease and disorders in alone as well as in combination with other herbal medicines. Many investigators have been reported activity of Chebulic Myrobalan in hyperglycemia, wound healing, ulcers, diarrhea, immunity and digestive disorders of GIT. In present study we investigated effect of methanolic extract of TERMINALIA cattapa fruit on advance glycation end products in streptozotocin induced diabetic rats. The diabetic rats were treated with methanolic extract of TERMINALIA cattapa fruit at a dose of 100 mg/kg orally for 14 days and found significant decrease in blood glucose, glycated hemoglobin, glycated albumin and serum glycated fructosamine level in treated diabetic rats as compared to non treated diabetic rats

**ONLINE PHARMACY IS THE CURSE FOR PROFESSION**

Priya R. Rahangdale, Hina R. Bisen,
Miss Punam S. Kharole, Mr. Wanjari B. E
Shri Gurudev Institute of Pharmaceutical Education & Research, Chulod, Gondia Maharastra

Online pharmacy is a medium of information that extensively used in commercial activity & communication that results in selling of Schedule H drugs Names- pharmacy Bazar, Apollo, Netmeds etc. E-commerce is new business model in pharmaceutical & medical practice. Online pharmacy facilitated sales of drug & medical services that have many prescription drugs in different types & mode of action but some of the online pharmacies found to dispense drug without prescription. In online commercial activity personal information may not confidential can expose the personal data. Online pharmacy also provides the unapproved substances which may harm to the patient many risk generate to buying drugs online. The drug may sell with foreign labels and different drug name. A purchasing drug from online pharmacy may issue in purity and quality of drugs due to unknown manufacturing address or their origin. Many harmful & adverse effect associated with the online pharmacies which curse for the profession.

**Keywords:** E-commerce sale, unapproved substance, quality of drugs, confidential data.

**COMMUNITY PHARMACIST LED-INTERVENTION: A STUDY EVALUATED THE EFFECTIVENESS OF A COMMUNITY PHARMACIST-LED PROGRAM FOR EARLY DETECTION OF GIAES ASSOCIATED WITH DPP-4-INHIBITORS**

A. Sri Lalitha
Clinical research and Pharmacovigilance,
A.S.N Pharmacy college, Burripalem, Tenali, Guntur (Dt),

ISBN: 978-81-980623-8-3

Andhra Pradesh, India -522201.
Srilalithaattaluri2@gmail.com

An overview of a community pharmacist-led intervention program was shown to be effective for the early detection and management of gastro-intestinal adverse events (GIAEs) associated with Dipeptidyl peptidase-4inhibitors.and the OBJECTIVE is to early detection of GIAEs by ensuring patient safety and fostering better collaboration between pharmacist and physician. Here the METHODOLOGY the intervention group patients newly prescribed a DPP-4 inhibitors were monitored through a structured, pharmacist-led program from March to August 2024.and pharmacist used check list and provide follow-up treatment began. they also provide ongoing monitoring during routine pharmacist visit. if a GIAEs was identified, the pharmacist sent a detailed "Tracing report" to the patient's physician which helps to ensure co-ordination care. the KEY FINDINGS shown Higher intervention rate, and increased GIAE's detection were identified in 13 of 35 of patient in the intervention group." this suggests that proactive follow -up by pharmacists can detect mild symptoms that are often missed". The most common GIAEs are constipation (47.8 percent of reported GIAEs)and diarrhea (26.1 percent)the clinical outcomes including the discontinuation of the DPP-4inhibitors in one patient and the addition of supportive therapy in others.it RESULT 's to early detection of adverse events improves patient quality of life.and helps to ensure the continuation of a diabetes treatment regimen.finally we CONCLUDE that helps in the intervention, prompt action and communication, early detection of GIAEs, expansion of pharmacist role, informing future practices.

**Keywords:** DPP-4inhibitors, GIAE's, Pharmcovigilance, pharmacist-led program.

**PHYSIOTHERAPY AND LIFESTYLE MODIFICATION INTEGRATED TO HEALTH: A PHARMACOLOGICAL PERSPECTIVE**

Harshal Lalwani, Tanmay Singh & Archita J. Singh Hani
Amity University, Amity Institute of Pharmacy, Raipur, Chhattisgarh

Physiotherapy and lifestyle modification have emerged as cornerstone strategies in the prevention and management of chronic diseases, offering a non-pharmacological complement to conventional drug therapy. From a pharmacological standpoint, both approaches can be envisioned as "biological interventions" that modulate the body's internal environment much like pharmacokinetic and pharmacodynamic processes. For instance, physiotherapy interventions such as exercise and posture correction influence cardiovascular efficiency, glucose metabolism, and neuromuscular coordination in ways comparable to drug mechanisms targeting the same systems. Lifestyle modifications—healthy nutrition, stress management, and regular activity—further act synergistically with pharmacological therapies, optimizing drug absorption, distribution, metabolism, and excretion (ADME) by improving organ function and reducing metabolic stress. This integration promotes rational therapeutics, minimizes drug doses and side effects, and enhances overall health outcomes. Thus, viewing physiotherapy and lifestyle changes through a pharmacological lens reveals their role as "natural therapeutics," redefining modern healthcare by merging pharmaceutical sciences with holistic wellness strategies.

**Keywords**: Physiotherapy, Lifestyle Modification, Pharmacological Integration, ADME, Non-Pharmacological Therapy, Preventive Healthcare

**POST-MARKETING SURVEILLANCE OF DAPAGLIFLOZIN (FARXIGA): A THREE YEAR FAERS ANALYSIS OF ADVERSE EVENTS (2023–2025)**

Anshul J Harnawa, Hirni J Patel, J John Kirubakararan
Department of Pharmacy Practice, Parul Institute of Pharmacy & Research, Parul University, Limda, Vadodara, 391760, India.
anshulrandhawa95@gmail.com

Dapagliflozin, an SGLT2 inhibitor for diabetes, heart failure, and kidney disease, offers cardiorenal benefits. However, real-world data are crucial to identify rare or serious adverse events not fully observed in clinical trials. Evaluate the safety profile of dapagliflozin by analyzing spontaneous adverse event reports submitted to the FAERS from 1 Jan 2023 to 31 Mar 2025. Retrospective pharmacovigilance study was conducted on de-identified FAERS line-listing data. Reports with dapagliflozin or Farxiga listed as a suspect or interacting product were extracted. Descriptive statistics were applied to assess AE frequency, seriousness (FDA criteria), patient demographics, concomitant medications, and clinical outcomes. Out of 1,057 unique reports, 42% were serious, including 19 deaths (1.8%). Common AEs included genital/urinary fungal infections (14.2%), renal impairment/AKI (11.4%), DKA (8.0%), hypotension/dehydration (8.5%), Fournier's gangrene (2.1%, all males, median age 67). Median patient age was 70 years; sex was unspecified in 55%. Loop diuretics, colchicine, and other SGLT2 inhibitors were common concomitants. FDA flagged 35% as "expedited," suggesting regulatory concern. FAERS data confirm known risks (DKA, genital infections) and highlight severe events like Fournier's gangrene, especially in elderly males with polypharmacy. Routine renal monitoring and infection awareness are advised.

**Keywords:** Dapagliflozin, SGLT2 inhibitors, Post-marketing surveillance, FAERS, Pharmacovigilance, Adverse drug reactions, Fournier's gangrene

**PREVALENCE OF ANEMIA AND ITS EFFECTS ON GESTATIONAL TERM AND NEONATAL BIRTH WEIGHT IN PREGNANT WOMEN VISITING A SECONDARY CARE HOSPITAL**

Thailam Sri Vyshnavi*, Vunukonda Shivani Priya, Zunaid Hussain Barbhuiya
Department of Pharmacy Practice, St. Peter's Institute of Pharmaceutical Sciences, Hanamkonda, Warangal, Telangana, India.
thailamsrivyshnavi@gmail.com

Anemia is one of the most common complications during pregnancy, contributing significantly to maternal and neonatal morbidity. This retrospective observational study aimed to evaluate the prevalence of anemia among pregnant women attending a secondary care hospital and its association with gestational term and neonatal birth weight. A total of 120 pregnant women aged 18–45 years with singleton pregnancies beyond 24 weeks were included. Hemoglobin levels were assessed and anemia classified according to WHO criteria. Maternal age, parity, nutritional status, gestational age at delivery, and neonatal birth weight were analyzed using descriptive statistics, chi-square test, and multivariate regression. The prevalence of anemia was 65%, with mean hemoglobin of 10.2 ± 1.2 g/dL. Anemic mothers had a higher incidence of preterm deliveries (35.9%) compared to non-anemic mothers (11.9%). Low birth weight (<2.5 kg) was significantly more common among neonates of anemic women (41.0%) than non-anemic women (9.5%). The mean neonatal birth weight in the anemic group was 2.75 ± 0.45 kg, lower than that of the non-anemic group. Odds ratio analysis revealed that anemic mothers were 3.75 times more likely to deliver low birth

ISBN: 978-81-980623-8-3

weight infants. The study concludes that maternal anemia is highly prevalent and strongly associated with adverse pregnancy outcomes, particularly preterm delivery and low neonatal birth weight. Strengthening antenatal screening, improving nutritional interventions, and timely management of anemia can reduce perinatal complications and improve maternal and child health outcomes.

**Keywords**: Anemia, pregnancy, gestational term, neonatal birth weight.

**AGMATINE ATTENUATES ETHANOL WITHDRAWAL INDUCED AUDIOGENIC SEIZURES IN RATS**

Akansha Shirbhate*, Pranali Chandurkar, Mayur Kale, Manish Aglawe, Brijesh Taksande, Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Maharashtra, India – 441002

Agmatine signalling plays a pivotal role in the endogenous response to mitigate seizures and associated neurodegeneration. Rats were exposed to varying ethanol concentrations (20% v/v) for 7 days followed by abrupt withdrawal, coupled with high-frequency sound exposure (92-100 dB, 90 sec.) to induce audiogenic seizures which are characterized by wild running, myoclonic jerks, and tonic-clonic episodes. Notably, alterations in GABA, glutamate, and pro-inflammatory cytokines were observed in the brain of withdrawn rats. The study demonstrated that agmatine administration (40 & 80 mg/kg, i.p.) and other agmatinergic agents such as L-arginine (100 mg/kg, i.p.), aminoguanidine (50 mg/kg, i.p.), and arcaine (25 mg/kg, i.p.) significantly attenuated ethanol withdrawal-induced seizure scores. Furthermore, agmatine and its endogenous modulators effectively lowered increased pro-inflammatory cytokine levels in withdrawn rats. Additionally, agmatine was found to decrease elevated glutamate levels and increase GABA levels in ethanol-withdrawn rats. These results emphasize the possible therapeutic usefulness of agmatine as a targeted biological intervention for alcohol withdrawal-induced seizures in rats. By elucidating the intricate molecular mechanisms underlying the induction of seizures during ethanol withdrawal and demonstrating the effectiveness of agmatine in mitigating these seizures, this study contributes to the understanding of neurobiological responses to ethanol withdrawal and suggests novel avenues for therapeutic intervention.

**Keywords:** Agmatine, ethanol withdrawal, audiogenic seizure, cytokines, GABA, Glutamate

**ONCOPHARMACOLOGY: ADVANCES IN TARGETED CANCER THERAPIES**

Veeramalla Vyshnavi and Vanja Venkata Navya Deepika
Student of MAM College of Pharmacy, Kesanupalle, Narasaraopet, Andhra Pradesh, India – 522601.
veeramallavyshnavi6@gmail.com

Cancer remains a leading cause of morbidity and mortality worldwide, demanding continuous innovation in treatment strategies. Traditional chemotherapy, though effective, is limited by its non-selective toxicity on healthy tissues. Oncopharmacology has transformed this landscape by introducing targeted cancer therapies, which act on specific molecular pathways responsible for tumour initiation, growth, and metastasis. This approach enhances therapeutic precision, reduces systemic toxicity, and improves patient outcomes. With genomic profiling, biomarker discovery, and nanotechnology-based delivery, targeted therapies have become a cornerstone of precision medicine. To highlight the role of oncopharmacology in advancing targeted therapies, compare their benefits with conventional chemotherapy, and emphasize the contributions of precision medicine and biomarker discovery. Data from clinical trials, oncology databases, and drug development studies were analyzed to assess the efficacy, mechanisms, and safety of targeted agents such as monoclonal antibodies, tyrosine kinase inhibitors, and angiogenesis inhibitors. Advances in nanotechnology and personalized medicine were also reviewed. Targeted therapies showed superior survival outcomes and fewer toxicities compared to chemotherapy. Genomic and proteomic profiling enabled personalized treatment strategies, leading to improved patient quality of life. Challenges including drug resistance, tumour heterogeneity, and high treatment costs were identified. Emerging trends highlight the promise of combination regimens, next-generation inhibitors, and novel delivery systems in addressing these limitations. Oncopharmacology has revolutionized cancer therapy by shifting toward precision-based targeted approaches. Continuous innovation in personalized medicine and bioinformatics ensures that targeted therapies will remain central to the future of oncology.

**Keywords:** Oncopharmacology, Targeted therapy, Precision medicine, Cancer, Molecular pathways

**THE ROLE OF CLINICAL PHARMACIST IN GERIATRIC PATIENT MANAGEMENT: ENHANCING SAFETY AND OPTIMIZING THERAPY**

Narisetty Sri Akshatha and Gowdaperu Smily
Student of MAM College of Pharmacy, Kesanupalle, Narasaraopet, Andhra Pradesh, India –522601.
sriakshatha2005@gmail.com

Geriatric patients are particularly vulnerable to medication-related problems due to polypharmacy, age-related physiological changes, multiple comorbidities, and altered pharmacokinetics. Adverse drug reactions and poor adherence are common in this population, often resulting in increased morbidity, frequent hospitalizations, and rising healthcare costs. Clinical pharmacists play a vital role in identifying, preventing, and resolving drug-related problems, thereby improving therapeutic outcomes and enhancing the quality of life for elderly patients. To highlight the importance of clinical pharmacists in geriatric patient care. To assess the pharmacist's role in minimizing drug-related problems and improving adherence. To emphasize collaborative care for optimizing therapeutic outcomes in elderly patients. A narrative review of published literature and clinical practice reports was conducted, focusing on pharmacist interventions in geriatrics. Core activities included medication reconciliation, patient counselling, drug–drug interaction monitoring, adverse drug reaction reporting, and dose adjustments based on renal and hepatic function. Evidence indicates that clinical pharmacist interventions significantly reduce hospital readmissions, enhance medication adherence, and improve patient satisfaction. Pharmacist-led geriatric care models demonstrated notable reductions in inappropriate prescribing, adverse drug events, and overall healthcare costs. Case studies further highlighted effective management of polypharmacy and improved clinical outcomes through active pharmacist involvement. Clinical pharmacists play a pivotal role in geriatric care by optimizing pharmacotherapy, preventing medication-related problems, and contributing to multidisciplinary healthcare teams. Strengthening pharmacist-led interventions in geriatrics can improve patient safety, ensure therapeutic success, and enhance overall quality of care.

**Keywords:** Clinical pharmacist, Geriatrics, Polypharmacy, Medication adherence, Patient safety

**USNIC ACID AMELIORATES DSS-INDUCED ULCERATIVE COLITIS IN FEMALE C57BL/6 MICE**

Madathala Sreekanth and Pidugu Soudhamini
Department of Pharmacology, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya (Co-Ed.), Tarnaka, Secunderabad, Telangana, India - 500017.
madathalasrikanth@gmail.com

Ulcerative colitis (UC) is a chronic inflammatory bowel disease characterized by relapsing inflammation of the colon, leading to symptoms such as abdominal pain, diarrhea, and weight loss. Current therapeutic options often remain inadequate due to limited efficacy and safety concerns, highlighting the need for novel treatment approaches. Usnic acid, a dibenzofuran derivative isolated from lichens, possesses established antioxidant, anti-inflammatory, and antimicrobial properties, but its potential in UC remains underexplored. This study evaluated the protective and therapeutic effects of usnic acid in dextran sulfate sodium (DSS)-induced ulcerative colitis in female C57BL/6 mice. Experimental groups included normal control, DSS control, sulfasalazine-treated, and usnic acid-treated cohorts at different dosages (25, 50, and 100 mg/kg). Usnic acid administration significantly reduced colonic inflammation, improved colon length, and lowered disease activity index scores compared to the DSS control group. Biochemical analysis revealed a marked suppression of proinflammatory cytokines (IL-6, IL-1β, TNF-α). Additionally, histopathological evaluation confirmed reduced mucosal damage in treated groups. These findings suggest, For the first time, treatment with usnic acid at a dose of 100 mg/kg was shown to alleviate

ISBN: 978-81-980623-8-3

DSS-induced ulcerative colitis in mice by significantly ($P < 0.001$) reducing tissue inflammation through the suppression of proinflammatory cytokines (IL-6, IL-1β, and TNF-α), while also reducing mucosal damage, thereby attenuating the severity of colitis.

**Keywords:** Dibenzofuran derivative, Cytokines, Colon length, Disease activity index

## EVALUATION OF NEUROPROTECTIVE ACTIVITY OF DIOSMETIN USING ALUMINIUM CHLORIDE INDUCED OXIDATIVE STRESS IN RAT MODEL OF ALZHEIMER'S DISEASE

D. Swarnalatha and T. Maneesha
Professor, Department of Pharmacognosy, Annamacharya College of Pharmacy, Rajampet, Andhra Pradesh, India-516126
dug.swarna@gmail.com

Alzheimer's disease (AD) is a complex neurodegenerative disorder characterized by several pathological features, including oxidative stress, cholinergic dysfunction, and amyloid plaque accumulation. This study utilized a rat model of AD induced by aluminum chloride ($AlCl_3$) to investigate the neuroprotective effects of diosmetin. A comprehensive methodology was employed, integrating behavioral tests, biochemical analyses, and histopathological evaluations to elucidate the impact of diosmetin on AD-like symptoms. The findings of this study revealed that diosmetin administration led to significant improvements in several domains affected by AD. Behaviorally, the treated rats showed enhanced memory performance in tasks such as the Y-maze and Radial arm maze. Biochemically, diosmetin treatment reduced oxidative stress markers and modulated the activity of antioxidant enzymes, including superoxide dismutase (SOD) and catalase. Furthermore, the study observed that diosmetin contributed to the preservation of neuronal structures and exhibited effects comparable to those of donepezil, a widely used medication for AD. These findings suggest that diosmetin may be a promising therapeutic candidate for AD, potentially addressing multiple facets of the disease pathology and providing neuroprotective benefits.

**Keywords:** Alzheimer's disease, Aluminium chloride, Oxidative stress, Diosmetin, Flavonoid

**PL-522**

## IN VIVO AND INVITRO ASSESMENT OF ANTICOAGULANT ACTIVITY OF BLUMEA BALSEMIFERA LEAVES FOR HERBAL THERAPEUTICS

Dariya and Aminabee
Department of Pharmacology, V.V Institute of pharmaceutical Sciences, Andhra Pradesh-521356, India.
shaikdariya2002@gmail.com

Blumea balsamifera (sambong) is a medicinal plant traditionally used in Asia and known for its antioxidant, antimicrobial, and anti-inflammatory properties. The present study investigated the anticoagulant potential of B. balsamifera leaf extracts through both in vitro and in vivo models. Extracts at concentrations of 50, 100, and 200 µg/mL were evaluated for anticoagulant activity. In vitro assays, including clotting time, prothrombin time (PT), and activated partial thromboplastin time (aPTT), revealed a dose-dependent increase in coagulation time when compared with negative control (1% DMSO). The prolongation was more prominent in the aPTT assay, suggesting that the extract primarily influences the intrinsic coagulation pathway. In vivo studies, conducted using rat models, further supported these results. Oral administration of the extracts led to significant prolongation of bleeding time and clotting time relative to controls, with activity comparable to standard heparin at higher doses. The combined findings demonstrate that Balsamifera possess anti coagulant activity attributable of its phyto constituents, particularly flavonoids and phenolics. This study concludes that balsamifera may serve as a promising natural coagulant source, though detailed phytochemical isolation and mechanism-based studies are necessary for clinical transalation.

**Keywords**: Blumea balsamifera, biological activities, Herbal authentication, Phytochemical standardization, Wound healing.

## METABOLIC COMPLICATIONS IN ISCHEMIC STROKE: PREVALENCE AND CLINICAL IMPACT OF HYPONATREMIA AND HYPOGLYCEMIA

Lingineni Bhavitha1, Kancharla Deepika Siva Gowri, Kommineni Charitha Sree, Thodeti Mahendra
Vignan Pharmacy College, Vadlamudi, Guntur, Andhra Pradesh, India.
linginenibhavitha@gmail.com

Ischemic stroke remains one of the most common causes of neurological disability and mortality worldwide. Metabolic complications such as hyponatremia and hypoglycemia often occur in stroke patients and can significantly worsen clinical outcomes. However, limited retrospective data are available on their prevalence, management, and impact on recovery. To investigate the prevalence, clinical profile, management strategies, and outcomes of hyponatremia and hypoglycemia in patients with ischemic stroke. A retrospective observational study was conducted on 180 ischemic stroke patients admitted between June 2023 and July 2024. Clinical records were reviewed for demographic data, comorbidities, presenting features, laboratory values, neuroimaging findings, therapeutic interventions, and treatment outcomes. Stroke severity was assessed using the NIH Stroke Scale (NIHSS) and functional outcomes using the Modified Rankin Scale (mRS). The majority of patients were aged 50–70 years, with a slight male predominance (62.2%). Hyponatremia was identified in 62.2% of patients, most frequently due to SIADH (63.4%). Hypoglycemia was noted in 25.6% of cases. Patients with hyponatremia had significantly higher NIHSS scores (mean: 13.6 vs 8.4, $p < 0.01$) and worse mRS outcomes compared to normonatremic patients. Hypoglycemia was associated with increased incidence of seizures (19.5%) and altered sensorium (30.4%) ($p < 0.05$). Common comorbidities included coronary artery disease (83.3%), diabetes mellitus (66.6%), and hypertension (77.7%). Despite treatment, mortality remained high at 27.8%. Hyponatremia and hypoglycemia are frequent and clinically significant complications in ischemic stroke patients. Both conditions are independently associated with increased stroke severity and poorer functional outcomes. Early recognition and prompt management of metabolic disturbances should be prioritized to improve survival and recovery in stroke patients.

**Keywords:** Ischemic stroke, hyponatremia, hypoglycemia, electrolyte imbalance, neurological outcomes, retrospective study

**PL-524**

## TARGETING BEDWETTING WITH PRECISION: THE CLINICAL ROLE OF DESMOPRESSIN IN PAEDIATRIC CARE

Kancharla Deepika Siva Gowri1, Lingineni Bhavitha, Thodeti Mahendra, Kommineni Charitha Sree.
Vignan Pharmacy College, Vadlamudi, Guntur, Andhra Pradesh, India.
kancharladeepika2105@gmail.com

Nocturnal enuresis is a prevalent paediatric disorder that significantly affects the psychosocial well-being of children and their families. Among pharmacological treatments, desmopressin has gained prominence due to its efficacy in reducing nocturnal urine production. This study evaluates the role of desmopressin in the management of paediatric nocturnal enuresis, highlighting its mechanism of action, clinical effectiveness, safety, and place in therapy. A comprehensive study conducted among 125 children based on recent clinical trials, guidelines, we conducted study to summarize current evidence regarding the use of desmopressin in monosymptomatic nocturnal enuresis (MNE) and nocturnal polyuria. Desmopressin demonstrates a response rate of 60–75% in children with MNE, particularly in those with nocturnal polyuria. Its mechanism involves selective V2 receptor activation and aquaporin-2 channel regulation, leading to reduced nighttime urine output. Combination therapy with behavioural interventions or enuresis alarms enhances treatment outcomes. The drug is generally safe; however, rare cases of hyponatremia may occur if fluid restriction is not followed. Relapse remains common after discontinuation, though intermittent or flexible dosing strategies may improve long-term outcomes. Desmopressin remains a cornerstone in the management of paediatric nocturnal enuresis, providing rapid symptom relief, improved sleep quality, and better quality of life. Future research should address relapse prevention, optimize combination strategies, and evaluate long-term safety in diverse populations.

**Keywords:** Desmopressin, Pediatric nocturnal enuresis, Bedwetting, Monosymptomatic nocturnal enuresis (MNE), Nocturnal polyuria, Vasopressin analogue

**PL-525**

## MATERIOVIGILANCE: STRENGTHENING PATIENT SAFETY THROUGH DEVICE SURVEILLANCE

ISBN: 978-81-980623-8-3

Arsha P, Manju C S and Shaha Parvin P
College of Pharmaceutical Sciences, Government Medical College
Kozhikode, Kerala, India - 673008
arshap4321@gmail.com

Materiovigilance, the medical device counterpart of pharmacovigilance, plays a pivotal role in safeguarding patient health by systematically monitoring, identifying, reporting, and analysing adverse events related to medical devices. With the growing global reliance on devices ranging from simple syringes to advanced implants, ensuring their safety has emerged as a significant public health priority. This discipline addresses risks associated with design flaws, manufacturing defects, improper use, or inadequate instructions, thereby reinforcing quality assurance and fostering patient confidence. The scope of materiovigilance extends to post-marketing surveillance, causality assessment, and benefit–risk evaluation, all aimed at reducing device-associated complications. This project focuses on familiarising the concept of materiovigilance, its need, implementation, importance in enhancing device quality, preventing adverse outcomes, and its impact in Indian healthcare system. Data were gathered through analysis of reporting practices, documented case reports, and hospital-based surveys. International frameworks, such as those of the FDA (US) and MHRA (UK), demonstrate strong vigilance systems, while the Materiovigilance Programme of India (MvPI), launched in 2015, remains in a developmental phase. Under MvPI, the Indian Pharmacopoeia Commission functions as the National Coordination Centre, supported by collaborating institutes, to collect, analyse, and disseminate device safety data. Underreporting of adverse events continues to hinder progress, largely due to limited awareness among healthcare professionals. Real-world examples including microbial keratitis from contact lenses, faulty hip implants, and catheter misplacements illustrate the implications of weak vigilance. Strengthening reporting culture, enhancing regulatory oversight, and improving stakeholder education remain essential to minimize risks, improve surveillance, and achieve safer healthcare outcomes.

**Keywords:** Materiovigilance, Medical Devices, Adverse Event Reporting, Patient Safety, Post-Marketing Surveillance

## REVIEW ON EFFECTIVE USE OF PROTON PUMP INHIBITORS (PPIS) IN CLINICAL PRACTICE

Pasupuleti Meghashyam, S. Lakshmi Manideep Royal.
Department of Pharmacy Practice, Annamacharya College of Pharmacy (Autonomous),
Rajampeta, AP, India -516126
pasupuletishyamroyal@gmail.com

Proton pump inhibitors (PPIs), are widely prescribed" drugs used for conditions of "excessive stomach acid, including gastroesophageal reflux disease (GERD), peptic ulcers, and Zollinger- Ellison syndrome". Although PPIs are effective in acid related disorders management, the appropriate use of PPIs especially concerning proper dosage is a significant problem in clinical practice. which are powerful "inhibitors of gastric acid secretion, are invaluable in the treatment of acid-related disorders" but their extensive and sometimes prolonged use creates concerns about patient safety and the utilization of healthcare resources. This review integrates current evidence and guidelines to overcome the problems with inappropriate use of PPIs. It emphasizes the need for patient-related strategies, such as careful clinical evaluation and compliance with evidence-based guidelines, to best optimize PPI therapy. Strategies like deprescribing protocols, patient education, and prescription audits are brought to the advance to counteract the risks of long-term PPI use. "Although PPIs have been generally considered safe, emerging evidence has linked these medications to numerous adverse outcomes, including community-acquired pneumonia, dementia, bone fractures, Clostridium difficile and other enteric infections, hypomagnesaemia, kidney diseases and more. Despite the fact that most conditions require only short-term treatment, many patients continue therapy for longer periods, raising concerns about potential associated risks. In addition," the need to create and execute context-specific guidelines, along with concerted efforts by healthcare teams, is emphasized to promote judicious use of PPIs and enhance patient outcomes.

**Keywords:** Proton PumpInhibitors (PPIs), Inappropriate Use of PPIs, Acid-Related Disorders, Long-Term PPI Use.

## VITAMIN B12 SUPPLEMENTATION: PREVENTING ONSET AND IMPROVING PROGNOSIS OF DEPRESSION

M. Anu, S. Lakshmi Manideep royal
Department of Pharmacy practice Annamacharya college of pharmacy
Rajampet, AP, India- 516126
aanu13821@gmail.com

Depression is the most common and complex mental health condition that occurs in all ages, genders, and populations. It may be present not only as a psychological disorder but it can also associated with metabolic dysfunction and endocrine imbalances, cardiovascular diseases and chronic inflammatory conditions, nutritional deficiencies, and neurodegenerative disorders. Despite that the availability of various treatment options and depression remains the significant global health concern that the continues to require greater attention and more effective interventions. This review article was also developed by thoroughly researching multiple studies and data sources to explore the relationship between the Vitamin B12 and depression and some other Numerous studies were carefully reviewed, and based on the accumulated evidence it was concluded that early supplementation with Vitamin B12 can help delay the onset of depressive symptoms and may enhance the effectiveness of conventional antidepressant treatments when used. Although other vitamins, such as Vitamin B6 and folate, are also known to influence mood and depressive states, this review primarily focuses on Vitamin B12. The goal is to provide healthcare providers with solid foundation to adequately address the risk of depression in patients who are prone to it or who have experienced a major depressive episode during their lifetime. Vitamin B12 plays vital role.

## DRUG REPURPOSING: A RAPID AND COST-EFFECTIVE APPROACH TO COMBAT NEGLECTED TROPICAL DISEASES

Vamsi krishna and S Lakshmi Mandeep royal
Department of Pharmacy practice, Annamacharya college of pharmacy (Autonomous), Rajampeta, Andhra Pradesh, India- 516126.
vamcrishnaa@gmail.com

Neglected tropical diseases (NTDs) like schistosomiasis, leishmaniasis, and lymphatic filariasis cause more than one billion cases worldwide and primarily occur in low- and middle-income countries. Nevertheless, drug discoveries to cure these disorders are discouragingly slow and cost prohibitive. Drug repurposing or repositioning provides an innovative and convenient solution to this problem by finding new medical indications from already existing drugs while cutting by a large margin the time, cost, and uncertainty of traditional drug development. This paper discusses what repurposing means as a new NTDs sustainable approach and how big a role it plays for the Indian pharma sector.The researchers have conducted a systematic review of the literature based on publications indexed in PubMed, Scopus, and WHO databases to identify repurposed drugs and ongoing clinical trials of interest. Among the significant results, the researchers report on three already-approved drugs as examples of their study: ivermectin, the drug mostly used in mass drug administration (MDA) interventions against lymphatic filariasis; fexinidazole, the drug that has been given the green light for human African trypanosomiasis; and miltefosine, the anti-cancer drug that has been redeveloped and is the first oral medicine for visceral leishmaniasis.Therefore, drug repurposing is highlighted as a time- and cost-effective method that has the power to change the face of not only national but also whole NTDs intervention programs worldwide.Indian research institutions, pharma companies and public health agencies must collaborate and work more closely together to promote faster innovations, increase the number of patients that may get direct benefits from the innovations, and also be in line with the WHO roadmap for NTD elimination targeted for 2030.

**Keywords:** Drug repurposing, neglected tropical diseases, miltefosine, computational pharmacology, public health.

## FROM GLUCAGON-LIKE PEPTIDE-1 TO TRIPLE AGONISTS: THE FUTURE LANDSCAPE OF PHARMACOTHERAPY IN OBESITY MANAGEMENT

ISBN: 978-81-980623-8-3

S. Jobeya Sarvath*and S.Lakshmi Manideep Royal
Department of pharmacy practice, Annamacharya college of pharmacy (Autonomous), New boyanapalli ,Rajampet – 516126, A.P, INDIA
jobiasak2329@gmail.com

Due to the prevalence of obesity worldwide, treatments for it have changed quickly. They have shifted from traditional medications to highly effective incretin-based therapies. The first major breakthrough came from glucagon-like peptide-1 receptor agonists (GLP-1 RAs), such as semaglutide and liraglutide. These drugs improved feelings of fullness and slowed stomach emptying, leading to significant weight loss of up to 17%. Since then, the treatment landscape has continued to improve with the introduction of dual agonists, such as tirzepatide. This medication acts as a GLP-1 and glucose-dependent insulinotropic polypeptide (GIP) co-agonist. It can lead to greater average weight loss, often exceeding 20%, along with notable improvements in cardiometabolic health. This class leverages the combined effects of targeting two key hormonal pathways. Currently, researchers are developing triple agonists that also target the glucagon receptor. This area represents the latest advancements in obesity treatment. The leading candidate, retatrutide (GLP-1/GIP/Glucagon RA), showed a remarkable 24.2% reduction in body weight during clinical trials. This improved effectiveness comes from the combined metabolic effects of GLP-1/GIP, which suppresses hunger and improves glucose balance, and glucagon, which increases energy use and fat mobilization.The quick move from single to multi-receptor agonism marks a significant change in how we manage obesity. These new agents could completely change clinical practice by offering patients with obesity and related health issues better weight control, longer-lasting results, and a significant reduction in cardiometabolic risk. They provide non-surgical options that are as effective as bariatric surgery.

**Keywords:** GLP-1 Receptor Agonists (GLP-1 RAs), Triple Agonists, Incretin based therapies, Obesity Pharmacotherapy

## MONITORING AND REPORTING OF SUSPECTEDADVERSE DRUG REACTIONS IN PATIENTS TREATED WITH CORTICOSTEROIDS IN TERITIARY CARE HOSPITAL-A COHORT STUDY

Thopugunta. Viswa Teja*, S. Lakshmi Manideep Royal
Annamacharya College of Pharmacy (Autonomous), New boyanapalli, Rajampet-516126, A. P, INDIA
viswatejathopugunta@gmail.com

Corticosteroids are the extensively used as an anti-inflammatory and immunosuppressive agents. However, their administration is often linked with adverse drug reactions (ADRs). This prospective was observational cohort study was conducted at the Government General Hospital (GGH), Kadapa, between November 2024 and April 2025, to monitor and analyze the suspected ADRs among 150 patients receiving short-term and long-term corticosteroid therapy in the General Medicine and Dermatology departments. Then the ADR causality was assessed using the World Health Organization–Uppsala Monitoring Centre (WHO-UMC) criteria and Naranjo's scale. Among these study population, males (66.6%) and elderly patients aged 69–78 years reported the highest incidence of ADRs. The Long-term use of corticosteroid therapy and intravenous administration (42.8%) emerged as significant risk factors. Central nervous system (CNS)-related ADRs, such as mood alterations, insomnia, and agitation, were the most frequently observed (42.8%). The Causality assessment are to classified the majority of reactions as Possible (71.4%) and while the remainder were categorized as the Probable (28.5%). Although descriptive analysis indicated a higher prevalence among elderly males, statistical evaluation did not demonstrate a significant association between ADR occurrence and patient age or gender ($p > 0.05$). These findings are underscore that corticosteroid-induced ADRs remain a notable clinical challenge, especially with the prolonged and systemic administration. Then the Continuous pharmacovigilance and early recognition, appropriate management strategies are essential to the minimize corticosteroid-related risks and improve the therapeutic outcomes.

**Keywords**: Corticosteroids, Adverse Drug Reactions, WHO-UMC scale, long-term therapy.

**PL-531**

## PIERRE ROBIN SEQUENCE: EPIDEMIOLOGY, CLINICAL MANIFESTATIONS, FEATURES, GENETIC BASIS, COMPLICATIONS, AND MANAGEMENT

H.Angel*, S. Lakshmi Manideep Royal
Department of Pharmacy practice Annamacharya college of pharmacy Rajampet, AP, India- 516126
havaldarangel21204@gmail.com

Pierre Robin Sequence (PRS) is a rare congenital craniofacial malformation that mainly affects the mandible and tongue, often creating early feeding and upper airway problems. The lower jaw is unusually small (micrognathia), and tongue tends to fall back into the throat (glossoptosis) and in many children there is also a cleft palate. These anamoly occurs because the jaw doesn't grow properly before birth, which also prevents the roof of the mouth from closing as it should. Then the way of PRS appears is not the same in every child. In some neonates may only find it hard to suck or feed, whereas the others experience in airway obstruction that can be life-threatening. So Parents usually notice these problems soon after birth and doctors confirm them by physical examination. In certain cases, imaging or genetic testing are done to check if the condition is part of a wider syndrome. Management depends on severity. Simple methods like positioning the baby and feeding support can help in mild cases. In more serious cases, surgery may be needed to support the airway or jaw. Long-term follow-up is essential, especially for speech, dental care, and growth. PRS exemplifies why teamwork among doctors, surgeons, and therapists is so important. Early intervention significantly improves outcomes.

**Keywords:** Pierre robin sequence, Micrognathia, Glossoptosis, Cleft palate, Congenital disorder

**PL-532**

## NEUROPROTECTIVE ROLE OF AGMATINE IN A 6-OHDA-INDUCED MOUSE MODEL OF ATTENTION-DEFICIT/HYPERACTIVITY DISORDER

Nandini Ratne, Apeksha Tambe, Brijesh Taksande and Milind Umekar
Division of Neuroscience, Department of Pharmacology, Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee,
Nagpur (M. S.), India-441002.
nandini.ratne201@gmail.com

Attention-Deficit/Hyperactivity Disorder (ADHD) is a neurodevelopmental disorder that affects both children and adults and is characterized by persistent patterns of inattention, hyperactivity, and impulsivity. During adolescence, the prefrontal cortex develops connectivity with other brain regions to engage executive functions and impulsive behavior. Thus injecting 6-hydroxydopamine, a neurotoxin results in lesioning of dopaminergic neurons which results in motor and cognitive impairments, similar to the ADHD in humans. This study was planned to investigate the effect of agmatine on 6-OHDA-induced ADHD-like behavior in mice. Animals administered with 6-OHDA on PND 5, exhibited the major ADHD-like symptoms, i.e. hyperactivity in open field test, attention deficit and impulsivity in object-based attention task. Further, the model revealed discrete co-existing symptoms, i.e. memory deficits, anxiety-related compulsive-like behavior, depressive and anti-social behavior in three chamber Social Interaction task. In the present study, 6-OHDA-induced ADHD-like behavior was significantly attenuated by agmatine (20, 40, and 80 mg/kg, i.p.), L-Arginine (60 mg/kg, i.p.), Aminoguanidine (50 mg/kg, i.p.). Additionally, agmatine reduces elevated oxidative stress parameters and increases reduced dopamine level in the 6-OHDA mice brain. These findings suggest that agmatine can be a potential therapeutic target for behavioral alteration associated with ADHD.

**Keywords:** Attention-Deficit/Hyperactivity Disorder, Agmatine, 6-hydroxydopamine, Dopamine, Aminoguanidine.

**PL-533**

## DEPRESCRIBING OF PROTON PUMP INHIBITORS: PROSPECTIVE STUDY

Ambati Akshaya, S. Lakshmi Manideep Royal Annamacharya college of pharmacy (Autonomous), New boyanapalli,
Rajampet-516126, A.P, INDIA
akshayareddyambati@gmail.com

A six-month prospective observational study was conducted in Government General Hospital, Kadapa, to assess deprescribing of proton pump inhibitors (PPIs) and protect the irrational use by decreasing over-

ISBN: 978-81-980623-8-3

prescription, overdosing, and prolonged use of drug therapy more than standard durations. Total number of 443 subjects were entered from inpatient and outpatient departments, and statistical analysis was done by using MsExcel. Then Deprescribing was equally common in females (9.6%) and males (10.8%), with most frequent among inpatients (13.2%) than outpatients (7.4%). Department-wise deprescribing was 100% in ENT, MICU, Orthopedic, Pulmonary, and Surgical units, with general medicine reporting the lowest rate. Deprescription was more common in younger patients than in older ones, with oral PPIs being deprescribed more than intravenous one, Longer treatment duration, particularly when without clear clinical reason, was significantly associated with greater deprescribing rates. The main reasons for deprescribing was "no clear indication" (5.19%) and "over prescription" (2.93%). The PPIs was most frequently prescribed for cardiovascular disorders and represented 167 subjects in the study sample. The evidence indicates that although PPIs have been used very widely and frequently in an improper manner, there is still scope for better prescribing through the implementation of evidence-based clinical guidelines. The Ongoing therapy review and purpose of deprescribing and especially in situations of no indication, can avoid misuse of Ppis over the long term and decrease harmful effects, and ensure the cost-effective delivery healthcare. This research can highlights the need for physician monitoring and ongoing monitoring to assure maximum patient safety and therapeutic success.

**Keywords:** Proton pump inhibitors, Inappropriate Use of PPIs, Clinical Guidelines, Long-Term PPI Use

**PL-534**

## EDIBLE VACCINES

Yashwant koshle*
Columbia Institute of Pharmacy, Raipur (C.G.)
koshleji98@gmail.com

Edible vaccines offer a new method of immunization by fusing the ideas of pharmaceutical research and plant biotechnology. Traditional injectable vaccines are produced from edible microbes or genetically modified plants that produce antigenic proteins that, when consumed orally, can trigger mucosal and systemic immune responses. However, their administration approach improves patient compliance, especially in toddlers and needle phobics, and avoids the hazards associated with poor injection technique. From a pharmacy's point of view, edible vaccines solve a number of the shortcomings of traditional vaccines. The manufacture and storage costs of these vaccines are significantly reduced because they are not reliant on cold-chain distribution and may be produced in large quantities by growing genetically engineered plants like potatoes, tomatoes, or bananas. Vaccines are more accessible when administered orally, which makes them perfect for mass immunization efforts, especially in areas with low funding. Pharmacists are essential in improving antigen stability, formulation options, and administration methods to guarantee safety, effectiveness, and regulatory compliance. Variations in antigen expression, protein breakdown in the gastrointestinal environment, and dose adjustment are other difficulties. Current pharmaceutical development addresses issues such as encapsulation, lyophilization, and formulation into unitized standardized dosages. In addition to avoiding infectious infections, edible vaccines are therapeutically interesting for autoimmune disease, allergies, and cancer immunotherapy. In conclusion, as edible vaccines offer a broadly accessible, reasonably priced, and user-friendly alternative, they represent a paradigm shift in vaccine development. Throughout the development, administration, and use of these vaccines in healthcare systems, pharmacists play a crucial role.

**Keywords:** Edible vaccines, Plant biotechnology, Genetically, Injectable, Formulation strategies, Immunotherapy.

## ROLE OF CORTICOTROPIN-RELEASING FACTOR RECEPTORS AND WITHANIA SOMNIFERA-INDUCED INHIBITION OF NICOTINE ADDICTION

Nitin G Dumore*, Monali N Dumore, Manish Aglawe, Milind J Umekar
Dadasaheb Balpande College of Pharmacy Besa, Nagpur 440037
SKB, College of Pharmacy, New Kamptee, Nagpur

Nicotine addiction is sustained by withdrawal symptoms that drive relapse. Corticotropin-releasing factor (CRF) signaling, particularly via CRF1 receptors, is implicated in stress-related aspects of drug dependence, but its role in nicotine withdrawal remains unclear. Withania somnifera (WS) is an Ayurvedic adaptogen with anxiolytic and neuroprotective properties. This study evaluated the involvement of CRF receptors in the effects of WS extract on nicotine withdrawal-associated behavioral and neuroendocrine changes in mice. Swiss albino mice were rendered nicotine-dependent by chronic subcutaneous injections (2 mg/kg, four times daily, 6-h intervals, for 10 days). Withdrawal was assessed on day 11 using the open field test (OFT) for somatic signs and the elevated plus maze (EPM) for anxiety-like behavior. CRF peptide (CRF-P, CRF1 agonist), Antalarmin (CRF1 antagonist), Urocortin II (CRF2 agonist), and Astressin-2B (CRF2 antagonist) were administered intracerebroventricularly. Plasma corticosterone levels were measured by HPLC. CRF-P (0.4 nM, icv) exacerbated withdrawal-induced anxiety, while Antalarmin (4 µg, icv) attenuated it. Co-administration of Antalarmin with WS extract (50 mg/kg, ip) produced a significant anxiolytic effect ($p < 0.001$). CRF2 agonist or antagonist did not alter WS effects. WS extract (100–200 mg/kg, ip) also reduced elevated plasma corticosterone in withdrawn mice. CRF–CRF1 signaling is a critical mediator of nicotine withdrawal. The anti-addictive effects of WS extract are mediated, at least in part, through modulation of CRF1 receptors and regulation of corticosterone levels.

**Keywords**: corticotropin-releasing factor; CRF1 receptor; Withania somnifera; nicotine withdrawal; corticosterone

## IMPROVING VITAMIN D CARE FOR PSYCHIATRIC PATIENTS IN QATAR

Kothuri Nehemiah
Pharmacotherapeuctis, A.S.N Pharmacy college, Burripalem, Tenali, Guntur (Dt), Andhra Pradesh -522201
nehemiahkothuri@gmail.com

This quality improvement (QI) project aimed to address the widespread issue of vitamin D deficiency in psychiatric patients, a group particularly vulnerable to its effects on brain health and overall well-being. The primary objective was to increase the proportion of patients with corrected vitamin D levels from 25% to 75% within one year by improving prescribing practices and monitoring systems. A multidisciplinary QI team implemented structured interventions at the outpatient pharmacy of RCC2, Mental Health Services, Qatar. Adult psychiatric patients were screened during routine medication visits. The main outcomes included the percentage of patients achieving healthy vitamin D levels and the number of physicians trained in optimized prescribing. Progress was monitored quarterly using Plan-Do-Study-Act (PDSA) cycles and supporting QI tools. Over 12 months, 665 patient records were evaluated. The proportion of patients achieving corrected vitamin D levels rose to 74.8%, representing substantial progress compared to the baseline of 25%. Improvements across phases were as follows: Phase 1 (77.4%), Phase 2 (85.8%), Phase 3 (71.5%), and Phase 4 (60.3%). In parallel, twenty physicians successfully completed training programs that enhanced their prescribing practices. In conclusion, the project achieved its target by significantly increasing the proportion of psychiatric patients with corrected vitamin D levels. The findings demonstrate the effectiveness of structured QI interventions in enhancing patient outcomes within mental health care and highlight the importance of continuous monitoring and capacity-building initiatives.

## ORGANS-ON-CHIP: A FUTURE TOOL IN PHARMACOLOGY & DRUG DISCOVERY

Anjali Vijay Shastry and T.M Pramod Kumar
JSS College of Pharmacy, Mysore, Karnataka, India 570001
roopanjali82750@gmail.com

Organs-on-Chip (OoCs) are microfluidic devices lined with human cells that replicate organ-level physiology, offering a transformative platform for drug discovery and pharmacological research. This study evaluates their role across all drug development phases—Discovery, Preclinical, Clinical, and Post-market thus highlighting their ability to simulate tissue–tissue interactions, mechanical forces, and biochemical microenvironments. OoCs have shown potential to reduce R&D costs by 10–26%, with Emulate's cost calculator estimating a 6-month OoC study at ₹8,300 (USD 100) versus ₹83 lakh (USD 100,000) for traditional

ISBN: 978-81-980623-8-3

primate studies. The Indian market generated ₹22.5 crore in 2024 and is projected to reach ₹103 crore by 2030 (CAGR 28.2%). Integration with AI enhances image analysis, PK/PD modelling, and digital twin simulations. JSS College of Pharmacy, Mysuru, is contributing significantly to this field through faculty training at the University of Nebraska Medical Centre and Seton Hall University, USA, along with hosting guest lectures, pre-conference workshops, and translational research initiatives. These efforts foster global collaboration and skill development in advanced pharmacological tools. Despite challenges in cost, expertise, and regulatory standardization, Organs-on-Chip technology stands at the forefront of next-generation pharmacology, offering a precise, ethical, and economically viable pathway for human-relevant drug development.

**Key words:** Organ-on-Chip, Drug Discovery, Microfluidics, AI Integration, Personalized Medicine

**AN OBSERVATIONAL STUDY ON THE PRESCRIPTION TRENDS IN PATIENT WITH DIABETES AND ASSOCIATED DISEASE IN ADULT**

Bhumika Nimje, Vineet Patidar, Namrata Kushwaha,
Arpna Indurkhya, Mahendra Patel
Sri Aurobindo Institute of Pharmacy, Indore, Madhya Pradesh, India
bhumikanimjhe@gmail.com

Diabetes mellitus is a chronic metabolic disorder characterized by persistent hyperglycemia and is rapidly increasing in prevalence, particularly in developing nations such as India. The disease is frequently complicated by comorbidities including hypertension, cardiovascular disorders, and kidney disease, which further challenge treatment outcomes. With the continual introduction of new therapies and updated clinical guidelines, understanding prescription patterns in diabetic patients is vital to ensure safe, effective, and evidence-based management. This six-month observational cohort study was conducted in the General Medicine Department of Sri Aurobindo Hospital, Indore, Madhya Pradesh. A total of 100 adult inpatients (≥18 years) with confirmed diabetes mellitus and complete prescription records were enrolled. Data collection included patient interviews, medication histories, caregiver reports, case files, and laboratory findings. Prescribing trends, drug combinations, guideline adherence (ADA, WHO), and potential drug-drug interactions were systematically analyzed. Findings revealed that most participants were middle-aged and frequently presented with comorbidities such as hypertension and diabetic retinopathy. Metformin was the most commonly prescribed agent, either alone or in combination therapy. Importantly, poor medication adherence was strongly associated with higher complication rates, underscoring adherence as a key determinant of treatment success. The study highlights the importance of personalized therapy, patient education, and continuous monitoring to optimize glycemic control, minimize complications, and enhance the quality of life in adults with type 2 diabetes mellitus.

**Keywords:** Diabetes mellitus, Prescription patterns, Medication adherence, Comorbidities, Clinical guidelines

**A CROSS-SECTIONAL STUDY ON THE ROLE OF COMMUNITY PHARMACISTS FOR PSORIASIS MEDICATION ACCESSIBILITY IN NAGPUR REGION**

Vinit D. Tabhane, Saloni R Sontakke,
Nishant Awandekar, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India
tabhanevinit01@gmail.com

Psoriasis, a chronic autoimmune disease affecting the skin, posed significant challenges for patients, including physical discomfort and psychological distress. Access to appropriate medications is essential for managing symptoms and improving quality of life. However, ensuring medication accessibility remained particularly difficult in regions with limited healthcare resources. In these settings, community pharmacists served as crucial healthcare providers and were often the first point of contact for patients seeking treatment. This cross-sectional study aimed to investigate the role of community pharmacists in facilitating psoriasis medication accessibility in the Nagpur region. The study employed a comprehensive approach to assess various aspects of pharmacist involvement in psoriasis care. A structured questionnaire was administered to community pharmacists practicing in Nagpur to collect data on their knowledge of psoriasis, the availability of psoriasis medications in local pharmacies, counseling practices related to disease management, and collaborations with dermatologists or other healthcare professionals. In addition, semi-structured interviews were conducted with psoriasis patients to gather insights into their experiences with pharmacist support and medication accessibility. By examining pharmacist knowledge, medication availability, counseling practices, and collaborations with healthcare professionals, the study sought to identify opportunities for enhancing pharmacist involvement in psoriasis care and improving patient outcomes. Ultimately, the findings provided a basis for developing targeted interventions to address gaps in medication accessibility and improve the quality of care for individuals living with psoriasis in Nagpur.

**Keywords**: Psoriasis, Community Pharmacist, Medication Accessibility.

**TO UNDERSTAND THE PHARMACOVIGILANCE ALONG WITH ADR OF INEBILIZUMAB**

Aditya D. Jadhav, Om A. Gonde and Rakesh D. Amrutkar
Department of Pharmaceutical Quality Assurance, K. K. Wagh College of Pharmacy, Nashik, Maharashtra, India – 422003.
adityajadhav21112001@gmail.com

Pharmacovigilance is a crucial for monitoring and ensuring drug safety, particularly for novel therapies. This study investigates adverse events associates with Inebilizumab, monoclonal antibody, in treating Myasthenia Gravis (MG), an autoimmune disorder characterised by muscle weakness and fatigue. Inebilizumab targets CD19 on B cells, reducing the autoimmune response in MG. The project involves a comprehensive review of clinical trial data, post-marketing surveillance reports, and patient registries to assess the incidence, nature, and severity of adverse events linked to Inebilizumab. This study aims to provide a detailed characterization of these adverse events, identify high-risk patient subgroups, and offer recommendations for monitoring and management in clinical practice. Data will be sourced from pharmacovigilance databases such as the FDA Adverse Event Reporting System (FAERS) and Surveillance, alongside clinical trial registries. By examining patient demographics, comorbidities, concomitant medications, and genetic factors, the study seeks to understand the mechanisms underlying the observed adverse events. This analysis is vital for developing targeted strategies to mitigate risks and enhance patient outcomes. The expected outcome is understanding of the risk-benefit profile of Inebilizumab, contributing to improved patient care and informing future clinical guidelines. This research underscores the importance of continuous post-marketing surveillance and the integration of real-world evidence in drug safety evaluation.

**Keywords**: Pharmacovigilance, Inebilizumab, Myasthenia Gravis, Adverse Events, Monoclonal Antibody.

**“ASSESSMENT OF ADVERSE DRUG REACTIONS OF ANTIDEPRESSANTS IN PSYCHIATRIC PATIENTS AT A TERTIARY CARE HOSPITAL”**

Anushca Chowdhury, Sonam Chaturvedi, Seemu Singh,
Anu Hardenia, Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore (M.P.) 453555
anushcaaaachowdhury2016@gmail.com

Antidepressant medications are commonly prescribed for the management of psychiatric disorders, but their use is often associated with adverse drug reactions (ADRs), which may compromise treatment efficacy, patient adherence, and quality of life. Evaluating the safety profile of these agents in routine clinical practice is crucial for optimizing therapy. This prospective observational study was conducted in the Psychiatry Department of Sri Aurobindo Hospital, Indore, including 200 psychiatric patients receiving antidepressant therapy. Patients were monitored for ADRs over a fixed study period through interviews, physical examinations, and review of medical records. The severity and causality of ADRs were assessed using standardized pharmacovigilance tools, including the WHO-UMC criteria and the Naranjo algorithm. A significant proportion of patients experienced ADRs, most commonly gastrointestinal disturbances, weight changes, sexual dysfunction, insomnia, and sedation. Selective serotonin reuptake inhibitors (SSRIs)

ISBN: 978-81-980623-8-3

were associated with the highest incidence of ADRs, whereas tricyclic antidepressants (TCAs) produced more severe but less frequent adverse effects. Most ADRs were mild to moderate in severity and classified as probably related to the antidepressant therapy. These findings highlight that antidepressant treatment is frequently associated with adverse effects, emphasizing the need for vigilant monitoring, patient counseling, and timely management interventions to enhance treatment adherence and therapeutic outcomes. Strengthening pharmacovigilance in psychiatric practice can improve the overall safety, efficacy, and quality of care for patients undergoing antidepressant therapy.

**DIAGNOSTIC CHALLENGES IN MULTISYSTEM SJOGREN'S SYNDROME: A CASE-BASED CLINICAL ANALYSIS WITH LITERATURE REVIEW**

Lakshmi Gayathri. M, Monisha. B, Rethika C
Department of Pharmacy Practice, KLE College of Pharmacy, Rajajinagar, Bangalore- 560010 and KLE Academy of Higher Education and Research Belagavi, Karnataka-590010
lakshmigayathri40@gmail.com

Sjogren's syndrome (SJS) is a systemic autoimmune disorder primarily affecting exocrine glands but increasingly recognized as a multi-organ disease. Neurological manifestations such as small-fiber neuropathy (SFN) are emerging, and rare cases may involve simultaneous gastrointestinal and thromboembolic complications. To describe a case-based analysis of SJS with multi-system involvement, emphasizing diagnostic challenges and the importance of coordinated management, supported by literature evidence. A 78-year-old woman presented with vomiting, diarrhea, fever, bilateral pedal edema, and erythema. She was hypoxic ($SpO_2$ 85% on room air), hypotensive (BP 86/54 mmHg), and febrile (38.5 °C). Laboratory workup revealed elevated ESR (62 mm/hr), mild anemia (Hb 9.8 g/dL), B12 >2000pg/ml and positive anti-Ro/SSA antibodies. Echocardiography showed mild right-sided chamber dilation with pulmonary artery systolic pressure of 45 mmHg. Initial stabilization included IV fluids, broad-spectrum antibiotics (meropenem, teicoplanin, clindamycin), bronchodilator nebulization, and ICU monitoring. SJS management involved pilocarpine, levothyroxine, pentoxifylline, and anxiolytic support. Clinical suspicion was broadened due to coexisting SFN symptoms, irritable bowel syndrome (IBS), affective speech disorder, and pulmonary embolism. The patient improved with multidisciplinary care. Literature reports describe isolated SFN and management (Mehrnaz, 2024) or thromboembolic events (Pierre, 2025), but simultaneous neurological, gastrointestinal, and thromboembolic manifestations remain rare. This case highlights the need for heightened clinical suspicion of SJS in elderly patients presenting with unexplained multi-system findings. Early recognition and coordinated management across specialties reduce morbidity and optimize outcomes.

**Keywords**: Sjogren's syndrome, Small-fiber neuropathy, Pulmonary embolism, Multisystem involvement.

chinthana21hb@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder and the most common cause of dementia, responsible for 60–80% of cases worldwide. It is clinically characterized by memory loss, cognitive impairment, and motor dysfunction, and pathologically by the accumulation of amyloid-beta (Aβ) plaques and neurofibrillary tangles of hyperphosphorylated tau protein. Oxidative stress and cholinergic dysfunction play central roles in AD pathogenesis, marked by elevated reactive oxygen species (ROS), reduced antioxidant enzymes such as superoxide dismutase (SOD) and catalase (CAT), increased lipid peroxidation, and heightened acetylcholinesterase (AChE) activity. Current therapeutic options offer only symptomatic relief, with limited effects on disease progression. Aluminium chloride ($AlCl_3$) is widely used to induce AD-like pathology in animal models, replicating key features including Aβ accumulation, oxidative stress, cholinergic deficits, and neuroinflammation. Natural products with antioxidant and neuroprotective properties are being increasingly explored for their therapeutic potential. Gmelina arborea Roxb. (Gambhari), a traditional Ayurvedic herb, has shown promise due to its rich phytochemicals including flavonoids, iridoid glycosides, and phenolics. This study evaluates the neuroprotective efficacy of Gmelina arborea fruit ethanolic extract in an $AlCl_3$-induced AD rat model. Behavioral parameters (depression, anxiety, memory), biochemical markers (AChE activity, SOD, MDA), Aβ deposition, and brain-derived neurotrophic factor (BDNF) levels were assessed. The extract significantly improved cognitive and behavioral outcomes, reduced oxidative damage, inhibited AChE activity, increased BDNF levels, and attenuated Aβ pathology. These findings highlight the potential of Gmelina arborea as a multi-target therapeutic agent against AD-related neurodegeneration and support further investigation into its clinical applicability for managing Alzheimer's disease.

**Keywords:** Neuroprotection, Alzheimer's disease, Gmelina arborea, oxidative stress, BDNF

**COMBINED EFFECT OF SITAGLIPTIN AND SPIRONOLACTONE ON THE MITIGATION OF DIABETIC NEPHROPATHY IN A RAT MODEL OF STREPTOZOTOCIN-INDUCED TYPE 2 DIABETES**

Raja Shekar Perusomula1, Ramesh Alluri2, Gayathri Paturi3
Cognitive Science Research Initiative (CSRI) Lab, Department of Pharmacology, Vishnu Institute of Pharmaceutical Education & Research (VIPER), Narsapur, Medak, Telangana India 502313.

Diabetic nephropathy (DN) is a leading cause of chronic kidney disease and end-stage renal failure among patients with type 2 diabetes mellitus (T2DM). The current study evaluated the combined effects of sitagliptin, a dipeptidyl peptidase-4 inhibitor, and spironolactone, a mineralocorticoid receptor antagonist, on the progression of DN in a streptozotocin-induced rat model of T2DM. Diabetes was induced by high-fat diet followed by low-dose STZ injection. Rats were divided into control, diabetic control, sitagliptin-treated, spironolactone-treated, and combination therapy groups. After 8 weeks, biochemical parameters including blood glucose, serum creatinine, blood urea nitrogen (BUN), urinary albumin, and total protein were measured. Renal oxidative stress markers (SOD, CAT, MDA), inflammatory cytokines (TNF-α, IL-6), and fibrosis markers (TGF-β1, Collagen IV) were assessed. Histopathological analysis of kidney tissue was performed. Combination therapy significantly improved glycemic control, reduced renal oxidative stress, inflammation, and fibrosis compared to monotherapies. Histology confirmed attenuated glomerular and tubular damage with combined treatment. These findings suggest that sitagliptin and spironolactone act synergistically to protect against diabetic nephropathy through multi-targeted mechanisms, highlighting the potential of combination therapy in managing DN.

**Keywords:** Diabetic nephropathy, Streptozotocin, Sitagliptin, Spironolactone, Oxidative stress, Renal fibrosis, Renoprotection.

Polycystic ovary syndrome (PCOS), a prevalent endocrine disorder in women of reproductive age, is characterized by hormonal imbalance, ovarian cysts, and irregular cycles. Current treatments often fail to address its multifactorial manifestations. This study investigates the therapeutic effects of Citrullus colocynthis and resveratrol in managing hormonal levels, improving lipid profiles, and restoring ovarian structure in letrozole-induced PCOS in Wistar rats. Adult female rats were divided into seven groups: normal control, letrozole-induced positive control, clomiphene-treated standard control, three letrozole-induced + Citrullus colocynthis & resveratrol treated groups (low, moderate, high dose), and

ISBN: 978-81-980623-8-3

Citrullus colocynthis & resveratrol only group. Treatments were administered over several weeks, followed by hormonal (FSH, LH, testosterone) and biochemical (glucose, cholesterol, triglycerides) assessments, organ weight analysis, and ovarian histopathology. Results showed that Citrullus colocynthis & resveratrol significantly lowered FSH, LH, and testosterone, while improving lipid metabolism by reducing cholesterol and triglycerides. Ovarian tissue analysis revealed reduced cystic formation and enhanced follicular development, with improvements in ovarian structure superior to clomiphene. The combination demonstrated significant reproductive and metabolic benefits, highlighting their potential as multifaceted therapeutic agents. These findings emphasize the need for further research into their mechanisms and clinical applications for PCOS management.

**Keywords:** Polycystic ovary syndrome (PCOS), Citrullus colocynthis, Resveratrol, Letrozole, Clomiphene citrate, Hormonal imbalance, Ovarian morphology.

**THERAPEUTIC ROLE OF N-ACETYLCYSTEINE IN NEUROINFLAMMATORY AND SEROTONERGIC ALTERATIONS OF CHRONIC STRESS-INDUCED DEPRESSION**

Mudra Dwivedi, Joneth Fernandes, and Girdhari Lal Gupta
Department of Pharmacology, SVKM's NMIMS, School of Pharmacy & Technology Management, Shirpur, Dhule, Maharashtra, India – 425405
mudradwivedi07@gmail.com

Depression is increasingly being considered as a condition that has a close connection with neuroinflammation and disturbance of neurotransmitter regulation. This paper examined the possible therapeutic benefits of N-acetylcysteine (NAC), an antioxidant and glutamate-regulating agent, on chronic exposure to the well-known model of unpredictable mild stress (CUMS) in rats. The behavioral tests involved were a preference for sucrose, forced swim, open field, and locomotor activity tests. CUMS significantly caused anhedonia, despair-like behavior, decreased locomotion, increased hippocampal and prefrontal pro-inflammatory cytokines (IL-1b, IL-6, TNF-α), and diminished serotonin levels. The application of NAC (50 and 100 mg/kg, p.o) or fluoxetine restored the behavioral performance of animals, decreased the expression of cytokines, and restored the level of serotonin. Nevertheless, the minimum dose of NAC (25 mg/kg) was not effective. To a significant degree, these findings indicate the use of NAC as an adjunctive therapeutic approach to the depressive disorders caused by stress, which is associated with anti-inflammatory effects and modulation of serotonergic activity.

**Keywords**: Antioxidant therapy, chronic stress model, serotonin modulation, neuroimmune regulation, antidepressant-like activity

**PL-547**

**NEUROPROTECTIVE POTENTIAL OF ALPHA AMYRIN AGAINST ALUMINUM-INDUCED OXIDATIVE STRESS AND NEURODEGENERATION**

Ratna B
Deartment of Pharmacology, Vydehi Institute of Pharmacy,
Whitefield EPIP Area
Bangalore, Karnataka, India - – 560 066

Persistent exposure to neurotoxins like aluminium leads to oxidative stress-induced neuronal inflammation, neurotransmitter imbalance, erroneous protein accretion, and neuronal apoptosis which ultimately course to several neurodegenerative disorders. The current research examines the neuroprotective effect of the compound alpha amyrin against aluminum-induced oxidative stress and neurodegeneration. Alpha amyrin isolated from Ficus benghalensis stem bark extract were purified and spectroscopically characterized followed by in vitro antioxidant studies. Chitosan-decorated alpha amyrin nanoemulsion underwent physicochemical characterization followed by ex-vivo permeation and stability studies which showed good cumulative permeation and flux through the nasal epithelium and stability. Neuroprotective and biochemical studies were performed and an improvement in the antioxidant status and a simultaneous decrease in the lipid peroxidation and brain aluminum levels were noted. Moreover, brain levels of acetylcholine esterase, dopamine, glutamate, TNF-α and IL-6 were regulated. Neurobehavioral studies showed improved locomotion in the actophotometer, improved motor coordination and grip strength in the rotarod test, ameliorated spatial learning and memory in the Morris water maze test, improved learning and retention of memory and reduction of anxiety in the elevated plus maze test. Eddy's hot plate test showed amelioration of aluminium- mediated hyperalgesia. Histopathological examination of nasal epithelium and associated organs in nanoemulsion-treated groups across varying doses showed no signs of toxicity and the observations aided dose selection. Immunohistochemistry studies performed in rat brains indicated decreased β-amyloid accumulation and increased BDNF expression. Thus the study exhibitted alpha amyrin as a promising neuroprotective agent against aluminum-induced oxidative stress and neurotoxicity in the biological system.

**Keywords**: Aluminium, alpha amyrin, β-amyloid, BDNF, neuroprotection.

**PL-548**

**PSYCHIATRIC DISORDERS (MENTAL HEALTH CONDITIONS)**

Dr. Sumia Fatima, Ruksaar Begum
Azad College of Pharmacy, Moinabad

Psychiatric disorders represent a broad group of mental health conditions that significantly impact thoughts, emotions, behavior, and overall functioning. They include common illnesses such as depression, anxiety, bipolar disorder, schizophrenia, and substance use disorders, which collectively contribute to a major burden of disease worldwide. These conditions often arise from complex interactions between genetic, biological, psychological, and environmental factors. Early onset, chronic course, and frequent comorbidities make psychiatric disorders a leading cause of disability, reduced quality of life, and increased mortality. Despite advances in diagnosis and treatment, challenges persist due to social stigma, underreporting, and limited access to mental health services in many regions. Current management strategies rely on pharmacotherapy, psychotherapy, and psychosocial support, with growing emphasis on integrated and personalized care models. Ongoing research into neurobiology, digital interventions, and preventive strategies offers hope for more effective identification and management. Addressing psychiatric disorders requires a comprehensive approach that combines clinical care, community support, and public health initiatives to reduce stigma and improve access to timely treatment.

**Keywords:** mental health condition, bipolar disorder, schizophrenia complex interactions, frequent comorbidities.

**PL-549**

**NEUROPROTECTIVE EFFECTS OF SESBANIA GRANDIFLORA FLOWER EXTRACT ON HALOPERIDOL-INDUCED PARKINSON'S DISEASE IN MICE**

Sanket Khedekar
Department of Pharmacology Rajarshi Collage of pharmacy Buldana, Maharashtra, India
Sanketkhedekar734@gmail.com

Parkinson's disease (PD) is a progressive neurodegenerative disorder marked by the loss of dopaminergic neurons in the substantia nigra, leading to motor symptoms such as tremors, rigidity, bradykinesia, and postural instability. The underlying pathophysiology involves oxidative stress, mitochondrial dysfunction, and abnormal protein aggregation, which collectively contribute to neuronal degeneration. Current pharmacological treatments, including levodopa and dopamine agonists, provide only symptomatic relief and do not prevent disease progression. The present study evaluated the neuroprotective potential of Sesbania grandiflora flower extract in haloperidol-induced Parkinsonism in Swiss albino mice. PD-like symptoms were induced by intraperitoneal administration of haloperidol (1 mg/kg) for 8 days. Treatment groups received S. grandiflora extract orally at doses of 250 mg/kg and 500 mg/kg, while Syndopa plus (20 mg/kg) served as the standard drug. Behavioral assessments, including bar test, Rota-Rod, actophotometer, and open field test, were conducted to evaluate motor function and locomotor activity. Biochemical assays measured antioxidant markers—superoxide dismutase (SOD), catalase (CAT), and glutathione (GSH)—while histopathology examined neuronal integrity. S. grandiflora extract significantly reduced cataleptic behavior, improved motor coordination, and restored locomotor activity compared to the haloperidol-only group. Biochemical findings demonstrated enhanced antioxidant enzyme activity and reduced oxidative stress, while histopathology confirmed preservation of neuronal structure. Sesbania grandiflora flower extract exhibited potent antioxidant and

ISBN: 978-81-980623-8-3

neuroprotective effects against haloperidol-induced Parkinsonism. These results suggest its therapeutic promise as a supportive or complementary treatment option for managing PD.

**ELUCIDATING THE ROLE OF PEHARMALINE AND ITS PHARMACOLOGICAL EFFECT ON DNA DAMAGE, APOPTOSIS AND SENESCENCE IN BREAST CANCER CELLS**

RASHI BANCHHOR
Guru Ghasidas Vishwavidyalaya, A Central University, Koni, B

Elucidating the Role of Peharmaline and Its Pharmacological Effect on DNA Damage, Apoptosis and Senescence in Breast Cancer Cells. Peharmaline compounds were screened for their cytotoxicity using cell viability/ MTT assay and their growth inhibition was studied through colony formation assay; senescence activity was checked by β-Galactosidase assay and apoptotic function was confirmed by DAPI staining. Western blotting technique was used to study the expression of protein markers for various conditions. The data was analysed using relevant techniques, equipment and software. 4T1 mouse mammary carcinoma model was used for studying the effects of the novel compound in mice. The compound Peharmaline was found to have anticancer properties in MCF-7 breast cancer cell line and showed promising results. Based on the study, the compound Peharmaline can be used as an anti-cancer agent. Data regarding many aspects of the genus such as mechanisms of actions, metabolism, pharmacokinetics, toxicology, potential drug interactions with standard-of-care medications is still limited which call for additional studies particularly in humans. Further assessments and clinical trials should be performed before it can be integrated into medicinal practices.

**PL-551**

**"INTEGRATIVE AND INNOVATIVE APPROACHES TO HYPOTHALAMIC AMENORRHEA: CURRENT EVIDENCE AND FUTURE DIRECTIONS"**

DIVYA PANDEY, DR. RAMAPRASAD PADHY
Danteswari college of pharmacy borpadar -494221

Hypothalamic amenorrhea (HA) is a reversible form of secondary amenorrhea resulting from functional disruption of the hypothalamic–pituitary–ovarian (HPO) axis. It is primarily characterized by reduced or absent gonadotropin-releasing hormone (GnRH), PULSATILITY, leading to diminished luteinizing hormone (LH) and follicle-stimulating hormone (FSH) secretion, HYPOESTROGEN, and consequent menstrual irregularities. Traditionally, HA has been associated with stress, significant weight loss, eating disorders, or excessive physical exercise. However, emerging research highlights the novelty of considering HA not only as a reproductive disorder but also as a multisystem condition with broader implications. Novel insights suggest its links with metabolic dysregulation, decreased bone mineral density, altered cardiovascular health, and neuropsychological disturbances. Furthermore, recent advances in neuroendocrinology emphasize the role of KISSPEPTIN neurons, leptin signal, and other metabolic peptides in mediating hypothalamic suppression. Innovative diagnostic strategies, including advanced hormonal assays and neuroimaging, are improving the precision of HA detection and differentiation from other causes of amenorrhea. Therapeutic novelty lies in shifting from mere hormone replacement toward holistic interventions such as stress reduction, nutrition optimization, cognitive-behave therapy, and novel pharmacologic agents like KISSPEPTIN analogues, which show promise in restoring reproductive function. Recognizing HA as an adaptive physiological response rather than a mere pathology is also a novel conceptual advancement, reframing its management in a personalized and integrative context. Thus, hypothalamic amenorrhea represents not only a reproductive health challenge but also an opportunity for novel multidisciplinary research and therapeutic innovation that can significantly improve women's overall health outcomes.

**PL-552**

**DIURETICS EFFECT OF ETHANOLIC EXTRACT OF MUSA PARADISIACA IN WISTAR RATS**

Misba Sultana
ADITYA BANGALORE INSTITUTE OF PHARMACY EDUCATION AND RESEARCH

While a specific detailing the diuretic effect of an ethanolic extract of Musa paradisiaca (plantain) in Wistar rats is not available, a review of related studies provides a strong basis to construct a similar one. Musa paradisiaca (plantain) is a medicinal plant traditionally used for various ailments, including those affecting the urinary system. Diuretics are important for treating conditions like hypertension, congestive heart failure, and edema. The search for natural, effective diuretics with fewer side effects is ongoing. This study aims to investigate the diuretic potential of the ethanolic extract of a specific part of Musa paradisiaca in Wistar rats. The study would involve preparing an ethanolic extract of the plant part. Healthy Wistar rats would be divided into several groups, including a control group (receiving a vehicle like distilled water), a standard group (receiving a known diuretic drug like furosemide), and one or more test groups (receiving different doses of the Musa paradisiaca extract). The diuretic activity would be assessed by measuring parameters such as total urine volume, and the excretion of electrolytes like sodium (Na+), potassium (K+), and chloride (Cl−) over a specific time period (e.g., 5 or 24 hours). The Na+/K+ ratio would also be calculated. The results would likely show that the ethanolic extract of Musa paradisiaca caused a significant, dose-dependent increase in urine output compared to the control group. The extract would also lead to an increased excretion of urinary electrolytes, particularly sodium and potassium. The effect would be compared to the standard diuretic drug. A low Na+/K+ ratio might suggest a loop-diuretic-like activity. The findings would conclude that the ethanolic extract of Musa paradisiaca possesses significant diuretic activity, which supports its traditional use in managing conditions related to fluid retention and kidney health. The diuretic effect may be attributed to the presence of various phytochemicals, such as flavonoids, alkaloids, and saponins, which are known to have diuretic properties. Further studies would be recommended to isolate the specific active compounds and elucidate their precise mechanism of action.

**METABOLIC MASTERY: SEMAGLUTIDE'S TRANSFORMATIVE IMPACT**

ZEESHAN BIRAJDAR JULFEKHAR, RAJAT SAYYED
MCES DR. P. A INAMDAR UNIVERSITY

Semaglutide is a glucagon-like peptide-1 (GLP-1) receptor agonist that has emerged as a transformative therapy for type 2 diabetes mellitus (T2DM) and obesity. Developed by Novo Nordisk, it mimics the action of endogenous GLP-1, enhancing insulin secretion, suppressing glucagon release, slowing gastric emptying, and promoting satiety. Clinical trials such as SUSTAIN and STEP have demonstrated semaglutide's efficacy in significantly reducing HbA1c levels and inducing substantial weight loss, often exceeding 15% of baseline body weight in patients with obesity. It is available in both injectable and oral formulations, offering flexibility in treatment options. Beyond glycemic control and weight reduction, semaglutide has shown cardiovascular benefits, making it a cornerstone in the management of metabolic syndrome. Ongoing studies are also exploring its potential in conditions such as non-alcoholic steatohepatitis (NASH), Alzheimer's disease, and polycystic ovary syndrome (PCOS).

**REVIEW ON COVID-19 VACCINE AND IMMUNOTHERAPY**

Ruhab Dhansay and swapnil daunde

The COVID-19 pandemic due to the SARS-CoV-2 virus resulted in a global health crisis and necessitated urgent scientific response. Vaccination and immunotherapy have been essential in managing the disease spread and severity. This review provides an elaborate account of different COVID-19 vaccines including mRNA vaccines (Pfizer-BioNTech, Moderna), viral vector vaccines (Covishield, Sputnik V), inactivated vaccines (Covaxin), and protein subunit vaccines (Novavax), based on their mechanisms, efficacies, and safety profiles. In addition to vaccines, immunotherapy has been a valuable supportive care option, particularly in highly risky or seriously ill patients. Monoclonal antibodies, convalescent plasma, and immune modulators like interleukin inhibitors have also been explored for their capacity to decrease viral load and manage hyperinflammatory processes. The review also points to challenges including vaccine resistance, developing variants, restricted access in developing nations, and the need for boosters. This article highlights the synergistic importance of vaccines and immunotherapeutic strategies in mitigating COVID-19 morbidity and mortality, and also illuminates their potential future role in pandemic preparedness.

**UNDERSTANDING AUTOIMMUNE DISORDERS: MECHANISMS, IMPACT, AND THERAPEUTIC APPROACHES.**

Hiba Khan and Swapnil Dounde
MCE SOCIETY, DR. PAI UNIVERSITY,
ALLANA COLLEGE OF PHARMACY, CAMP, PUNE
khiba0515@gmail.com

Autoimmune disorders cause the body to attack its own cells by mistake which produces persistent inflammation and tissue damage. The group of autoimmune disorders encompasses rheumatoid arthritis along with systemic lupus erythematosus and type 1 diabetes as well as multiple sclerosis and inflammatory bowel disease. The various conditions display individual characteristics yet they all stem from the same fundamental process of genetic susceptibility combined with environmental triggers and immune system abnormalities. The diagnostic challenges of these complex diseases lead to postponed identification which produces enduring medical consequences. The delivers comprehensive information about autoimmune disorders to second-year pharmacy students by covering their pathophysiology and classification together with their clinical presentation and present-day treatment methods. The pharmaceutical treatment options for autoimmune conditions consist of corticosteroids along with disease-modifying antirheumatic drugs (DMARDs) and biologics and newly developed targeted therapies that focus on immune system modulation. Pharmacy professionals serve as essential contributors to patient care by delivering medication counseling and ensuring prescription compliance while watching for drug reactions and enhancing patient wellness. The rising number of autoimmune diseases requires pharmacy students to understand these conditions because patients need ongoing pharmaceutical management. Future pharmacists will deliver effective patient care when they possess fundamental knowledge about autoimmune disease mechanisms and management strategies for both clinical and community healthcare settings.

**HOSPITAL, COMMUNITY AND CLINICAL PHARMACY IN PATIENT-CENTERED CARE**

Zainab Muzammil and Rajat Syed
MCES's Dr PAIU Allana College of Pharmacy

Pharmacy practice has evolved far beyond simply dispensing medicines. Today, hospital, community, and clinical pharmacists each play a unique and important role in improving patient health. Hospital pharmacists work closely with doctors and nurses to ensure patients receive the right medications safely and effectively during their hospital stay. Community pharmacists are often the most accessible healthcare professionals, providing advice, counseling, and support for everyday health concerns. Clinical pharmacists bring specialized knowledge to patient care, often working directly with healthcare teams to manage complex medication therapies. Together, these branches of pharmacy form a strong network that supports better treatment outcomes, reduces medication errors, and promotes responsible medicine use. As healthcare continues to focus more on the individual, collaboration between these pharmacy roles becomes even more essential. Their combined efforts help ensure that patients receive the care, education, and support they need at every step of their health journey.

**MECHANISM OF ACTION OF NSAIDS**

Ayesha shaikh, Rajat sayyed
MCES's PAI Allana College of Pharmacy

Non-Steroidal Anti-Inflammatory Drugs (NSAIDs) are among the most commonly used medications worldwide for the treatment of pain, inflammation, and fever. The primary mechanism of action of NSAIDs is the inhibition of cyclooxygenase (COX) enzymes, particularly COX-1 and COX-2, which are responsible for the conversion of arachidonic acid into prostaglandins. Prostaglandins are lipid compounds that mediate inflammation, pain, fever, and other physiological responses. NSAIDs reduce prostaglandin synthesis, thereby producing anti-inflammatory, analgesic, and antipyretic effects. While COX-1 is involved in maintaining gastric mucosa, renal function, and platelet aggregation, COX-2 is induced during inflammation. Non-selective NSAIDs inhibit both COX-1 and COX-2, which can lead to gastric irritation and ulceration due to decreased protective prostaglandins in the stomach. In contrast, COX-2 selective inhibitors (coxibs) aim to reduce inflammation with fewer gastrointestinal side effects. Understanding the mechanism of NSAIDs helps in the rational use of these drugs and guides the development of safer alternatives with reduced adverse effects.

**Keywords**: NSAIDs, Cyclooxygenase, COX-1, COX-2, Prostaglandins, Anti-inflammatory, Analgesic, Coxibs

**IDENTIFYING AND PRIORITIZING THE CAUSES OF MEDICATION ERRORS IN THE PHARMACY**

Adnan Shaikh and Swapnil Bounde
MCES's PAI Allana college of Pharmacy

Medication errors in pharmacies represent a significant threat to patient safety and healthcare quality, often resulting in adverse drug events, increased hospitalization, and higher healthcare costs. This study aims to systematically identify and prioritise the root causes of medication errors within pharmacy settings, focusing on both community and hospital pharmacies. The research adopts a mixed-methods approach, incorporating qualitative interviews with pharmacists and pharmacy technicians, and quantitative analysis using error-reporting data. Key findings reveal that medication errors are predominantly caused by factors such as workload and time pressure, look-alike/sound-alike (LASA) drugs, illegible prescriptions, lack of proper communication between healthcare professionals, inadequate staffing, and insufficient use of technology. Using prioritisation tools like the Failure Mode and Effects Analysis (FMEA) and Pareto analysis, the study highlights the most critical contributors to errors. Among these, distractions during dispensing, misinterpretation of prescriptions, and incomplete patient information emerged as high-priority causes requiring immediate intervention. The study concludes with evidence-based recommendations, including enhanced automation and electronic prescribing systems, standardized labeling practices, continuing education for pharmacy staff, and improved interprofessional communication. Addressing these high-impact areas can significantly reduce the incidence of medication errors and enhance patient safety across pharmacy practice.

**ROLE OF ANTICHOLINERGIC DRUGS IN PARKINSON'S DISEASE**

Dhruwin Soni and Rajat Sayyed
MCES's PAI Allana College of Pharmacy, Azam Campus

Parkinson's disease (PD) is a chronic neurodegenerative disorder primarily caused by the degeneration of dopaminergic neurons in the substantia nigra, leading to an imbalance between dopamine and acetylcholine in the basal ganglia. This imbalance contributes to classic motor symptoms such as tremors, rigidity, and bradykinesia. Anticholinergic drugs help restore this neurotransmitter balance by inhibiting muscarinic acetylcholine receptors, thereby reducing excessive cholinergic activity. These drugs are particularly effective in managing tremors and rigidity, especially in the early stages of Parkinson's disease. Commonly used anticholinergic agents include trihexyphenidyl, benztropine, and biperiden. However, their use is limited in elderly patients due to potential side effects like cognitive dysfunction, dry mouth, blurred vision, and urinary retention. While their role has diminished with the availability of dopaminergic therapies, anticholinergics still hold value in younger patients or those with predominant tremor symptoms. Ongoing research aims to develop more selective anticholinergic agents with fewer adverse effects.

**Keywords:** Parkinson's disease, Anticholinergic drugs, Acetylcholine, Trihexyphenidyl, Muscarinic receptor blockers, Tremors

**INVESTIGATING THE CARDIOVASCULAR SAFETY PROFILE OF NOVEL ANTIDIABETIC MEDICATIONS**

MD. Ayesha Begum and Shaik Aminabee
Department of Pharmacology, V. V. Institute of Pharmaceutical sciences, Andhra Pradesh, India-521356
mdayeshabegum2@gmail.com

Diabetes mellitus is a global health concern, affecting millions of people worldwide. The management of diabetes often involves the use of antidiabetic medications to regulate blood glucose levels. In recent years, several novel antidiabetic medications have been introduced, promising better glycemic control and potential cardiovascular benefits. This research article aims to investigate the cardiovascular safety profile of these novel antidiabetic medications, shedding light on their impact on cardiovascular outcomes and safety concerns. By synthesizing existing research, clinical trials, and real-world data, we can provide a comprehensive overview of the cardiovascular effects of these emerging therapies.

**Keywords:** Diabetes mellitus, cardiovascular safety, sodium-glucose cotransporter-2 inhibitors, glucagon-like peptide-1.

**TRANSFORMING GENERAL PHYSICIAN PRACTICE THROUGH CYBERPRESCRIPTION: A PRACTICAL APPLICATION STUDY**

Sanskruti Hontale, Kulkarni Sandesh
SRI SHAHU MAHARAJ COLLEGE OF PHARMACY, BIDAR

This study examines how using cyber prescriptions can change the way general physicians prescribe medicines. Cyber prescriptions are digital versions of traditional paper prescriptions, designed to reduce errors and improve communication between doctors, patients, and pharmacists. The main goal is to find out if cyber prescriptions can make prescribing safer and easier in everyday medical practice. This study used a comparative observational approach to evaluate the impact of cyber prescriptions on general physician practice. Two groups of general physicians were selected: one using traditional paper prescriptions and the other using a cyber prescription application. Over a period of three months, prescription accuracy, patient understanding, and pharmacist feedback were recorded for both groups. Data were collected through prescription audits to identify errors, patient-surveys to assess clarity and adherence, and pharmacist interviews to report on prescription processing efficiency. Results showed that cyber prescriptions reduced medication errors by 37% and helped patients understand their medication better. Doctors and pharmacists found the system more convenient because it prevented mistakes caused by unclear handwriting and helped check for drug-interactions automatically. However, some challenges like the cost of setting up system and training older doctors were noted. The study concludes that cyber prescriptions can improve general physician practice by making prescriptions safer and more reliable. It encourages hospitals and clinics to adopt digital prescription systems to enhance patient care and reduce medication errors.

**Keywords**: Cyber prescriptions, general physician, errors, pharmacists, prescriptions audits.

**ASSESSMENT OF DRUG-RELATED PROBLEMS IN GERIATRIC PATIENTS USING BEERS CRITERIA: A PROSPECTIVE OBSERVATIONAL STUDY**

K.Jithender
Department of Pharmacy Practice, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya. Hyderabad, Telangana, 500017.
Kag.jithender@gmail.com

Geriatric patients are highly vulnerable to drug-related problems (DRPs) due to polypharmacy, comorbidities, and age-related changes in drug metabolism. The present study aimed to assess the incidence and distribution of potentially inappropriate medications (PIMs) in older adults using the American Geriatrics Society (AGS) Beers Criteria. A prospective observational study was conducted in a tertiary care hospital among patients aged ≥65 years. Data on demographics, comorbidities, and prescribed medications were collected. Beers' Criteria were applied to identify PIMs, and the frequency of DRPs was documented across clinical departments. Statistical analysis was performed using the chi-square test and t-test. Out of 320 geriatric patients screened, 184 DRPs were identified, with 56% involving at least one PIM. The highest prevalence was in the cardiology department (38%), followed by neurology (25%), while the lowest occurred in endocrine and urogenital departments (5–7%). The most common PIM classes were benzodiazepines (18%), anticholinergics (15%), NSAIDs (14%), and sulfonylureas (12%). Patients with ≥5 medications had a 2.1-fold higher risk of DRPs ($p<0.05$). Hospital stay was prolonged in patients with PIMs (mean 9.2 ± 2.4 days vs 6.1 ± 1.8 days). Application of the Beers Criteria effectively identified PIMs and highlighted polypharmacy and comorbidities as major risk factors. Regular pharmacist-led medication reviews can reduce DRPs, prevent complications, and improve clinical outcomes in geriatric care.

**Keywords**: GERIATRICS, DRP, BEERS CRITERIA

**ASSESSMENT OF PREVALENCE AND RISK FACTORS OF ANEMIA AMONG PATIENTS AT TERTIARY CARE TEACHING HOSPITAL**

Dhanush S 1&3, Sivasakthi R 1&3 and Mohan.S 2&3
1 Department of Pharmacy practice, Karpagam college of Pharmacy, Coimbatore-641032, Tamil Nadu, India.
2 Department of Pharmaceutics, Karpagam college of Pharmacy, Coimbatore-641032, Tamil Nadu, India.
3 The Tamil Nadu Dr.M.G.R. Medical University, Chennai- 600032, Tamil Nadu, India.
smdhanush4@gmail.com

The prevalence of anemia is a major clinical challenge. Due to poor Socio- economic, malnutrition, heredity diseases and mal-absorption of Iron also leads to Anemia. Menstrual periods with excessive bleeding also major concern in anemia. This study aimed to assess the Socio-demographic factors in relation to the problem of anemia in adult females. The randomized, cross sectional study was carried out with 120 patients for 6 months as per the study criteria. Patients were screened for biochemical tests. Out of 120 patients, 32% were male and 68% were female. The 17 to 30 years of age group were mostly affected. The educational status indicates 35% were illiterate. The severity was assessed based on Hb value and result that, 8% patient were severe, 8% were moderate and 84% were in mild anemia. The mean Hb value was found that 10.82 mg/dl. 42% of female patients not consuming red meat, fish and chicken. Serum ferritin value is only 5.8 ng/ml, MCV found that 72.30 fL and Hb is 10.82 g/dl. The patient counseling on healthy diet and awareness about risk factors of anemia may reduce the severity and complications of anemia. The Pharmaceutical care on anemic patients is essential to prevent the morbidity and mortality rate.

**Keywords**: Anemia, Adult female, Mal-nutrition, Iron.

**NOMOPHOBIA SURVEY STUDY**

KOTHAPALLI.JAYA DURGA, CH. S. MADHURI
Department of Pharmacy Practice, Vikas Institute of Pharmaceutical Sciences, Near Airport, Rajahmundry, East Godavari District, Andhra Pradesh, India-533102.
jayadurganaidu@gmail.com

Nomophobia, defined as the fear or anxiety of being without a mobile phone, has become a significant concern in today's highly connected digital world. With smartphones serving as primary tools for communication, social networking, information access, and online learning, students have become increasingly dependent on them. The COVID-19 pandemic and the shift to online education have further intensified this reliance, making nomophobia a highly relevant psychological issue. This study aimed to identify the key dimensions of nomophobia, develop a reliable measurement tool, and examine its relationship with self-esteem, loneliness, and happiness among university students in Turkey and Pakistan. The study employed a two-phase exploratory sequential mixed-methods design. In the first phase, nine undergraduate students from a Midwestern university in the United States were interviewed. The analysis identified four core dimensions of nomophobia: inability to communicate, loss of connectedness, limited access to information, and reduced convenience. These findings informed the development of the 20-item Nomophobia Questionnaire (NMP-Q). In the second phase, the NMP-Q was administered to 301 students, demonstrating strong reliability and validity as a tool to assess

ISBN: 978-81-980623-8-3

nomophobia.A larger cross-cultural study was then conducted with 729 students, comprising 368 from Turkey and 361 from Pakistan. Participants also completed surveys measuring loneliness, self-esteem, and happiness. Statistical analyses, including multiple regression and MANOVA, revealed significant gender differences in self-esteem and nomophobia, with male and female students showing different levels of vulnerability. The results suggest that nomophobia is a measurable, multidimensional condition with clear psychological consequences. The NMP-Q provides a practical tool for research and assessment, and the study highlights how modern smartphone dependence—especially in contexts like remote learning, social media, and online interactions—affects students' mental well-being. Cultural and gender differences underline the role of social and environmental factors in shaping how students experience smartphone-related stress. The findings call for increased awareness and targeted interventions to support student well-being in today's digitally dependent world.

**TIRZEPATIDE MITIGATES COGNITIVE DECLINE IN ZEBRAFISH MODEL OF TYPE 2 DIABETES MELLITUS INDUCED BY HIGH-FAT DIET**

PRABHA RAJPUT
SPTM NMIMS SHIRPUR

In examining the enduring consequences of diabetes, recent research has focused on the anticipated outcomes of the condition. Specifically, cognitive impairment has been linked to diabetes mellitus dating back to the discovery of insulin. This study delves into the neuroprotective effects of TZP, i.e. tirzepatide a dual GIP and GLP-1 receptor agonist that works by mimicking these two gut hormones, against cognitive impairment associated with type 2 diabetes mellitus (T2DM). T2DM-like zebrafish model of varying age groups was created through a 6-week administration of a high-fat diet (HFD). Parameters such as body weight, body mass index, and blood glucose levels were monitored, and behavioural assessments (T-maze, novel tank diving test, and inhibitory avoidance test) were conducted at the conclusion of the protocol to assess learning and memory. Additionally, lipid profile biochemical parameters (MDA, AChEs, and GSH), molecular markers (IL-1β, IL-10, TNF-α, Bcl-2, Bax, GSK-3β, and AMPK), and histopathological examinations were performed. Treatment with the novel GLP-1 and GIP dual agonist TZP (10 nM/kg, i.p.) significantly ameliorated cognitive impairment, as evidenced by behavioural parameters, and restored antioxidant like GSH ($p < 0.05$) and catalase ($p < 0.05$) and anti-inflammatory marker levels, i.e. IL-10 ($p < 0.05$) compared to the HFD group. TZP also mitigated abnormal glucose ($73.2 \pm 5.889$) and lipid profiles (TG $0.159 \pm 0.0075$ and TC $0.100 \pm 0.0020$) in hyperglycaemic zebrafish. This study suggests that the positive effects of TZP on cognition and memory may stem from its neuroprotective capabilities, potentially attributed to its antioxidant, anti-inflammatory, and anti-apoptotic properties, as well as its ability to enhance AMPK levels as GLP-1 agonist has the potential to increase the level of AMPK.

**TRANSFORMING TRADITIONAL BONE FRACTURE TREATMENT: A BREAKTHROUGH IN PERSONALIZED CARE**

I.P. Deshpande and B. R. Dravyakar
SVKM's Institute of Pharmacy, Dhule, Maharashtra

India experiences over 134 million reported incidents annually, with many more unreported accidents, where bone fractures are common. Currently, these fractures are treated using traditional methods like bamboo sticks or plaster of Paris (PoP) casts, which have limitations such as restricted movement, poor ventilation, and skin complications, causing discomfort to patients. The proposed solution aims to address these issues by using 3D-printed casts. These casts not only provide mechanical support but also incorporate sustained-release medication through their inner lining, offering a unique blend of traditional treatments with modern technological support.

**Keywords**: Bone fracture treatment, 3D-printed casts, personalized care

**DECIPHERING THE MECHANISTIC INSIGHTS OF AEGLE MARMELOS LINN AGAINST ALZHEIMER'S DISEASE**

Devyani Chandrakant Kirve
JSPM University
devyanikirve23.sdsr@jspmuni.ac.in

The progressive neurodegenerative disease known as Alzheimer's disease (AD) is typified by memory loss, cognitive impairment, and compromised synapse function. The fact that current treatments simply relieve symptoms emphasizes how urgently new, multi-target strategies are needed. The traditional medicinal plant Aegle marmelos, also known as Bael, is abundant in bioactive phytochemicals that have been shown to have neuroprotective properties. To clarify the mechanistic insights of Aegle marmelos against AD, this study used a network pharmacology and molecular docking technique. From the databases that were available, important phytoconstituents were found, and their probable protein targets were anticipated. Strong connections with AD-related pathways, such as cholinergic neurotransmission, amyloid-beta processing, and oxidative stress modulation, were found using network pharmacology analysis. Significant participation in neuroinflammation, PI3K-Akt signaling, and apoptotic regulation was revealed by Gene Ontology (GO) and KEGG pathway enrichment. Compounds including marmeline, marmelosin, aegeline, and skimmianine also showed strong binding affinities for important AD targets like acetylcholinesterase (AChE), beta-secretase 1 (BACE1), and glycogen synthase kinase-3β (GSK-3β), according to molecular docking studies. According to these results, Aegle marmelos has the potential to be used therapeutically to slow the progression of AD by exerting a multi-target modulatory impact. The scientific foundation for additional in vitro and in vivo confirmation of Aegle marmelos as a viable option for Alzheimer's disease treatment is provided by this integrative in silico study.

**Keyword:** Aegle marmelos(L), acetylcholinesterase, beta-secretase 1 (BACE1), and glycogen synthase kinase-3β (GSK-3β), Alzheimer's, marmaline.

**NEUROPROTECTIVE EFFECTS OF AVICULARIN AGAINST AMYLOID-BETA INDUCED MEMORY DEFICITS IN RATS**

Rakshit. R. Sangolli, Nikita Patil Samant, Girdhari Lal Gupta
1Department of Pharmacology, School of Pharmacy & Technology Management, SVKM'S NMIMS Deemed-to-be University,
Shirpur, Maharashtra, India
rakshitsangolli696@gmail.com

Alzheimer's disease is defined by toxic aggregates of amyloid-beta peptides that provoke degeneration of neurons and progressively damage memory and cognitive functions. Here we examined the protective potential of natural flavonoid avicularin against amyloid-beta-induced cognitive dysfunctions in a rat model. After intracerebroventricular injection of amyloid-beta Aβ1-42, rats were treated orally with graded doses of avicularin (30, 60, and 120 mg/kg) for 21 days, with cognition assessed by various behavioural parameters. Avicularin treatment, particularly at higher doses, enhanced performance in spatial recognition and memory tests, coinciding with reductions in acetylcholinesterase activity and restoration of antioxidant enzyme levels (catalase, SOD, GSH). Molecular analysis showed that avicularin inhibited the increase in pro-inflammatory cytokines (TNF-α, IL-6, IL-1β) and diminished amyloid-beta deposition in brain tissues, in contrast to upregulating brain-derived neurotrophic factor (BDNF) expression. These results emphasize antioxidant as well as anti-inflammatory actions, avicularin has multidimensional neuroprotective actions. The capability of altering amyloid-beta dynamics while restoring neurotrophic homeostasis is an indication of its promise as a Supportive Therapy for Alzheimer's-related memory loss.

**Keywords**: Avicularin, Alzheimer's disease, Amyloid-beta, Neuroprotection, Acetylcholinesterase, Behavioural tests, Rat model

ISBN: 978-81-980623-8-3

hormonal imbalance, metabolic disturbances, insulin resistance and chronic inflammation. Conventional treatments provide symptomatic relief; their efficacy remains limited and side effect profiles necessitate the exploration of complementary solutions. Recent advances in natural product research have identified bioactive phytochemicals including inositol, resveratrol, berberine, quercetin, flavonoids, polyphenols, alkaloids, and omega-3 fatty acids as key modulators in PCOS pathophysiology. Experimental and clinical studies have highlighted their potential for improving ovarian morphology, metabolic function, and reproductive outcomes with that various class of bioactives including flavonoids, polyphenols, alkaloids and isoflavones exhibit beneficial effects on PCOS by modulating hormonal imbalance, improving insulin resistance, reducing oxidative stress and reducing chronic inflammation. Among well studied compounds resveratrol, Berberine, Curcumin, Quercetin and soybean isoflavones (genistein, daidzein) show promising result in reducing hyperandrogenism, restoring ovarian function and ameliorate metabolic disturbances. These bioactives act through diverse molecular mechanisms such as inhibition of steroidogenic enzymes, activation of AMPK and SIRT1 pathways, antioxidant enzyme enhancement and modulation of inflammatory cytokines. Emerging research directions highlight novel bioactives with potential for future investigation. Future research should focus on clinical validation, bioavailability enhancement, genetic and epigenetic modulation and integrative approaches combining phytochemicals with conventional therapies. This integrative strategy holds a significant promise for personalized and effective management of PCOS.

**Keywords:** PCOS, bioactives, flavonoids, polyphenols, isoflavones, resveratrol

**RECENT ADVANCES IN NANOTHERAPEUTICS AND TARGETED PATHWAYS FOR THE MANAGEMENT OF RHEUMATOID ARTHRITIS**

Jyoti Nayak
Shri Rawatpura Sarkar University, Raipur C.G. Faculty of Pharmacy
jyotinayakk002@gmail.com

Rheumatoid arthritis (RA) is a chronic autoimmune disorder characterized by joint inflammation and progressive cartilage destruction. Traditional therapies often exhibit systemic side effects and limited efficacy. Recent advances in nanotherapeutics have revolutionized RA management by enabling targeted drug delivery, improved bioavailability, and reduced toxicity. Various nanocarriers—such as liposomes, dendrimers, and polymeric nanoparticles—have been engineered to deliver anti-inflammatory agents and biologics directly to inflamed tissues. Additionally, insights into key molecular pathways, including TNF-α, IL-6, and JAK/STAT signaling, have facilitated the development of pathway-specific interventions. This review highlights the emerging nanotechnology-driven strategies and molecular targets offering promising avenues for more effective and personalized RA treatment.

thalarinaveen2323@gmail.com

Pseudomonas aeruginosa is a gram-negative, rod-shaped, opportunistic pathogen and a major cause of hospital-acquired infections, particularly in immunocompromised patients and patients with comorbidities. It is accountable for numerous acute and chronic infections, resulting in mortality rates of up to 40 % and significant morbidity. Its remarkable ability to survive under hostile conditions stems from a combination of virulence factors, biofilm formation, and multidrug resistance (MDR) mechanisms. Conventional antibiotic therapies are often ineffective due to intrinsic barriers such as efflux pumps and low outer membrane permeability, as well as acquired resistance via β-lactamases, carbapenemases. Additionally, the antibiotic resistance mechanisms within biofilms make them challenging to treat, emphasizing the need for strategies to be develop. The novel therapeutic strategies to treat P. aeruginosa infections such as Phage Therapy which target Bacterial Virulence factors (toxins, enzymes, adhesins) and CRISPR-Cas9 can directly disable genes responsible for resistance or virulence, Antimicrobial Peptides target Membranes, Biofilms, and Virulence mechanisms, Immunomodulators boost the host immune response and reduce tissue damage, Drug repurposing, Biofilm Disruption Molecules, nanotechnology-based delivery systems, Quorum-Sensing Inhibitors. These approaches aim not to kill the bacterium directly, but to weaken its pathogenic potential, making infections more manageable and antibiotics more effective. This gives rise for the development of the newer therapies than antibiotics and reduces the usage and dosage of antibiotics which reduces the development of Resistance.

**Keywords:** Phage Therapy, CRISPR-Ca9, Immunomodulators, Biofilm Disruption Molecules, Quorum-Sensing Inhibitors.

**DECITABINE PRESERVES TIGHT JUNCTION INTEGRITY AND ATTENUATES NEUROINFLAMMATION IN CEREBRAL ISCHEMIA-REPERFUSION INJURY**

Abha Machwe, Jotiram Salunkhe, Bhavesh Verma,
Dinesh Anandani, Rajesh Ugale
Department of Pharmaceutical Sciences, Rashtrasant Tukadoji Maharaj Nagpur University, Nagpur440033, India

Background and Aim: Ischemic reperfusion myury in bran triggers neuroinflammation, disruption of blood brain barrier and downregulation of tight junction proteins. DNA Methylation is an epigenetic mechanism implicated in inflammatory gene regulation. Decitabine, a DNMT inhibitor and has shown neuroprotective effects in MCAO models. Present study is aimed to investigate the neuroprotection offered by decitabine on tight junction proteins and neuroinflammation. Methods: Adult Wistar rats (200-250g) were used for induction of ischemic reperfusion injury usng MCAO for 90 minutes followed by 24 hours of reperfusion. Rats were treated with the dose (0.125, 0.25, 0.50 mg kg) and time (0.3, 6, 12 hour) ofDecitabine after MCAO. Beamwalk test and neurological deficit score were evaluated followed by TTC staining, ELISAfor cytokines (TNF-a and TGF-B). Further, mRNA estimation using RT-PCR was performed to evaluate tight junction proteins (claudin and occludin) Result: Present investigation examined the dose (0.125, 0.25, 0.50 mg/kg) and time (0, 3, 6, 12 hour) dependent neuroprotection of Decitabine after MCAO reperfusion in rats. Decitabine 0.25 mgkg (i.p.) improved neurological deficit and beam walk score at 6 hours of reperfusion Additionally, decitabine reduced infarction volume, ameliorated the TNF-a expression and elevated TGF-B expression Furthermore, it alleviated the BBB disruption via restoration of tight junction proteins (claudin and occludin) Conclusion: This study elucidated the neuroprotective effect of decitabine on ischemic reperfusion injury by suppressing neuroinflammation and preserving BBB integrity via maintenance oftightjunction proteins.

Thrombosis is a serious medical condition marked by a clot formation within the veins or arteries, which creates an obstruction to normal blood flow thus inducing cardiovascular disease including stroke, myocardial infarction, and deep vein thrombosis. Thrombosis is often a result of endothelial dysfunction, hypercoaguability, inflammatory response, dyslipidemia, and environmental/ lifestyle conditions such as obesity, smoking, and sedentary behavior. Current anti-thrombotic modalities have demonstrated efficacy, but possess serious limitations related to bleeding risk and/or side effects; thus, a need persists for natural, safer, therapeutically valuable options. Guggulsterone, a bioactive steroid compound, isolated from the resin of Commiphora mukul, has garnered interest due to its anti-inflammatory, hypolipidemic, and anti-platelet therapeutic effects. However, guggulsterone has poor aqueous solubility and oral bioavailability that limit its therapeutic application. Phytosome based delivery systems represents an alternative approach using phospholipid–phytoconstituent complexes to enhance absorption of phytoconstituents, membrane permeability, and biological activity. A phytosomal formulation containing guggulsterone may improve its pharmacokinetic profile and provide anti-thrombotic effect. In conclusion, phytosomes containing guggulsterone are a promising new natural therapeutic option in the prevention and treatment of thrombosis. Future pre-clinical and clinical research is warranted to demonstrate safety, refine dosing, and evaluate their potential as an effective alternative to existing anti-thrombosis treatment options.

**Keywords:** - Guggulsterone, Thrombosis, Anti-thrombotic activity, Phytosome, Bioavailability enhancement, Commiphora mukul.

## PATIENTS' PERCEPTION AND ITS IMPACT ON ADHERENCE BEHAVIOR AND ANALYSIS OF POLYPHARMACY PRESCRIPTIONS IN MIDDLE-AGED POPULATION

Amrita Nigam, Ganesh Banasiya, Gautam Mandliya, Anu Hardenia, Seemu Singh Sri Aurobindo Institute of Pharmacy, Indore, 452016
nigamm652@gmail.com

Polypharmacy, defined as the concurrent use of multiple medications, is increasingly common among middle-aged adults due to the growing prevalence of chronic diseases. Understanding polypharmacy is essential to identify potential risks such as drug interactions and adverse effects, and to enhance medication safety and treatment effectiveness. Patient perception significantly influences medication adherence, impacting overall health outcomes. This study aimed to assess how patients perceive polypharmacy and its effect on their adherence to prescribed medications. It also focused on determining the prevalence and patterns of polypharmacy, identifying key factors that influence adherence, and analyzing the most common diseases associated with polypharmacy in the middle-aged population. A prospective observational study was conducted over six months at Sri Aurobindo Institute of Medical Sciences, Indore. The study included 217 inpatients aged 50 to 65 years who were prescribed five or more medications. Data collection involved demographic profiling, prescription analysis, and evaluation of medication adherence using the 8-item Morisky Medication Adherence Scale (MMAS-8). Patient perceptions were collected through structured interviews, and statistical analysis was performed to identify correlations. Among the 217 patients, 70.97% were male and 29.03% female, with 92.63% from rural areas. Common diagnoses included hypertension (31.34%), diabetes (23.04%), and asthma (16.59%). According to MMAS-8, 16.6% demonstrated high adherence, 48.8% medium adherence, and 34.6% low adherence. A majority (75.6%) believed their medications improved their health, which was significantly associated with better adherence ($p = 0.042$). The leading barriers to adherence were medication costs (60.8%) and regimen complexity (24%).

**Keywords:** Polypharmacy, Medication Adherence, Patient Perception, Middle-Aged Adults, Chronic Diseases

## A COMPARATIVE EFFECTIVENESS ANALYSIS OF TELMISARTAN AND CILNIDIPINE IN HYPERTENSIVE PATIENTS USING AMBULATORY BLOOD PRESSURE MONITORING

Arpita Carpentar, Manak Bakore, Shivam Singh
Arjun Patidar, Arpna Indurkhya
Sri Aurobindo Institue of Pharmacy, Indore, Madhya Pradesh - 453555
arpita.carpentar05@gmail.com

Hypertension management is crucial for reducing the risk of cardiovascular events. Telmisartan, an angiotensin II receptor blocker (ARB), and Cilnidipine, a dual L/N-type calcium clunnel blocker (CCB), are widely used antihypertensive agents. Ambulatory Blood Pressure Monitoring (ABPM) provides a comprehensive assessment of blood pressure control over 24 hours, offering insights into the efficacy of antihypertensive treatments beyond clinic measurements. This study aims to compare the effectiveness of Telmisartan and Cilnidipine using ABPM. A systematic review and meta-analysis were conducted, focusing on randomized controlled trials (RCTs) and observational studies that employed ABPM to evaluate Telmisartan and Cilnidipine. The data were used in deriving new variables of interest by writing a customized script. Descriptive statistics like mean, SD, minimum and maximum were obtained using SPSS software for each variable at baseline and using individual measurements. The comparison of mean values between the two groups at base line was performed using a t-test for independent samples. After treatment, a gradual decline in SBP from 166.60±16.2 at baseline to 140.4±14.0 and DBP from 93.30±6.2 at baseline to 84.54±4.7 was noted in Telmisartan group. Gradual decline in SBP from 163.30 15.12 at baseline to 142.04±11.8 and DBP from 96.60±8.6 at baseline to 82.6±6.1 was noted with Cilnidipine group. Statistical analysis using independent t-test was obtained which is statistically non-significant, $P=0.447$. The efficacy assessment of Telmisartan 40 mg and Cilnidipine 10 mg using ABPM concluded that the both drugs equal efficacy in reducing blood pressure in hypertensive individuals.

**Keywords:** Telmisartan; Cilnidipine; hypertension, ABPM

## NANOVESICULAR SYSTEM FOR SKIN CANCER TREATMENT THROUGH LIPOSOMAL DRUG DELIVERY OF 5-FLUROURACIL AND AVOBENZONE

Atharva B. Kurkute, Amit B. Page, Mayank Sharma.
Department of Pharmaceutics, SVKM'S NMIMS SHIRPUR, MAHARASHTRA 425405
kurkuteatharva@gmail.com

One of the common malignancies is skin cancer, which requires effective topical chemotherapy that has high skin penetration and low local side effects but, in many cases, its application is hampered by poor penetration to the skin. 5-Fluorouracil (5-FU) is a proven chemotherapeutic agent in the treatment of superficial skin cancer but its use is restricted by low penetration into the skin. To address this drawback, a dual-drug nanovesicular liposomal system of 5-FU and avobenzone, an extensive ultraviolet filter, has been designed and optimized to deliver therapeutic and protective effects on UV radiation. This study aimed at developing and testing a nanovesicular liposomal gel, which could be used in achieving better drug delivery and effective treatment of skin cancer. A 2 2 factorial design was used to optimize the nanovesicles to form spherical vesicles with an average diameter of about 150200nm, low polydispersity index and stable zeta potential (c. -30mV). FTTIR, UV spectral, HPLC characterization showed drug encapsulation and no drug-excipient interactions and encapsulation efficiency was more than 80. The optimized liposomal gel exhibited good viscosity, homogeneity and pH which was desirable in the application of dermals. The in vitro diffusion and skin permeation experiments have shown sustained release and greatly increased drug permeation characteristics in comparison to traditional gel preparations. Finally, the resulting dual-drug nanovesicular liposomal gel is a chemotherapeutic agent which incorporates the photoprotective effect of avobenzone with excellent stability, skin diffusion, and prolonged release of the drug. The innovative solution is very promising as a safe and effective topical treatment of skin cancer, and other dermatological diseases that would be treated and provided with UV protection simultaneously.

**Keywords**: 5-Fluorouracil, Avobenzone, Nanovesicular Liposomes, Skin Cancer

## CELL LINES

Avineedi Lakshmi Prasanna*, Ramya Teja Medarametla, Raghavendra Kumar Gunda, J.N. Suresh Kumar

ISBN: 978-81-980623-8-3

Department of Pharmaceutics, Narasaraopeta Institute of Pharmaceutical Sciences (Autonomous), Narasaraopet, Palnadu, Andhra Pradesh, India-522601.
lakshmiprasanna06360@gmail.com

Cell lines are indispensable tools in modern biomedical and pharmaceutical sciences, providing reproducible and sustainable models for investigating cell biology, disease mechanisms, and therapeutic interventions. Since the establishment of the first immortalized human cell line, HeLa, in 1951, cell lines have facilitated groundbreaking discoveries in cancer biology, vaccine development, toxicology, and regenerative medicine. They are classified into finite and continuous cell lines, each serving distinct roles in research and industry. Human and animal cell lines alike have contributed to advancements in understanding cellular physiology, drug discovery, virology, and genetic engineering. Recent innovations, such as three-dimensional (3D) cultures, organoids, and CRISPR-Cas9 gene-editing technologies, are expanding the relevance and accuracy of cell-based models. This review explores the types of cell lines, their applications, established models, ethical challenges, and emerging trends, while highlighting their role in bridging laboratory science and translational medicine. Future perspectives emphasize the need for authentication, reduction of misidentification, development of physiologically relevant systems, and incorporation of personalized medicine approaches. Through continuous innovation and ethical stewardship, cell line research will remain a cornerstone of biomedical discovery and therapeutic advancement.

**Keywords:** 3 dimensional cultures, CRISPR, Cell Lines, ethics.

## CDK4/6 INHIBITORS IN THE MANAGEMENT OF HR+/HER2- BREAST CANCER

Aviyansh Tiwari, Uma D Kabra, Krishna R Gupta, Milind J Umekar
Department of Pharmaceutical Chemistry, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur-441002

Hormone Receptor-Positive (HR+) and HER2-Negative breast cancer accounts for majority of breast cancer cases in women. The traditional treatment relies mostly on endocrine therapy (ET). However, major clinical challenge in ET includes inherent and acquired resistance. The introduction of CDK4/6 inhibitors represents a definitive paradigm shift, moving the standard of care from ET monotherapy to ET combination therapy. Accumulating evidences has revealed that G1-S phase cell cycle is driven by hyperactivated Cyclin-Dependent Kinase 4/6 (CDK4/6) pathway. Currently available CDK4/6 inhibitors include palbociclib, ribociclib, and abemaciclib has reshaped the therapeutic landscape by targeting a core mechanism of resistance. This has been proved by a consistent body of evidence from major Phase 3 clinical trials (PALOMA, MONALEESA, MONARCH families). In the metastatic setting, the combination significantly prolonged Progression-Free Survival (PFS) across all lines of therapy, with select agents also demonstrating a meaningful Overall Survival (OS) benefit, establishing them as the preferred first-line treatment. However, the therapeutic role has expanded into the high-risk early breast cancer (eBC) setting, notably with the monarchE (abemaciclib) and NATALEE (ribociclib) trials, which demonstrated a significant improvement in Invasive Disease-Free Survival (IDFS) when these agents are added to standard adjuvant ET. This expansion validates the role of CDK4/6 inhibition in interrupting the natural history of high-risk disease and preventing recurrence. CDK4/6 inhibitors are now indispensable in the management of HR+/HER2- breast cancer. While significant progress has been made, ongoing research is focused on optimizing treatment sequencing post-CDK4/6 inhibitor failure and identifying predictive biomarkers to guide personalized therapy. Their integration represents one of the most significant clinical advancements in solid tumor oncology in the last decade.

**Keywords:** CDK4/6 Inhibitors, Hormone Receptor-Positive Breast Cancer, Metastatic Breast Cancer, Endocrine Therapy

## OPIOID-SPARING PAIN MANAGEMENT FOR BETTER POST-SURGERY RECOVERY

Ayushi S. Kapse,Sushil S.Burle, Krishna R. Gupta, Milind Umekar
Department of Pharmaceutical Chemistry, Smt. Kishoritai Bhoyar College Of Pharmacy, Kamptee, Nagpur 441002
ayushiak2004@gmail.com

Acute post-surgical pain (PSP) is traditionally managed with opioid analgesics, a practice contributing to the global opioid crisis and associated with significant risks, including opioid-related adverse events (ORADEs) and potential for persistent use. This necessitates the adoption of safer, more effective strategies. This evaluates the comparative effectiveness of opioid-based regimens versus multimodal analgesia (MMA) strategies emphasising non-opioid medications in managing acute PSP.A review focused on comparative outcomes: pain intensity (VAS), 24-hour opioid consumption (MME), ORADE incidence, and length of hospital stay (LOS). The evidence demonstrates that opioid-sparing, multimodal non-opioid regimens provide comparable or superior pain control across various surgeries. The combination of non-opioid analgesics (NOAs) like acetaminophen, NSAIDs (e.g., ketorolac), and adjuncts (e.g., gabapentinoids, regional blocks) leads to a significant reduction in 24-hour opioid consumption. Critically, MMA is consistently associated with a lower incidence of ORADEs (e.g., PONV), which improves early recovery and correlates with a shorter LOS.Current evidence strongly supports the implementation of multimodal, opioid-sparing analgesic protocols as the standard of care for acute postoperative pain. These strategies offer effective pain management while successfully mitigating the risks inherent in opioid-centric treatment.

**Keywords**: Opioid-Sparing Pain Management, Acute post-surgical pain (PSP), Opioid-related adverse events (ORADEs), Multimodal analgesia (MMA), Effective pain management

## AMYLOID BETA AND THE IMMUNE SYSTEM: HARNESSING NEURODEGENERATIVE PATHWAYS FOR CANCER IMMUNOTHERAPY

B Yoga Amrutha1, B V Ramana2
Dr. K. V. Subba Reddy Institute of Pharmacy, Kurnool, Andhra Pradesh, India-518218
yogaamrutha82@gmail.com

Amyloid beta (Aβ), traditionally recognized as a neurotoxic peptide central to Alzheimer's disease pathology, is now gaining acknowledgment for its unexpected immunomodulatory and antitumor properties. Emerging evidence indicates that Aβ, beyond its harmful buildup in the brain, can play a crucial role in activating immune pathways that inhibit tumor growth. This dual functionality highlights a significant biological link between neurodegeneration and cancer, conditions often observed to have an inverse epidemiological relationship. Aβ has been shown to enhance tumor antigen presentation, stimulate microglial activation, and promote the release of pro-inflammatory cytokines such as TNF-α, IL-6, and IFN-γ, collectively boosting innate and adaptive antitumor responses. Furthermore, Aβ's impact on immune checkpoints and T-cell activation parallels the principles of modern immunotherapies, suggesting that carefully regulating Aβ signaling could be used to strengthen antitumor immunity. Harnessing these neurodegenerative mechanisms may allow for reprogramming the tumor microenvironment into a more immunogenic and cancer-resistant state. By integrating insights from neurology and oncology, current research aims to develop precision immunotherapies using Aβ or its derivatives to enhance immune defense while protecting neurons. Therefore, Amyloid beta is not only a hallmark of Alzheimer's disease but also a promising molecular link between Neuroinflammation and cancer immunity, offering a transformative approach for future cancer immunotherapy development.

**Keywords:** Amyloid beta, Microglial Activation, cytokine production, Precision oncology, Peptide modulation

## NEUROMODULATION REVOLUTION: HOW EMERGING SPINAL CORD STIMULATION DEVICES ARE TRANSFORMING PAIN AND NEUROLOGICAL CARE

B.Venkata Sushma1, B.V. Ramana2
Department of pharmacy,Dr.K.V.Subbareddy Institute of Pharmacy,Kurnool,Andhra Pradesh, India-518002.
Sushmabellam15@gmail.com

ISBN: 978-81-980623-8-3

The field of neuromodulation has entered a period of remarkable innovation and transformation, particularly through cutting-edge developments in spinal cord stimulation (SCS) technology. Between 2024 and 2025, significant strides in stimulation waveform engineering, closed-loop feedback mechanisms, and artificial intelligence integration have reshaped the therapeutic landscape. Once regarded primarily as a palliative intervention, SCS is now evolving into a dynamic and personalized form of therapy at the core of chronic pain and neurological disorder management. This review provides a comprehensive overview of the recent technological breakthroughs that have advanced the precision and adaptability of SCS devices. It explores the clinical efficacy evidence supporting these new systems, highlighting improvements in patient outcomes, device responsiveness, and long-term safety profiles. Furthermore, key challenges—such as variability in patient response, the need for improved biocompatibility, and ethical considerations surrounding AI-guided modulation—are critically examined. Finally, this paper discusses future directions for SCS research and development, envisioning a future where neuromodulation systems function as intelligent, self-optimizing therapeutic platforms capable of continuous adaptation to an individual's neural and physiological state. Through these innovations, spinal cord stimulation stands poised to redefine the boundaries of neurotherapeutic care and establish a new standard for precision medicine in pain and neurological management.

**Keywords:** Neuromodulation,Spinal Cord Stimulation,Pain Management

## OSTEOPROTECTIVE EFFECT OF HYDROALCOHOLIC EXTRACT OF TERMINALIA ARJUNA BARK ON DEXAMETHASONE INDUCED OSTEOPOROSIS IN RAT MODEL

C. Senthilkumari, B. Sagunthala
Department of Pharmacology, K. K. College of Pharmacy, Affiliated to The Tamil Nadu Dr. MGR Medical University, Gerugambakkam, Chennai - 600128, Tamil Nadu, India.

This study aimed to scientifically evaluate its osteoprotective efficacy in a rat model of glucocorticoid induced osteoporosis. This study specifically employed a dexamethasone-induced osteoporosis rat model to investigate the efficacy of the hydroalcoholic extract of Terminalia arjuna bark in mitigating glucocorticoid-induced bone deterioration. The model was selected because dexamethasone administration is a well-established method to induce bone resorption and simulate osteoporosis-like conditions. In this context, the objective of the present study was to comprehensively evaluate the osteoprotective potential of T. arjuna by assessing its effects on biochemical parameters, bone biomechanical indices, motor coordination, pain threshold, and histopathological architecture of the femur bone. Phytochemical analysis of T. arjuna was performed to identify its active constituents. Thirty rats were divided into five groups (n = 6). Group I served as the normal control; Group II received dexamethasone (7 mg/kg, i.m 3x/week for 2 weeks) and served as the negative control; Group III received dexamethasone followed by the standard drug alendronate (0.2 mg/kg, p.o. daily for 3 weeks). Groups IV and V received dexamethasone followed by T. arjuna bark extract at 100 mg/kg and 500 mg/kg, respectively, orally for 3 weeks. Body weight was monitored weekly. Osteoporosis induction and treatment efficacy were assessed using biochemical markers, behavioural tests, biomechanical assessments and histopathological analysis. Data were analysed using one-way ANOVA, with $p < 0.05$ considered significant. Dexamethasone administration resulted in significant decreases in body weight, serum calcium, and phosphorus levels, along with elevated alkaline phosphatase (ALP) activity, confirming the induction of osteoporosis. These changes were accompanied by behavioural alterations, including reduced fall latency on the rotarod test and increased pain sensitivity in the hotplate test, indicating functional bone weakness and impaired neuromuscular coordination. Treatment with T. arjuna extract markedly reversed these changes in a dose-dependent manner. The high-dose extract (500 mg/kg) restored biochemical parameters, improved bone weight and length, and enhanced performance in rotarod and hotplate tests, indicating improved neuromuscular coordination and pain tolerance.

## THE CLINICAL SIGNIFICANCE OF THE RH FACTOR AND ITS ENHANCEMENT THROUGH ARTIFICIAL INTELLIGENCE

Battula Dhanush and Garlapati Usha Kiran
Department of Pharmacology, NRI College of Pharmacy, Pothavarappadu, Agiripalli Mandal, Eluru District, Andhra Pradesh, India -521212.
dhanushbattula9@gmail.com

The Rh factor (Rhesus factor) is a protein found on the surface of red blood cells. It was first identified in monkeys, which is how it got its name. People who have this protein are considered Rh-positive, while those who don't are Rh-negative. Problems can arise when a Rh-negative person is exposed to Rh-positive blood. Their immune system may see the Rh factor as foreign and begin producing antibodies against it. This situation is known as Rh incompatibility or Rh disease. This condition most commonly affects pregnancy. If a Rh-negative mother is carrying a Rh-positive baby, small amounts of the baby's blood may enter her bloodstream during pregnancy or childbirth. This exposure can also happen after a miscarriage, abdominal trauma, or certain medical procedures. During the first pregnancy, the mother's body usually takes time to recognize the Rh factor and form antibodies, so the baby is rarely harmed. However, in future pregnancies, the mother's immune system may already have anti-Rh (anti-D) antibodies. This can lead to serious complications such as fetal anemia, jaundice, erythroblastosis fetalis, or in severe cases, hydrops fetalis, which involves dangerous fluid buildup. Fortunately, Rh disease is highly preventable. Giving a Rh-negative mother an injection of anti-D immunoglobulin (RhIg) during pregnancy and after delivery prevents her immune system from forming harmful antibodies and helps protect future pregnancies.

**Keywords:** Rh factor, Rhesus antigen, Haemolytic disease, Blood transfusion, Artificial intelligence.

## ASSESSMENT OF PREVALENCE AND RISK FACTORS OF ANEMIA AMONG PATIENTS AT TERTIARY CARE TEACHING HOSPITAL

Dhanush S 1&3, Sivasakthi R 1&3 and Mohan.S 2&3
1 Department of Pharmacy practice, Karpagam college of Pharmacy, Coimbatore-641032, Tamil Nadu, India.
2 Department of Pharmaceutics, Karpagam college of Pharmacy, Coimbatore-641032, Tamil Nadu, India.
3 The Tamil Nadu Dr.M.G.R. Medical University, Chennai- 600032, Tamil Nadu, India.
smdhanush4@gmail.com

The prevalence of anemia is a major clinical challenge. Due to poor Socio- economic, malnutrition, heredity diseases and mal-absorption of Iron also leads to Anemia. Menstrual periods with excessive bleeding also major concern in anemia. This study aimed to assess the Socio-demographic factors in relation to the problem of anemia in adult females. The randomized, cross sectional study was carried out with 120 patients for 6 months as per the study criteria. Patients were screened for biochemical tests. Out of 120 patients, 32% were male and 68% were female. The 17 to 30 years of age group were mostly affected. The educational status indicates 35% were illiterate. The severity was assessed based on Hb value and result that, 8% patient were severe, 8% were moderate and 84% were in mild anemia. The mean Hb value was found that 10.82 mg/dl. 42% of female patients not consuming red meat, fish and chicken. Serum ferritin value is only 5.8 ng/ml, MCV found that 72.30 fL and Hb is 10.82 g/dl. The patient counseling on healthy diet and awareness about risk factors of anemia may reduce the severity and complications of anemia. The Pharmaceutical care on anemic patients is essential to prevent the morbidity and mortality rate.

**Keywords**: Anemia, Adult female, Mal-nutrition, Iron.

**PL-586**

## ROLE OF ANTICHOLINERGIC DRUGS IN PARKINSON'S DISEASE

Dhruwin Soni and Rajat Sayyed
MCES's PAI Allana College of Pharmacy,Azam Campus

Parkinson's disease (PD) is a chronic neurodegenerative disorder primarily caused by the degeneration of dopaminergic neurons in the substantia nigra, leading to an imbalance between dopamine and acetylcholine in the basal ganglia. This imbalance contributes to classic motor symptoms such as tremors, rigidity, and bradykinesia.

ISBN: 978-81-980623-8-3

Anticholinergic drugs help restore this neurotransmitter balance by inhibiting muscarinic acetylcholine receptors, thereby reducing excessive cholinergic activity. These drugs are particularly effective in managing tremors and rigidity, especially in the early stages of Parkinson's disease. Commonly used anticholinergic agents include trihexyphenidyl, benztropine, and biperiden. However, their use is limited in elderly patients due to potential side effects like cognitive dysfunction, dry mouth, blurred vision, and urinary retention. While their role has diminished with the availability of dopaminergic therapies, anticholinergics still hold value in younger patients or those with predominant tremor symptoms. Ongoing research aims to develop more selective anticholinergic agents with fewer adverse effects.

**Keywords**: Parkinson's disease, Anticholinergic drugs, Acetylcholine, Trihexyphenidyl, Muscarinic receptor blockers, Tremors

**PL-587**

**NEUROPROTECTIVE AND COGNITIVE-ENHANCING EFFECTS OF ASHWAGANDHA GHRITA IN ANIMAL MODELS OF CNS DISORDERS**

DIVYA O. BENDE and SHUBHANGI PILLEWAN
SCHOOL OF PHARMACY, G.H RAISONI UNIVERSITY AMRAVATI, MAHARASHTRA.

Ashwagandha (Withania somnifera), widely recognized as a Rasayana herb in Ayurveda, is increasingly being recognized for its neuroprotective and memory-enhancing effects. Current research focuses on means to optimize its effects in the brain, while traditional texts approve of lipid-based carriers such as ghrita (medicated ghee) to facilitate delivery of its active ingredients. To this end, using a Ghrita formulation containing Ashwagandha, a recent study in mice examined the effect in established models of anxiety and models of cognition. Following treatment, anxiety levels were measured by the normal Elevated plus Maze (EPM) method. The EPM demonstrated that mice that were treated with the Ashwagandha formulation showed an increase of 42% in open-arm entries compared to controls, and they spent 35% more time in the open arms, signifying that they had lower anxiety. Effects on cognition were measured through the Morris Water Maze (MWM), demonstrating a reduction in escape latency from an average of 58.3 ± 4.2 seconds in the control mice and 29.6 ± 3.8 seconds for treated mice, which signifies normalization of learning. These effects were further verified in a probe trial, as treated animals spent more time in the target quadrant. Finally, the Novel Object Recognition Test indicated an improvement in recognition memory, which is observed as an increase in the discrimination index (0.41 ± 0.03 to 0.72 ± 0.04). From a biochemical standpoint, the identification of reduced levels of malondialdehyde, increased levels of antioxidant enzymes, and normal levels of acetyl cholinesterase activity was demonstrated to induce neuroprotection with Ashwagandha Ghrita. These findings support Ayurvedic tenets and the functional likely role of the ghrita to enhance central nervous system health.

**Keywords:** Ashwagandha, Ayurveda, Neuroprotective, anxiety, Rasayana herb, acetyl cholinesterase, Elevated plus Maze

**PL-588**

**A PROSPECTIVE STUDY ON THE UTILIZATION PATTERN OF VONOPROZAN ON GASTROESOPHAGEAL REFLUX DISEASE (GERD)**

Bhukya Swecha Sanjana Rathod, K. Purnachander
Department of Pharmacy Practice, Jyothishmathi Institute of Pharmaceutical Sciences, Thimmapur (V), Karimnagar – 505481, Telangana, India.
b.swechasanjanarathod@gmail.com

Gastroesophageal reflux disease (GERD) is a chronic gastrointestinal condition, which is marked by retrograde gastric flow to the esophagus resulting in symptoms heartburn and regurgitation. The increasing prevalence of GERD especially among youngsters has been attributed to beneficial lifestyles, life characteristics as well as malfunction of lower esophageal sphincter. Although proton pump inhibitors (PPIs) are also a frequently used method of therapy, not all patients respond. This was a prospective observational study and lasted six months at PIMS where the efficacy and tolerability of vonoprazan as a novel potassium-competitive acid blocker (P-CAB) were determined in the treatment of erosive and non-erosive GERD. Two hundred patients took part in this study and the males were the majority (68) and the age group 31-40 years was the most affected. The use of spicy foods (97.5%), caffeine (78%), and smoking (26.5%) were major contributing lifestyle factors. Vonoprazan 20mg showed high efficacy with regard to relief of symptoms particularly heartburn, regurgitation, epigastric and nausea with total elimination of severe heartburn in all 112 cases. There was no significant difference between genders and the recovery rates and erosive and non-erosive groups were equal (P=0.31). Some patients had mild residual symptoms reported such as dyspepsia and bloating. The research finds that vonoprazan is a safe and very effective therapy in GERD with a significant symptomatic control and quality of life. Changing lifestyle and drug therapy complement each other in terms of improving treatment results. There is a recommendation of early diagnosis and personalized therapy on the basis of demographic and clinical profiles, which is most effective in treating GERD.

**Keywords:** Gastroesophageal Reflux Disease (GERD), Vonoprazan, Potassium-Competitive Acid Blocker (P-CAB), Erosive Esophagitis, Non-Erosive Esophagitis.

**PL-589**

**IN VITRO AND IN VIVO ASSESSMENT OF CICLOPIROX OLAMINE ENCAPSULATED NIOSOMAL TOPICAL GEL FORMULATION FOR THE TREATMENT OF FUNGAL INFECTIONS**

Ganesh G Keshavshetti
Department of Pharmaceutics, Tatyaraoji More college of Pharmacy, Umarga, Dharashiv, Maharashtra, India-413606
kganesh.cop@gmail.com

The present study aims to create and test a unique combination (Niosomal gel) of niosomes and gel base containing Ciclopirox Olamine (CPO) using in vitro and in vivo test and compare with commercial formulations. The objective of present study was to investigate transdermal absorption enhancement through rat skin of CPO loaded niosomal gel in order to evaluate its potential topical use for pharmaceuticals and cosmeceuticals. Vesicles were prepared by film hydration method using drug, surfactant and cholesterol in 1:1:0.2 ratios respectively. The microbial assay for zone inhibition was performed on Candida albicans as a fungal strain. Further, skin permeation study, drug retention study and skin irritation study of niosomal gel, plain gel and marketed cream were investigated by using adult albino rats. In addition, antifungal activity was performed on experimentally induced cutaneous candidiasis in albino rats. The in vitro antifungal studies, it was concluded that the niosomal gel of CPO showed an enhanced zone inhibition against the Candida albicans compared to the plain gel and marketed cream. The results of drug retention and permeation studies revealed that the modified niosomal gel has a greater potential for improving the delivery of topical ingredients and drug retention to skin parts significantly improved CPO compared to conventional formulations. The findings of the study demonstrate that niosomal gel of CPO (1% w/w) were clinically effective, tolerable and beneficial in enhancing resolution of topical fungi than plain gel (1% w/w) and marketed (1% w/w) formulation. The regimen can be the best alternative for treating fungal infection of the topical fungus.

**Keywords**: Ciclopirox Olamine (CPO), Niosomal gel, Antifungal activity, In vitro and in vivo assessment.

**ANALYZING CONVERSION OF INTRAVENOUS TO ORAL DOSING OF ANTIBIOTICS IN ADULT POPULATION AT A TERTIARY CARE HOSPITAL**

Gautam Manoj, Gouri Barasker, Isha Sethiya, Gaurav Kant Saraogi, Rezy Mathew
Department of Pharmacy Practice, Sri Aurobindo Institute of Pharmacy, Indore, Madhya Pradesh, 453555
gautam.manojphd2024@saip.ac.in

Antibiotic therapy is a critical component in managing infectious diseases, and its inappropriate usage poses a significant risk for the emergence of drug-resistant organisms. Early transitioning from intravenous to oral antibiotic therapy may influence the length of hospital stay. Additionally, if adverse drug reactons (ADRs) occur during IV, they might be challenging to treat. A prospective, single centred observational, cohort analysis of IV to PO convension in antibiotic program for the adult population was performed at Sri Aurobindo Institute of medical sciences, Indore. The study was conduct for 6 months. The data was collected using case record form through which demographic details, type of conversion therapy used for antibiotics. The

ISBN: 978-81-980623-8-3

reviews of health care professional were collected using the standard questionnaire WHO/EMP/IAU/2018.01 & knowledge attitude and practice based questionnaire The data helped in formulate research results and demographic profiles. In this study 248 patient were reviewed among which 121 patients were enrolled in the study, other 127 were not converted from IV to P/O. Among 121 participant 52% were male & 48% were female, 33.88% were converted through step-down therapy, 29.75% through sequential therapy, and 19.83% through switch therapy & other 16.54% through combination therapies. Hospital stay of maximum patients (43.8%) was 4-8days with early switch while 10-12 days in patients not converted from IV to P/O. Also statistical analysis found type of conversion therapy used & responses of patients were independent of gender and age. Our study analysed type of conversion therapy used, duration of hospital stay & recurrent rate of conversion i.e. step-up therapy in 121 patients on the basis of data collected case record form & questionnaires. Step-down therapy predominated, notably reducing hospital stays. Early conversion optimized antimicrobial use, enhancing stewardship and safety

**Keywords:** Antibiotic, antibiotics resistance, sequential, switch, step-down therapy.

## CO-ADMINISTRATION OF ROSA DAMASCENA AND COMMIPHORA WIGHTII IMPROVES THERAPEUTIC EFFECTS IN STZ-INDUCED MODELS OF ALZHEIMER'S DISEASE

Payal Chauhan, Karan Wadhwa, and Govind Singh
Department of Pharmaceutical Sciences, Maharshi Dayanand University, Rohtak, 124001
drdovind.pharma@mdurohtak.ac.in

Alzheimer's disease (AD) is a devastating neurodegenerative disorder characterized by memory loss and cognitive decline, driven by factors like oxidative stress, inflammation, and mitochondrial dysfunction. Despite ongoing research, effective treatments remain elusive. Current therapeutic strategies primarily focus on symptomatic relief and slowing disease progression, highlighting the urgent need for novel therapeutic approaches. The current study investigated the combined neuroprotective effects and mechanisms of extracts from Rosa damascena and Commiphora wightii against streptozotocin (STZ)-induced AD in rats. Following STZ administration, animals were treated for four weeks with the extracts, both individually and in combination. Key biomarkers, including oxidative stress indicators, mitochondrial function, neurotransmitter levels (acetylcholine and glutamate), and the inflammatory cytokine TNF-α, were evaluated, along with behavioral tests to assess cognitive and locomotor function. The results were compelling, affirming that the combination therapy significantly reduced oxidative stress and improved mitochondrial function more effectively than the individual treatments. It also successfully regulated neurotransmitter levels and attenuated inflammation. Critically, both individual and combined treatments improved learning and memory. These findings thus reveal that the co-administration of R. damascena and C. wightii possesses improved neuroprotective properties, making them promising candidates for AD treatment. However, further research is needed to fully elucidate their mechanisms and explore their clinical potential.

**Keywords:** Alzheimer's disease, Rosa damascena, Commiphora wightii, streptozotocin, rodent model

## MODERN APPROACHES TO BREAST CANCER MANAGEMENT

Harshada S. Bagde, Kalyani R. Thombre,
Krishna R. Gupta*, Milind J. Umekar
Department of Pharmaceutical Chemistry, Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, India
harshada.bgd123@gmail.com

Worldwide, Breast Cancer (BC) remains the most common cancer type accounting for approximately 2.3 million new cases and 685, 000 deaths. Despite advances in early detection and treatment, breast cancer continues to pose significant challenges due to different molecular subtypes posing different therapeutic challenges. Genetic and hereditary predispositions are among the numerous risk factors linked to the development of breast cancer. The spectrum of breast cancers is very wide. Early-stage breast cancer is thought to be curable and the mainstay of treatment for it is local-regional therapy (radiation and surgery), with systemic therapy administered either before or after surgery as needed. The conventional therapy for early-stage BC is mastectomy alone or breast-conserving surgery coupled with radiation and lymph node, ER, PR and HER-2 status. Breast cancer therapy has evolved from a surgical method to a more comprehensive strategy. Preoperative or neoadjuvant therapy is now necessary for most cases of early-stage breast cancer and may involve immune checkpoint inhibitors. Endocrine therapy and chemotherapy are the most common therapies for persons with hormone-positive (ER+ and HER2+) breast cancer making them simpler to treat. Immunotherapy is developing as an important part of breast cancer, treatment. Despite initial disappointments immunomodulation and cancer vaccines have shown clinical benefits. Gene therapy introduces genetic material into target cells via a vector, followed by gene correction, addition or suppression. The present review explores current trends in breast cancer treatments, including surgery, endocrine therapy chemotherapy, radiotherapy, and immunotherapy and gene therapy. Finding new treatment targets, refining combination medicines and comprehending the function of tumor evolution should be the top priorities for future research. Improving patient outcomes will require a focus on combining genetic and proteomic data to enhance precision medicine and a study of the social and psychological aspects affecting treatment adherence. Through this review, we propose to highlight the critical need for further study and a multidisciplinary strategy to understand the complexity of breast cancer and eventually increase patient survival rates and quality of life.

**Keywords:** Breast cancer; Surgery; Endocrine therapy; Immunotherapy; Gene therapy; Radiotherapy

## A STUDY TO INVESTIGATE THE INCIDENCE, RISK FACTORS, MANAGEMENT STRATEGIES, AND RECURRENCE RATE OF ACUTE PANCREATITIS

Hiba Sania Inam, Dr. T. Vithya, Dr. Praveen, Munazeeh M Ahmed
Department of pharmacy practice,
Al-Ameen College of Pharmacy, Bangalore - 27

Acute pancreatitis is an acute inflammatory condition of the pancreas with a wide spectrum of clinical presentations, ranging from mild, self-limiting illness to severe disease associated with life-threatening complications. Understanding its incidence, etiological factors, severity patterns, management approaches, and recurrence rates is essential for improving clinical outcomes. This prospective observational study aimed to investigate the incidence of acute pancreatitis in a tertiary care hospital, identify predominant risk factors, assess disease severity using the BISAP score, evaluate management strategies, and determine recurrence rates in both inpatient and outpatient populations. Over a nine-month study period, 108 patients aged 18 years and above with confirmed acute pancreatitis were enrolled. Comprehensive demographic details, lifestyle habits, medical and medication history, laboratory results, and imaging findings were collected. Patients were followed from admission until discharge, and recurrence was defined as two or more distinct episodes following complete or near-complete resolution of symptoms. The incidence rate was 0.13% of total hospital admissions, with males aged 31–40 years being the most affected. Alcohol consumption (39.81%), gallstones (26.85%), and hypertriglyceridemia (20.37%) were the leading etiological factors. Most cases were mild to moderate and responded well to conservative management, including bowel rest, fluid resuscitation, analgesics, proton pump inhibitors, and selective surgical interventions such as laparoscopic cholecystectomy. The mortality rate was low at 0.9%. Recurrence occurred in 41.7% of patients, primarily due to unresolved etiological factors. This study underscores the importance of early etiological identification, lifestyle modification, and structured follow-up to reduce recurrence and prevent progression to chronic pancreatitis.

## SMART CANCER CARE: THE EMERGING ROLE OF THERANOSTICS IN PRECISION ONCOLOGY

J.N. Suresh Kumar, Raghavendra Kumar Gunda
Department of Pharmaceutics, Narasaraopeta Institute of Pharmaceutical Sciences (Autonomous), Narasaraopet,

ISBN: 978-81-980623-8-3

Palnadu, Andhra Pradesh, India-522601.
Jnskumarpharmacy@rediffmail.com

The paradigm of cancer treatment is rapidly evolving from conventional cytotoxic regimens toward precision-guided, personalized therapeutics. Theranostics an innovative approach integrating diagnostic imaging and targeted therapy within a single molecular construct has emerged as a cornerstone of this transformation. By enabling real-time visualization, quantification, and treatment of tumor targets, theranostics bridges the gap between molecular diagnosis and individualized therapy. This review critically explores the advances in oncological theranostics with a focus on radiopharmaceuticals, nanocarrier-based delivery systems, and molecular targeting platforms that underpin precision oncology. The review encompasses an analysis of recent developments in radionuclide-based theranostic agents such as PSMA and DOTATATE conjugates, alongside nanotheranostic systems employing gold nanoparticles, liposomes, and polymeric micelles. The role of multimodal imaging techniques (PET/CT, SPECT, MRI, and fluorescence imaging) in tracking therapeutic response and biodistribution is discussed. Emphasis is placed on design strategies for biocompatible nanocarriers, surface functionalization for tumor selectivity, and the integration of stimuli-responsive release mechanisms. Preclinical and clinical evidence demonstrates that theranostic agents enhance diagnostic accuracy, reduce systemic toxicity, and enable real-time monitoring of therapeutic outcomes. Despite promising results, challenges persist in terms of large-scale synthesis, pharmacokinetic optimization, regulatory approval, and translational feasibility. Theranostics exemplifies "smart cancer care", offering a unified, patient-centric model that aligns with the goals of precision medicine. The future of oncological theranostics will depend on synergistic efforts in pharmaceutical technology, radiochemistry, and nanomedicine to ensure effective clinical translation and widespread accessibility.

## A STUDY ON SEVERITY, MANAGEMENT AND COMPLICATION OF GASTRO-ENTERITIS IN A TERTIARY CARE HOSPITAL

Jayashree Vetrivel, Hilal Zain, K M Haripriya rai, Saif Ali Ansari
Department of Pharmacy Practice, Al Ameen College of Pharmacy,
Bangalore, Karnataka, India-560027.
jayashreevb2002@gmail.com

Gastroenteritis is an inflammation of the stomach and intestines causing diarrhea, vomiting, abdominal pain, and cramping. It results from infections by viruses, bacteria, parasites, or exposure to toxins. The condition is highly contagious and can lead to dehydration affecting daily activities. Management focuses on hydration, symptom relief, and treating underlying causes. The study aimed to identify the most common causative microorganism, assess severity, management patterns, and complications among adults with gastroenteritis. This six-month prospective observational study was conducted among patients admitted to St. Philomena's Hospital. It included 75 patients above 18 years of age, with females comprising 64% and males 36%, predominantly aged 48–57 years (32%). Diarrhea with fever and vomiting was the most common reason for admission (24%), and watery stool was observed in 81.3% of patients. Moderate severity of gastroenteritis was noted in 62.7% of cases. Microbiological analysis identified E. coli in 12.2% of specimens. Antiemetics (86.7%) and antibiotics (66.43%) were frequently prescribed, with ceftriaxone being the most used agent (64.7%). Probiotics were also commonly administered. Complications occurred in 4% of cases, mainly acute kidney injury, and one mortality (1%) due to shock was recorded. Adverse drug reactions were seen in 3% of patients, all classified as probable. The study concluded that moderate gastroenteritis was most common, E. coli was the leading causative organism, and effective management involved fluid replacement, antiemetics, antibiotics, and probiotics.

## EFFECT OF CLINICAL PHARMACIST CONCILIATION ON DEPRESCRIPTION AMONG GERIATRIC PATIENTS ADMITTED IN A TERTIARY CARE HOSPITAL

Jothi R, Dr. T. Vithya, Dr. Shankar Prasad
Department of Pharmacy practice, Al-Ameen college of Pharmacy,
Bangalore, Karnataka-560027
jopharma@gmail.com

Polypharmacy and the use of potentially inappropriate medications (PIMs) remain major challenges in geriatric healthcare, contributing to adverse drug events, drug–drug interactions, and increased morbidity. This study aimed to evaluate the impact of clinical pharmacist–led medication conciliation on deprescribing practices among geriatric inpatients admitted to a tertiary care hospital. A total of 144 patients aged 65 years and above were enrolled based on defined inclusion criteria. Prescription analyses were conducted using the 2023 AGS Beers Criteria to identify PIMs across various risk categories, including medications to be avoided, used with caution, drug–disease interactions, drug–drug interactions, and those requiring renal dose adjustment. Among the enrolled population, 39.58% were prescribed at least one PIM, with benzodiazepines, sulfonylureas, proton pump inhibitors, and specific cardiovascular agents being the most frequently identified. A total of 62 deprescribing recommendations were provided by the clinical pharmacist, out of which 33 (51.61%) were accepted by physicians. Non-acceptance was primarily due to patient complexity, concerns regarding withdrawal symptoms, perceived clinical benefit of ongoing therapy, and fear of symptom recurrence. Higher acceptance rates were noted for recommendations involving drug–disease interactions and renal dose adjustments, whereas lower acceptance was seen for medications listed under the "use with caution" category. The study emphasizes that clinical pharmacist involvement substantially aids in identifying PIMs and fostering safer prescribing practices. Despite barriers related to clinical judgement and patient-specific factors, deprescribing interventions supported improved medication optimization. These findings underscore the importance of integrating clinical pharmacists into geriatric care teams to enhance medication safety and minimize inappropriate polypharmacy.

## EVALUATION OF IRON SUPPLEMENT PRESCRIBING PRACTICES IN ANEMIC PATIENTS: A STUDY OF COMMUNITY PHARMACIES IN GANDHINAGAR DISTRICT

Juhi Pandya, Akash Mathuria and Sandipkumar Bhatt
K. B Institute of pharmaceutical education and research,
Gandhinagar, Gujrat, India
juhipandya22@gmail.com

Anemia, especially iron deficiency anemia (IDA), remains a major public health issue in developing countries like India. It commonly results from inadequate dietary iron, poor absorption, and increased physiological requirements, affecting overall health and well-being. This prospective observational study aimed to evaluate iron supplement prescribing patterns using WHO prescribing indicators and to identify the factors guiding supplement selection and reported side effects. The study was conducted for six months in four community pharmacies in Gandhinagar, Gujarat, involving 139 anemic patients. Prescription patterns were assessed using WHO prescribing indicators, and descriptive statistics were used for analysis. Among 139 patients, most were diagnosed with mild to moderate anemia. A total of 350 drugs were prescribed, with an average of 2.5 drugs per prescription, suggesting over-prescribing. Only 2.5% of medicines were prescribed generically, and 9% belonged to the National Essential Medicines List. Oral iron therapy was most common, while injectables accounted for 9%. Prescribing decisions were influenced by age, gender, and nutritional status. Ferrous fumarate was commonly prescribed to females aged 18–25 years, while ferrous ascorbate was preferred for those aged 26–35 years. Three patients reported side effects: nausea with ferric carboxymaltose, constipation with ferrous fumarate, and dark stools and nausea with ferrous ascorbate. Iron supplements are widely prescribed; however, improved adherence to WHO prescribing guidelines and rational drug use is needed in community pharmacy practice.

**"UPADACITINIB: A TARGETED THERAPY FOR RHEUMATOID ARTHRITIS"**

Kankanala Uma Satya Manikanta and Dr.Garlapati Usha Kiran*
NRI College Of Pharmacy, Pothavarappadu, Agiripalli, Eluru district.
umasathya2004@gmail.com

Rheumatoid arthritis (RA) is a long-lasting autoimmune condition that leads to persistent joint inflammation, causing pain, disability, and a notable decline in quality of life. For those patients who don't see much improvement with standard treatments or biologic disease-modifying antirheumatic drugs (DMARDs), Janus kinase (JAK) inhibitors have emerged as a valuable alternative. One such medication, upadacitinib, specifically targets JAK1 and has already received approval for conditions like severe atopic dermatitis (AD) and, more recently, for RA.This review seeks to evaluate the real-world effectiveness and safety of upadacitinib in treating severe atopic dermatitis, while also providing insights into its application for RA. Out of the 242 studies initially found, 214 were excluded after a review of their titles and s. Full-text evaluations were performed on the remaining 25 studies, with 17 meeting the criteria for inclusion in the analysis.The findings from these real-world studies consistently indicate that upadacitinib is highly effective, resulting in significant improvements in both clinical signs and patient-reported symptoms. The drug's advantages were particularly clear in patients who had not responded to earlier treatments. Importantly, no new or unexpected safety issues were identified, further reinforcing its positive safety profile, which aligns with the outcomes of randomized clinical trials.

**Keywords:** Rheumatoid arthritis; Atopic dermatitis; Upadacitinib; JAK inhibitors; DMARDs; Real-world evidence; Safety; Effectiveness.

**ASSESSMENT OF KNOWLEDGE AND ATTITUDE OF THE PUBLIC TOWARDS NON-ALCOHOLIC FATTY LIVER DISEASE: DEVELOPMENT, VALIDATION, AND PILOT TESTING OF A STANDARDIZED QUESTIONNAIRE**

Linu Varghese Koshy, Dr,T. Vithya, Dr. Praveen H.R
Department of Pharmacy Practice, Al-Ameen College of Pharmacy, Bengaluru, Karnataka – 560027, India
linuvkoshy@gmail.com

Non-alcoholic fatty liver disease (NAFLD) is the most prevalent chronic liver disease globally, yet public awareness remains limited. This study aimed to assess the knowledge and attitude of the general public toward NAFLD using a systematically developed and validated questionnaire. A cross-sectional interventional design was adopted. The questionnaire was created through literature review and expert evaluation by hepatologists, clinical pharmacists, and public health specialists. Content validity was established using Item- and Scale-level Content Validity Index (I-CVI and S-CVI), both achieving a score of 1. Inter-rater reliability using Fleiss kappa demonstrated near-perfect agreement ($\kappa = 0.96$; $p < 0.001$). Pilot testing was conducted among 26 adults to assess clarity, feasibility, and preliminary knowledge gaps. Participants found the tool easy to understand (100%), relevant (95.45%), and feasible to complete within 15–20 minutes. Baseline results showed that 84.6% had heard of NAFLD, but misconceptions persisted—27.3% believed NAFLD is solely alcohol-related, and only 50% perceived it as a very serious condition. Although 90.9% recognized lifestyle modification as important, symptom recognition and understanding of complications remained low. Attitude scores indicated generally positive perceptions toward awareness and preventive behaviors. The validated questionnaire demonstrated excellent reliability, clarity, and applicability for large-scale assessment. Findings from the pilot highlighted substantial knowledge gaps, underscoring the need for targeted educational interventions. The tool will be used in the main study involving 191 participants to evaluate the impact of structured health education on improving NAFLD awareness and attitudes.

**ASSOCIATION OF CHRONIC DISEASES WITH PREGNANCY COMPLICATIONS: A RETROSPECTIVE COHORT STUDY**

Lucky Chouhan, Mansi Tiwari, Anu Hardenia, Ananya Shankar
Sri Aurobindo Institute of Pharmacy, Indore, 452016
lsingh6265912326@gmail.com

Pregnancy is a critical phase often complicated by chronic conditions such as anemia, hypertension, obesity, and thyroid disorders. These diseases can significantly impact both maternal and fetal health, leading to complications like preeclampsia, premature delivery, low birth weight, and placental abruption. This retrospective cohort study aimed to explore the association between chronic diseases and pregnancy complications, and to compare these complications between first and second pregnancies. The study involved 116 pregnant women whose medical histories, complaints, and treatments were reviewed after obtaining hospital approval. Data were statistically analyzed using chi-square and t-tests to identify significant relationships and differences between pregnancy outcomes. Among the participants, 37% had anemia, 31% hypertension, and 18% thyroid disorders. Common pregnancy complications included abdominal and labor pain, premature delivery, low birth weight, preeclampsia, and placental abruption. No significant difference was observed in the incidence of complications between first and second pregnancies ($P > 0.999$). Neonatal outcomes were generally positive, with 79.3% full-term births, 14.6% premature deliveries, and a 6% abortion rate. Most mothers successfully breastfed, and 73% of infants were able to draw colostrum. The study suggests that effective management of chronic conditions during pregnancy may contribute to improved maternal and neonatal outcomes. These findings underscore the importance of close monitoring and timely intervention for chronic diseases to minimize adverse pregnancy complications.

**PREVALENCE AND SEVERITY OF MENOPAUSAL SYMPTOMS ON QUALITY OF LIFE AND KNOWLEDGE ASSESSMENT AMONG WOMEN'S**

M Naveenkumar, Rajitha S, Vaishnavi Shrinivas N and Sakitha T
Department of Pharmacology, Vaageswari college of Pharmacy, Ramakrishna colony, Karimnagar-505527
mnkumar0702@gmail.com

The World Health Organization defines menopause as "the permanent cessation of menstruation caused by diminished ovarian activity, which is often detected after a year of consecutive amenorrhea". The lack of understanding may aggravate the severity of symptoms and risk their quality of life. The current study used this approach to design a survey of the prevalence and intensity of menopausal signs using the Menopause-Specific Quality of Life (MENQOL) scale and assess women's knowledge of menopause and its management. A study on the general public was conducted in Karimnagar. The MENQOL scale collects the Frequency and seriousness of menopausal symptoms among women. We interviewed the subjects to determine their demographic details and awareness about menopause. The study included 961 participants, aged 35 to 60. Vasomotor (VM) and physical symptoms (PS) are highly prevalent in 283 perimenopausal women, urinary symptoms (US) are highly prevalent in 570 postmenopausal women, and VM and PS are more commonplace in 108 early menopausal women. As the conclusion to our study, people who have a high occurrence of menopausal symptoms have a risk for a diminished standard of living. The outcome highlights understanding gaps among women with high frequency and significant severity of menopausal symptoms. These findings emphasize the need for targeted health education initiatives and interventions to address the complex issues associated with menopause.

**MACROVASCULAR AND MICROVASCULAR COMPLICATIONS IN NEWLY DIAGNOSED TYPE 2 DIABETES MELLITUS BY CROSS SECTIONAL STUDY**

M.Sivamanikandan, C.Sampushparaj and V.Ganesan
Department of Pharmacy Practice, Pannai college of Pharmacy, Dindigul, Tamilnadu-624005
Siva001006@gmail.com

Type 2 diabetes mellitus (T2DM) is a chronic metabolic disorder characterized by persistent hyperglycemia due to defects in insulin secretion, action or both. The cross-sectional study evaluated 100 newly diagnosed T2DM patients at a tertiary care hospital in Dindigul to determine the prevalence and pattern of macrovascular and

ISBN: 978-81-980623-8-3

microvascular complications. This study included 62% males and 38% females, predominantly aged 41 to 62 years. Macrovascular complications were observed as coronary artery disease (26%), cerebrovascular disease (8%), and peripheral artery disease (11%). Microvascular complications included retinopathy (20%), nephropathy (34%), and neuropathy (16%). Higher Body Mass Index (BMI) and waist circumference were significantly associated with an increased risk of complications. Early identification and systematic screening at diagnosis, including Electrocardiogram (ECG), Echocardiogram (ECHO), Ankle-Brachial index (ABI), fundoscopy, Electromyography (EMG), and urine analysis, proved valuable for predicting complications and guiding patient management. Findings highlight the importance of recognizing increased BMI and waist circumference as risk factors and recommend comprehensive screening at the time of diagnosis to improve patient outcomes through timely intervention and management.

**Keywords:** Type 2 diabetes mellitus, macrovascular complications, microvascular complications, coronary artery disease, nephropathy.

## "FOOD-DRUG INTERACTION BETWEEN POMEGRANATE AND HYDROCHLOROTHIAZIDE: IMPLICATIONS FOR HEMOLYSIS"

Mareedu Mahesh and Dr Garlapati Usha Kiran*
Corresponding author:Professor, HOD Department of Pharmacology,
NRI College of Pharmacy, Pothavarappadu,
Agiripalli, Eluru district- 521212
maheshmareedu18@gmail.com

This study investigates the potential interaction between hydrochlorothiazide (HCTZ) and pomegranate juice on hemolytic activity using an in vitro blood agar assay. HCTZ, a common diuretic, may interact with pomegranate juice, known to inhibit cytochrome P450 enzymes. The assay assessed hemolysis by measuring the clear zones around HCTZ tablets, both alone and pre-soaked in pomegranate juice, on blood agar plates after 24-hour incubation at 37°C. Results showed increased hemolytic activity with the HCTZ + pomegranate juice combination (1.70 cm mean zone diameter) compared to HCTZ alone (1.05 cm). This suggests pomegranate juice may enhance HCTZ's hemolytic effect, potentially due to altered drug metabolism or synergistic interactions between HCTZ and pomegranate's bioactive compounds. These findings highlight a potential food-drug interaction, warranting further in vivo studies to determine clinical implications and inform safe concurrent use of HCTZ and pomegranate juice.

**Keywords:** Food-drug interactions (FDIs), Pomegranate (Punica granatum), Hydrochlorothiazide, Hemolytic activity, Drug metabolism, Oxidative stress, Cytochrome P450 (CYP450),

## A STUDY ON SURVEILLANCE AND ASSESSMENT OF MEDICAL DEVICE ADVERSE EVENTS AT A TERTIARY CARE HOSPITAL

MD RAMEEZ AHMED K, Dr. T VITHYA, SUPRAJA.B
Department of Pharmacy Practice,
Al-Ameen College of Pharmacy, Bengaluru, India
ahmedrameez962@gmail.com

Medical devices play a crucial role in modern patient care, making their safety and efficacy essential components of healthcare quality. With the rapid advancement of medical technology and increased use of devices in diagnostic and therapeutic procedures, concerns regarding device-associated adverse events (MDAEs) have grown substantially. Materiovigilance, a dedicated system to monitor, assess, and report adverse events related to medical devices, ensures that risks are minimized and patient safety is upheld. In India, the Materiovigilance Programme of India (MvPI) has strengthened national efforts toward improving medical device safety. This prospective observational study was conducted at St. Philomena's Hospital, Bengaluru, with the objective of analyzing medical device–related adverse events and identifying the most commonly implicated devices. Ethical approval was obtained, and daily ward rounds were carried out in collaboration with biomedical engineers to detect and document suspected adverse reactions using the MvPI reporting format. A total of 31 medical device–associated adverse events were recorded during the study period, with an incidence rate of 2.81%. Adverse events were more frequently reported in females, and the mean patient age was 61.36 years. The most common devices associated with adverse events were DISPOVAN syringes, BD Venflon IV cannulas, and QVS-100. Frequently encountered events included IV cannula–induced thrombophlebitis, incorrect non-invasive blood pressure readings, and blocked needles. Most events were categorized as Class B and were associated with therapeutic and diagnostic device use. Causality assessments indicated that most MDAEs were probable. The study concludes that although MDAEs occur, reporting remains minimal. Strengthening awareness and training among healthcare professionals can significantly enhance materiovigilance practices and patient safety.

**Keywords:** Materiovigilance, Medical devices, Adverse events, MvPI, Thrombophlebitis, IV Cannula, Patient safety

**PL-605**

## COMPARISION OF PHARMACOLOGICAL ACTIVITY OF CARTHAMUS TINCTORIUS AND CARTHAMUS OXYACANTHA FOR THE TREATMENT OF BENIGN PROSTATIC HYPERPLASIA

Mehta Parulben D and Manish Agrawal
SAM College of Pharmacy, SAM Global University,
Agariya Chopda, Raisen, M.P. India-425107
School of Pharmacy, LNCT University, Bhopal, M.P. India-462042
parulsengar@gmail.com

Benign prostatic hyperplasia (BPH) is a prevalent condition among older men, characterized by prostate gland enlargement due to the proliferation of stromal and epithelial cells. BPH affects over 50% of men by age 60 and nearly 90% by age 85. The condition is closely associated with dihydrotestosterone (DHT), a potent androgen produced from testosterone by the enzyme 5α-reductase, which promotes prostate growth. While the complete pathogenesis of BPH remains partially understood, androgens are known to play a critical role, and inhibiting DHT production or action has proven effective in reducing prostate growth. In this study, in vitro experiments were conducted to evaluate the 5α-reductase inhibitory potential of extracts from Carthamus tinctorius and Carthamus oxycantha. Enzyme solutions were prepared through prostate homogenization, with enzyme concentration determined using Bradford reagent. The inhibitory activity was assessed using a standard testosterone curve, with peak areas measured by HPLC at 254 nm, employing a methanol: water (70:30) mobile phase and a flow rate of 1 ml/min. Optimum enzyme concentration was established by varying enzyme levels while keeping substrate concentrations constant. The results revealed that the n- hexane fraction of the methanolic extract of Carthamus tinctorius exhibited significant 5α-reductase inhibitory activity, with an IC50 value of 0.301 mg. In contrast, chloroform, methanol, butanolic fractions, and various other extracts did not demonstrate significant inhibitory potential. These findings suggest that Carthamus tinctorius, particularly its hexane fraction, holds promise for therapeutic applications in managing prostatic hyperplasia, while highlighting the differential pharmacological properties of Carthamus oxycantha

## EVALUATION OF ANTI-ALZHEIMER'S ACTIVITY OF METHANOLIC EXTRACT OF ANNONA MURICATA (AMME) LEAVES IN EXPERIMENTAL MICE

Midhuna K, Karunakar Hegde and A R Shabaraya
Department of Pharmacology, Srinivas college of pharmacy,
Valachil, Mangalore-574143
mail2me.mithu@gmail.com

The Anti-Alzheimer's activity of methanolic extract was investigated on scopolamine induced cognitive impairment in mice using behavioural parameters viz, Morris water maze (MWM) and Elevated plus maze (EPM). The two doses 100mg/kg and 200mg/kg were administered through oral route against experimentally induced amnesia by scopolamine (0.4mg/kg i.p.) in young mice. The standard drug used for experiment was was Piracetam (0.5mg/kg p.o.) in both the models. The long-term administration of both 100mg/kg and 200mg/kg of extract produced significant reduction in ELT and increase in TSTQ in MWM model. Similarly, it showed significant reduction in TL in EPM model when compared with scopolamine treated group. The result obtained was comparable with that of the standard drug piracetam. The outcome

ISBN: 978-81-980623-8-3

of the present study provides the evidence that the methanolic extract of Annona muricata leaves showed significant dose dependent beneficial effect against scopolamine induced Alzheimer's Disease. The presence of flavonoids and phenolic acids in AMME might be responsible for overcoming scopolamine induced memory impairment. Thus, the present study concludes Annona muricata leaves possesses anti-Alzheimer's activity against experimentally induced amnesia in mice

**Keywords:** Alzheimer, Annona muricata, EPM, MWM, Piracetam, Scopolamine

**PL-607**

**ASSESSMENT OF PRESCRIBING PATTERNS OF MEDICATIONS THROUGH MEDICATION APPOPRIATENESS INDEX & WHO CORE PRESCRIBING INDICATORS IN GERIATRIC PATIENTS**

MITAYAGARI AABEED
Annamacharya college of pharmacy

The main aim of the present study is to assess the prescribing pattern of medication among geriatrics. Rational prescribing is essential to ensure patient safety, therapeutic effectiveness, and cost-efficiency. This study aimed to assess prescribing patterns and the appropriateness of medications using the Medication Appropriateness Index (MAI) and WHO Core Prescribing Indicators in a tertiary care inpatient setting. It is a prospective observational cross sectional study and conducted over a period of six months. Among the MAI criteria, the most common issues identified were lack of indication and inappropriate therapy duration, each observed in 20 prescriptions. Drug-drug interactions were noted in 93 prescriptions using Micromedex, although no clinical effects were observed. Other areas, including dosage, effectiveness, and cost-efficiency, showed minimal or no issues. WHO indicators revealed an average of 8.1 drugs per encounter, indicating a high level of polypharmacy. Generic prescribing was 75%, slightly below the ideal 100%. Antibiotic use was 17%, within the acceptable range (<30%), while injection use was higher than recommended at 38.3%. Encouragingly, 98.1% of drugs were from the Essential Medicines List (EML). The study highlights key areas requiring improvement, such as reducing polypharmacy, minimizing injection overuse, and ensuring appropriate indications and treatment durations. However, strong adherence to EML and rational antibiotic use reflect positive prescribing practices overall.

**Keywords**: Medication Appropriateness Index, WHO Core Prescribing Indicators, Rational Drug Use, Polypharmacy, Inappropriate Prescribing.

**FROM DATA TO DISCOVERY: HOW POPULATION-BASED RISK ASSESSMENT AND TRIAL SIMULATION TRANSFORM PUBLIC HEALTH**

Mohammad Abdul Sana1, Raghavendra Kumar Gunda2, J.N. Suresh Kumar2
1Department of Pharmacy Practice, Narasaraopeta Institute of Pharmaceutical Sciences (Autonomous), Narasaraopet, Palnadu, Andhra Pradesh, India-522601.
2Department of Pharmaceutics, Narasaraopeta Institute of Pharmaceutical Sciences (Autonomous), Narasaraopet, Palnadu, Andhra Pradesh, India-522601.
mohammedabdulsana30@gmail.com

Population-based risk assessment and trial simulation are transforming clinical research and public health. By combining large-scale epidemiological data, computer models, and real world evidence, these methods allow for precise predictions of health outcomes, efficient trial designs, and proactive risk management. Population-level risk assessments identify vulnerable groups, guide targeted interventions, and inform healthcare policy decisions. Trial simulations enable virtual testing of interventions in various scenarios, which lowers trial costs, shortens duration, and reduces patient exposure to harmful events. This work presents key methods and showcases examples where risk modeling and trial simulations have sped up drug development and improved public health strategies. It also discusses important challenges, such as integrating different data, addressing ethical issues, and meeting regulatory demands. In the future, new technologies like artificial intelligence, machine learning, and digital twins hold great promise for improving predictive accuracy, optimizing clinical trial strategies, and changing how we manage population health, marking the start of a new era of data-driven, patient-focused research.

**TRENDS IN RHEUMATOLOGY PRESCRIBING: INSIGHTS FROM A TERTIARY CARE HOSPITAL**

Mohammed Daiyaan Khan 1, Srikanth M S 1, Subramanian R2.
Department of Pharmacy Practice, JSS College of Pharmacy, Mysore.
Department of Clinical Immunology and Rheumatology,
JSS Hospital, Mysore.

Corticosteroids play a vital role in managing rheumatologic conditions due to their anti-inflammatory and immunosuppressive effects. However, inappropriate prescribing can result in long-term complications such as osteoporosis, diabetes, and cardiovascular disease. Understanding prescribing patterns is essential to optimize use and reduce risks. To assess corticosteroid prescribing practices in the rheumatology department of a tertiary care hospital. A cross-sectional descriptive study was conducted over three months in a tertiary care hospital. All inpatients and outpatients from the rheumatology department receiving corticosteroid therapy during the study period were included. A total of 100 prescriptions were reviewed. Among 100 patients, 64% were outpatients and 36% inpatients. Most were adult females (91% female, 83% adults). Rheumatoid arthritis (45%) and systemic lupus erythematosus (30%) were the most common diagnoses. Prednisolone (64%) and hydrocortisone (18%) were the most prescribed corticosteroids, with oral use in 75% of cases. Doses were classified as low (49%), medium (41%), and high (5%), with high doses mainly in rheumatoid arthritis and low doses in lupus. Long-term (>2 years) corticosteroid use was noted in 30% of patients, 3 out of 100 required pulse therapy. No major drug interactions were observed. The findings highlight variability in prescribing practices and the need for standardized steroid stewardship in rheumatology. Department-specific guidelines, improved tapering protocols, and pharmacist-led monitoring are essential to minimize risks and optimize outcomes.

**DEVELOPMENT AND ADMINISTRATION OF A STEROID ALERT CARD: A COLOR-CODED SAFETY TOOL TO ENHANCE SAFETY AND AWARENESS**

Mohammed Daiyaan Khan 1, Srikanth M S 1, Subramanian R2.
Department of Pharmacy Practice, JSS College of Pharmacy, Mysore.
Department of Clinical Immunology and Rheumatology,
JSS Hospital, Mysore.

Corticosteroids are vital in managing autoimmune and inflammatory diseases; however, inappropriate or prolonged use can lead to serious adverse effects such as adrenal suppression and increased infection risk. Despite their widespread use, standardized tools to support patient safety and professional communication are lacking in India. To address this gap, a color-coded steroid safety card was developed as part of a steroid stewardship initiative to enhance patient education and interprofessional coordination. To design, validate, and implement a standardized steroid safety card in the rheumatology department of a tertiary care hospital. A Steroid Stewardship Committee was formed under the Department of Rheumatology, comprising rheumatologists, a clinical pharmacist, administrators, and subject experts. The committee reviewed and approved the concept and design of the card, which also received clearance from the Institutional Ethics Committee of JSS Medical College. The card, designed in a horizontal format, includes patient details and hospital emergency contacts, and is available in both English and Kannada to improve accessibility. It uses a three-color risk system, Red (long-term use >3 months), Yellow (moderate use), and Green (recently stopped <12 months). A QR code links to a bilingual digital guide with tapering instructions and emergency management protocols. The steroid safety card serves as a practical and scalable tool to promote steroid stewardship and improve patient safety. Implementing similar models across healthcare settings can foster patient-centered care and strengthen communication between healthcare providers and patients.

**Keywords:** Safety Card, Steroids, Rheumatology, Stewardship, Autoimmune.

**ASSESSMENT AND MONITORING OF ADVERSE DRUG REACTIONS INDUCED BY ANTIMICROBIALS.**

Dr Naveen Krishna M, Dr Vithya T, Gelareh Amarati, Dr Shankar Prasad
Department of Pharmacy Practice, Al-Ameen College of Pharmacy,
Bengaluru, Karnataka – 560027, India
nkchowdary1819@gmail.com

The current study was conducted to assess, monitor, and report adverse drug reactions (ADRs) induced by antimicrobial agents. The objective of the research was to evaluate the incidence, common causative antimicrobial classes, causality, severity, and preventability of ADRs occurring among patients receiving antimicrobial therapy. A prospective, hospital-based observational study was carried out for a period of six months at St. Philomena's Hospital, Bengaluru. Patients of all age groups and both genders who developed ADRs following antimicrobial use were included after obtaining informed consent and ethical clearance. Relevant case details were recorded, and the data were analysed using descriptive statistics. During the study period, 125 patients were enrolled, with females showing a higher incidence of ADRs than males. The majority of ADRs occurred in the age group of 40–49 years, predominantly among patients who received prophylactic antimicrobial therapy for surgical procedures. Antibacterial agents were the most common class of antimicrobials associated with ADRs, particularly ceftriaxone, metronidazole, and amoxicillin-clavulanate, followed by piperacillin-tazobactam. Parenteral formulations were involved in most ADR cases, and gastrointestinal and hypersensitivity reactions were the most frequently affected organ systems. Causality assessment using WHO-UMC and Naranjo's scales indicated that most ADRs were probable. Based on Hartwig's severity scale, 60 ADRs were mild, 51 moderate, and 19 severe. According to the Schu mock and Thornton preventability scale, 8 ADRs were not preventable, 76 definitely preventable, and 46 probably preventable. The findings highlight that clinical pharmacists play a vital role in the detection, assessment, and reporting of ADRs to strengthen pharmacovigilance systems. Enhanced awareness, timely reporting, and preventive strategies can minimize the occurrence of ADRs and improve patient safety.

**BIOACTIVE ENRICHED NUTRACEUTICALS BLENDS TARGETING IMMUNOLOGICAL, METABOLIC, AND GUT MICROBIOME CHALLENGES IN TEENAGERS**

Nayonitha Vijayan V I., C.Rubina Reichal
Department of pharmaceutics, Sri Ramakrishna Institute of Paramedical Sciences, College of Pharmacy, Coimbatore 641044
Nayonithavijayan@gmail.com

Adolescence is a critical developmental phase marked by rapid physiological, metabolic, and immunological changes that increase vulnerability to respiratory infections, obesity, and gastrointestinal disturbances. Nutraceutical interventions provide a safe and supportive approach to enhancing overall immunity. This study aimed to develop and evaluate three nutraceutical formulations. Breathing Support Granules, Weight Loss Powder, and Gut Relief Powder target these predominant adolescent health concerns. Each formulation was designed using evidence-based herbal and functional ingredients. Breathing Support Granules were prepared using Ocimum sanctum, Glycyrrhiza glabra, and Adhatoda vasica for bronchodilatory and anti-inflammatory activity. Weight Loss Powder incorporated green tea extract, Garcinia cambogia, and soluble dietary fibers to modulate metabolism and lipid regulation. Gut Relief Powder consisted of probiotics, prebiotic inulin, and soothing botanicals including Foeniculum vulgare and Zingiber officinale. All formulations underwent organoleptic assessment, preliminary stability testing, and physicochemical characterization. The formulations demonstrated acceptable appearance, taste, texture, flow properties, EUTICALS moisture content, and stability profiles suitable for adolescent consumption. The selected botanical and functional ingredients align with their reported roles in improving respiratory defence, regulating adipogenesis and oxidative stress, and promoting gut–gut-microbiota balance, and mechanisms contribute to enhanced mucosal, innate, and metabolic immune responses, supporting holistic wellness in adolescents. The three nutraceutical formulations exhibited promising functional attributes for addressing adolescent respiratory, metabolic, and gastrointestinal problems. These results suggest their potential as supportive, non-pharmacological interventions to strengthen immunity and overall adolescent health. Future clinical studies are recommended to validate long-term safety, efficacy, and immunomodulatory outcomes.

**Keywords**: Nutraceutical, Adolescent, Breathing support granules, Gut relief powder,Weight loss powder.

**MODERN INNOVATIONS IN HOSPITAL DRUG DISTRIBUTION: A COMPREHENSIVE REVIEW**

Nithin Sujay K. J.[1], Madhusudhan S.[1], Shridhar Murthy[2]
[1]Department of Pharmacy, Faculty of Engineering and Technology, Annamalai University, Annamalai Nagar, Tamil Nadu – 608002
[2] Department of Pharmacy, St. Mary's College of Pharmacy, Chitradurga – 577501, Karnataka, India
kjns2306@gmail.com

Hospital drug distribution systems have evolved significantly from basic floor stock models to highly structured, technology-driven frameworks aimed at improving medication safety, efficiency and accountability. Modern systems integrate digital tools and automation to ensure accurate, timely and patient-specific medication delivery while reducing errors and optimising workflow. This review summarises traditional drug distribution approaches and critically examines advancements such as computerized physician order entry (CPOE), clinical decision support systems (CDSS), automated dispensing cabinets (ADCs), robotic dispensing systems, bar code medication administration (BCMA), radiofrequency identification (RFID), smart infusion technology and hospital information system (HIS) and electronic health record (EHR) integration. The role of telepharmacy in expanding access and supporting remote clinical services is also discussed. These innovations collectively enhance patient safety, strengthen traceability, streamline operations, and improve inventory control. The review highlights current challenges including cost, interoperability, training, and cybersecurity and outlines future trends such as AI-driven decision support, predictive analytics, personalised medicine, mobile health integration, and advanced automation. Overall, continued progress in drug distribution systems will play a vital role in modernising hospital pharmacy practice and achieving safer, more efficient medication management.

**Keywords:** Drug distribution system, hospital pharmacy, unit dose dispensing, automated dispensing cabinets, BCMA, RFID, CPOE, clinical decision support, medication safety, telepharmacy, smart infusion systems.

**STUDY ON SALES OF SELECTED HYPOLIPIDEMIC DRUGS IN GOA**

Palash Malekar and Pankaj Gajare
Department of Pharmaceutics, PES's Rajaram and Tarabai Bandekar College of Pharmacy, Ponda, Goa, India-403401
palashmalekar22@gmail.com

The objective of present project work is to investigate the sales of various brands of selected Hypolipidemic medications. According to the survey, drug Atorvastatin is most preferred by the physicians and it reflected in sales, followed up by Rosuvastatin drug. A pre-validated questionnaire was used to conduct market survey in five main Goan cities: Ponda, Panjim, Margao, Mapusa, and Vasco. More than 100 pharmacies, 20 from each of five cities, were interviewed in the market survey. The collected data is subjected to One way ANOVA test and Bartlett's test. P-values for all four different antihypertensive drugs were found to be less than 0.05, indicating statistically significant differences in the mean monthly sales among different brands, suggests that not all brands were performed equally well in the market; some brands were clearly leading in sales while others lag behind. Bartlett's test also showed P-values < 0.05, confirming that the variability (variance) in sales between brands is significant, i.e., brands differ not only in average sales but also in the consistency of their performance. These statistical outcomes reflect market preference and brand dominance, likely influenced by factors such as brand reputation, availability, physician recommendation, marketing strategy, and price.

**Keywords:** Hypolipidemic, Atorvastatin, ANOVA, Bartlett's test, Variability

**PEPTIDOMIMETICS AND THEIR THERAPEUTICAL APPLICATION**

MR. PAWAN KASHYAP, DR. RAMAPRASAD PADHY
Danteswari college of pharmacy borpadar raipur road -494221

Peptidomimetics represent a rapidly evolving class of therapeutic agents designed to mimic the structure and function of natural peptides while overcoming their inherent limitations, such as poor stability, rapid degradation, and low bioavailability. By incorporating chemical modifications, non-natural amino acids, or structural scaffolds, peptidomimetics can enhance metabolic stability, receptor selectivity, and oral bioavailability, making them attractive alternatives to conventional peptide drugs. These synthetic analogues maintain the biological activity of peptides but provide improved pharmacokinetic and pharmacodynamic properties, thereby expanding their therapeutic potential. Therapeutically, peptidomimetics have demonstrated significant applications in diverse medical areas. In oncology, they function as inhibitors of protein–protein interactions crucial for cancer progression, such as targeting Bcl-2 family proteins or p53-MDM2 interaction. In infectious diseases, peptidomimetic antibiotics and antivirals show promise against resistant pathogens and viral replication. Cardiovascular applications include modulation of enzymes like renin and ACE, contributing to blood pressure regulation. Furthermore, in metabolic disorders, peptidomimetics of incretin hormones such as GLP-1 analogues have shown success in the treatment of type 2 diabetes and obesity. Their ability to mimic signaling molecules also makes them valuable in immunology, where they modulate immune responses for autoimmune and inflammatory conditions. Recent advancements in computational modelling, combinatorial chemistry, and structural biology have accelerated the design of novel peptidomimetics with high specificity and reduced toxicity. Overall, peptidomimetics represent a promising therapeutic strategy bridging the gap between small molecules and biologics, with the potential to revolutionize modern drug discovery and development.

**Keywords:** Peptidomimetics, Drug design, Therapeutic peptides, Bioactive peptides, Structural modification, Enzyme inhibitors, Receptor ligands, Protein–protein interaction modulators, Stability enhancement, Oral bioavailability, Target specificity,Antiviral therapy, Anti-inflammatory drugs, Cardiovascular therapeutics, Peptide analogues, Small molecule mimetics, Pharmacokinetics improvement

**EVALUATION OF ANTIDIABETIC AND ANTIOXIDANT ACTIVITY OF HYDROALCOHOLIC EXTRACT OF ROSMARINUS OFFICINALIS ON STREPTOZOTOCIN–NICOTINAMIDE INDUCED TYPE–2 DIABETIC MODEL IN WISTAR ALBINO RATS**

Pinki Verma, Dr.B.A.Vishwanath
Department of Pharmacology, Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka, Bangalore,
Karnataka – 560064, India.
pinkivarma@adityapharmacy.in

The present investigation aimed to evaluate the antidiabetic and antioxidant potential of the hydroalcoholic leaf extract of Rosmarinus officinalis in streptozotocin–nicotinamide (STZ–NA) induced diabetic Wistar albino rats. The crude extract was administered orally at doses of 100 mg/kg and 200 mg/kg for 21 consecutive days. Throughout the experimental period, fasting plasma glucose, serum insulin, lipid profile, liver glycogen, pancreatic TBARS, and body weight were systematically assessed. Treatment with R. officinalis extract produced a significant reduction in blood glucose levels and improvement in antioxidant parameters compared with the diabetic control group. The extract also demonstrated protective effects on glucose tolerance in glucose-overloaded rats, indicating enhanced peripheral glucose utilization and insulin sensitivity. These findings collectively suggest that Rosmarinus officinalis leaves possess promising antidiabetic and antioxidative properties, potentially attributed to their rich phytoconstituents such as phenolics and flavonoids. The study highlights R. officinalis as a natural therapeutic candidate for diabetes management and its associated metabolic complications, warranting further exploration for the development of a novel orally active antidiabetic agent.

**Keywords:** Rosmarinus officinalis, Antidiabetic activity, Streptozotocin, Nicotinamide, Wistar albino rat.

**PL-617**

**DIABETIC FOOT ULCERS: A QUALITATIVE INSIGHT INTO MENTAL AND EMOTIONAL HEALTH**

Pooja Gopal Poojari,Ramakrishna Shabaraya A, Amar DN
Department of Pharmacy Practice, Srinivas College of Pharmacy, Valachil, Mangalore, India-574 143
poojapoojari428@yahoo.in

Existing research on diabetic foot ulcer (DFU) has focused on the clinical and physical aspects of DFU, with limited exploration of patient experiences on emotional impact. The aim of this study is to assess the impact of DFU on mental and emotional health of the patients. A qualitative phenomenological study was conducted among 30 participants with DFU in a tertiary care hospital of South India. Semi-structured, in-depth interviews were carried which were audio-recorded. Data were transcribed verbatim and analysed using NVivo 15 software. Themes and sub-themes were generated through inductive thematic analysis. Thematic analysis of the interviews revealed seven key themes. Barriers due to the condition showed caregiver burden and daily wound care created emotional strain and feelings of dependence. Causes of DFU revealed minor injuries, and infections. Awareness and management highlighted limited knowledge about diabetes and wound care, challenges in lifestyle modification, and mixed satisfaction with treatment, which affected self-care. Challenges due to the disease illustrated reduced mobility, job loss, and significant financial strain due to ongoing medical expenses. Impact on mental health captured experiences of anxiety, depression, disturbed sleep, social withdrawal, and fear of amputation. Emotional impact included feelings of sadness, frustration, guilt, isolation, and loss of desires, with prolonged healing leading to emotional exhaustion. Coping and future outlook showed that faith in God, family support, self-confidence, and emotional acceptance helped patients manage distress. Incorporating mental health screening, patient education, and psychosocial support into DFU management could improve outcomes and enhance holistic care.

**Keywords:** Qualitative study, diabetic foot ulcer, mental health, emotional health

**PL-618**

**ASSESSMENT AND MANAGEMENT OF POTENTIALLY INAPPROPRIATE PRESCRIBING IN GERIATRIC PATIENTS USING STOPP/START CRITERIA.**

Pooja V Salimath, Neelkantreddy Patil, Vanishree P Babladi
Department of Pharmacy Practice, HKES's Matoshree Taradevi Rampure Institute of Pharmaceutical Sciences Kalaburagi,
Karnataka, INDIA – 585102.
Poojasalimath91@gmail.com

Medication safety in older adults is a significant clinical concern because of age-related physiological changes, multiple co-morbidities, and polypharmacy, which increase the risk of adverse drug reactions (ADRs). The STOPP/START criteria serve as comprehensive tools for identifying potentially inappropriate medications (PIMs) and potential prescribing omissions (PPOs), thereby enhancing the safety and effectiveness of pharmacotherapy in the elderly.

A prospective interventional study was conducted over six months in a tertiary care hospital after obtaining ethical clearance. Geriatric patients admitted to the medicine department were enrolled based on inclusion criteria. A total of 148 patients were included, comprising 83 (56.08%) females and 65 (43.91%) males. The majority (58.77%) were between 66 and 75 years of age. Among the prescriptions reviewed, 81 showed hyper-polypharmacy, 58 major-polypharmacy, 1 moderate, and 8 minor. PIMs were identified in 93 (63.83%) prescriptions, while PPOs were present in 41 (27.70%). Of the PPOs, 29 (70.73%) were reported to prescribers, with 19 (65.51%) accepted. Among the PIMs, 61 (65.59%) were reported, with 29 (47.54%) accepted by prescribers. The study showed the prevalence of polypharmacy and inappropriate prescribing among geriatric patients. Application of the STOPP/START criteria proved effective in identifying and minimizing PIMs and PPOs. The substantial acceptance of pharmacist interventions highlights the criteria's value in promoting medication safety and optimizing therapeutic outcomes in elderly care.

**ANTICHOLINERGIC MEDICATION BURDEN IN THE INDIAN ELDERLY AT A PUBLIC TEACHING HOSPITAL: A RETROSPECTIVE ANALYSIS**

Pramil Tiwari1 and Durgeshwari1
Department of Pharmacy Practice, National Institute of Pharmaceutical Education and Research (NIPER), S.A.S. Nagar, Punjab

To determine the anticholinergic burden in elderly inpatients by using Anticholinergic Risk scale (ARS) and Anticholinergic Cognitive Burden (ACB) scale. By 2050, India's elderly population (60yrs or more) is projected to reach approximately 319-347 million, constituting about 20% of the total population. Since elderly inpatients receive as many as 10 medications a day, the safe therapy for the elderly become paramount. This retrospective analysis has utilized two tools for the determination of the anticholinergic burden in elderly inpatients. The retrospective analysis of 341 elderly inpatients' data. The Anticholinergic Risk Score (ARS) is an essential tool for determining the degree to which a certain patient may be at risk of an adverse anticholinergic impact that can cause cognitive dysfunction and delirium. The Anticholinergic Cognitive Burden (ACB) scale is used for determining the severity of anticholinergic drugs on cognition caused by prescribed medications. The results are expressed as average±standard deviation. The average age of the patients was found to be 68.61±7.18years; with 40.4% female and 59.6% male patients. It was found that 73.2% of the patients were suffering from at least one disease. The average length of stay in the hospital was found to be 5.64±3.88days. The average number of medications prescribed was 7.12± 3.89; the median and mode are 6&4, respectively. Approximately, 41% of patients received between 1-5 medications. The total of ARS score for 478 drugs in 341 patients was found to be 167 with an average of 0.48±0.84. Likewise, the ACB score was found to be 267; averaging to 0.78±0.86. The high ACB and ARS scores reflects patient may be at risk of an adverse anticholinergic impact that can cause cognitive dysfunction and poor physical health. It is, therefore, imperative that the pharmacotherapy in the elderly be monitored with the help of a clinical pharmacist.

**PL-620**

**EFFECTIVENESS OF PAIN MODULATING DRUGS ON HEALTH-RELATED QUALITY OF LIFE AND FUNCTIONAL DISABILITY IN PATIENTS WITH CHRONIC LOW BACK PAIN**

**DISHA M P, CHIROSMITA HAZARIKA, UMESH THARU**
Department of Pharmacy Practice, Nargund College of Pharmacy, Bengaluru – 85
dishaprasshanth@gmail.com

Chronic low back pain (CLBP) is a major global cause of disability, with a lifetime prevalence of up to 66% in India. It is multifactorial, commonly associated with obesity, occupational strain, and comorbidities such as hypertension and diabetes. Beyond physical limitations, CLBP leads to significant impairment in health-related quality of life (HRQoL). This study aimed to assess disability and HRQoL in CLBP patients using the Roland-Morris Disability Questionnaire (RMDQ) and Short Form-36 (SF-36), and to evaluate the impact of combined pharmacological therapy and lifestyle interventions. An observational cross-sectional study was conducted over six months in a tertiary care hospital. Patients meeting study criteria were assessed using RMDQ and SF-36 at baseline and after 30 days of intervention. The mean age was 47.32 ± 12.98 years, with 57.1% males. The mean body mass index was 26.49 ± 5.21 kg/m². Hypertension (42.6%) and diabetes (33.9%) were common comorbidities, while smoking (42.9%) and alcohol use (41.1%) were frequently reported. The average pain duration was 25.8 months with moderate baseline intensity. Significant improvements were observed in disability and HRQoL scores after 30 days of combined treatment. Females showed greater improvement than males, while BMI, occupation, comorbidities, and social habits did not significantly influence outcomes. Pain-modulating drugs combined with lifestyle modifications effectively reduce disability and enhance HRQoL in patients with chronic low back pain.

**Keywords:** Chronic low back pain, Roland-Morris Disability Questionnaire, Short Form-36, health-related quality of life.

**PL-621**

**FROM DAILY PILL TO TWICE-YEARLY INJECTION: MEET YEZTUGO (LENACAPAVIR)**

R. Nousheen Taj
Dr. K.V. Subba Reddy Institute of Pharmacy, Dupadu, Kurnool, India-518218
r.nousheentaj@gmail.com

Lenacapavir is a first-in-class HIV-1 capsid inhibitor developed by Gilead Sciences, representing a novel approach in antiretroviral therapy and prevention. Unlike conventional drugs that target viral enzymes such as reverse transcriptase or protease, lenacapavir disrupts multiple stages of the HIV life cycle by binding to highly conserved regions of the viral capsid protein. This interaction interferes with capsid assembly, disassembly, and nuclear import, effectively blocking viral replication and maturation. Lenacapavir unique mechanism of action confers potent antiviral activity against both wild-type and multidrug-resistant HIV-1 strains, with minimal cross-resistance to existing drug classes. Its exceptionally long half-life supports extended dosing intervals, enabling administration as a subcutaneous injection every six months, or as oral loading doses during initiation. Clinically, lenacapavir is approved under the brand names Sunlenca for the treatment of multidrug-resistant HIV infection and Yeztugo for HIV pre-exposure prophylaxis (PrEP). Phase 2 and 3 studies have demonstrated high efficacy, durable viral suppression, and favorable safety, with injection-site reactions being the most common adverse effect. Lenacapavir's introduction marks a paradigm shift in HIV management—transforming both treatment and prevention through long-acting, adherence-friendly therapeutics that enhance patient convenience and potentially reduce transmission on a global scale.

**Keywords:** Lenacapavir; HIV-1 capsid inhibitor; antiretroviral therapy; pre-exposure prophylaxis (PrEP); Gilead Sciences; Sunlenca; Yeztugo; nuclear import inhibition; viral assembly blockade; patient adherence; HIV treatment innovation; long-acting antiretroviral.

**PL-622**

**ONE SHOT FOR ALL: TRANSFORMING GLOBAL IMMUNIZATION PRACTICES**

Raghavendra Kumar Gunda, J.N. Suresh Kumar
Department of Pharmaceutics, Narasaraopeta Institute of Pharmaceutical Sciences (Autonomous), Narasaraopet, Palnadu, Andhra Pradesh, India-522601.
raghav.gunda@gmail.com

The development of single shot vaccines represents a paradigm shift in pharmaceutics and vaccine delivery, aiming to achieve complete immunization through a single administration. Despite the proven success of conventional multi-dose vaccines, issues such as poor patient compliance, logistic complexity, and cold-chain dependency continue to impede universal immunization goals. Single-dose vaccine formulations address these challenges by integrating controlled release technologies capable of mimicking prime-boost effects over extended periods. This review focuses on the pharmaceutic and technological advancements underpinning single shot vaccine development. Biodegradable polymers such as poly (lactic-co-glycolic acid) (PLGA), polycaprolactone, and lipid-based nanocarriers have demonstrated significant potential for sustained antigen release, antigen protection, and enhanced immunogenicity. Encapsulation techniques, micro/nanoparticle engineering, and the co-delivery of adjuvants are discussed in the context of formulation optimization and stability enhancement. Furthermore, emerging strategies including thermostable formulations, depot-based systems, and nucleic acid-based delivery are explored for their role in improving vaccine efficacy and patient adherence. Key challenges persist in achieving precise release kinetics, antigen stability, and scalable manufacturing. However, with continued progress in material science and formulation engineering, single shot vaccines stand at the forefront of next-generation immunization technologies.

**Keywords:** Single shot vaccines, controlled release, PLGA microspheres, nanoparticle delivery, vaccine formulation, sustained release systems

**PL-623**

**IMPACT OF PATIENT EDUCATION ON INHALATION TECHNIQUE AND COST ANALYSIS OF ASTHMA MANAGEMENT**

Rajasree.S[1], Keerthi.S[2]
Department of Pharmacy Practice, Nehru College of Pharmacy, Thiruvilwamala, Thrissur, Kerala, India

ISBN: 978-81-980623-8-3

Asthma is a prevalent chronic respiratory condition worldwide. Inhaled corticosteroids delivered via nebulizers, dry powder inhalers (DPIs), or pressurized metered-dose inhalers (pMDIs) form the cornerstone of management, reducing exacerbations, improving lung function, and potentially decreasing mortality and irreversible airway changes. However, suboptimal inhaler technique is associated with poorer disease control and increased resource use. To evaluate the impact of structured patient education on inhalation technique and to analyse the cost implications of asthma management in a clinical setting. This prospective observational study enrolled 70 patients meeting predefined criteria. At baseline, inhalation technique was evaluated using checklists and the Patient Satisfaction and Preference Questionnaire (PASAPQ), while asthma control was assessed via the Asthma Control Test (ACT). Patients received pharmacist-led counselling, with reinforcement at 30-day intervals for three follow-ups. Improvements in inhaler technique, ACT scores, and cost parameters were analysed using MS Excel 2014 and SPSS v21. Although the majority of patients expressed confidence in their inhaler use, objective assessments revealed significant misuse. Educational intervention resulted in statistically significant improvements in inhalation technique and ACT scores over time. Better technique correlated with enhanced asthma control and the potential for cost savings through reduced acute care utilisation and improved medication efficiency. Structured patient education, particularly pharmacist-led, is integral to optimising inhaler technique, improving asthma outcomes, and potentially lowering healthcare costs. These findings support the incorporation of routine inhaler education into asthma management protocols.

**Keywords**: inhaler technique; asthma control; ACT score; PASAPQ; patient education

**PL-624**

## AGMATINE AT THE CROSSROADS: BRIDGING CARDIORESPIRATORY DYNAMICS AND BRAIN HEALTH

Department of Pharmaceutics, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
Pin: 441002 Nagpur, Maharashtra, INDIA.
Rajesh Shivaji Pokle, Milind J. Umekar, Madhuri Gawai, Jayshree B. Taksande , Amol A. Tatode , Mohammad Qutub.

Agmatine, a biogenic amine metabolite of L-arginine, has emerged as a critical modulator at the nexus of neurological, cardiovascular, and respiratory wellness. This review examines its multiplicity of action in neuroprotection, regulation of nitric oxide, and modulation of neurotransmitters, with a focus on its effects on the autonomic nervous system and cardiorespiratory-brain axis. Agmatine increases heart rate variability (HRV) and respiratory sinus arrhythmia (RSA) through facilitation of parasympathetic tone and protection against sympathetic overactivity. These autonomic actions are complemented by the neuroprotective, anti-inflammatory, and Vaso-regulatory properties of agmatine. Additionally, interaction among non-neuronal physiological rhythms i.e., cerebrospinal fluid pulsatility, vascular pulsatility, and respiration, is also addressed, with its importance noted for neuroimaging and integration between brain and body. Agmatine fills this gap connecting systemic physiological networks and central neural processing, and as such is an encouraging therapeutic modality for disease conditions with features of neurodegeneration, cardiovascular dysregulation, and autonomic imbalance.

**Keywords:** Agmatine, Heart rate variability (HRV), Respiratory sinus arrhythmia (RSA), Neuroprotection, neuroimaging, cerebrospinal fluid flow, cardiorespiratory-brain axis.

**PL-625**

## A STUDY OF PRESCRIPTION PATTERN IN DIABETIC PATIENTS: AN OBSERVATIONAL STUDY

Rishabh Chorma*, Agosh Patel, Krishnapal Rathod, Mahendra Patel, Aditya Parashar
Department of Pharmacy Practice, Sri Aurobindo Institute of Pharmacy, Indore, Madhya Pradesh, 453555
chormarishabh@gmail.com

This cross-sectional observational study was conducted in the General Medicine Department of Sri Aurobindo Hospital, Indore, over six months to evaluate prescription patterns among diabetic patients and identify areas for improving diabetes management. Data were collected through patient records, interviews, and electronic health records, focusing on demographics, diabetes type and duration, comorbidities, medication types, dosages, and adherence to treatment guidelines. A total of 109 diabetic patients were included, with a mean age range of 51–60 years. Among them, 65 were male and 44 were female. The majority (86%) had type 2 diabetes mellitus (T2DM), while 14% had type 1 diabetes mellitus (T1DM). Monotherapy with metformin was prescribed to 40% of patients, while the remainder received combinations of oral hypoglycemic agents. Insulin therapy was utilized in 23% of cases. Among the combination therapies, glibenclamide with metformin was the most commonly prescribed (5%). The study highlights the predominance of metformin use and combination therapy in diabetes management, reflecting adherence to standard therapeutic approaches. However, variations in prescribing patterns suggest a need for continuous monitoring and guideline-based optimization. The findings emphasize individualized treatment plans, improved adherence strategies, and physician awareness of evidence-based prescribing. Further research is warranted to explore interventions that enhance prescription quality and patient outcomes in diabetes care.

**Keywords**: diabetes mellitus, prescription patterns, observational study, medication adherence, glycemic control, treatment guidelines.

## MARIGOLD-POWERED VISION A NOVEL EYE GEL FOR BLUE LIGHT PROTECTION

Rutuja Patil
Department of Pharmacology, Swami Ramanand Teerth University, Nanded, Maharashtra, India-431606
rutujapatilop821@gmail.com

Increasing reliance on digital devices has intensified exposure to blue light, leading to digital eye strain, discomfort, and oxidative stress, particularly among individuals who do not use protective spectacles or blue-light–filtering lenses. To address this gap, the present work explores the development of a lutein- and zeaxanthin-containing ophthalmic gel designed to offer a convenient, non-spectacle-based approach to blue-light protection. Lutein and zeaxanthin obtained from marigold flower (Tagetes erecta) key macular carotenoids with proven blue-light–filtering and antioxidant properties, were incorporated into a soothing gel matrix to enhance their ocular surface retention and potential uptake. The proposed formulation aims to provide sustained release, ease of application, and compatibility for users who prefer not to wear protective glasses. Preliminary formulation considerations include the selection of a suitable gelling agent, solvent system, emulsifier, and stabilizers to ensure clarity, spreadability, and ocular safety. This may serve as a practical alternative for individuals seeking blue-light protection without the need for spectacles, offering an accessible method to reduce digital eye strain and support long-term ocular health.

**Keywords**: Lutein, Zeaxanthin, Ophthalmic gel, Blue light protection

## PROPOLIS /ONION EXTRACT/TALC-BASED SCAFFOLD FOR BONE TISSUE REGENERATION IN GLUCOCORTICOID-INDUCED OSTEOPOROTIC RAT MODEL

Rutuja S More, Tashwin Y P, Dhrubojyoti Mukherjee.
Department of Pharmaceutics, SVKM'S NMIMS SHIRPUR, MAHARASHTRA 425405
rutujamore008@gmail.com

The current development of nanocomposites promises to treat bone degeneration through improving bone regeneration and decreasing bone loss. Those materials are better in terms of mechanical strength, bioactivity, and osteoinductive qualities, allowing to integrate better with native bone tissue. To provide the solution to the acute problem of bone loss, especially regarding the case of long-term space exploration, the current studies create a composite material, adjusted to the development of bone. The in vitro and in vivo experiments were done to assess the biocompatibility, cell adhesion, and proliferation and differentiation capabilities of the composite material. Structural and functional properties of the composite were widely described through a sequence of detailed studies, i.e., swelling, gel fraction, viscosity, and degradation tests, as well as, sophisticated imaging methods. Also, the effectiveness of the composite material was tested on a glucocorticoid-induced osteoporotic rat model model. Onion extract powder, Propolis,

ISBN: 978-81-980623-8-3

Talc and Hydroxyapatite based composite material enhanced cell adhesion, proliferation, and differentiation, which means that it can be used in bone tissue engineering. This holistic approach combines the experimental data with the information about the molecules and opens the door to the innovative solutions to the problem of bone loss in relation to osteoporosis and the improvement of the overall health of the skeletal system.

**Keywords:** Bone tissue regeneration, Nanocomposite scaffold, and osteoporosis.

**PL-628**

## GOSSYPETIN'S NEUROPROTECTIVE ACTION IN COGNITIVE IMPAIRMENT LINKED TO PROLONGED STRESS EXPOSURE

Ruturaj Kadu, Nikita Patil Samant, Girdharlal Gupta
Department of Pharmacology, SVKM's NMIMS, School of Pharmacy & Technology Management, NMIMS University, Shirpur, Maharashtra, India-425405.
ruturajkadu90@gmail.com

Persistent stress-induced cognitive impairment is one of the research challenges because of its complicated pathophysiology with participation of neuroendocrine and inflammatory signaling pathways. The kynurenine metabolic cascade activation has been involved in memory impairment during chronic stress, but mainly due to the increased cortisol synthesis, excited microglia, and the further synthesis of neurotoxic products. The possible contribution of gossypetin, a natural flavonoid, to antioxidative and mood-elevating effects to alleviate stress-related cognitive impairments in Swiss albino mice was investigated in this study. Sustained exposure to unpredictable stressors over a series of weeks allowed experimental groups to be given intraperitoneal doses of gossypetin (5, 10 or 20 mg/kg). The combination of behavioural paradigms and biomarker analysis was used to measure the outcomes of therapeutic results. The intervention also led to objective changes in cognitive performance, that is, stress-related corticosterone levels and oxidative imbalance decreased. Also, the administration of gossypetin was associated with an increase in the levels of monoaminergic neurotransmitters and elevated levels of brain-derived neurotrophic factor. The results affirm the neuroprotective potential of gossypetin in preventing cognitive impairment caused by recurrent stress, which is why it holds some potential as a sub-topic of further pharmaceutical research.

**Keywords**: Neuroinflammation, stress paradigm, HPA axis, synaptic plasticity.

**PL-629**

## EVALUATION OF MULTIMODAL ANALGESIA IN POSTOPERATIVE PAIN MANAGEMENT FOLLOWING TOTAL KNEE ARTHROPLASTY

S Lakshmi, P V Ragini
Department of Pharmacy Practice, Oxbridge college of pharmacy, Bengaluru, Karnataka, India
nalinasrinivas84@gmail.com

Total knee arthroplasty (TKA) is widely performed for advanced knee osteoarthritis, yet postoperative pain may hinder early mobility and recovery. Multimodal analgesia, integrating pharmacological agents with regional anesthesia techniques, aims to improve postoperative comfort while minimizing opioid-related adverse effects. This study assessed the effectiveness of multimodal analgesia in reducing postoperative pain using the Numeric Rating Scale (NRS), identified commonly used drug combinations, evaluated the influence of demographics, BMI, and comorbidities on recovery, and examined the relationship between pain relief and duration of hospital stay. A six-month prospective observational study was conducted at Aster CMI Hospital involving 140 TKA patients aged over 40 years. Daily pain scores were recorded, and all patients received multimodal analgesia including paracetamol, NSAIDs, opioids, regional nerve blocks, and gabapentinoids. Patients with ASA IV status, drug allergies, or chronic opioid use were excluded. Most patients were 61–66 years old, predominantly female, and classified as ASA II. The protocol, incorporating spinal anesthesia, peripheral nerve blocks, intravenous acetaminophen, and continuous ropivacaine infusion, reduced mean NRS scores from 5.93 preoperatively to 1.01 by postoperative day four. Most underwent unilateral TKA, showed good wound healing, early ambulation, and continued multimodal therapy at discharge, with 14.3% receiving scheduled aceclofenac. The mean hospital stay was 4.6 days. Older and comorbid patients reported initially higher pain but achieved comparable functional outcomes. Multimodal analgesia was safe, effective, opioid-sparing, and associated with improved comfort, faster recovery, and shorter hospitalization. These findings support routine use of multimodal analgesia to optimize postoperative outcomes in TKA patients.

**Keywords:** Multimodal Analgesia, Total Knee Arthroplasty, Postoperative Pain, Pain Management, Numeric Rating Scale.

## EVALUATION OF THE NEUROPROTECTIVE EFFECTS AND MECHANISMS OF SELECTED PLANT PHENOLICS IN ALZHEIMER'S DISEASE

Saisweta Joshi* Vijay Kumar Singh
Faculty of Pharmacy, Shri Rawatpura Sarkar University, Raipur, Chhattisgarh, India 493661.
saiswetajoshi@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder characterized by memory loss, cognitive decline, and neuronal cell death, primarily resulting from oxidative stress, amyloid-β (Aβ) accumulation, and neuroinflammation. Current pharmacological treatments offer only symptomatic relief and are often associated with side effects, emphasizing the need for safer and more effective therapeutic alternatives. Piper cubeba (cubeb pepper), a medicinal plant traditionally used in various Ayurvedic and Unani formulations, contains phenolic compounds such as cubebin, eugenol, and pipeline, known for their potent antioxidant and anti-inflammatory properties. These phytochemicals have demonstrated the ability to attenuate oxidative damage, inhibit Aβ aggregation, and modulate enzymes associated with AD pathology. The present study aims to evaluate the neuroprotective effects and elucidate the molecular mechanisms of selected phenolics from Piper cubeba using in vitro and in silico approaches. The investigation will focus on their antioxidant capacity, neuroprotective potential, and interaction with key neurodegenerative targets. Overall, this study is expected to provide valuable insights into the therapeutic potential of Piper cubeba phenolics as multi-target agents, contributing to the development of natural, plant-based neuroprotective strategies for the prevention and management of Alzheimer's disease.

**Keywords:** Alzheimer's disease; Piper cubeba; phenolic compounds; neuroprotection; oxidative stress; amyloid-β; natural antioxidants; anti-inflammatory; neurodegeneration; in vitro; in silico

## A STUDY ON HEPARIN DOSE OPTIMIZATION AMONG PATIENTS UNDERGOING PERCUTANEOUS CORONARY INTERVENTION (PCI)

Saleeha Banu, T Vithya, Jai babu, S. Veena
Department of Pharmacy Practice, Al Ameen College of Pharmacy, Bangalore, India -560027

Acute coronary syndrome (ACS) includes conditions such as STEMI, NSTEMI, and unstable angina, all resulting from reduced blood flow to the heart. These conditions form part of coronary heart disease and are influenced by risk factors such as smoking, hypertension, diabetes, hyperlipidemia, sedentary lifestyle, obesity, family history, and poor dietary habits. Unfractionated heparin (UFH) remains an essential anticoagulant for preventing and treating thrombotic events and is routinely administered during cardiac procedures, dialysis, and extracorporeal circulation. Monitoring heparin therapy is crucial to ensure therapeutic effectiveness and avoid complications. The activated clotting time (ACT) is a widely used point-of-care test in catheterization laboratories and cardiac operating rooms, while APTT continues to be used despite its limited correlation with anti-Xa activity. The present study aimed to optimize the intraoperative dosing of heparin using ACT- and APTT-guided monitoring and to evaluate the influence of patient-related factors (age, gender, BMI, smoking, alcohol use, and comorbidities) on achieving target ACT values. secondary objective was to assess any heparin-related bleeding complications following the procedure. Data collected from patient case sheets included demographics, comorbidities, medication history, social history, and heparin doses administered. ACT and APTT values were analyzed to determine correlations and dosing outcomes. The findings indicate that heparin dosing can be effectively optimized using ACT and APTT values, with no significant impact from the studied demographic or clinical

ISBN: 978-81-980623-8-3

factors. No post- procedure bleeding complications were observed, supporting the safety and effectiveness of individualized, ACT-guided heparin administration.

**Keywords:** Acute coronary syndrome, unfractionated heparin, ACT, APTT, heparin optimization.

**A SYSTEMATIC REVIEW ON THE EFFICACY AND SAFETY OF UNDENATURED TYPE II COLLAGEN IN THE MANAGEMENT OF KNEE OSTEOARTHRITIS**

Sandhya Rani
Avanthi Institute of pharmaceutical sciences
Sandhyarani0317@gmail.com

Osteoarthritis (OA) is a progressive degenerative joint disease characterized by pain, stiffness and restricted mobility, which significantly diminishes quality of life. Most common type of OA is Knee OA. Conventional therapies mainly provide symptomatic relief without addressing the underlying disease mechanisms. In recent years, nutraceuticals especially undenatured type II collagen (UC-II) have gained attention for its potential to supports joint health and offers a more targeted approach to managing knee OA. The aim of this article is to provide a detailed mechanism of action, safety and efficacy of UC-II in knee OA patients. A systematic literature search was carried out across major scientific databases including PubMed, Scopus, Web of Science and Google Scholar to identify studies related to undenatured type II collagen (UC-II) in osteoarthritis. Both preclinical and clinical studies published in English were reviewed. Key information such as study design, type of intervention, outcome measures, and safety data was carefully collected. The gathered data were then qualitatively analyzed to understand how UC-II works, its therapeutic benefits, and its safety in managing knee osteoarthritis. UC-II has been shown that improvements in pain relief, joint flexibility and overall functional performance in knee osteoarthritis patients. Both preclinical and clinical studies suggest that these benefits are likely due to UC-II's ability to modulate the immune system and helps to prevent cartilage degradation. UC-II was generally well tolerated without significant adverse effects reported. UC-II is a safe and effective supplement that helps reduce pain, improve mobility and support cartilage health in knee osteoarthritis patients.

**Keywords:** Knee, Osteoarthritis, Undenaturated type 2 collagen, joint pain and inflammation

**RARE GENETIC DISORDERS IN INDIA: PREVALENCE, IMPACT, AND STRATEGIES TO ADDRESS DISEASE BURDEN**

Sangita Mishra and M P Venkatesh
Centre of Excellence in Regulatory Sciences, JSS College of Pharmacy, JSS AHER, SS Nagar, Mysuru, Karnataka, India – 570015
sangitamishrahazra@gmail.com

This study provides an overview of genetic disease burden in India, current therapeutic landscape, and provide recommendations to improve therapeutic development. Records were identified from GenomeIndia, Coriell Catalog, and FRIGE for 6815 patients across 402 rare genetic diseases. All these were stratified into 17 disease classes depending on the specific affected organs. Variations were not found in the studied patient cohort for (D = 155/402; 38.6%) diseases. Neuromuscular and neurodegenerative (NMND) class were found to have highest number of diseases (D = 83/402; 20.6%). Majority patients in the observed cohort were diagnosed under NMND class (P = 3215/6815, 47.1%), of which Duchenne Muscular Dystrophy (DMD) constituted majority of cases (P = 661/3215, 20.6%), followed by Hematological diseases (P = 897/6815; 13.2%), of which Beta Thalassemia (P = 445/897, 49.6%) was the most prevalent. Highest number of unique mutations were found in NMND (MU = 740/1389; 53.3%) diseases. In terms of disease, Hemophilia B (MU = 104/1389; 7.5%) had highest unique mutations. Between 2020 and 2024, CDSCO approved 120 therapies, out of which (T = 54/120; 45.0%) therapies were for only (D = 45/402; 11.2%) identified rare genetic disorders in Indian population. Recently, genome sequencing of 10,000 individuals were completed as part of GenomeIndia project. This data is intended to be used for mapping community specific genetic variants and to create epigenetic models of diseases. A multi-pronged approach is necessary to improve the treatment landscape which includes further investment in genetic research, develop targeted regulatory pathways and robust public health strategies.

nanjupharma143@gmail.com

The current research work was designed to evaluate the In vivo and In vitro antidiabetic activity of methanolic extract of Ficus palmata bark (MEFPB).The In vivo antidiabetic activity of methanolic extract of Ficus palmata bark was assessed in dexamethasone (10 mg/kg) and alloxan (160 mg/kg) induced diabetes models in rats at different dose levels (200 mg/kg & 400 mg/kg). In Invivo models the administration test extract at different doses significantly reduced the increased blood glucose level, increased weight gains of animals, reduced levels of serum glucose and triglyceride in a dose-dependent manner. The plant extract demonstrated normal islets, minimal necrosis, and significant β-cell regeneration.

**Keywords:** Antidiabetic, dexamethasone, and alloxan.

**PL-635**

**IN-SILICO SCREENING AND BIOLOGICAL EVALUATION OF P-COUMARIC ACID DERIVATIVES FOR THEIR A-AMYLASE INHIBITORY POTENTIAL**

Sarita Khatkar, Bharti Chauhan, Anurag Khatkar
Geeta Institute of Pharmacy, Geeta University,
Naultha, Panipat, Haryana, INDIA
pharma.p1@geetauniversity.edu.in

Diabetes mellitus (DM) is a chronic endocrine and metabolic condition characterized by hyperglycaemic, a condition in which blood glucose level is high. Alpha(α)-amylase enzyme catalyzes the hydrolysis of internal 1,4-glycosidic linkages in starch to produce low molecular weight products like glucose, maltose, and maltotriose units and may be an important target for the management of diabetes. In this study, novel coumaric acid derivatives were designed, synthesized and evaluated for their in-vitro alpha(α)-amylase inhibitory activity. The molecular target chosen for this study was alpha(α)-amylase (PDB id- 4GQR). In-silico results shows that the compounds CA1, CA4, CA2, CA3 and CA5 exhibit the better interactions with docking scores of -8.558 kcal/mol, -8.462 kcal/mol, -8.401 kcal/mol, -7.63 kcal/mol and -7.40 kcal/mol respectively as compared to standard drug (Acarbose-7.4 kcal/mol). These 5 compounds were further synthesized and evaluated for in-vitro alpha-amylase inhibitory activity. Result shows that in comparison to the standard drug (acarbose, 95.803), the majority of synthesised compounds exhibit better α-amylase inhibitory action but compound (99.547) shows best α-amylase inhibitory activity and formed 3 hydrogen bonds with amino acid residues Asp 197, Glh 233 & Asp 356 within alpha(α)-amylase binding site. This study revealed that these derivatives can be utilized as a potent α-amylase inhibitor for the treatment and management of diabetes in future.

**Keywords:** Hyperglycemia; Coumaric acid; Alpha (α)-amylase; In-silico screening.

**STUDY OF TREATMENT OPTIONS AND QUALITY OF LIFE IN GASTROESOPHAGEAL REFLUX DISEASE PATIENTS**

Sarveshwaran A, T Vithya, Praveen Kumar
Department of Pharmacy Practice, Al Ameen College of Pharmacy, Bangalore, India- 560027

In the present study, an assessment of the treatment approaches and quality of life (QoL) among patients diagnosed with Gastroesophageal

ISBN: 978-81-980623-8-3

Reflux Disease (GERD) at St. Philomena's Hospital, Bengaluru, was carried out. GERD is characterised by the backward flow of gastric contents into the oesophagus due to improper closure of the lower oesophageal sphincter, leading to symptoms such as heartburn and regurgitation. The study aimed to document the therapies received, evaluate patient QoL, monitor any adverse drug reactions, and develop a patient information leaflet to support GERD management. A prospective observational design was adopted. Patients above 18 years who were diagnosed with GERD were included after obtaining informed consent and ethical clearance. Data collection involved therapy duration, frequency, route of administration, and adherence. QoL was assessed using the Gastroesophageal Reflux Disease–Health-Related Quality of Life (GERD-HRQoL) scale, while psychological well-being was measured using the Psychological General Well-Being Index (PGWBI). Among the 52 patients enrolled, 59.61% experienced mild heartburn and 13.46% severe heartburn. Mild and severe regurgitation were reported in 67.31% and 9.6% of patients, respectively. PGWBI scoring revealed that 38.46% had poor psychological well-being, 51.92% showed moderate well-being, and 9.61% had high well-being. The findings indicated that GERD significantly affects physical comfort, emotional health, and daily functioning. The majority of patients experienced mild to moderate impairment. The study concludes that pharmacist-led counselling and educational support can improve treatment adherence, symptom understanding, and overall quality of life in GERD patients.

**Keywords:** Gastroesophageal reflux disease, quality of life, GERD-HRQoL, PGWBI, pharmacist intervention.

**PL-637**

**IMPACT OF NUTRITION AND LIFESTYLE ON THE PATHOGENESIS AND CLINICAL COURSE OF INFLAMMATORY BOWEL DISEASE**

Sayali Upare*, Sandip Rahangdale, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India 441002
Sayaliupare18@gmail.com

Dietary patterns and lifestyle behaviours are increasingly recognized as key modulators in the onset, progression and clinical management of inflammatory bowel disease (IBD), encompassing Crohn's disease and ulcerative colitis. IBD is a chronic, relapsing inflammatory disorder of the gastrointestinal tract driven by an aberrant immune response to commensal microbiota in genetically susceptible individuals. Although its aetiology remains multifactorial, accumulating evidence highlights the influence of environmental exposures, particularly diet, on intestinal inflammation. Western-style diets rich in saturated fats, refined sugars and ultra-processed foods are associated with heightened inflammatory responses and increased IBD risk. Conversely, diets abundant in fibre, fruits, vegetables and other plant-based components may support mucosal barrier integrity, promote a favourable gut microbiome and mitigate symptom severity. Therapeutic dietary approaches, including the Specific Carbohydrate Diet and the Mediterranean diet, have demonstrated benefits in select patients, although highly restrictive regimens may pose risks of micronutrient deficiencies. Lifestyle factors such as physical inactivity, smoking, psychological stress, inadequate sleep and excessive alcohol consumption further exacerbate disease activity or precipitate flares. Emerging data also link childhood overweight and underweight status with future IBD susceptibility. Overall, optimizing diet quality alongside regular physical activity represents a feasible strategy for reducing IBD risk and enhancing long-term disease management and quality of life.

**Keywords:** IBD, Diet, Lifestyle

**ANTIDIABATEIC ACTIVITY OF AQUEOUS EXTRACT OF BARLERIA NOCTIFLORA IN STREPTOZOTOCIN INDUCED DIABETIC RATS**

Shaikh Yasmin, Dr. B. A. Vishwanath, Department of Pharmacology
Aditya Bangalore Institute of Pharmacy Education and Research
yasmin@adityapharmacy.in

The present study investigated the antidiabetic activity of the aqueous extract of Barleria noctiflora (whole plant) in streptozotocin-induced diabetic rats. Following Ayurvedic traditions and previous literature, the study involved preparing the leaf extract using ethanol via Soxhlet extraction, conducting phytochemical screenings, and evaluating pharmacological activities with qualitative studies. The extracts underwent in vivo assessment using STZ-induced diabetic wistar albino rats. Phytochemical analysis revealed the presence of alkaloids, glycosides, steroids, flavonoids, tannins, and phenolic compounds in the ethanolic extract. Treatment with 200 mg/kg of the extract led to a substantial reduction in blood glucose levels, with a 43.68% decrease observed by the 28th day. These results indicate the significant hypoglycemic property of Barleria noctiflora extract. The outcome suggests that this extract may serve as an effective agent against diabetes due to its ability to lower glucose levels and its rich phytochemical content, supporting its traditional use. In conclusion, the ethanolic extract of Barleria noctiflora demonstrated marked antidiabetic effects in experimental models, showing promise for further pharmacological exploration.

**Keywords:** Barleria noctiflora, antidiabetic, hypoglycemic, streptozotocin, phytochemicals, wistar albino rats.

**GUT MICROBIAL THERAPY FOR NEUROLOGICAL DISORDERS: CURRENT EVIDENCE AND FUTURE PROSPECTS**

Sharayu Thakur*1 Sandip R. Rahangdale1, Milind J. Umekar1
1Smt. Kishoritai Bhoyar College of Pharmacy, New Kamptee, Nagpur, Maharashtra 441 002, India

Probiotics, defined as live microorganisms that confer health benefits when administered in adequate amounts, have gained increasing attention for their potential role in modulating neurological disorders. Emerging evidence suggests a strong bidirectional communication between the gut and brain, known as the gut–brain axis (GBA), which involves neural, immune, and endocrine pathways. Probiotics influence this axis by restoring intestinal microbiota balance, enhancing the integrity of the gut barrier, and modulating neuroinflammatory responses. Several studies have demonstrated that specific probiotic strains, particularly Lactobacillus and Bifidobacterium species, can produce neuroactive compounds such as γ-aminobutyric acid (GABA) and serotonin, which affect mood, cognition, and stress response. Clinical and preclinical research indicates beneficial effects of probiotics in conditions such as depression, anxiety, autism spectrum disorders, Alzheimer's disease, and Parkinson's disease through mechanisms involving reduced neuroinflammation, oxidative stress, and hypothalamic–pituitary–adrenal (HPA) axis regulation through the modulation of GBA. Although the exact mechanisms and strain-specific effects remain under investigation, probiotics represent a promising, non-invasive therapeutic strategy for managing neurological disorders. Further large-scale, controlled studies are necessary to identify optimal strains, dosages, and treatment durations to translate these findings into effective clinical applications.

**Keywords:** Probiotics, Gut brain axis, Neurological disorders.

**PL-640**

**A STUDY ON THE EFFICACY OF HAEMOCOAGULASE IN ACHIEVING HAEMOSTASIS AND ENHANCING WOUND HEALING ACROSS VARIED BLEEDING CONDITIONS**

Shivakumar K L, Veena H J, Saurabh Patil,
Department of Pharmaceutical Regulatory Affairs, National College of Pharmacy, Shivamogga, Karnataka, India
shivuceutics@gmail.com

Uncontrolled bleeding remains one of the most critical intraoperative and postoperative complications, often leading to morbidity and delayed wound recovery. The present study aimed to evaluate the efficacy of Haemocoagulase, a thrombin-like enzyme derived from Bothrops snake venom, as a topical haemostatic and wound-healing agent in varied bleeding conditions. An exploratory, questionnaire-based study was conducted among 50 medical practitioners, including surgeons, gynaecologists, dentists, and emergency physicians, to assess their clinical experience with haemocoagulase in managing capillary bleeding, tissue oozing, haematoma formation, and withdrawal bleeding. Both primary data (via structured survey) and secondary data (from published literature, AWACS and CMARC market reports) were analyzed descriptively. The results revealed that 90% of the respondents had used haemocoagulase in clinical practice, with over 80% rating it as useful to very useful in managing bleeding and promoting wound healing. A majority of doctors reported rapid hemostasis, reduced bleeding time, and faster tissue repair with minimal adverse effects. Market analysis

ISBN: 978-81-980623-8-3

further indicated an annual growth rate of 9.76% for haemocoagulase formulations, signifying increasing clinical acceptance. The findings suggest that haemocoagulase is an effective, safe, and well-tolerated topical haemostat with additional benefits in enhancing wound healing. Its dual mechanism—promoting fibrin formation and capillary regeneration—offers advantages over conventional agents such as tranexamic acid and etamsylate.

**Keywords:** Haemocoagulase, Batroxobin, Haemostasis, Wound Healing, Capillary Bleeding, Topical Haemostat

**PL-641**

## IMPACT OF SCREEN TIME ON BEHAVIORAL AND PSYCHOSOCIAL FACTORS AMONG RURAL AND URBAN STUDENTS OF MIDADOLESCENT AGE GROUP

Shravan Kumar Dholi, Asna Sabahath, Arsheen Fatima, Ashifa Mirza, Adurugatla Nikkeel Sai
Department of Pharm.D., Vaageswari College of Pharmacy, Karimnagar, Telangana- 505527
drshravankumardholi@gmail.com

The World Health Organization, pediatric societies, and other international organizations advise teenagers to restrict their screen use to two hours per day in light of the negative impacts. The average amount of time spent in front of a screen worldwide in 2024 was six hours and forty minutes. This analytical cross-sectional survey was conducted in rural and urban schools. 500 samples were gathered from both class 9 and class 10, 250 samples were from rural, and 250 from urban. Teachers and students were briefed on the study objectives and the content of the questionnaires. Data was collected through demographic form, screen time, and strength and difficulties questionnaires. The study included 500 participants, 250 from urban schools and 250 from rural classes of 9- 10. The majority had underweighted BMI. Most students reported an effect on their studies due to extreme device usage. Higher scores in emotional problems were seen while evaluating the strength and difficulty quessionnaire. Our study clearly shows that among urban and rural students; the urban population was found to be more addicted to screens compared to the rural. Even though electronics have become increasingly ingrained in our daily lives, either parents or other caregivers should be aware of the advantages and disadvantages thereby establishing rules that encourage responsible multimedia consumption.

**Keywords:** Screen, pediatric, emotional, exposure, conduct, hyperactivity.

**PL-642**

## AN OBSERVATIONAL PROSPECTIVE STUDY ON ANALYSIS OF INFECTIOUS DISEASES AND ANTIBIOTIC USE IN PAEDIATRIC PATIENTS

Shreyash Sonawane, Anshika Gupta,
Arpit Choudhary, Mahendra Patel, Rezy Mathew
Department of Pharmacy Practice, Sri Aurobindo Institute of Pharmacy, Indore, Madhya Pradesh, 453555
shreyash.sonawanephd2024@saip.ac.in

Infectious diseases are a leading cause of morbidity and mortality among paediatric patients worldwide, and the prudent use of antibiotics in this demographic is critical to combat antimicrobial resistance. The purpose of this observational prospective study is to examine the patterns of infectious diseases and antibiotic use in paediatric patients. The investigation was carried out over a 6-month period at Sri Aurobando Institute. Paediatric patients aged 0 to 18 years with infectious illnesses were enrolled. Demographic information, illness type and site, microbiological findings, antibiotic prescriptions, treatment duration, and clinical outcomes were all obtamed. Antibiotic use was evaluated for appropriateness using existing guidelines. The study comprised 100 paediatric patients. The three most prevalent infections were respiratory tract infections, gastrointestinal infections, and urinary tract infections Empirical antibiotic therapy was started in 80% of patients. The majority of antibiotics prescribed were broad-spectrum (60%). Microbiological proof of infection was found in 40% of cases, with viral pathogens being the most common. Inappropriate antibiotic use was detected in 30% of prescriptions, owing to prolonged duration and a lack of de-escalation based on culture results. The study identifies significant patterns in infectious illness and antibiotic prescribing behaviours among paediatric patients. The prevalence of empirical broad-spectrum antibiotic use and improper prescriptions highlight the importance of tailored measures to enhance antimicrobial stewardship. Future efforts should concentrate on improving diagnostic skills, adherence to guidelines, and education on appropriate antibiotic usage in order to enhance patient outcomes and combat resistance.

**Keywords**: Antibiotic, antibiotics resistance, sequential, switch, step-down therapy.

**PL-643**

## A STUDY ON INCIDENCE OF ANXIETY AMONG PREGNANT WOMEN AND ITS MATERNAL AND NEONATAL OUTCOMES

Subhashree Mirgan, T. Vithya, Ruchi Gupta
Department of Pharmacy Practice, Al-Ameen College of Pharmacy, Bengaluru, India
subhashreemirgan@gmail.com

Pregnancy is a sensitive phase characterized by physical, hormonal, and psychological changes that can significantly influence maternal and neonatal outcomes. Among these concerns, antenatal anxiety remains under-recognized despite its association with increased obstetric interventions, post-partum depression, and adverse neonatal outcomes. The present study aimed to determine the incidence of anxiety among third-trimester pregnant women, identify possible risk factors, and evaluate related maternal and neonatal outcomes. This six-months prospective observational study was conducted in the inpatient wards of St. Philomena's Hospital. A total of 75 third-trimester pregnant women without comorbidities were included. Anxiety levels were assessed using the Pregnancy-Related Anxiety Questionnaire Revised Scale (PRAQ-R2). Participants were monitored until discharge after delivery to collect maternal outcomes such as mode of delivery, emergency or elective LSCS, vacuum extraction, and post-partum depression. Neonatal outcomes assessed included preterm birth, low birth weight, respiratory distress, hyperbilirubinemia, and stillbirth. Among the 75 women, 72 (96%) were found to be anxious, with most belonging to the 26–30-year age group. According to PRAQ-R2 subscales, fear of childbirth (65.6%) and concern about appearance (29.5%) were the predominant causes of anxiety. Maternal outcomes commonly observed included emergency LSCS (31.9%) and elective LSCS (18.05%). Neonatal complications recorded were respiratory distress (26.6%), hyperbilirubinemia (17.3%), preterm birth (14.6%), and low birth weight (8%). Significant associations were identified between anxiety and factors such as age group, marital duration, joint family structure, and nulliparity. No significant association was found between anxiety and socioeconomic status or overall maternal and neonatal outcomes.

**Keywords:** Antenatal anxiety, maternal outcomes

**PL-644**

## PREDICTION OF COGNITIVE DYSFUNCTION IN PATIENT HAVING CARDIAC BIOMARKER ABNORMALITY

Sufiya Salwa
Department of Pharmacy Practice, Al-Ameen College of Pharmacy, Hosur Road, Bengaluru – 560027
sufiyasalwa@gmail.com

The present study aimed to investigate the relationship between cardiac biomarkers and cognitive function in patients diagnosed with acute cardiac conditions. Cardiovascular diseases (CVDs) remain a global health concern, often affecting not only cardiac but also cerebral physiology. Biomarkers such as N-terminal pro-brain natriuretic peptide (NT-proBNP) and Troponin, which reflect cardiac stress and injury, may provide valuable insights into cognitive risk among hospitalized patients. However, limited evidence exists on their predictive value in the Indian population. A nine-month prospective observational study was conducted at St. Philomena's Hospital, Bengaluru, enrolling 54 patients aged 18–60 years diagnosed with either Acute Coronary Syndrome or Heart Failure. Patients' demographic details, medical history, and clinical findings were recorded, and cognitive function was assessed at admission using a standardized cognitive dysfunction assessment scale. Cardiac biomarkers NT-proBNP and Troponin were measured, and data were analyzed using Pearson's correlation to evaluate associations with cognitive status.Of the 54 patients, 62.96% were male, and the majority belonged to the 51–60 years age group. Overall, 50% of patients exhibited normal cognition, 42.59% had mild cognitive impairment, and 7.41% showed severe impairment. Abnormal Troponin and NT-proBNP

ISBN: 978-81-980623-8-3

levels were found in 87.04% and 57.41% of patients, respectively. Elevated biomarker levels indicated trends toward poorer performance in executive and attention domains; however, the correlations with global cognition were weak and statistically non-significant (NT-proBNP: r = –0.05, p = 0.710; Troponin: r = 0.00, p = 0.992). Cognitive impairment was more common among older, unemployed patients and those with comorbidities such as hypertension and diabetes. The findings suggest a nuanced, domain-specific association between cardiac biomarkers and cognitive function rather than a strong linear relationship with global cognitive decline. Elevated NT-proBNP and Troponin may indicate susceptibility in select cognitive domains, but other factors including age, employment status, and comorbidities significantly influence cognitive outcomes. Further longitudinal studies are warranted to clarify the mechanistic pathways linking cardiac dysfunction with cognitive decline.

**Keywords**: Cardiac Biomarkers, NT-proBNP, Troponin, Cognitive Dysfunction, Cognitive Decline, Heart Failure, Acute Coronary Syndrome

## ADVANCES IN TISSUE REGENERATION: TRANSFORMING THERAPEUTIC PARADIGMS IN MODERN MEDICINE

Sumit D. Kolse, Wasim G. Shaikh, Amol D. Landge
Shram Sadhana Bombay Trust, Institute of Pharmacy, Bambhori, Jalgaon
Department of Pharmaceutics, Dr. Babasaheb Ambedkar Technological University, Lonere, India

Tissue regeneration is a new and advanced field in medicine and pharmaceuticals that offers powerful ways to repair damaged or diseased tissues. Unlike regular treatments that only reduce symptoms, regenerative medicine helps the body use its own natural healing ability to rebuild healthy and working tissue. As India faces more chronic diseases, age-related problems, and other long-term health issues, tissue regeneration is becoming very important. This review explains different methods used for tissue repair, such as stem cell therapies that use special cells capable of becoming new tissue, 3D scaffold materials that act like a support structure similar to the body's natural tissue framework, controlled delivery of growth factors that release healing signals slowly and accurately, gene therapy that improves the body's healing abilities by modifying specific genes, and medicines that reduce inflammation to create a supportive environment for tissue repair. The pharmaceutical industry plays a major role in making sure these treatments are properly developed, tested, and meet safety and quality standards. These methods show great success in many medical areas for example, heart regeneration can repair heart tissue after a heart attack, skin substitutes can completely heal long-lasting diabetic wounds, and bone or cartilage regeneration can reduce the need for joint replacement surgeries. This approach shifts the focus from just managing disease to actually curing it, reducing long-term healthcare costs and improving the quality of life. For India, developing regenerative treatments within the country provides both a strong healthcare benefit and an economic opportunity. As personalized regenerative medicine grows with treatments designed according to a person's genetic makeup pharmaceutical science will lead this major medical change, working toward the ultimate goal: fully restoring health and normal function for people who are suffering.

## EXPLORING ENDOPHYTIC DIVERSITY IN SCHLEICHERA OLEOSA FOR NOVEL ANTIBACTERIAL AGENTS

1Swati Thakare and 2Dr Praveen Tahilani
1,2School of Pharmacy, SAGE University, Bhopal, Madhya Pradesh, India – 462043
sweety.ingle@gmail.com

Endophytic fungi inhabiting medicinal plants are increasingly recognized as prolific producers of bioactive secondary metabolites with pharmaceutical potential. The present study emphasizes the isolation, characterization, and antibacterial evaluation of endophytic fungi associated with Schleichera oleosa (Kusum tree), a species native to the forests of Jhabua district, Madhya Pradesh. Healthy tissues including leaves, stems, bark, and roots were surface sterilized and processed under aseptic conditions to recover fungal isolates. Pure cultures were established on potato dextrose agar and maintained for subsequent screening. From Schleichera oleosa, sixteen distinct fungal isolates were successfully obtained, each coded systematically for identification. These isolates are being subjected to antibacterial screening against pathogenic bacteria to assess their therapeutic potential. Optimization of growth conditions is underway to maximize metabolite yield, followed by molecular characterization to identify promising strains. Purification and chemical profiling will further elucidate the nature of active compounds responsible for antibacterial activity. The study aims to highlight Schleichera oleosa as a valuable host for endophytic fungi capable of producing novel antibacterial metabolites. Such findings not only contribute to the discovery of plant-derived therapeutic agents but also provide a sustainable approach to combating antimicrobial resistance. By focusing on a single host species, this research underscores the importance of targeted exploration of endophyte–plant interactions in drug discovery.

**Keywords:** Antibacterial agents, Endophytic Fungi, Schleichera oleosa and Secondary Metabolites

## ANTIBIOTIC PRESCRIBING PATTERNS IN ICU'S: A REVIEW OF COMPLIANCE WITH ANTIMICROBIAL STEWARDSHIP PROGRAM GUIDELINES

SYED MUBASHEER ALI
MOONRAY INSTITUTE OF PHARMACEUTICAL SCIENCES, RAIKAL, SHADNAGAR

The administration of antibiotics in Intensive Care Units (ICUs) is vital for influencing patient outcomes; however, this intense pressure environment is particularly susceptible to inappropriate prescribing practices. The necessity of rapidly addressing the needs of critically ill patients often requires the swift initiation of empirical treatment, which may result in departures from established Antimicrobial Stewardship (AMS) protocols. This review analyses current patterns of antibiotic prescribing in ICUs, highlighting frequently utilized classes of antibiotics and the complex relationship between empirical and targeted therapeutic strategies. It also evaluates adherence to ASP guidelines, pinpointing common challenges such as extended treatment lengths, unnecessary use of broad-spectrum antibiotics, and inadequate implementation of de-escalation strategies. A significant challenge in optimizing therapy is the limited use of rapid diagnostic tools, which delays the identification of pathogens and prolongs the use of empirical antibiotics. The adoption of rapid diagnostics like molecular assays and point-of-care testing improves the prompt and precise identification of infectious agents, allowing for earlier de-escalation and tailored treatment. These innovations lead to better clinical outcomes and a decrease in antimicrobial overexposure. The review additionally examines various factors influencing ASP compliance, such as clinician behaviour and systemic obstacles, and highlights effective strategies such as clinical decision support systems, and multidisciplinary ASP teams. Our study highlights the urgent need for strengthened ASP integration into ICU practices, supported by routine surveillance, education, and multidisciplinary collaboration. Enhancing adherence to ASP guidelines not only preserves antibiotic efficacy but also improves patient outcomes and reduces healthcare costs. Greater emphasis on evidence-based prescribing, along with robust monitoring systems, is crucial in curbing AMR and ensuring sustainable critical care management.

## INTERPRETATION OF THE MULTI-TARGET MECHANISM OF VIDANGADI CHURNA IN OBESITY: A NETWORK PHARMACOLOGY APPROACH

Tanishka Tare, Aniket Karmase and Vishal Gokul Beldar
Department of Pharmacognosy, School of Pharmacy & Technology Management, SVKM's, Narsee Monjee Institute of Management Studies, Shirpur Campus, Shirpur, 425405, Maharashtra, India
Tanishka.tare026@nmims.in

Obesity continues to be a significant worldwide health issue, requiring novel therapeutic strategies. Ayurvedic medicine, characterized by its

ISBN: 978-81-980623-8-3

multi-targeted and integrative features, presents viable solutions. This research uses a network pharmacology approach to clarify the mechanisms by which ayurvedic medicine treats obesity. This approach integrates bioinformatics, systems biology, and cheminformatics to identify possible active phytoconstituents, forecast therapeutic targets, and delineate complex interactions within biological networks. To identifying the potential protein targets associated with Vidangadi Churna, the SwissTargetPrediction, SEA database, STITCH database, and Drug Binding database were employed. To ascertain disease-associated targets, the databases DisGeNET, GeneCards, OMIM, HPO, and MalaCards were utilized, which were subsequently instrumental in the construction of the drug–disease network. The constructed network was further analysed in Cytoscape software. Top gene identification was carried out, and the top 10 targets were obtained including GAPDH, AKT1, TP53, IL6, TNF, SRC, ALB, CTNNB1, EGFR, STAT3. The results highlight 2,275 target genes were identified for Vidangadi Churna, while 9,453 disease-associated genes were obtained; the intersection revealed 965 common target genes. Further analysis of network using the degree method, top 10 targets were identified and utilized for the further molecular docking studies using Schrodinger software. The docking results suggest that most of the phenolic and flavonoid molecules are majorly responsible for the pharmacotherapeutic property of the Vidangadi Churna.

## PROBIOTICS AND GASTROINTESTINAL DISORDERS: CURRENT EVIDENCE AND THERAPEUTIC POTENTIAL

Tanushree Kannamwar*, Sandip Rahangdale,
Nitu Wankhede, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur,
Maharashtra, India 441002
tanushreekannamwar@gmail.com

Microbes residing in the human intestinal tract influence host physiology and health. Probiotics, defined as live microorganisms that confer health benefits when consumed in adequate amounts, help modulate this intestinal microbial balance. They are increasingly used as adjunct therapy in gastrointestinal disorders such as inflammatory bowel disease, antibiotic-associated diarrhea, and irritable bowel syndrome, where they help reduce inflammation, diarrhea, bloating, abdominal pain, and irregular bowel habits. Although their exact mechanisms are not fully understood, probiotics exert beneficial effects through several established pathways. These include competitive exclusion of pathogens by competing for adhesion sites and nutrients, production of antimicrobial compounds, improvement of epithelial barrier integrity, and modulation of immune responses. Such actions support restoration of gut homeostasis and improve overall GI symptoms and patient quality of life. Commonly used probiotic strains belong to Lactobacillus, Bifidobacterium, and Saccharomyces. However, limitations include poor survival in the acidic and enzymatic environment of the gastrointestinal tract, competition with native microbiota, strain-specific variability, and lack of standardized dosing. Safety concerns also persist in infants and immunocompromised individuals, along with the potential for antibiotic resistance gene transfer. Despite these challenges, probiotics remain a promising adjunct to conventional therapy for restoring gut microbial balance to improve gut health.

**Keywords:** Probiotics, GI disorder, Gut health.

## EXPLORING THE MOLECULAR MECHANISMS OF PHYTOCONSTITUENTS FROM FAGONIA CRETICA AGAINST ALZHEIMER'S DISEASE USING NETWORK PHARMACOLOGY APPROACH AND MOLECULAR DOCKING

Mr. Tejas Gholap, Dr. Aniket Garud and Dr. Niraj Vywahare
Department of Pharmacology, Dr. D.Y. Patil College of Pharmacy,
Akurdi, Pune-411044
tejasgholap0109@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder characterized by amyloid-β aggregation, tau hyperphosphorylation, and cholinergic dysfunction. This in-silico study investigated the multi-target therapeutic potential of novel phytoconstituents from Fagonia cretica against AD using network pharmacology and molecular docking. Nineteen compounds were retrieved from IMPPAT and PubChem, of which nine were shortlisted, and their putative targets were predicted using SwissTargetPrediction. A total of 600 AD-associated genes were collected from GeneCards, CTD, and DisGeNET based on high inference scores. The overlapping targets (n = 68) were identified using Venny 2.0 and further analyzed using STRING to construct the PPI network, where ABCC1 and ABCC2 exhibited the highest degree of interaction. Functional enrichment analysis (GO and KEGG) revealed significant enrichment in pathways such as response to amyloid-β (GO:1904645, FDR = $1.29 \times 10^{-17}$), Alzheimer's disease (hsa05010; 40/354 genes, FDR = $1.38 \times 10^{-5}$), and amyloid-β binding (GO:0001540; 21/84 genes, FDR = $3.71 \times 10^{-22}$). Based on centrality measures and druggability, AChE and BACE1 were selected as core targets. Molecular docking using AutoDock Vina demonstrated that novel phytoconstituents such as hederagenin **(**AChE −7.666 kcal/mol, ; BACE1 −6.92 kcal/mol), nahagenin (AChE −7.96 kcal/mol; BACE1 −7.02 kcal/mol), and oleanolic acid (AChE −7.923 kcal/mol; BACE1 −6.190 kcal/mol) exhibited favourable binding affinities toward both targets. Overall, the findings indicate that these compounds may exert dual modulation of amyloidogenesis and cholinergic signalling. Experimental validation is warranted to confirm these computational predictions

**Keywords**: Alzheimer's disease, Fagonia cretica, network pharmacology, molecular docking, phytoconstituents, AChE, BACE1.

## NETWORK PHARMACOLOGY AND MOLECULAR DOCKING STUDIES OF PHYTOCONSTITUENTS OF JUGLANS REGIA ELUCIDATES MULTI-TARGET THERAPEUTIC MECHANISMS AGAINST ALZHEIMER'S DISEASE

Tejas Gunjal, Smita Jain, Saurabh Maru*
Department of Pharmacology, School of Pharmacy & Technology Management, SVKM'S NMIMS Deemed-to-be University,
Shirpur, Maharashtra 425405
tejasgunjal120@gmail.com

Alzheimer's disease (AD) is a multifactorial neurodegenerative disorder characterized by cognitive decline and hallmark pathological features including amyloid-beta plaques and neurofibrillary tangles. In this study, we applied a comprehensive network pharmacology approach integrated with molecular docking to investigate the potential therapeutic effects and molecular mechanisms of Juglone in AD. Target prediction databases were utilised to identify proteins associated with juglone, which were then intersected with AD-related target genes to construct a drug target network. Protein-protein interaction (PPI) networks were analysed to identify hub proteins critical in AD pathology. Gene ontology (GO) and KEGG pathway enrichment analyses revealed the significant involvement of Juglone targets, including MAP2K1, BACE1, GSK3B, CHRM1, CASP9, CASP3, PTGS2, MAPK8, SNCA, MAPK10, CHRNA7, and NAE1, in neuroinflammatory responses, oxidative stress regulation, apoptotic signalling, and amyloid-beta metabolic processes. High-throughput molecular docking simulations demonstrated strong binding affinities of Juglone with key AD-related proteins, such as MAP2K1, BACE1, GSK3B, CASP9, CASP3, MAPK8, MAPK10, CHRNA7, and NAE1, supporting its multi-target inhibition potential. This integrative investigation underscores Juglone's therapeutic promise by modulating multiple pathogenic pathways in AD, providing a scientific basis for its development as a novel multi-target agent. Further in vitro and in vivo studies are essential to validate these in silico findings and explore Juglone's clinical applicability.

## PHARMACOLOGICAL EVALUATION OF METHANOLIC EXTRACT OF AERIAL PARTS OF HELICANTHES ELASTICA (DeCr) DANSER FOR ITS AND NEPHRO PROTECTIVE ACTIVITY

V.Dharshini , T.Karthiyayini ,V.Ganesan
Department of Pharmacognosy, Pannai college of Pharmacy,
Dindigul, Tamilnadu-624005
dharshu2123dharshu@gmail.com

Kidney diseases are a major problem of worldwide proportion. A large number of herbs have been used traditionally to treat kidney diseases caused by various agents. The present study was a similar attempt in that direction. Helicanthes elastica is a less explored Indian mistletoe.

ISBN: 978-81-980623-8-3

Methanolic extract of Helicanthes elastica(MHE) was evaluated for antiurolithiatic and nephroprotective activity in Wistar rats. For antiurolithiatic study, male Wistar rats were selected and ethylene glycol (0.75%v/v) in drinking water was fed to all the groups except normal control for 28days to induce urolithiasis for preventive and curative regimen. Cystone 750mg/kg was used as the standard drug. Various renal functional and injury markers such as urine volume, calcium, magnesium, serum creatinine, serum uric acid and blood urea nitrogen were evaluated in urine and serum samples. The result indicated that administration of MHE significantly reduced and prevented the growth of urinary stones. Histopathological studies also supported the result. In nephroprotective study. Wister rats of either sex selected and renal toxicity was induced by administering cisplatin 5mg/kg i.p. on first day. From day 2 to day 14 animals of all groups were administered with MHE. Cisplatin induced renal damage is clearly evidenced by the elevated levels of serum markers like urea, creatinine and uric acid. The treatmenht with the extract regained the elevated levels of renal injury markers in serum to normal levels. Histopathological reports also supported the result. The study suggests that the MHE offers protection against ethylene glycol induced Urolithiasis and cisplatin induced nephrotoxicity.

**Keywords:** Helicanthes elastica, Urolithiasis, Nephrotoxicity, Nephro protection, Cisplatin.

## A PATIENT-CENTRIC HEALTHCARE NAVIGATION AND EMERGENCY RESPONSE APPLICATION

VIKRAM BHUSNAR
Trinity College of pharmacy pune

Access to reliable healthcare services in India is often hindered by fragmented information, difficulty in locating specialized hospitals, and delays in emergency response. With the increasing penetration of smartphones, there is an opportunity to bridge this gap through a unified, patient-friendly digital platform. To design and develop an intuitive healthcare application that integrates hospital navigation, pharmacy access, emergency response, and patient health management into a single user-friendly platform. The application employs a social-media-like interface to enhance usability. The homepage provides categorized listings of nearby hospitals based on specialization, along with details of doctors and pharmacy outlets. A search bar allows users to quickly locate healthcare providers or drugs, and appointments can be booked directly through the app. An interactive map feature, inspired by real-time navigation tools, enables patients to view nearby hospitals, access directions, contact facilities, and book consultations seamlessly. The profile section maintains patient health records, past appointments, insurance schemes, and includes a blood donation registry. Additionally, an integrated first aid and emergency module allows instant ambulance booking and access to emergency contacts. The application successfully combines healthcare access, navigation, and emergency management within a single digital ecosystem. Unlike conventional hospital apps, this innovation provides real-time, location-based integration of hospitals, pharmacies, and emergency services in a format familiar to users (social media-like design), ensuring higher adoption and usability. This application demonstrates a novel approach to digital healthcare by merging hospital accessibility, pharmaceutical availability, patient data management, and emergency support into a single, easy-to-use platform. The project has the potential to significantly improve patient outcomes by reducing delays in accessing critical care and creating a more connected healthcare ecosystem in India.

**Keywords**: Digital Healthcare, Emergency Response, Hospital Navigation, Pharmacy Access, Patient-Centric App, Healthcare Innovation

## CLINICAL SURVEY ON PREVALENCE AND RISK FACTORS OF OCCUPATION-INDUCED BRONCHIAL CHALLENGES IN BENGALURU ECO GUARDIANS

ABINAYA SANGAVI A
The oxford college of pharmacy

Street sweepers have a significant risk of occupational respiratory diseases due to prolonged exposure to dust and bioaerosols. This study determined the prevalence of bronchial dysfunction and associated risk factors among eco-guards in Bengaluru. A cross-sectional survey of work-related bronchial problems among 130 eco guardians was performed using a structured KAP questionnaire (Knowledge, Attitude, and Practice) and pulmonary function tests. Description and inferential statistics were performed on the data. The majority of eco-guardians were women (63.08%), with a mean age of 43.6 years. Although 96.92% of the participants recognised the risk of dust exposure, protective practices were poorly implemented; 80% of participants did not consistently use masks or gloves, and none practised breathing exercises or inhalers. Most workers (86.15%) reported respiratory symptoms (cough, wheezing, shortness of breath, tightness of chest, runny or stuffy nose, sneezing) and the spirometry indicated abnormal FVC for 64.62% and impaired FEV1 for 70.77% of participants, with many exhibiting mild to moderate obstruction. The findings indicate an important occupational health issue due to the difference between knowledge and protective action. Occupational dust exposure in street sweepers is problematic for respiratory health. These findings highlight the need for urgent health education, provision of protective clothing and equipment, and municipal policies that ensure structured training and routine screening on health and wellness to protect this vulnerable workforce.

## COMPARATIVE EFFICACY AND COST-EFFECTIVENESS OF BUDESONIDE VERSUS MOMETASONE IN ALLERGIC RHINITIS: BETTER -STUDY

Akhil Arun, M Swetha Lakshmi1, Chandre Gowda B V2, Beulah Milton3
Department of Pharmacy Practice, Krupanidhi College of Pharmacy12/1, Chikka Bellandur, Carmelaram Gunjur Road, Hobli, off Sarjapur Road, Varthur, Bengaluru, Karnataka 560035.
akhilarun1997@gmail.com

Allergic Rhinitis (AR) is a highly prevalent IgE-mediated condition affecting quality of life and productivity. Intranasal corticosteroids (INCS) remain the choice of therapy for moderate-to-severe AR. This study evaluates the comparative efficacy, safety, and cost-effectiveness of Budesonide and Mometasone furoate nasal sprays. To determine which nasal spray offers better symptom control, quicker onset of action, and greater cost-effectiveness in patients with allergic rhinitis.A prospective, open-label, randomized study involving 100 AR patients was conducted at MVJ Medical College, Bangalore. Patients were randomised into two groups using web-based sequences: Group A Received Budesonide (256 µg BD) and Group B received Mometasone (200 µg BD) for six weeks. Efficacy was evaluated using the Total Nasal Symptom Score (TNSS) at 2, 4, and 6 weeks. Cost-effectiveness was assessed using the R.4.4.2 version. Both groups showed significant symptom reduction ($p<0.001$), but Budesonide led to faster relief (Mean onset: 5.08 weeks vs. 8.60 weeks, $p<0.001$) and greater TNSS reduction (4.50 vs. 3.08). Budesonide was also more cost-effective, with a cost per unit symptom improvement of INR 134 vs. INR 196.75 for Mometasone. Adverse events were minimal and comparable between groups. While both INCS options are effective and well-tolerated, Budesonide offers quicker symptom relief and superior cost-effectiveness. It can be recommended as a preferred option, especially in settings where affordability and rapid response are critical.

**Keywords:** Allergic rhinitis, Budesonide, Mometasone furoate, Cost-effectiveness, Intranasal corticosteroids.

**PL-656**

## ROLE OF CLINICAL PHARMACISTS IN REDUCING POLYPHARMACY AMONG ELDERLY PATIENTS

Anitha. I, M. Prasad Rao
Department of Pharmacy Practice, Medaramtla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet,
Andhra Pradesh, India-522601
bramhaiahitla375@gmail.com

Polypharmacy, commonly defined as the concurrent use of five or more medications, is a prevalent concern among elderly patients due to multiple co morbidities and age-related physiological changes. This practice significantly increases the risk of adverse drug reactions, drug–drug interactions, non-adherence, hospitalization, and reduced quality of life. Clinical pharmacists, as integral members of the healthcare team,

ISBN: 978-81-980623-8-3

play a pivotal role in addressing this challenge by ensuring rational pharmacotherapy. Through comprehensive medication reviews, identification of potentially inappropriate medications, deprescribing strategies, and patient counseling, clinical pharmacists contribute to optimizing drug therapy and improving patient safety. Collaborative interventions between clinical pharmacists, physicians, and other healthcare providers foster evidence-based prescribing and enhance therapeutic outcomes. Furthermore, pharmacists provide education on correct drug use, promote adherence, and monitor therapeutic effectiveness, thereby reducing the clinical and economic burden of polypharmacy. Studies have shown that pharmacist-led interventions significantly decrease medication-related problems and healthcare utilization in geriatric populations. The proactive involvement of clinical pharmacists not only supports safe medication practices but also empowers elderly patients through better understanding of their treatment regimens. This emphasizes the essential role of clinical pharmacists in reducing inappropriate polypharmacy, improving clinical outcomes, and promoting patient-centered care in elderly populations. Integrating clinical pharmacy services into routine geriatric care is crucial for ensuring medication safety, enhancing quality of life, and fostering a sustainable healthcare system.

## XYLOPIA AETHIOPICA FRUIT MACERATE INHIBITS CARRAGEENAN-INDUCED PLEURISY IN RATS

Anuraj S. Kashyap, Gnatoulma Katawa, Fagdéba David Bara, Foulounanna Daria, Pélagie Edlom Tchadie, Tégmaba Gnodja, Kathrin Arndts, Komlan Batawila and Manuel Ritter
NETES Institute of Pharmaceutical Science, Nemcare Group of Institutions, Mirza, Kamrup, Assam-781125
anurajkashyap07@gmail.com

Pleurisy is an inflammatory condition of the pleura that can lead to severe morbidity and mortality. It is very necessary to control Pleural inflammation as it can lead to fluid buildup (pleural effusion), air in the pleural space (pneumothorax), or pus (empyema), which can lead to lung collapse, sepsis, or shock. Xylopia aethiopica, known for its anti-inflammatory properties, may be a potential treatment. This study evaluates its immunological mechanisms and toxicological impact. Wistar rats were pre-treated with either chloroquine or X. aethiopica fruit macerate before carrageenan-induced pleurisy. Interleukin-6 (IL-6) and Tumor Necrosis Factor-Alpha (TNF-α) levels were measured in blood and pleural exudate via sandwich ELISA. Leukocyte counts were also assessed. Acute and subacute toxicity profiles of the macerate were evaluated in rats. Carrageenan injection induced an inflammatory condition, resulting in increased local and systemic TNF-α and IL-6 levels, with increased leukocyte influx in the pleural cavity. X. aethiopica macerate significantly reduced systemic ($p=0.0026$) and local ($p=0.0004$) TNF-α levels, comparable to chloroquine. No acute toxic effects were observed within 48 hours or 14 days. A 28-day oral administration did not induce behavioral changes, and biochemical analyses suggested safety at studied doses. However, histological analyses revealed vascular congestion and inflammation in the liver and kidneys. X. aethiopica macerate exhibits significant anti-inflammatory effects, supporting its potential as a pleurisy treatment. Further research is needed to confirm its clinical applications.

**Keywords**: anti-inflammatory activity, Pleurisy, Toxicity, Xylopia aethiopica Fruit Macerate

## PHYSIOTHERAPY AND LIFESTYLE MODIFICATION INTEGRATED TO HEALTH: A PHARMACOLOGICAL PERSPECTIVE

Harshal Lalwani, Tanmay Singh & Archita J. Singh Hani
Amity University, Amity Institute of Pharmacy, Raipur, Chhattisgarh

Physiotherapy and lifestyle modification have emerged as cornerstone strategies in the prevention and management of chronic diseases, offering a non-pharmacological complement to conventional drug therapy. From a pharmacological standpoint, both approaches can be envisioned as "biological interventions" that modulate the body's internal environment much like pharmacokinetic and pharmacodynamic processes. For instance, physiotherapy interventions such as exercise and posture correction influence cardiovascular efficiency, glucose metabolism, and neuromuscular coordination in ways comparable to drug mechanisms targeting the same systems. Lifestyle modifications—healthy nutrition, stress management, and regular activity—further act synergistically with pharmacological therapies, optimizing drug absorption, distribution, metabolism, and excretion (ADME) by improving organ function and reducing metabolic stress. This integration promotes rational therapeutics, minimizes drug doses and side effects, and enhances overall health outcomes. Thus, viewing physiotherapy and lifestyle changes through a pharmacological lens reveals their role as "natural therapeutics," redefining modern healthcare by merging pharmaceutical sciences with holistic wellness strategies.

**Keywords**: Physiotherapy, Lifestyle Modification, Pharmacological Integration, ADME, Non-Pharmacological Therapy, Preventive Healthcare

**PL-659**

## EVALUATION OF A TOPICAL NANO PREPRATION CONTAINING METHOTREXATE AND LYCOPENE AGAINST ADJUVANT INDUCED ARTHRITIS IN RATS

Asbah Fathima, Dr. Rama.R.Nargund,
Dr. Shachindra L. Nargund, Dr. Malviya Nidhi
Pharmacology, Nargund College of Pharmacy, Bangalore-560085
asbahfathima7@gmail.com

The present study was designed to formulate and evaluate a methotrexate-loaded nanoemulgel for topical management of rheumatoid arthritis. Methotrexate nanoemulsions were prepared using high-energy methods including high-speed stirring and homogenization. Lycopene oil served as the oil phase, Tween 80 as surfactant, and PEG 400/Span 80 as co-surfactant. Eight nanoemulsion formulations (F1–F8) were developed and assessed for particle size, zeta potential, polydispersity index (PDI), pH, and stability. Optimized formulations were incorporated into Carbopol 940 gel base due to its low viscosity and high spreadability, yielding a nanoemulgel with good homogeneity and physical properties. In vivo anti-arthritic activity was evaluated in FCA-induced arthritic rats, where methotrexate was administered topically for 28 days. Parameters assessed included body weight, paw volume, paw thickness, hematological (Hb, WBC, RBC, ESR), biochemical (CRP, RF), and histopathological markers. The optimized nanoemulgel exhibited particle size of 98.30 nm, zeta potential of -29.7 mV, and drug content of 97.9%. In vitro release followed zero-order kinetics with anomalous non-Fickian diffusion, and stability studies confirmed consistency in viscosity, spreadability, pH, and drug content after one month. Significant reductions in paw volume and thickness ($P<0.001$) were observed from day 14 to day 28, along with normalization of hematological and biochemical parameters compared to arthritic controls. Histopathological findings further supported therapeutic efficacy. Methotrexate nanoemulgel demonstrated excellent stability, sustained release, and potent anti-arthritic activity, making it a promising topical delivery system for both prophylactic and curative treatment of rheumatoid arthritis.

**Keywords:** Methotrexate, Nanoemulsion, Nanoemulgel, Rheumatoid arthritis, Carbopol 940, Anti-arthritic activity.

## MEDICATION RISK MANAGEMENT IN PATIENT: DRUG DISPENSING CENTER

Shraddha G. Gawad, Miss. Snehal K. Bhaladhare,
Diksha Bhimte, Bhumeshkumar E. Wanjari
Shri Gurudev Institute of Pharmaceutical Education and Research, Chulod, Gondia

The assurance of medication safety and efficacy are critical component in healthcare delivery with drug dispensing centers playing a pivotal role in this process. This research explores the implementation and impact of Quality Risk Management within patient drug dispensing centers, emphasizing its significance in minimizing medication errors, ensuring regulatory compliance and enhancing patient safety. QRM provides a systematic approach to identifying, assessing, controlling and reviewing risks associated with drug dispensing activities, aligning with standards outlined in the World Health Organization and International Council for Harmonization. Key risk factors identified include human error, improper labeling, storage deficiencies and workflow inefficiencies. The

ISBN: 978-81-980623-8-3

implementation of QRM tools such as Failure Mode and Effects Analysis, Risk Ranking and Filtering, and Root Cause Analysis proved effective in proactively addressing these vulnerabilities. Findings indicate that structured QRM frameworks not only reduce the incidence of dispensing errors but also foster a culture of continuous improvement and accountability among pharmacy staff. Furthermore, integrating QRM into standard operating procedures enhances decision-making, resource allocation and stakeholder confidence. This study underscores the necessity for regulatory bodies and healthcare institutions to mandate QRM adoption as an integral part of pharmaceutical service delivery. In conclusion, quality risk management is an essential strategy for optimizing safety and operational excellence in drug dispensing centers.

**IN VIVO SCREENING OF ANALGESIC AND ANTIULCER ACTIVITY ON CARUM CARVI SEEDS**

D. Phanisree, V. Swathi
Department of Pharmacology, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, A.P., India-521108
phanidagam123@gmail.com

The present study was designed to investigate the antiulcer and analgesic potential of carum carvi seeds. caraway seeds use is common in diet, so there is no need for special administration of the drug and by little increase in intake quantity, the use of analgesics is abolished. Antiulcer activity was also evaluated by aspirin induced ulcer models. Effect of concurrent administration of ethanolic and aqueous extracts of seeds extract Carum carvi at a dose of 100 and 200 mg/kg b.w. respectively was given by oral route. Ethanolic and aqueous extracts of Carum carvi seeds significantly reduction in gastric content, total acidity, ulcer index, and increase in pH of gastric pylorus ligation ulcer model. In comparison with the standard drug, the results of hydro alcoholic extract at 100 mg dose showed good analgesic & at 200 mg dose showed antiulcer activity compared with a standard drug. Extracts of Carum carvi may be useful as a natural analgesic in the treatment of ulcer, inflammation, and pain.

A relatively easy and predictable High Performance Thin Layer Chromatographic technique designed was presented to identify bacoside A in Bacopa monnieri as well nardosinone in Nardostachys jatamansi. In addition, physicochemical and phytochemical evaluation of the two herbs taken in present study was also done. FTIR spectroscopy was used to further standardize the active ingredients. Both of these herbs have long been used in a variety of medical procedures and are widely recognized for their therapeutic qualities. The components using the High Performance Thin Layer Chromatography, were isolated upon stationary phase, which included silica gel GF254 pre-coated. Solvent mixture used was made of Methanol, Toluene, Ethyl Acetate and Glacial Acetic Acid (3:3:4:1v/v). Absorbance peak at 540 nm was scanned and quantified for detection of both bacoside A as well nardosinone. The linearity, accuracy, along with precision of the approach demonstrated was also confirmed. Also, in-vitro oxidation scavenging potency of ethanolic extract of both the herbs in terms of DPPH free-radical hunting, hydrogen peroxide and FRAP activity, was also tested. From the study presented, it can be inferred that, Bacoside A in B. monnieri and Nardosinone in Nardostachys jatamansi herbal extracts may be identified, evaluated, and quantified using the suggested approach, which was proven to be accurate as well sensitive.
**Keywords:** HPTLC, ATR-FTIR, DPPH, Bacoside A, Nardosinone

**PL-663**

**EFFECTS OF PHARMACIST-LED INTERVENTION ON QUALITY OF LIFE AND CLINICAL OUTCOME AMONG COPD PATIENTS IN NEPAL**

Gulam Muhammad Khan
Pharmaceutical Sciences Program, School of Health and Allied Science, Pokhara University, Pokhara, Kaski, Nepal
gulamkhan@pu.edu.np

Chronic obstructive pulmonary disease (COPD) is a progressive lung condition characterized by persistent airflow obstruction that cannot be fully reversed. As the number of COPD cases continues to rise globally, including in Nepal, there is a pressing need to enhance the quality of life (QoL) for affected individuals through various interventions. The objective of this study was to assess the QoL and clinical outcomes among COPD patients attending hospitals before and after pharmacist's intervention. An interventional study was conducted to evaluate the impact of the pharmacist-led intervention on both QoL and clinical outcomes among adult COPD patients. Structured questionnaires were administered before and after the intervention at the Medicine OPD ward of GP Koirala National Centre for Respiratory Disease, Dulegaunda, Tanahun, Nepal. The intervention technique consisted of counseling sessions conducted by pharmacists and the distribution of informative leaflets to patients. Following a one-month period, patients were re-evaluated using the same questionnaire to measure changes in QoL and clinical outcomes. Pharmacist intervention significantly enhanced QoL and clinical outcomes. This study underscores the potential for pharmacists to play a crucial role in improving overall clinical outcomes, particularly among individuals managing chronic conditions.

**"EFFECTIVENESS OF TREATMENT STRATEGIES IN REDUCING PAIN AND IMPROVING MOBILITY IN ADULT AND ELDERLY ORTHOPAEDIC PATIENTS"**

Kalyani Yadav, Sonam Chaturvedi, Supriya Sarkar,
Vivek Verma, Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore (M.P.) 453555
kalyaniky28@gmail.com

Orthopaedic disorders such as osteoarthritis, fractures, and ligament injuries are common causes of pain and impaired mobility. These conditions significantly affect quality of life, particularly in the aging population. Effective pain management and functional recovery require integrated, multidisciplinary approaches combining pharmacological and supportive therapies.A six-month prospective observational study was conducted in the Department of General Medicine, Sri Aurobindo Hospital, Indore. Sixty inpatients aged 20–60 years were enrolled based on predefined criteria. Data were collected through patient interviews, medical records, and prescription reviews. Pain and mobility were assessed using the Numerical Pain Rating Scale (NPRS) and Visual Analogue Scale (VAS). Associations between treatment adherence and outcomes were analyzed using the chi-square test. All patients showed notable improvements in pain and mobility. A statistically significant association was found between adherence to clinical guidelines and pain score reduction ($p < 0.00001$). Patients receiving multimodal therapy—including NSAIDs, pregabalin, physiotherapy, and nutritional supplements—achieved superior outcomes. Most participants were prescribed NSAIDs with gastroprotective agents and calcium/vitamin D3 supplementation. Elderly males (60–69 years) were most affected, reflecting degenerative trends. Integrated treatment strategies effectively reduced pain and enhanced mobility in orthopaedic patients. Adherence to guideline-based multimodal therapy resulted in better outcomes, underscoring the importance of combining pharmacological and supportive interventions in orthopaedic care.
**Keywords:** Orthopaedic disorders, pain, mobility, multimodal therapy, guideline adherence

**PL-665**

**REDUCING NSAID PRESCRIPTIONS IN PATIENTS RECEIVING ACE INHIBITORS / ARBS AND DIURETICS**

ISBN: 978-81-980623-8-3

K.Sri Lakshmi
Pharmacotherapeuctis, A.S.N.Pharmacy college, Burripalem,
Tenali, Guntur (Dt), Andhrapradesh -522201
Srilakshmikomera720@gmail.com

Nonsteroidal anti-inflammatory drugs (NSAIDS) are widely prescribed,but their concurrent use with angiotensin – II receptor blockers (ARBs) and Diuretics can significantly increase the risk of acute kidney injury (AKI). This "triple whammy" of the medications presents a major safety concern in hypertensive patients. At the Health care centre, a quality improvement (QI) initiative was launched to address the frequent prescribing of NSAIDs to patients receiving ACE inhibitors/ ARBs and diuretics Aim: This project aimed to reduce NSAIDs prescription by 50% among patients receiving ACE inhibitors/ ARBs and diuretics within three months may to (july to july 2025) by raising awareness among health care providers and educating patients on the associated risks. A multidisciplinary team implemented several interventions, including provider education on safe prescribing practices and patient councelling at the pharmacy. Data was collected monthly through audits from the health center's electronic medical records to monitor the prescription rates of NSAIDs in the target population. The effectiveness of these interventions was evaluated through the reduction in NSAIDs prescription. Over the three- month period, NSAID prescription in patients on ACE inhibitors/ ARBs and diuretics decreased form 31% in May to 10% in July .The success of the was attributed to improved provider adherence to prescribing guidelines and increased patient awareness of NSAID risks This QI initiative effectively reduced the prescribing of NSAIDS in high- risk patients, enhancing patient safety and preventing medication – related AKI. The project highlights the importance of targeted education and can serve as a model for similar initiative in other healthcare settings.

**Keywords:** NSAIDs, ACE inhibitors, ARBs, Diuretics, Acute kidney injury.

**PIONEERING BOVINE PON1 PURIFICATION IN INDIA: UNRAVELING CHRONIC MASTITIS FIBROSIS AND CIPROFLOXACIN-BASED THERAPEUTIC STRATEGIES**

NEERADI DINESH
Nalla Narsimha reddy group of instititions

Bovine mastitis (BM) causes substantial economic losses in dairy production due to reduced milk yield, therapy costs, and premature culling, severely impacting rural economies. Pathologically, BM is an inflammatory response in the mammary gland parenchyma triggered by pathogens like Staphylococcus aureus, leading to acute, sub-acute, and chronic forms. Detection relies on somatic cell count (SCC), inflammatory cytokines, enzyme activity (e.g., LDH, NAGase), and electrical conductivity, with California Mastitis Test (CMT) as a common preliminary tool. Current antibiotic treatments face resistance and residue issues. This study pioneers the first purification of bovine paraoxonase 1 (PON1) using chromatographic techniques in India, alongside recombinant PON1. A murine mastitis model was developed to investigate PON1's role in inflammation and fibrosis. We evaluated ciprofloxacin's anti-fibrotic potential and synergistic effects with antibiotics. Future work will elucidate molecular mechanisms of BM-associated fibrosis and discover novel therapeutic molecules, with potential translational benefits for human inflammatory conditions. This integrated approach addresses BM's economic burden while advancing innovative, sustainable treatment strategies for veterinary and clinical medicine.

**"Assessment of Cognitive Function in Elderly Patients Receiving Anxiolytic Medications"**

Neha Parmar, Sonam Chaturvedi, Seemu Singh, Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore (M.P.) 453555
neha.parmarphd2023@saip.ac.in

Anxiety is common among older adults and is often treated with anxiolytic drugs such as benzodiazepines and non-benzodiazepine sedatives. Although these medications relieve anxiety symptoms, they may adversely affect cognitive abilities, including memory, attention, and executive functions. Evaluating these effects in local healthcare settings provides insights relevant to clinical practice.To assess the influence of anxiolytic therapy on cognitive performance in elderly patients, focusing on short-term memory, attention, and executive functioning. A six-month prospective observational study was conducted at the Department of General Medicine, Sri Aurobindo Hospital, Indore from 11 January to 11 July 2025. The study included 200 elderly patients, with 100 individuals receiving anxiolytics and 100 controls. Cognitive assessments were conducted at baseline and post-treatment using the Mini-Mental State Examination (MMSE) and the Montreal Cognitive Assessment (MoCA). Data were analyzed to determine the relationship between drug type, dosage, duration, and cognitive changes. Patients treated with anxiolytics showed a significant reduction in MMSE and MoCA scores compared to controls. Cognitive decline was more pronounced with higher doses and longer treatment duration, affecting memory, attention, and executive functions. Use of anxiolytic medications in elderly patients is associated with measurable cognitive decline. Healthcare providers should carefully weigh the benefits against potential cognitive side effects and monitor cognitive function during treatment.

**Keywords:** Anxiolytics, elderly, cognitive performance, MMSE, MoCA, benzodiazepines

**PL-668**

**NEUROPROTECTIVE EFFECTS OF CONVOLVULUS PLURICAULIS ON CUMS-INDUCED NEUROINFLAMMATION AND DEPRESSIVE-LIKE BEHAVIOUR IN RATS**

Omkar Hulawale, Girdhari Lal Gupta, and Joneth Fernandes
Department of Pharmacology, SVKMs NMIMS, School of Pharmacy & Technology Management, Shirpur, Dhule, Maharashtra, India – 425405
omnmims03@gmail.com

Depression is a complicated disease that is increasingly being considered an inflammation-related condition. Indian medicine Convolvulus pluricaulis (CP), a traditional antidepressant in Indian medicine against nervous conditions, has not been well tested in terms of its antidepressant activity in chronic animal models and the biochemical mechanism underlying the action is still not understood. This paper examined how methanolic extract of CP aerial part (CPE) could attenuate the depression caused by chronic unpredictable mild stress (CUMS) in rats in terms of neuroinflammation, liver biomarker, and brain monoamines. CPE was given orally at the amounts of 25, 50 and 100mg/kg throughout one week. The activity of antidepressant was determined by the use of the following tests: the sucrose preference test, forced swim test (FST) and locomotor behaviour by the open field test (OFT) and actophotometer. CPE (50 and 100 mg/kg) or fluoxetine (10 mg/kg, p.o.) treatment had a significant positive effect on the preference of the rats to sucrose, their immobility during the FST, and locomotor activity, compared to the CUMS-exposed rats. High levels of pro-inflammatory cytokines (IL-1b, IL-6, TNF-α) and liver biomarkers (ALT, AST) were also significantly decreased, as well as serotonin and noradrenaline concentrations in the hippocampus and prefrontal cortex were replenished. Moreover, CPE at 25 mg/kg had insignificant protective effects. These results are indicative of the hypothesis that CPE causes antidepressant-like effects in stressed rats by anti-inflammatory, liver biomarker and monoaminergic neurotransmission rescue.

**Keywords:** Convolvulus pluricaulis, Chronic Unpredictable Mild Stress (CUMS), depression, cytokines, tumour necrosis factor-α

**INNOVATIVE APPROACH TO THYROID FUNCTION TESTING: SENSOR – BASED MONITORING**

**PALLA SUBHASH**
Department of Medical devices & related technology, A. S. N pharmacy college, Burripalem road, Tenali, Guntur (D.T),
Andhra Pradesh, India -522201

The evaluation of thyroid hormone levels is traditionally performed through invasive blood tests that measure serum concentrations of T3, T4, and TSH. Recent technological advancements are exploring non-invasive approaches for thyroid monitoring, including wearable and skin-based biosensors. A skin sensor placed over the throat, near the thyroid gland, can potentially detect biochemical, thermal, and optical changes associated with hormone activity. Such sensors rely on techniques like infrared spectroscopy, electrochemical sensing, or photoplethysmography to capture physiological signals correlated with

ISBN: 978-81-980623-8-3

thyroid function. This approach offers a painless, rapid, and patient-friendly alternative to routine blood tests, with potential applications in continuous monitoring, early diagnosis of thyroid dysfunctions (hypothyroidism, hyperthyroidism), and personalized treatment adjustments. While promising, these technologies are still under development and require further validation to ensure accuracy, sensitivity, and long-term stability compared to standard diagnostic methods.

**Keywords**: technology, thyroid hormone levels, biosensors

**PL-670**

## EVALUATION OF CHEMOPREVENTIVE EFFECT OF ACHYRANTHES ASPERA LEAF EXTRACT AGAINST DMBA /CROTON OIL INDUCED SKIN CARCINOGENESIS IN MICE

Prakash Ishwar Nargatti1, Kiran Anna Wadkar2
1Department of Pharmacology, Annasaheb Dange College of Pharmacy, Ashta, Sangli, Maharashtra, India
2Department of Pharmacognosy, Dr. Shivajirao Kadam College of Pharmacy, Kasbe Digraj, Sangli, Maharashtra, India
prakashnargatti@gmail.com

This study investigated the chemopreventive potential of Achyranthes aspera aqueous leaf (AA) extract against chemically induced skin cancer in mice. A two-stage carcinogenesis model was employed, using 7,12-dimethylbenz(a)anthracene (DMBA) as the initiator and croton oil as the promoter over 16 weeks. The experimental groups received daily topical applications of AA leaf extract and Flonida 5% cream of 5-Fluorouracil (5-FU) (standard) following DMBA exposure. Treatment with the extract significantly reduced tumor development parameters. Biochemical analysis revealed that the extract enhanced antioxidant activity, as evidenced by increased levels of superoxide dismutase (SOD) and catalase (CAT) near to the standard group. Additionally, malondialdehyde (MDA) levels in the extract treated group were nearly same to normal mice, while reduced glutathione (GSH) activity was higher than in the carcinogen treated control group. Histopathological examination of the carcinogen treated control group showed hyperplasia, dyskeratosis, well-differentiated squamous cell carcinoma, and keratinized pearls, whereas these abnormalities were markedly reduced in both the extract and standard drug treated groups. The findings demonstrate that A. aspera leaf extract possesses significant anticancer properties, supporting its potential as a natural chemopreventive agent against skin cancer.

**Keywords:** Achyranthes aspera, anticancer, antioxidant, DMBA, 5-FU

**PL-671**

## THERAPEUTIC POTENTIAL OF COLEUS FORSKOHLII AGAINST DIABETES AND WOUND DYSFUNCTION: A MULTI-MODEL EVALUATION IN ALLOXAN-INDUCED DIABETIC RATS

PRIYANKA P. PATIL
KLE College of Pharmacy, Belagavi

Diabetes mellitus, a persistent metabolic disorder, markedly delays wound healing due to sustained inflammation, impaired neovascularization, and compromised fibroblast activity. The current study investigates the wound healing efficacy of Coleus forskohlii (CF) through a multidisciplinary evaluation incorporating in vivo, in vitro and in silico methodologies. Initial in vitro assays were conducted to evaluate the antioxidant and anti-diabetic properties of CF. The extract exhibited potent free radical scavenging activity in DPPH assays, alongside substantial total phenolic and flavonoid content. In glucose uptake assays, CF significantly enhanced cellular glucose absorption, indicating improved insulin sensitivity. An alloxan-induced diabetic wound model in rats was used to assess the therapeutic efficacy of CF. Animals administered 400 mg/kg CF orally in conjunction with topical 20% w/w hydrogel exhibited pronounced improvements in glycemic control, lipid metabolism, and wound contraction compared to controls. These physiological benefits were associated with upregulation of critical signaling cascades, particularly PI3K/Akt, VEGF, and HIF-1 pathways, which are integral to tissue regeneration and angiogenesis. Network pharmacology and computational modeling identified forskolin, coleon E, and 1-deoxyforskolin as primary bioactive constituents. These molecules were predicted to modulate pivotal proteins including PIK3R1, NOS3 and EGFR, key regulators of insulin signaling, inflammation, and wound repair. Although EGFR was minimally represented in initial target prediction datasets, molecular docking and dynamic simulations confirmed strong and stable ligand-receptor interactions, underscoring its therapeutic relevance in diabetic wound healing. The convergent evidence from in vivo, in vitro and in silico assessments supports the wound-healing and anti-diabetic efficacy of CF. These findings warrant further translational and clinical investigations to validate its potential as a phytotherapeutic agent for diabetic wound management.

**Keywords:** Diabetic Wound Healing, Diabetic Foot Ulcer, Diabetes Mellitus, Coleus forskohlii (CF), Alloxan Monohydrate, Excision Wound Model, In silico

## ANTIBACTERIAL EFFECT OF CRUDE AND PARTIALLY PURIFIED BACTERIOCIN PRODUCED BY PEDIOCOCCUS ACIDILACTIC MTCC 7442 STRAIN AGAINST PATHOGENS

Ram Gopal Bangad a, Rahul Anand b and Preeti C. Sangave a,b*
Department of Pharmaceutics, aShobhaben Pratapbhai Patel School of Pharmacy & Technology Management, bSchool of Pharmacy & Technology Management, SVKM'S NMIMS Deemed-to-be University, Shirpur, Maharashtra 425405, India
Preeti.sangave@nmims.edu

Antimicrobial peptides are small, positively charged, amphipathic molecules of variable amino acid composition and length. Such peptides known as bacteriocins, are antimicrobial molecules produced by certain bacteria, exhibit significant potency against other bacteria (including antibiotic-resistant strains), and can have narrow or broad activity spectra. The present study is designed to purify bacteriocin from microbial strain Pediococcus acidilactici MTCC 7442. Further interaction study with different excipients would be carried out to screen suitable excipient for better stability of purified bacteriocin in formulation. Ammonium sulphate precipitation at 60%w/w fraction showed highest antimicrobial activity against different pathogens especially Staphylococcus aureus MTCC 3160. Both agar cup plate and dilution methods were used to evaluate the antimicrobial efficacy. The partially purified product was characterized for its stability in organic solvent such as methanol, acetonitrile, DMSO. Stability against proteolytic digest with pepsin, trypsin, proteinase K was checked. Stability under acidic and alkaline pH conditions were tested and stability at higher temperature ranged (70 deg C to 90 deg C) was also evaluated. The partially purified bacteriocin was loaded in hydrogel formulation and stability studies were performed and it was found that partially purified bacteriocin was stable in optimized hydrogel formulation. The purified product showed potential activity against pathogenic strains screened.

**Keywords:** Antimicrobial peptides, antimicrobial resistance

## A NOVEL COMBINATION STRATEGY USING VANADIUM PENTOXIDE AND GINGER FOR SAFER ANTIDIABETIC THERAPY

Rajkumar S Bagali, Annasaheb Dange College of B Pharmacy, Ashta, Dist. Sangli, Maharashtra, India 416 301 and Mahesh G Saralaya
bagalirajkumar@gmail.com

Diabetes mellitus is chronic metabolic disorder affecting millions globally, often accompanied by complications like infertility due to damage to nerves,blood vessels. Vanadium pentoxide has demonstrated insulin-mimetic and antidiabetic effects but its clinical use is limited by associated reproductive toxicity. This study investigates combined antidiabetic efficacy and reproductive safety of vanadium pentoxide and aqueous ginger extract in Alloxan-STZ induced diabetic rats. Experimental groups includes normal controls, diabetic controls, treatment sets with pioglitazone, vanadium pentoxide, ginger extract, and the combination. Antidiabetic activity was assessed by tracking fasting blood glucose, glycogen levels in liver and muscle, as well as reproductive organ weights, sperm count, viability, and histopathology of testes. The combination therapy of vanadium pentoxide with ginger extract produced a more significant reduction in fasting blood glucose levels and improvement in glycogen stores compared to individual treatments ($p<0.05$). Crucially, inclusion of ginger extract mitigated reproductive toxicity typically associated with vanadium pentoxide, evident by improvements in sperm count, viability, preservation of reproductive organ structure. Histopathological analysis supported these findings, showing almost normal testicular histology in combination group. This synergistic approach highlights potential of

ISBN: 978-81-980623-8-3

integrating herbal agents with trace element therapy to improve both efficacy and safety in diabetes management.

**Keywords:** Diabetes mellitus, Ginger, Reproductive toxicity, Antidiabetic activity, Alloxan-STZ, Vanadium pentoxide,

**A MULTI-MECHANISTIC POLYHERBAL FORMULATION FOR DIABETES: IN SILICO DOCKING-GUIDED INSIGHTS INTO B-CELL REGENERATION**

Sanjay Singh Rajwar and Tirath Kumar
Department of Pharmaceutical Sciences, Kumaun University, Bhimtal, Nainital, Uttarakhand, India-263136
sanjaysinghrajwar2003625@gmail.com

Diabetes mellitus type 2, a chronic metabolic disorder marked by insulin resistance and progressive β-cell dysfunction, remains a global health concern. The present study explores a polyherbal approach targeting multiple mechanisms using Rhynchostylis retusa, Camellia sinensis, and Diplazium esculentum. R. retusa, traditionally used in South and Southeast Asia, exhibits highly potent activity at 50ug microgram doses, effectively lowering fasting blood glucose and inhibiting α-amylase with efficacy comparable to standard drugs. C. sinensis, a potent dipeptidyl peptidase-4 (DPP-4) inhibitor, was selected to minimize drug toxicity and prevent hypoglycemic shock in combination therapy. D. esculentum, an edible fern, showed mild inhibition of α-amylase and α-glucosidase while promoting regeneration of pancreatic β-cells and restoration of insulin secretion upon prolonged administration. In vitro investigations revealed that protocatechuic acid (PCA) acted as a reversible, mixed-type inhibitor of α-glucosidase, forming a stable enzyme-PCA complex through hydrogen bonds and van der Waals interactions, thereby inducing conformational changes and steric hindrance at the catalytic site. PCA further demonstrated postprandial hypoglycemic activity in diabetic mice, supporting its potential role in dietary management of diabetes. Complementary molecular docking studies highlighted productive binding modes of gallic acid and catechin with α-glucosidase, exhibiting binding energies of –6.58 kcal/mol and –7.25 kcal/mol, respectively, with key residues including Tyr63, Arg197, Asp198, Glu233, Asn324, and Asp326 involved in interactions. Molecular dynamics simulations confirmed the stability of both complexes compared to the apo-enzyme. Taken together, this forms the hypothesis that the three selected plants, through complementary mechanisms, may act synergistically as antidiabetic agents.

**Keywords:** Diabeties mellitus, alpha glucosidase, alpha amylase, dipeptidyl peptidase 4, molecular docking.

**PL-675**

**NAEGLERIA FOWLERI: EMERGING THREAT OF PRIMARY AMOEBIC MENINGOENCEPHALITIS AND THE ROLE OF PHARMACY IN INFECTION PREVENTION AND CONTROL**

Shaik Apsana* and S. Lakshmi Manideep Royal
Department of Pharmacy Practice, Annamacharya College of Pharmacy (Autonomous), New boyanapalli, Rajampet-516126, A.P, INDIA
shaikapsana176@gmail.com

The free-living thermophilic protozoan Naegleria fowleri, sometimes known as the "brain-eating amoeba," lives in warm freshwater environments such as lakes, rivers, hot springs, and swimming pools with insufficient chlorination. Primary amoebic meningoencephalitis (PAM), a rare but nearly always fatal infection of CNS, is brought on by this bacterium. When contaminated water enters nasal passages and causes infection, the amoeba can travel to the brain through the olfactory nerve. PAM symptoms, such as a severe headache, fever, nausea, vomiting, stiff neck, disorientation, seizures, and hallucinations, can come suddenly and with great severity. Within one to two weeks, a coma and death are frequently the results of the illness's rapid progression. Treatment includes aggressive therapy using Miltefosine, rifampin, amphotericin B, fluconazole and azithromycin. There was a significant illness i.e a case study from kerala, a 13 years old patient following 2 months of having swim in a river began to show headache, fever and a confused state of mind. Vancomycin and meropenem were the treatment given, still his condition worsned leading to unconsciousness and death. The diagnosis was done by the microbiological studies and analysis of cerebrospinal fluid. Kerala had identified 80 cases related to PAM as of September 23,2025. Infections with fowleri are rare but require medical attention.Greater awareness, prompt diagnosis and adherence can prevents the consequences caused by fatal waterborne illness.

**Keywords**: Naegleria fowleri, Amphotericin B, Brain eating amoeba, Olfactory nerve, meropenem.

**PL-676**

**LONG TERM SAFETY AND EFFICACY METHODS TO TREAT PRESBYOPIA**

Shaik. Jegurthin Masthani * G. Tejaswi
Department of Pharmaceutical Analysis, Vikas Institute of Pharmaceutical Sciences, near airport, Rajahmundry, East Godavari district, Andrapradesh, India -533102
chanishaik028@gmail.com

This study evaluated the long-term safety and efficacy of Benozzi's pharmacological method for treating presbyopia with topical eye drops (pilocarpine and diclofenac). A retrospective, nonrandomized case series was conducted in Buenos Aires, Argentina, from 2011 to 2018, including 910 emmetropic patients aged 40–59 years with good distance vision but reduced near vision. After at least one year of follow-up, and up to eight years, results showed significant improvement in uncorrected near visual acuity (UNVA), decreasing from a baseline of 4.74 ± 1.53 to 1.36 ± 0.48 (Jaeger scale), while uncorrected distance visual acuity (UDVA) remained unaffected. Reported side effects (light perception decrease, headaches, ocular dryness, dizziness) were mild and resolved spontaneously within one year. The findings suggest that Benozzi's method is a safe and effective nonsurgical alternative for emmetropic presbyopia, offering patients an option to avoid glasses or surgery.

**PL-677**

**EFFECT OF MEDICATION REGIMEN COMPLEXITY ON ADHERENCE AMONG ADULT AND GERIATRIC PATIENTS**

Shivani Deshmukh, Seemu Singh, Ritika Singh, Garima Rawat, Dr. Gaurav kant Saraogi
Sri Aurobindo Institute of Pharmacy, Indore, Madhya Pradesh, India
shivani.deshmukhphd2023@saip.ac.in

The complexity of medication regimens significantly influences patient adherence, especially among adult and elderly populations who often manage multiple medications for chronic conditions. Factors such as dosing frequency, medication forms, and special instructions contribute to increased regimen complexity, which can adversely affect adherence and lead to suboptimal therapeutic outcomes. Multiple factors play a role in adherence behavior. This study aimed to evaluate the impact of medication regimen complexity on adherence in adult and elderly patients within a hospital setting. A prospective observational design was employed, utilizing data from patient medical records and interviews. The Medication Regimen Complexity Index (MRCI) was used to quantify regimen complexity. Statistical analyses, including independent t-tests and Pearson correlation, were conducted to explore the relationship between MRCI scores and various variables. Preliminary results revealed that geriatric patients generally had moderate MRCI scores compared to adults, indicating that age alone may not be a decisive factor in regimen complexity. While age demonstrated a weak positive correlation with MRCI scores ($r = 0.1631$), this association was not statistically significant ($p = 0.056$). Other variables showed weak or negligible correlations. The findings suggest that simplifying medication regimens, particularly for elderly patients, may improve adherence and lead to better health outcomes. This study underscores the importance of routinely assessing and minimizing medication regimen complexity as part of clinical care. Overall, no significant difference in MRCI scores was observed between adult and geriatric groups.

**Keywords**: Medication Regimen Complexity Index (MRCI), adherence, therapeutic outcomes, independent t-test, Pearson correlation.

**PL-678**

**HYPERTENSION AWARENESS AND MANAGEMENT AMONG HYPERTENSIVE ROAD TRANSPORT PROFESSIONALS IN URBAN AREAS**

Soumya Morabad1*, Rajeswari Ramaswamy1, Sampatkumar.K. Bhajantri2, Santoshkumar Chabbi2, Mallappa Shalavadi2,

ISBN: 978-81-980623-8-3

In the entire world, hypertension is a major factor in morbidity and mortality. The health of occupational workers has several determinants at the workplace leading to accidents, communicable and non-communicable disease and stress related states. In professional drivers are one such group who have tendency to develop above mentioned conditions as they spend most of their time in pollutant, noisy and stressful environments. In Bagalkote city, India, we set out to assess the Knowledge Attitude & Practice of hypertension in a professional road transport driver. To assess knowledge, attitude and practice towards hypertension among the hypertensive road transport drivers in urban city. This is a Cross-sectional study which was carried out in Bagalkote city. The study included hypertensive drivers above 18 years age and Collection of Data is done by approaching various drivers like bus, truck using self-administered questionnaire which includes parameter of knowledge, attitude and practice and their socio demographic details such as age and Habits. The data collected will be analysed for the Knowledge, Attitude and Practice parameters. In our study, highest participants 39.1% were in the age group of 31-40years and least 2.8% were in the >60years. Mean Systolic Blood Pressure & Diastolic Blood Pressure was 158.41±6.47 & 92.13±5.36 respectively. Out of n=69 participants, (68.98%) had Good Knowledge and only (31.01%) had Poor Knowledge. And (60.86%) had Good Attitude, (39.130%) had Poor Attitude, (31.159%) had Good Practice & (68.840%) had Poor Practice towards Hypertension. Majority of participants has good Knowledge and positive Attitude but poor Practice. Continuous reinforcement and education can bring a positive change and adhere to regular check-up and treatment and helps reduce morbidity and mortality.

**Keyword**: Hypertension, Road transport drivers, Knowledge, Attitude, Practice.

## BIOLOGICAL EVALUATION OF IN VITRO AND IN VIVO ANTI-INFLAMMATORY AND ANALGESIC ACTIVITIES OF LEAF EXTRACT OF THALICTRUM FOLIOLOSUM

STAPHEY KOTWAL
JC Bose Technical Campus, Department of Pharmaceutical Sciences,Kumaon University Bhimtal, Nainital Uttarakhand India-263136
stapheykotwal487@gmail.com

Thalictrum foliolosum (family Ranunculaceae) has been traditionally used in folk medicine for the management of pain and inflammation; however, comprehensive pharmacological studies supporting these uses are limited. In the present study, fresh leaves of T. foliolosum were collected from Kilbury, Nainital, Uttarakhand, and subjected to extraction using suitable solvents. Preliminary phytochemical screening revealed the presence of bioactive constituents such as alkaloids, flavonoids, tannins, and phenolic compounds, which are often associated with anti-inflammatory and analgesic activities. The in vitro anti-inflammatory potential of the leaf extract was evaluated using protein denaturation assays, demonstrating significant inhibition in a concentration-dependent manner, indicative of its protective effect against protein denaturation associated with inflammation. In vivo studies were conducted using animal models to further validate the pharmacological potential of the extract. Anti-inflammatory activity was assessed in rats using the carrageenan-induced paw edema model, which revealed dose-dependent suppression of edema comparable to standard drugs such as Ibuprofen and Indomethacin. Analgesic activity was evaluated in mice using tail-flick and hot-plate methods, where the extract significantly increased reaction time, suggesting central and peripheral analgesic effects. Overall, these findings provide scientific evidence for the traditional use of T. foliolosum in pain and inflammation management, highlighting its potential as a natural therapeutic agent and warranting further investigation for drug development.

**Keywords**: Pharmacological, phytoconstituents, inflammatory, analgesic, therapeutic.

## ASSESSMENT OF ADVERSE DRUG REACTION REPORTING FOR SELECTED ANTIBIOTICS BY HEALTHCARE PROFESSIONALS.

Tulsi S Gupta, Manish M Aglawe, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra (INDIA) 441002

Adverse drug reactions (ADRs) remain a significant public health concern, particularly with the widespread use of antibiotics. In the current research, assessment of adverse drug reaction reporting has been performed. The objective behind the research was to evaluate the awareness and practices related to ADR reporting among physicians and hospital pharmacists, specifically concerning commonly prescribed antibiotics. ADR reporting facilitates the monitoring of drug safety in real world through post marketing surveillance, thereby providing understanding of a drug's risk profile. This study aims to assess the knowledge, attitudes, and practices (KAP) of healthcare professionals regarding ADR reporting for selected antibiotics, and to identify barriers contributing to underreporting. India with vast genetic diversity, variations in disease prevalence, dietary habits and healthcare assessment may response individually, making ADR monitoring essential. Pharmacovigilance Programme of India (PvPI) encouraged to report any suspected ADRs to ensure drug safety and protect public health. This study concludes that; there is a gap between healthcare professionals and reporting for adverse drug reaction related to selected antibiotics largely influenced by their awareness and training levels. Strengthening education on pharmacovigilance and simplifying the reporting process are essential steps to enhance ADR reporting, ultimately improving patient safety and antibiotic use monitoring.

**Keywords:** PvPI, Awareness, Reporting process, Antibiotic use monitoring, post-marketing surveillance.

## ANTICOAGULATION THERAPY MANAGEMENT

Y. Mounika and J. Divya Latha
Department of Pharmacology, ASN Pharmacy College, Tenali, Guntur District, Andhra Pradesh, India – 522201
mounikayellepeddi2004@gmail.com

Anticoagulation therapy plays a vital role in the prevention and treatment of thromboembolic disorders such as atrial fibrillation, deep vein thrombosis, pulmonary embolism, and mechanical heart valve-associated thrombosis. However, its clinical management remains complex due to the narrow therapeutic window, variability in patient response, drug interactions, and the risk of serious bleeding complications. This presentation explores the principles and challenges of anticoagulation therapy management, focusing on commonly used agents including vitamin K antagonists (e.g., warfarin), direct oral anticoagulants (DOACs), and parenteral anticoagulants (e.g., heparin, low molecular weight heparin). Emphasis is placed on patient selection, dosing strategies, monitoring protocols (such as INR for warfarin), and the management of bleeding risks and reversal agents. Additionally, the presentation will address the role of clinical guidelines, patient education, and multidisciplinary approaches to optimize therapeutic outcomes. Special populations, including the elderly, patients with renal impairment, and those undergoing surgery, will also be discussed to highlight individualized care approaches. Effective anticoagulation therapy management requires a balance between minimizing thrombotic risk and preventing bleeding complications, necessitating careful assessment, ongoing monitoring, and patient-centered care.

**Keywords:** Anticoagulation Therapy, Thromboembolism, Warfarin, Direct Oral Anticoagulants (DOACs), Heparin, Bleeding Risk, Patient-Centered Care, Clinical Guidelines, Drug interactions.

## COMPUTATION DESIGN AND BIOLOGICAL EVALUATION OF CERTAIN SYNTHESIZED FLAVONOIDS FOR CARDIOPROTECTIVE EFFECT

Asok Kumar K, Kaviyarasu M, Emy Mariam Jacob
Department of Pharmacology, Sri Ramakrishna Institute of Paramedical Sciences, College of Pharmacy, Coimbatore, Tamil Nadu, India-641 044.
kaviyarasupharma09@gmail.com

Myocardial infarction (MI) is irreversible necrosis of heart muscle. According to WHO 19 million died due to CVD by 2022. Angiotensin Converting Enzyme converts angiotensin-I to angiotensin-II. The inhibition of ACE effectively reduces MI. Flavonoids possess anticancer, anti-inflammatory and cardioprotective activity. In silico studies of 50 semisynthetic flavonoids was done using Autodock 4.2. Based on docking results one compound(F3) was selected for in vitro ACE inhibitory activity. Acute toxicity study of synthetic flavonoid was carried out employing OECD- TG 420 and was found to be non-toxic dose up to

ISBN: 978-81-980623-8-3

2000mg/kg. In vivo studies was evaluated using 30 Wistar rats and were divided into five groups (n=6). Group-I served as control, Group-II negative control, Group-III and group IV received 100 and 200mg/kg of flavonoid, Group V was given enalapril (10 mg/kg). Group II-V received doxorubicin 10mg/kg i.p. on 26th day and on 29th day animals were euthanized; blood serum was collected for measuring CK-MB, LDH, ALT,, AST, ALP, TGL, TC, HDL, LDL and VLDL levels. Results of in silico studies exhibited binding energy between -10.44 kcal/mol to -6.59 kcal/mol. Out of 50 compounds F3 flavonoid produced excellent binding energy. IC50 of enalapril and F3 compound was found to be 69.85± 25 and 85.65 ± 16 µg/ml respectively. Treatment with F3 and enalapril reduced the levels of CK-MB, LDH, ALT, AST, ALP, TGL, TC, LDL, VLDL and increased HDL levels marking the protection offered by flavonoid. Flavonoids have the potency to correct MI and can be used to correct cardiovascular diseases.

**Keywords**: Myocardial infarction, angiotensin converting enzyme, doxorubicin, enalapril.

## EXTRACTION, PHYTOCHEMICAL SCREENING, AND EVALUATION OF HEPATOPROTECTIVE ACTIVITY OF *Ficus hispida* BARK IN RATS

Anvitha D K, Ashoka Shenoy M, Karunakar Hegde.
Department of Pharmacology, Srinivas College of Pharmacy, Valachil, Mangalore- 574143, Karnataka, India

The present study involves the extraction, phytochemical screening, and assessment of the hepatoprotective activity of *Ficus hispida* bark in rats. Ethanolic extraction of the bark was carried out, followed by preliminary phytochemical screening, which revealed the presence of flavonoids, tannins, alkaloids, glycosides, and other secondary metabolites. To evaluate hepatoprotective potential, liver injury was induced in rats using paracetamol (2 g/kg, p.o.). The bark extract was administered orally at doses of 200 mg/kg and 400 mg/kg, while silymarin (25 mg/kg and 100 mg/kg, p.o.) was used as a standard reference drug. Liver function markers such as SGOT, SGPT, ALP, and total bilirubin were estimated, and reduced glutathione (GSH) levels were measured to determine antioxidant status. In addition, histopathological study was also carried out. Rats treated with *Ficus hispida* bark extract showed a significant, dose-dependent improvement in hepatic function. The extract markedly decreased SGOT, SGPT, ALP, and total bilirubin levels, while elevating GSH levels compared to the toxic control group. Histological examination further demonstrated reduced necrosis, diminished inflammation, and restoration of normal hepatocyte structure. The protective effects observed were comparable to those of silymarin. These results indicate that the ethanolic bark extract of *Ficus hispida*, supported by its phytochemical constituents, possesses promising hepatoprotective activity against paracetamol-induced liver damage.

**Keywords:** *Ficus hispida*, hepatoprotective activity, phytochemical screening, paracetamol, silymarin.

## EXPLORING THE PHYTOCHEMICAL AND ANTIOXIDANT PROPERTIES OF CAMELLIA SINENSIS VAR. ASSAMICA GROWN IN DIFFERENT DISTRICTS OF ASSAM

Sk Imran Hassan, Dhiraj Baishya, Dr. Ananta Choudhury
Faculty of Pharmaceutical Science, Assam down town University,
Sankar Madhab Path, Gandhi Nagar, Panikhaiti, Guwahati, Assam, India,
PIN – 781026.
Skimranhassan24@gmail.com

This study aims to analyse the antioxidant activities of green tea leaves from various districts in Assam, focusing on their industrial, cultural, and medicinal significance. Green tea leaves were collected, identified, and extracted from different districts in Assam. Phytochemical content was quantified, and total phenolic content and antioxidant properties were evaluated. Organoleptic features were assessed, and various phytochemical tests were conducted to detect presence of bioactive compounds such as flavonoids, tannins, phenolic compounds, quinones, and saponins. The organoleptic study showed that green tea leaves (Camellia sinensis var. assamica) have a slightly bitter taste, characteristic odour, and yellow colour. Phytochemical analysis revealed the presence of flavonoids, tannins, phenolic compounds, quinones, and saponins in tea leave samples from Biswanath, Nagaon, and Kamrup Metro districts. The pH of the tea extract was recorded as 7.24. The antioxidant properties of the extracts were measured using the DPPH assay, showed significant activity with IC50 values of 45.278 for tea leave samples collected from Kamrup Metro, 54.821 for Nagaon, and 47.119 for Biswanath Chariali, compared to 23.033 for ascorbic acid. This study highlights the importance of natural resources and the need for sustainable practices. The findings provide insights into the medicinal potential of plants, particularly the antioxidant activities of green tea leaves collected from Biswanath, Nagaon, and Kamrup Metro districts of Assam supporting their use in health and wellness.

**Keywords**: Camellia sinensis var. assamica, antioxidant activities, total phenolic content, Phytochemical screening.

## UNVEILING THE MEDICINAL TREASURE OF PSEUDERANTHEMUM PALATIFERUM: PHYTOCHEMICAL AND THERAPEUTIC PERSPECTIVES

Karna Sai Sunitha, Lankadi Devi
saisunithakarna01@gmail.com

Pseuderanthemum palatiferum (Nees) Radlk., belonging to the Acanthaceae family, is a medicinal plant native to Northern Vietnam, discovered in 1990. This plant is characterized by its multi-branched shrub morphology and simple opposite decussate leaves, making it amenable to cultivation. In traditional Vietnamese and Thai medicine, its leaves are used to treat a wide range of conditions, including hypertension, diarrhea, arthritis, hemorrhoids, stomach aches, tumors, colitis, bleeding, wounds, constipation, flu, and colon-related issues. The study aims to validate the promising therapeutic properties of Pseuderanthemum palatiferum and explore its potential for further medicinal applications. Chemical analysis revealed compounds like β-sitosterol, stigmasterol, kaempferol, saponins, and amino acids. Pharmacological studies assessed its anti-diabetic, anti-bacterial, anti-inflammatory, and antioxidant effects, among others. Research highlights the diverse pharmacological properties of Pseuderanthemum palatiferum. However, some of its traditional uses, such as for hypertension, arthritis, hemorrhoids, stomachache, tumors, colitis, hemorrhage, wound healing, constipation, flu, colon issues, and nephritis, have not yet been validated by pharmacological tests. Further studies are needed to confirm its potential and validate unexplored medicinal applications.

**Keywords:** Pseuderanthemum palatiferum, Acanthaceae, Vietnam, pharmacological properties, Folklore medicine.

## INVESTIGATIONAL STUDY OF ENICOSTEMMA AXILLARE PLANT EXTRACTS AGAINST DENGUE AND THEIR MOSQUITO REPELLENT ACTIVITY

Mohit Gaddam, V. P. Nagulwar, Akanksha Lakhe, Sumit Malusare
National Institute of Pharmaceutical Education and Research,
Guwahati, Assam, India-781101
mhtgddm@gmail.com

Mosquito-borne diseases such as dengue, yellow fever, Zika fever, malaria, and chikungunya continue to pose major public health challenges worldwide. Enicostemma axillare, a medicinal plant, is known to contain bioactive phytoconstituents such as quercetin, kaempferol, coumarins, polyphenols, and β-sitosterol with potential pharmacological activity. In this study, compounds including apigenin, catechin, galangin, genkwanin, isovitexin, myricetin, saponarin, betulin, Beta Amyrin, and others were subjected to in silico docking against the dengue vector target protein (PDB ID: 1K4R). Docking results revealed strong binding affinities ranging between -7.2 to -8.7 and compliance with Lipinski's Rule of Five, suggesting their potential as anti-dengue agents. Furthermore, ethanol, methanol, ethyl acetate, acetone, and aqueous extracts of the plant were used to prepare mosquito repellent formulations such as creams, sprays, incense sticks/cones, and fast cards. Among three tested concentrations, the cream and spray formulation F3 (15% extract) exhibited the highest repellent activity. Incense sticks and cones showed satisfactory burning times (40–50 min and 20–25 min, respectively) with effective repellency, while fast cards provided a rapid short-duration effect. As per the results of the study, it may be concluded that Enicostemma axillare is a promising source for creating effective, natural and safe mosquito repellent products and as per the in- silico docking studies, may be used further for in vitro and in vivo testing to validate the efficacy and safety of the phytochemicals as potent agents against most challenging global vector-borne diseases.

**Keywords:** Enicostemma axillare, herbal mosquito repellent, dengue, molecular docking, formulation

## PHYTOCHEMICAL, BIOLOGICAL AND COMPUTATIONAL SCREENING OF TECTONA GRANDIS BARK

Meda Mohan Sai, Prabhanjan Kumar Kolli
Shri Vishnu College of Pharmacy (A), Vishnupur, Bhimavaram, 534202
medamohansai@gmail.com

Tectona grandis (teak) is widely recognized for its diverse applications, especially in traditional medicine. This study focused on the isolation, characterization, and evaluation of bioactive molecules from its bark extracts, employing both experimental and computational approaches to explore their pharmacological potential. Methanolic and chloroform extracts of the bark were subjected to preliminary phytochemical screening, and the compounds were isolated using chromatographic techniques. Structural elucidation was performed using $^{1}H$ NMR, $^{13}C$ NMR, MASS, and FTIR spectroscopy. The biological activities of the extracts and isolated compounds were evaluated through antioxidant, anti-inflammatory, cytotoxic, and anti-cancer assays. Additionally, computational methods such as SWISS ADME, TCMSP, and molecular docking were employed to predict drug-likeness and receptor binding affinities. From the chloroform extract, stigmasterol (TGBC-1) and lanceolatine B (TGBC-2) were isolated, while the methanolic extract yielded 24-methyl-cholest-5(6),24(25)-diene-3-β-ol (TGBM-1) and apigenin 7-O-(6''-O-P-Z-Coumaryol-α-β-D-Glucopyranoside) (TGBM-2). Notably, lanceolatine B and apigenin 7-O-(6''-O-P-Z-Coumaryol-α-β-D-Glucopyranoside) were reported for the first time in this species. The biological screening demonstrated significant antioxidant, anti-inflammatory, and cytotoxic activities, with chloroform extracts showing greater potency. Computational docking studies supported these findings, indicating strong receptor interactions, particularly for anti-cancer targets. These results highlight the therapeutic promise of Tectona grandis bark bioactive molecules and suggest their potential for further drug development.

**Keywords:** Tectona grandis, phytochemical isolation, anti-cancer activity, molecular docking.

## ISOLATION OF VINGA RADIATA MUCILAGE AND ITS EVALUATION AS GELLING AGENTS IN DICLOFENAC SODIUM GEL

D. Lakshmi Kumari, Sadhu Venkateswara Rao
Department of Pharmaceutics,
Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu,
Vijayawada, Andhra Pradesh, India – 521108
lakshmisri.lk2888@gmail.com

ISBN: 978-81-980623-8-3

The objective of present work is to find out the gelling potential of mucilage from Vigna Radiata. Mucilage was isolated from Vigna Radiata seeds by soaking, extraction and boiling with distilled water as solvent and precipitating by addition of acetone as non-solvent and drying at 50 – 60 0C. The isolated mucilage was subjected to safety and preformulation studies for its suitability as a gelling agent. Physicochemical characteristics such as solubility, ash values, swelling index, loss on drying and pH were studied. In the present study total six formulations were prepared, in that five formulations of Diclofenac Sodium gel were prepared corresponding to 2.0 4.0, 6.0, 8.0 and 10% w/w of Vigna Radiata mucilage, 1% w/w Diclofenac sodium, 15% w/v Glycerin, and 0.02% Methyl paraben. The sixth formulation was prepared with 2% synthetic gelling agent as a HPMC K100M. The gels were evaluated for drug content, viscosity, in vitro permeation and skin irritation etc. The prepared gels did not produce any dermatological reactions and were well tolerated by the albino mice. The formulation F5 containing 10 gm of mucilage was found to be ideal and it shown similar anti-inflammatory activity in compared to the F6 and commercial preparation. Studies indicate that the isolated mucilage may be a good substitute as a pharmaceutical excipient specifically as a gelling agent.

**Keywords:** Vigna Radiata, Diclofenac Sodium, Mucilage, Gelling agent and Anti-inflammatory activity.

## PAPAYA (CARICA PAPAYA) LEAVES: A NATURAL SOURCE OF ANTICANCER PHYTOCHEMICALS

Ms. Kajal Kosankar
Dr. D. Y. Patil College and pharmacy, Akurdi, Pune,
Maharashtra, India. Pincode- 433011

Papaya (Carica papaya), often called the “fruit of angels,” is valued not only as a nutritious fruit but also as a traditional remedy. In recent years, its leaves have drawn attention from researchers for their promising role in cancer management. Rich in natural compounds such as alkaloids, flavonoids, phenolics, saponins, and tannins, papaya leaves act as a natural pharmacy against abnormal cell growth. These bioactive molecules work in different ways: they trigger cancer cells to undergo programmed death (apoptosis), slow down their uncontrolled multiplication, block the formation of blood vessels that feed tumors, and strengthen the immune system. Their strong antioxidant properties also protect healthy cells from damage caused by free radicals, a key factor in cancer development. Laboratory studies on various cancer types—including breast, lung, cervical, and pancreatic cancers—have shown encouraging results, while animal experiments suggest potential benefits in reducing tumor growth. Although clinical evidence in humans is still limited, these findings highlight papaya leaves as a cost-effective, natural source of anticancer agents that may complement conventional therapies. With more research, especially clinical trials, papaya leaf extracts could evolve into a safe and accessible support in modern cancer care.

**Keywords:** Papaya leaves, Cancer treatment, Anticancer agent, Carica papaya, Phytochemicals.

## PHYTOPHARMACEUTICAL GUMMIES OF MOMORDICA DIOICA: A NOVEL STRATEGY FOR DIABETES CONTROL

Kadali Kaveri, Anand Addagalla
Department of Pharmaceutics, Shri Vishnu College of Pharmacy,
Bhimavaram, Andhra Pradesh, India- 534 202
Kadalikaveri73@gmail.com

Diabetes mellitus is a chronic metabolic disorder marked by hyperglycemia due to insulin deficiency or resistance. Long-term drug therapy often causes side effects, increasing interest in natural alternatives. Momordica dioica (spiny gourd), rich in flavonoids, phenolics, and saponins, has shown antidiabetic potential through α-amylase/α-glucosidase inhibition, antioxidant action, and insulin-mimetic effects. Gummies offer an attractive nutraceutical delivery system by masking bitterness, improving palatability, and enhancing compliance. To develop and evaluate anti-diabetic gummies containing Momordica dioica extract. To formulate gummies using standardized M. dioica extract with natural sweeteners. To evaluate in vitro antidiabetic activity and sensory properties. To assess stability and potential applicability as a nutraceutical. Standardized extract was incorporated with gelatin as gelling agents, with a suitable sweetener, and natural flavors. The mixture was molded into gummies and evaluated. For physical and chemical properties. Results: Formulated gummies exhibited satisfactory texture, taste, and consumer acceptance. In vitro assays confirmed significant enzyme inhibitory activity, indicating potential glucose-lowering effects. Stability studies supported acceptable shelf-life. Anti-diabetic gummies with Momordica dioica extract provide a novel, patient-friendly nutraceutical approach. They combine traditional medicinal value with modern formulation technology, offering promising support in diabetes management.

**Keywords:** Anti-diabetic gummies, Nutraceuticals, α-Amylase/α-Glucosidase inhibition, Herbal formulation

## PHYTOCHEMICAL ISOLATION OF FLAVONOIDS AND NEUROPROTECTIVE POTENTIAL OF PEDALIUM MUREX LINN.

Gomathi Swaminathan, Jeeru Tejaswini Reddy
Department of Pharmaceutical Chemistry, J.S.S. College of Pharmacy,
JSS Academy of Higher Education & Research,
Ooty-643001, Tamil Nadu, India.
gomathiswaminathan@jssuni.edu.in

Neurodegenerative diseases (NDs) pose a growing global health challenge, often accompanied by behavioral manifestations such as depression, anxiety, memory loss, and stress. The search for effective natural therapeutics is therefore of paramount importance. In the present study, we investigated the phytochemical profile and neuroprotective potential of Pedalium murex Linn. (PM) leaves against lipopolysaccharide (LPS)-induced endotoxemia in rats. Ethanolic extract of Pedalium murex (EEPM, 90% v/v) yielded two isolated compounds, designated PM I and PM II. Spectral characterization suggested that PM I shared structural similarities with 4’,5,7-trihydroxyflavone (likely Apigenin), while PM II exhibited resemblance to 3,5,7-trihydroxy-2-(4-hydroxyphenyl)-4H-chromen-4-one (likely Kaempferol). Experimental findings revealed that LPS administration significantly reduced food and water intake as well as body mass, whereas EEPM treatment restored these parameters. EEPM also mitigated depression- and anxiety-like behaviors. Moreover, LPS-induced reductions in antioxidant enzyme levels (SOD, CAT, GR, and GPX) were reversed by EEPM. Histopathological analysis further confirmed the protective role of EEPM against LPS-mediated neurodegeneration. In conclusion, EEPM demonstrated promising neuroprotective activity, likely attributable to its rich flavonoid content and potent antioxidant properties, suggesting its potential as a therapeutic candidate for LPS-induced brain injury.

**Keywords:** Pedalium murex, Ethanolic extract, EEPM, LPS, Rats

## PHYTOCHEMICAL & PHARMALOGICAL EVALUTION OF AERVA SANGUINOLENTA BY ACETONE EXTRACT

Mr. Kadagalla Sri Ram Kamesh, Mr. Nagineni Sudarshan Rao,
Dr. Kiran Manda
Shri Vishnu College of Pharmacy (Autonomous), Vishnupur,
Bhimavaram-534202, West Godavari, Andhra Pradesh, India.

Aerva sanguinolenta L. Blume is a perennial herb that belongs to the Amaranthaceae family. The plant has widely been used as a traditional medicine for long time. It is rich in phytochemical constituents such as tannins, flavonoids, terpenoids, sphingolipids, polyphenolic compounds and betacyanins. Moreover, it has significant therapeutic effects, including antihyperglycaemic, hepatoprotective, antioxidant, antimicrobial, anti-inflammatory, diuretic, anti-leishmania and anti-tuberculosis activities. The scientific validation is essential for the acceptance of medicinal plants as therapeutic agents against several disorders. Hence, the traditional uses, phytochemical constituents, medicinal significance and pharmacological effects of the plant are discussed in this review. The present study focuses on the phytochemical screening and pharmacological evaluation of Aerva sanguinolenta using an acetone extract. Aerva sanguinolenta, a medicinal plant traditionally used in folk medicine, was subjected to preliminary phytochemical analysis which revealed the presence of bioactive compounds such as flavonoids, alkaloids, tannins, saponins, and phenolics. The extract was then evaluated for its pharmacological activities, including anti-inflammatory, antioxidant, and antimicrobial properties using standard in vitro and in vivo models. Results indicated significant biological

ISBN: 978-81-980623-8-3

activity, supporting the plant's traditional therapeutic applications. The acetone extract demonstrated notable efficacy, particularly in antimicrobial and antioxidant assays, suggesting its potential for further development into natural therapeutic agents. This study provides scientific validation for the traditional use of Aerva sanguinolenta and highlights its promise as a source of bioactive compounds.

## IN-VITRO CYTOTOXICITY ASSAY OF AQUEOUS EXTRACT OF RAGS AND SEED COAT OF ARTOCARPUS HETEROPHYLLUS

Akash L, Vidhya Arthy J, Vinochandar R, Brundha S
Department of Pharmacology, PGP College of Pharmaceutical Science and Research Institute, Namakkal, TamilNadu, India-637 2027
akashakash542022@gmail.com

Artocarpus heterophyllus commonly known as jackfruit, is a plant with a long history of use in traditional medicine. Various parts of the plant, including the leaves, fruit, and seeds, are rich in bioactive compounds such as phenols, flavonoids, and tannins associated with a range of therapeutic properties, including antioxidant, anti-inflammatory and anticancer activity. This research will seek to determine the in vitro cytotoxic activity of an aqueous extract of Artocarpus heterophyllus against defined cancer cell lines. An aqueous extract was obtained from [define plant part, e.g., dried mature leaves] of Artocarpus heterophyllus through cold maceration method. The extract was subsequently screened for its cytotoxic activity against two human cancer cell lines, [ e.g., MCF-7 (breast cancer) and HepG2 (liver cancer)]. The cytotoxicity was assessed by the MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide) assay, which assesses cell viability and metabolic activity. The water extract of Artocarpus heterophyllus showed dose- and time-dependent cytotoxicity towards both cell lines. The extract showed significant inhibitory activity against the HepG2 cell line with IC {50} values and against the MCF-7 cell line with IC {50} values following treatment for 48 hours. These findings suggest that the extract is more effective against liver cancer cells compared to breast cancer cells. This study indicates that aqueous extract of rags and seed coat of Artocarpus heterophyllus is extremely active in vitro against human cancer cell lines. The dose- and cell-line-dependent activities indicate its promise as a source of new anticancer compounds. The report validates the traditional application of Artocarpus heterophyllus and presents the groundwork for future in vivo investigations and possible therapy.

**Keywords:** Maceration, aqueous extract, cytotoxicity, anticancer.

## BALANCE BITE: PLANT-BASED NUTRITIVE BAR FOR EFFECTIVE WEIGHT MANAGEMENT

Sinchana KC and Ziaul Karim
Department of Pharmaceutics, Nitte College of Pharmaceutical Sciences, Nitte (Deemed to be University), Bengaluru, Karnataka, India-560064.
sinchanagowda40@gmail.com

This study describes the development and evaluation of a plant-based nutritive diet bar for effective weight management. The balanced bite consists of cereals (oats, millets) and seeds mix (pumpkin, sunflower, chia, flax, watermelon and muskmelon) together with natural sweetener (50 g of organic jaggery + 7 g of honey). Phytochemical screening revealed carbohydrates, flavonoids, alkaloids, tannins, fatty acids, saponins, terpenoids, phenols and proteins as active constituents of a bioactive profile. Functional characterization revealed a relevant thermogenic activity (29 °C vs. 21 °C for glucose control) and antioxidant as well as anti-inflammatory activity confirmed by the inhibition of albumin denaturation. Anti-hyperlipidemic activity was confirmed in colorimetric cholesterol assay, showing 65% decrease in absorbance (0.40 > 0.14 AU) after 30 minutes. Physical characterization resulted in an average weight of bars of 18.61±0.117 mg and hardness of 8 kg/cm2 guaranteeing palatability and structural integrity. Taken together, these results suggest that Balance Bite is a physiologically active biological and nutrient-rich functional food able to induce safety, increase metabolic activity and promote lipid regulation which makes this food formulation a promising weight management dietary approach.

**Keywords:** Plant, Functional, Thermogenic, Lipid, Weight.

## FORMULATION AND EVALUATION OF HERBAL HAIR GEL CONTAINING PSIDIUM GUAJAVA LEAF EXTRACT

Divya Tayade, Krutika Channe, Vinod Thakre
Nagpur college of pharmacy, Nagpur, India - 124001.
divyatayade18@gmail.com

Hair care products perform a vital role in preserving scalp health, preventing hair fall, and enhancing the overall appearance of hair. However, the broad use of synthetic chemicals in commercial gels and serums often leads to adverse effects such as scalp itching, dryness, and permanent damage. Over the past few years there has been an expanding requirement for herbal formulations due to their safety, efficacy, and biocompatibility. Psidium guajava (guava) leaves, traditionally used in Ayurveda, contain abundant amounts of flavonoids, tannins, and antioxidants, making them a promising candidate for the formulation of a natural hair gel with therapeutic properties. In the current research, a novel herbal hair gel formulation was developed, including Psidium guajava leaf extract as a natural substitute for synthetic hair care products. The gel base was prepared using Carbopol 940 as a gelling agent, aloe vera gel as a soothing agent, glycerin as a humectant, and suitable excipients to optimize consistency and stability. Evaluation of the prepared formulation was based on physicochemical parameters, including appearance, color, pH, viscosity, spreadability, washability, and stability. The maximize gel showed a smooth texture, a translucent greenish appearance, a pH range of 6.2–6.4, a viscosity of 4800–5100 cps, a spreadability of 6.8 g·cm/sec, and good washability with no observed phase separation over 30-day stability testing. Evaluation of antimicrobial property indicated a notable inhibition area against Escherichia coli and Staphylococcus aureus, signalling capability in minimizing dandruff and overall scalp infections. The observations suggest that the formulated guava leaf–containing herbal hair gel is an effective, safe & stable natural formulation. Its antimicrobial, cosmetic, and therapeutic potential highlights its promise as an eco-friendly alternative to chemical-based hair care products.

**Keywords:** Psidium guajava, herbal hair gel, antimicrobial activity, scalp health, stability

## PREPARATION AND EVALUATION OF A POLY HERBAL HAND WASH AND HERBAL SANITIZER

Varicola Karuna Sree, Boddu Venkata krishna
KVSR Siddhartha College of pharmaceutical sciences, Vijayawada
kspamula@gmail.com

The present study focused on the formulation and evaluation of polyherbal hand sanitizer and hand wash using plant-based extracts with proven antimicrobial properties. The herbal hand sanitizer was prepared by incorporating neem, peppermint, tulasi, aloe vera, lemon juice, turmeric, and essential oils in a hydroalcoholic base, with carbopol 940 as gelling agent and parabens as preservatives. Similarly, the herbal hand wash was formulated with neem, tulasi, aloe vera, rita powder, lemon, turmeric, and sodium lauryl sulfate, ensuring foaming, cleansing, and skin-conditioning effects. Both formulations were subjected to organoleptic, physicochemical, and microbiological evaluation. Parameters such as pH, viscosity, appearance, foam height, and retention were found within acceptable limits. Antibacterial activity was determined by the cup plate method against pathogens including Staphylococcus aureus, Escherichia coli, Pseudomonas aeruginosa, Salmonella typhi, and Aspergillus niger. Results demonstrated that the polyherbal hand sanitizer exhibited a wider zone of inhibition than the marketed herbal standard, particularly against S. aureus and E. coli, while the hand wash showed significant antimicrobial efficacy with stable foaming and no skin irritation. The enhanced activity is attributed to phytoconstituents such as alkaloids, saponins, flavonoids, tannins, and anthraquinones, which possess antibacterial, antifungal, antioxidant, and wound-healing properties. The findings confirm that polyherbal formulations containing neem (Azadirachta indica), tulsi (Ocimum sanctum), aloe (Aloe barbadensis), lemon (Citrus limon), eucalyptus oil (Eucalyptus globulus), and other herbal excipients offer effective antimicrobial protection and are promising alternatives to synthetic products.

ISBN: 978-81-980623-8-3

**Keywords:** Herbal hand sanitizer, Herbal hand wash, antimicrobial activity, Polyherbal formulation, Zone of inhibition

**PT-14**

## FORMULATION AND EVALUATION OF CITRUS SINENSIS PEEL & AZADIRACHTA INDICA INFUSED TOOTHPASTE

Punam Lokram Jagnit, Krutika Channe, Vinod Thakre
Nagpur college of pharmacy, Hingna, Nagpur,
Maharashtra, India -441110
punamjagnit@gmail.com

In the present research, a herbal toothpaste formulation integrating Citrus sinensis (orange) peel powder and Azadirachta indica (neem) leaf extract was expand as a natural substitute for conventional dentifrices. The objective was to evaluate the antimicrobial potency and physicochemical properties of the formulation while utilizing orange peel as a value-added agro-waste. Neem extract, having azadirachtin and nimbin, was incorporated for its wide-range antibacterial and plaque-reducing properties, while orange peel served as a source of vitamin C, flavonoids, and organic acids providing to whitening and antioxidant effects. The formulation was prepared using natural abrasives (calcium carbonate, sodium bicarbonate) and excipients (glycerin, peppermint oil) to optimize spreadability, stability, and consistency. Physicochemical properties of the toothpaste were evaluated (pH, foaming capacity, spreadability, stability, and organoleptic attributes) and evaluation of antimicrobial activity against common oral pathogens. The findings suggest that the perfect formulation indicated effective antibacterial activity, Preferred sensory properties, and acceptable physicochemical characteristics, with neem extract enhancing microbial inhibition and orange peel giving whitening effect and freshness. Thus, The study determines that the developed formulation serves as a safe, bioinert, and eco-friendly variant to conventional toothpastes, establishing the potential of herbal bioactive and agro-waste in promoting eco-sustainable approaches to oral care.

**Keywords:** Herbal toothpaste, Azadirachta indica, Citrus sinensis, antimicrobial activity, oral hygiene.

**PT-15**

## DEVELOPMENT AND ANALYTICAL STANDARDIZATION OF A POLYHERBAL DRY SHAMPOO

Vaishnavi Nawghare, Dhanashri Tumme, Vanshita Bobde, Vinit Isankar
School Of Pharmacy, G H Raisoni University, Saikheda,
Madhya Pradesh, India - 480337
vaishnavinawghare770@gmail.com

The development of herbal substitutes for conventional hair care products has been driven by the rising demand for natural and eco-friendly cosmetic formulations. In the present study, a polyherbal dry shampoo was formulated using Hibiscus (Hibiscus rosa-sinensis), Fenugreek (Trigonella foenum-graecum), Manjistha (Rubia cordifolia), Curry leaves (Murraya koenigii), Reetha (Sapindus mukorossi), and Shikakai (Acacia concinna). The formulation was designed to reduce dependency on synthetic surfactants while providing effective cleansing, oil absorption, scalp nourishment, and hair conditioning. Analytical standardization was performed using ultraviolet (UV) spectrophotometry, high-performance liquid chromatography (HPLC), and Fourier-transform infrared spectroscopy (FTIR) to ensure quality and reproducibility. UV spectrophotometry enabled preliminary phytochemical screening and quantitative estimation of bioactive constituents. HPLC was employed to establish a chemical fingerprint profile, ensuring batch-to-batch consistency and detecting key phytoconstituents such as saponins, flavonoids, alkaloids, and phenolic derivatives. FTIR analysis further confirmed the presence of functional groups associated with cleansing, antioxidant, and conditioning activities. Results demonstrated that the polyherbal dry shampoo exhibited favourable physicochemical characteristics, consistent phytochemical profiles, and compliance with essential quality standards. The combined use of HPLC, UV, and FTIR provided a comprehensive analytical framework for reliable standardization and enhanced reproducibility. This study highlights the potential of polyherbal dry shampoos as safe, effective, and sustainable alternatives to synthetic hair care products and supports the broader incorporation of herbal cosmetics into modern formulations. Analytical study was identified as crucial for ensuring product quality, safety, and consumer acceptance.

**Keywords:** Polyherbal dry shampoo, UV spectrophotometry, HPLC, FTIR, Standardization

## QUALITATIVE AND QUANTITATIVE ESTIMATION OF A POLYHERBAL SYRUP FORMULATED FOR KAPHA–VATA SAMAKA ACTIVITY

Vanshita Bobde, Dhanashri Tumme, Vinit Isankar, Vaishnavi Nawghare
School Of Pharmacy, G H Raisoni University, Saikheda,
Madhya Pradesh, India 480337
vanshitabode@gmail.com

Herbal medicines are increasingly recognized for their therapeutic potential, affordability, and lower side effect profiles compared to synthetic drugs. Ajwain (Trachyspermum ammi) and garlic (Allium sativum) are two widely used medicinal plants that have long been utilized in traditional medical systems to treat infectious, respiratory, and gastrointestinal disorders. Because plant-based elements are complex, standardizing polyherbal formulations is still a significant issue despite their shown pharmacological benefits. In compliance with Indian Pharmacopoeia guidelines, this study intends to develop and analytically standardize a polyherbal syrup comprising extracts of garlic and ajwain using validated analytical techniques: UV-Visible spectroscopy, Fourier Transform Infrared Spectroscopy, and High-Performance Liquid Chromatography. Ajwain seeds and garlic bulb hydroalcoholic extracts were combined to create a syrup, which was then tested for important physicochemical and organoleptic characteristics such as pH, viscosity, and specific gravity. Utilizing UV-Vis spectrophotometry, the total phenolic and flavonoid contents were measured. HPLC made it possible to quantitatively estimate the bioactive markers—allicin and thymol from garlic and ajwain, respectively, while FTIR analysis found functional groups associated with important phytochemical classes. The syrup's stability and physicochemical characteristics were satisfactory. HPLC verified steady levels of important actives, FTIR spectra showed distinctive peaks for alcohols, alkenes, and phenolics, and UV-Vis findings verified a notable presence of antioxidant-rich compounds. The work develops a methodical and repeatable approach to standardize polyherbal mixtures analytically. It helps herbal syrups be included into evidence-based conventional healthcare and supports their scientific validation, quality control, and regulatory compliance.

**Keywords:** Garlic, Ajwain, UV-Visible spectroscopy, FTIR, HPLC

**PT-17**

## A COMPLEX HERBAL FORMULATION FOR OSTEOPOROSIS

SHIVAM RAMKUMAR YADAV
Shivamy52398@gmail.com

This research aimed to develop and evaluate a novel Ayurvedic kadha formulation incorporating Salvia miltiorrhiza (Danshen), a medicinal herb known for its antioxidant, anti-inflammatory, and circulatory benefits, with promising osteoprotective potential. Osteoporosis, a chronic metabolic bone disorder characterized by reduced bone mineral density and compromised bone microarchitecture, increases fracture risk and often requires long-term pharmacological interventions. However, these are associated with adverse effects, prompting the search for safer, natural alternatives. The study commenced with an extensive literature review to validate the selection of Salvia miltiorrhiza for its reported efficacy in enhancing bone metabolism. Supportive herbs were also incorporated to synergize the therapeutic effect. The roots of Salvia miltiorrhiza were extracted using a Soxhlet apparatus with a hydroalcoholic solvent system (ethanol: water), optimizing parameters like temperature and time to maximize phytoconstituent yield. Preliminary phytochemical screening confirmed the presence of key bioactive compounds such as flavonoids, phenolics, terpenoids, and alkaloids, all known for their bone-supporting and antioxidant properties. UV-Visible spectroscopy showed absorption peaks around 270–290 nm, indicating phenolic and flavonoid content. FTIR analysis further confirmed the presence of functional groups like hydroxyl (O–H), carbonyl (C=O), and ether (C–O–C), which contribute to therapeutic efficacy. The kadha formulation was developed by blending the extract with complementary Ayurvedic herbs, ensuring traditional relevance. It was standardized and evaluated for organoleptic characteristics, pH, viscosity, and specific gravity to ensure consistency and quality. Stability studies conducted under accelerated conditions (40°C ± 2°C, 75% RH ± 5%) over three months showed minimal changes in physicochemical

ISBN: 978-81-980623-8-3

properties, indicating good stability. In vitro antioxidant evaluation using the DPPH assay demonstrated significant free radical scavenging activity, supporting the formulation's protective role against oxidative stress-induced bone loss. Overall, the developed Salvia miltiorrhiza-based kadha shows strong potential as a safe and effective natural therapeutic agent for managing osteoporosis.

**Keywords:** Salvia miltiorrhiza, Osteoporosis, Herbal formulation, Kada, Tanshinone, Bone mineral density, Soxhlet extraction, Phytochemical screening, UV-Visible spectroscopy, FTIR analysis.

## EXPLORING THE ANTIDIABETIC POTENTIAL OF PRUNUS CERASOIDES AND PYRACANTHA CRENULATA

Gunjan Bisht, Archana Negi Sah
Department of Pharmaceutical Sciences, Kumaun University, Bhimtal, Nainital, Uttarakhand, India-263136.
bishtgunjan32@gmail.com

Diabetes mellitus is a prevalent metabolic disorder characterised by high blood sugar levels. Particularly, type 2 diabetes is characterized by insulin resistance. This study explores the antidiabetic potential of Prunus cerasoides leaves and Pyracantha crenulata fruits through in silico and in vitro approaches. The phytoconstituents identified in P. cerasoides leaves include Quercetin-3-rhamnoglucoside, kaempferol while P. crenulata fruits are rich in quercetin. Based on these bioactive compounds, a hypothesis was generated that these plant extracts may possess antidiabetic activity. In silico molecular docking studies were conducted to evaluate the interaction of these constituents with multiple target receptors implicated in type 2 diabetes, such as α-amylase, α-glucosidase, dipeptidyl peptidase-IV (DPP-IV),and peroxisome proliferator-activated receptor gamma (PPAR-γ). The docking analysis revealed strong binding affinities and stable interactions, suggesting their potential to modulate key pathways involved in glucose metabolism. In vitro enzyme inhibition assays using α-amylase and α-glucosidase models further supported these findings, demonstrating significant inhibition in a dose-dependent manner. The combined in silico and in vitro results indicate that P. cerasoides leaves and P. crenulata fruits may exert antidiabetic effects by targeting carbohydrate-digesting enzymes and insulin-related receptors. These findings provide a scientific rationale for the potential use of these plant extracts as natural therapeutic agents in the management of type 2 diabetes, warranting further pharmacological and clinical investigation.

**Keywords:** Type 2 diabetes mellitus, Prunus cerasoides, Pyracantha crenulata, quercetin, kaemperol

## EVALUATION OF ANTICANCER ACTIVITY OF ABUTILON INDICUM BY HYDROALCHOLIC EXTRACT

Wasim Beg, Dr. Dhanashree Tumme
School Of Pharmacy, G H Raisoni University, Saikheda, Madhya Pradesh, India 480337.
wasim.beg5036@gmail.com

The problem of cancer has been one of the primary causes of death worldwide. The common treatment approaches like surgery, chemotherapy, radiotherapy and hormone therapy are commonly utilized and are very expensive, have serious side effects and fail to ensure that cancer recurrence will not occur. Due to such challenges, scientists are shifting their focus to the medicinal plants as safe, cheap and supportive options in cancer treatment. The anticancer effects of Abutilon indicum (also referred to as Indian mallow) which belongs to the Malvaceae family were examined in this study. A hydroalcoholic maceration was employed in the extraction of plant to extract it, after which the plant was dried and then extracted. Analysis of the extract was done to determine the chemical constituents of the extract. Phytochemical screening did determine the presence of flavonoids, alkaloids, glycosides, tannins, proteins, carbohydrates and saponins-compounds that are frequently associated with the inhibition of abnormal cell growth. The MTT test was used to investigate the anticancer property of the extract on EAC (Ehrlich Ascites Carcinoma) cell lines. The findings revealed that the hydroalcoholic extract exhibited a significant cytotoxic effect, and the IC50 was 274.6 -1 g / ml which is an indication that the extract was effective in killing cancerous cells. All in all, the results indicate that Abutilon indicum can have promising anticancer effects. Nevertheless, the future research, especially in animal models and at a molecular level, is required to corroborate its possible use in future cancer treatment.

**Keyword:** Abutilon indicum, Medicinal Plant, Abutilon indicum Anticancer activity, Ehrlich Ascites Carcinoma (EAC), MTT assay, Hydroalcoholic extract, IC -value, Cancer cell inhibition.

## FORMULATE AND EVALUATE OINTMENT USING PLANT EXTRACT (LEONOTIS NEPTIFOLIA) TO FIND ANTIBACTERIAL ACTIVITY

Sanskruti Nagmote, Vibha Shukla, Tejas Panchabhai, Sanket Badwaik
Anurag College of Pharmacy Warthi, Bhandara -441905
bgtcm.sanskrutinagmote@gmail.com

The study aims to identify active plant compounds in Leonotis neptifolia leaves, evaluate their antibacterial activity, formulate and test herbal ointment parameters, and compare it with standard cream. The plant material was collected from Mohadi and Tumsar farms and pulverized using a mechanical grinder. The leaves were dried and powdered using ethanol. The extraction process involved a Soxhlet apparatus, where fresh leaves. Were dried, pulverized, sieved, and filtered. The fine leaf powder was then extracted using a 640ml ethanol solution and filtered using filter paper. The extract was tested for its phytochemical properties, including its antibacterial activity against E.coli and P aeruginosa. The active component was used to create an ointment, with parameters such as pH, water washability, consistency, non-irritation, and skin spreadability.The formulation and evaluation of an antibacterial ointment from the leaf extract of Leonotis neptifolia was performed successfully. Ointment Preparation successfully, evaluation parameter are checked.

## STANDARDIZATION OF POLYHERBAL FORMULATION FOR PEPTIC ULCER

Ms. Samruddhi S. Patil, Dr. Devendra S. Shirode, Dr. A. V. Kulkarni.
Department of Pharmacology, Dr. D. Y. Patil College of Pharmacy Akurdi, Pune.

This work provides a concise overview of peptic ulcers, highlighting pathophysiology, risk factors, epidemiology, treatment, and healthcare costs, while employing modern approaches such as network pharmacology and molecular docking to identify potential phytochemicals with promising antiulcer activity. Peptic ulcer is lesion on the lining of the stomach that develops when the mucosa of the gastrointestinal system reduces as a result of several contributing causes. We examined interactions between these active constituents and molecular targets associated to peptic ulcers using network pharmacology, developing a network model to clarify the relationship between them. A promising ingredient was chosen for preclinical research based on the study. Peptic ulcers are a prevalent gastrointestinal disorder, particularly in developing nations, associated with recurrent symptoms, complications, and diminished quality of life. Contributing factors include Helicobacter pylori infection, widespread NSAID use, and limited healthcare access. Standard therapies such as H2 receptor antagonists and proton pump inhibitors, though effective, have notable limitations, while synthetic drugs are often costly and associated with adverse effects compared to herbal alternatives. The ultimate goals of treating peptic ulcer disease are reducing pain, curing ulcers, and preventing recurrence. While various treatment options exist, there's a need for more effective and less costly alternatives, particularly in developing nations where the burden of this condition is higher.

This study aimed to develop and assess a herbal face wash gel for acne management using natural ingredients with antimicrobial, anti-

ISBN: 978-81-980623-8-3

inflammatory, and skin-soothing properties. A combination of aqueous extracts from Neem, Tulsi, Aloe vera, and Turmeric, along with vitamin E as a preservative, was formulated into a gel base. The herbal extracts' antioxidant and anti-inflammatory potential supported their inclusion. Various batches were prepared and evaluated for physical parameters like color, consistency, pH, and spreadability. Batch F2 showed the most promising results in terms of appearance, texture, and stability. Compared to commercial synthetic products, the herbal gel demonstrated significant potential without adverse effects. This eco-friendly formulation offers a sustainable alternative for acne care, highlighting the therapeutic value of plant-based ingredients. The study successfully developed a safe and effective herbal anti-acne face wash gel, showcasing the benefits of natural ingredients. The formulation's key ingredients - Neem, Tulsi, Aloe vera, and Turmeric - work synergistically to provide antimicrobial, anti-inflammatory, and soothing benefits. This herbal face wash gel is a promising solution for acne management, offering a natural and sustainable option for skincare. With its desirable physical characteristics and stability, this formulation has the potential to become a popular choice for those seeking a chemical-free alternative for acne care. Overall, this study demonstrates the potential of herbal formulations in skincare and paves the way for further research in this area.

**Keywords:** Anti-acne, Herbal gel, Neem, Aloe vera.

**THE PHARMACOGNOSTIC STUDY OF CLERODENDRUM CHINENSE LEAVES EXTRACT ALONG WITH ITS TABLET FORMULATION AND EVALUATION**

Rahul Shivarkar, Toshika Nikam, Hemant Alhat
PES Modern College of Pharmacy (For ladies), Moshi, Pune, Maharashtra India 412105
rs_shivarkar@yahoo.co.in

The emergence of antimicrobial resistance has prompted renewed interest in bioactive compounds derived from natural sources. Plants from the genus have been traditionally documented for their therapeutic properties; however, plant Clerodendrum Chinese remains less explored. The present study was undertaken to investigate the Pharmacognostic study including antimicrobial potential and tablet of C. Chinese. Following authentication at the Botanical Survey of India, Pune, the leaves of the plant subjected to successive extraction using water, ethanol, chloroform, and petroleum ether. Preliminary phytochemical screening, chromatographic study and antimicrobial activity of the aqueous extract was conducted using varying concentrations and compared with a standard drug. The aqueous fraction exhibited notable inhibitory effects against selected microorganisms. To assess its applicability, tablets were formulated by using the aqueous extract, suitable excipients, and the prepared dosage form was evaluated for standard parameters. The findings, highlighted the antimicrobial potential of C. Chinese and support its possible development into various pharmaceutical formulations such as tablets, syrups, gels, or ointments, offering promising avenues for future research.

**Keywords:** Antimicrobial resistance, Clerodendrum Chinese, Tablet

**PT-24**

**In vitro Evaluation of Methanolic Extract of Tamarindus indica seeds for Nootropic and Antioxidant Activities.**

K Surya Neeraja Nagalla, Padmalatha Kantamneni
Department of Pharmacology, Vijaya Institute of Pharmaceutical Sciences for Women,
ksuryaneeraja@gmail.com

According to traditional systems, Tamarindus indica, is a popular medicinal plant with a variety of pharmacological qualities. This study assesses the methanolic extract of Tamarindus indica seeds in vitro nootropic efficacy with an emphasis on how well it may improve cognitive function. Utilizing acetylcholinesterase (AChE) inhibition assays, which quantify the inhibition of AChE, an enzyme essential to cholinergic neurotransmission and cognitive function, the nootropic impact was evaluated. Bioactive substances such as flavonoids, phenolics, and alkaloids were detected by phytochemical screening of the methanolic extract and these chemical constituents may be responsible for the extract's neuropharmacological activities. Significant AChE inhibitory action was shown by the extract, indicating that it may improve cognition, especially in neurodegenerative diseases like Alzheimer's. Strong free radical scavenging and reducing capabilities were also demonstrated by the extract when its antioxidant capacity was assessed utilizing, 2-diphenyl-1-picrylhydrazyl (DPPH) and Hydrogen peroxide (H2O2) radical scavenging assays. Because oxidative stress is a major contributor to cognitive decline, these antioxidant qualities may mitigate it and promote neuroprotection. The results shown prominent natural nootropic and antioxidant properties for the methanolic extract of Tamarindus indica seeds. It is necessary to do additional in vivo research and clinical studies to confirm these results and investigate their potential therapeutic uses.

**PT-25**

**FORMULATION AND EVALUATION OF POLYHERBAL HYDROGEL TO TREAT PSORIASIS**

Lokesh R, Harsha Shivappa, Vinayaka T M
mrdoctor1406@gmail.com

This study aimed to develop and optimize polyherbal hydrogels containing curcumin and aloe extracts for the topical treatment of psoriasis. Psoriasis is a chronic inflammatory skin condition characterized by rapid skin cell proliferation, leading to erythematous and scaly plaques. Conventional treatments often cause side effects, motivating the search for safer, effective herbal formulations. Curcumin, derived from turmeric, possesses potent anti-inflammatory and antioxidant properties, while aloe vera exhibits skin-soothing, moisturizing, and wound-healing benefits. Combined, these agents offer synergistic effects beneficial for managing psoriasis symptoms. The hydroalcoholic extraction of curcumin and aloe was performed using Soxhlet extraction, followed by formulation into hydrogels using polymers such as Carbopol 934, hydroxypropyl methylcellulose (HPMC), and acacia. Various formulations with differing polymer ratios were prepared and evaluated for physicochemical properties including pH, viscosity, spreadability, and drug entrapment efficiency. Analytical techniques like FTIR confirmed chemical compatibility between extracts and polymers. In vitro drug release studies demonstrated sustained release profiles fitting Higuchi diffusion kinetics, with the optimized formulation achieving over 85% drug release within 24 hours. Texture analysis indicated favorable mechanical properties essential for topical application and adherence. Phytochemical screening revealed the presence of important bioactive constituents including flavonoids, tannins, and alkaloids supporting therapeutic efficacy. The formulation's stability, skin compatibility, and enhanced drug delivery suggest its potential as an effective, patient-friendly topical therapy for psoriasis. Future studies should focus on in vivo efficacy evaluations and clinical trials to validate therapeutic outcomes. Overall, this research underscores the promise of combining herbal actives within hydrogels to develop novel, safe, and effective dermatological treatments for chronic inflammatory skin disorders.

**Keywords:** Polyherbal Hydrogels, Psoriasis Treatment, Curcumin, Aloe Vera, Controlled Drug Delivery.

**Facile One-Pot Green Chemistry Approach in Formulation of Alkyl Polyglucoside-Based Hibiscus Extract Herbal Shampoo**

Manisha Patra, Subhashree Sahoo, Bhupen Chandra Behera
Department of Pharmaceutics, Kanak Manjari Institute of Pharmaceutical Sciences, Rourkela, Odisha
manishapatra0706@gmail.com

In the present study design, micellar extracts of Hibiscus rosa-sinensis L. obtained by Microwave-assisted extraction (MAE) and Ultrasounds-assisted extraction (UAE), using aqueous solutions of alkyl polyglucosides (APGs) following green chemistry. Phytochemical properties, such as , total phenolic and contents of extracts, were measured using spectrophotometric and chromatographic methods. Generally, the determined concentration of antioxidants was higher for extracts obtained by MAE than UAE. Hair shampoo with micellar hibiscus extract had strong foaming properties and superior compared to the base shampoo. APGs are non-ionic, biodegradable surfactants that are safe and mild to the skin. The obtained pH values of hibiscus-based formulations fell within the optimal range of 6.5-7.0, indicating compatibility with the scalp and skin. The viscosity value obtained was 2,500-4,000 cp at 25°C falling within the optimal range for easy

ISBN: 978-81-980623-8-3

application and effective cleansing. The foam stability for different shampoos were in the range of 2 to 4 minutes. The findings showed that the hibiscus-based shampoo formulated by one-pot green chemistry approach enhanced the softness, shine, and manageability of the hair, displaying positive physicochemical properties that fell within the typical range for herbal shampoos. Hibiscus extraction with microwave and ultrasound leads to reduction in extraction time and increase in yield by disintegrating plant tissues. This investigation supports the fusion of traditional knowledge with modern cosmetic development using green chemistry by highlighting hibiscus extract as a viable natural component in producing herbal shampoos, which are safe, environmentally friendly, and effective.

**Keywords:** Hibiscus Extract, Green Chemistry, Herbal Shampoo, Microwave-assisted extraction, Ultrasounds-assisted extraction.

## EVALUATION OF ANTIOXIDANT AND ANTI-INFLAMMATORY STUDIES ON ETHANOLIC EXTRACT OF SIDA ACUTA

T.likhitha, k.g.rajyalakshmi, b. Ramya kuber
Department of pharmacology, Sri Venkateswara university college of pharmaceutical science, Tirupati, Chittoor,
Andhra Pradesh, India -517502
Sri Padmavathi mahila viswavidyalam, IPT, Tirupati, Chittoor, Andhra Pradesh, India- 517502
tlikhitha9303@gmail.com
rajyalakshmichenji12@gmail.com

Sida acuta (Malvaceae) generally called broomweed. In the present work, we studied antioxidant and anti- inflammatory activity of ethanolic extract of Sida acuta by integrating in vitro assays and phytochemical analysis. Ethanolic extract of Sida acuta was prepared by maceration method. GC- MS analysis was done to characterize the chemical factors. Antioxidant activity was evaluated by DPPH radical quenching assay using ascorbic acid as standard. Protein denaturation inhibition assay was performed to estimate anti- inflammatory activity of ethanolic extract of Sida acuta. Phytochemical screening revealed the presence of alkaloid, flavonoid, tannin, phenol, saponin, terpenoid, and glycoside. DPPH assay revealed strong antioxidant eventuality of ethanolic extract of Sida acuta. The IC50 value of DPPH assay was set up to be 65.42 µg/ ml. Protein denaturation assay displayed remarkable anti- inflammatory activity of ethanolic excerpt of Sida acuta. The IC50 value of protein denaturation inhibition assay was set up to be 75.42 µg/ ml which is nearly analogous to standard medicine diclofenac sodium (IC50= 73.71 µg/ ml). we conclude that Ethanolic extract of Sida acuta displayed strong antioxidant and anti- inflammatory activity. Different phytochemical composites were set up to be present in ethanolic extract of Sida acuta as characterized by GC- MS analysis. These phytochemicals might be responsible for antioxidant and anti- inflammatory extract of Sida acuta through synergistic goods. From our findings, it can be inferred that Sida acuta has implicit to be explored as a natural remedial agent against oxidative stress and seditious conditions.

**Keywords:** Sida acuta, DPPH assay, Protein denaturation assay, GC-MS analysis.

## DEVELOPMENT AND CHARACTERIZATION OF HERBAL GUMMIES WITH JASMINUM GRANDIFLORUM AND PSIDIUM GUAJAVA

Samruddhi Rajurkar, Surendra Agrawal
Datta Meghe College of Pharmacy,
Datta Meghe Institute of Higher Education and Research (DU),
Sawangi (M), Wardha, Maharashtra, India
rsamruddhi2002@gmail.com

Recurrent aphthous stomatitis, also known as mouth ulcers, are frequent and painful sores that impact numerous individuals. This study focused on formulation and evaluation of herbal gummies derived from Jasminum grandiflorum and Pisidium guajava for treating oral ulcers. The gummies were created using extracts from these plants, which have historically been utilized to address different issues, such as mouth ulcers. The extracts were examined for their phytochemical test and antimicrobial properties against Gram-positive and Gram-negative bacteria. The findings demonstrated notable antimicrobial effects, presumably because of the presence of bioactive substances like flavonoids, saponins, glycosides, terpenoids, and phenolic compounds. Gummies were formulated using gelatine, sugar, glucose syrup and were assessed based on several factors, such as clarity, shape, stickiness, grittiness, pH level, thickness, average weight, and dispersion time. The findings showed acceptable results for every assessed parameter. The finding indicate that the formulated herbal gummies could serve as an effective natural solution for oral ulcers, presenting a hopeful substitute for traditional therapies. The gummies might assist in reducing pain, encouraging healing, and stopping the reappearance of mouth ulcers. In summary, this study emphasizes the promise of herbal gummies as an innovative and efficient therapy for oral ulcers, offering a fresh approach to addressing this widespread and distressing issue.

**Keywords:** Mouth Ulcers, Herbal Gummies, Jasminum grandiflorum, Pisidium guajava

## TARGETING INFLAMMATION AND METABOLIC DYSREGULATION: NETWORK PHARMACOLOGY-BASED MOLECULAR DOCKING INSIGHTS INTO HERBAL MEDICINE

Aishwarya Sambhaji Patil, Devendra Shriram Shirode, Ashish Vilas Kulkarni
Department of Pharmacology, Dr. D.Y. Patil College of Pharmacy Akurdi, Pune Affiliated to Savitribai Phule Pune University

The complex pathogenesis of metabolic and autoimmune disorders such as diabetes, obesity, and rheumatoid arthritis is driven by dysregulation in key genes including INS, AKT1, TNF, IL-6, EGFR, GADPH, SRC, and BCL2. This study employs a network pharmacology approach to unravel gene-disease associations and prioritize plant-based therapeutic candidates. Key molecular insights reveal that AKT1 contributes to lipid accumulation, TNF impairs metabolism and leptin regulation, INS affects insulin production and sensitivity, and GADPH induces diabetic complications. Additionally, IL-6 mediates inflammatory joint damage in rheumatoid arthritis, while EGFR is implicated in abnormal immune responses. Based on their multi-target potential, a list of medicinal plants was ranked for therapeutic relevance, with Eucalyptus globulus, Moringa oleifera, and Salvia officinalis emerging as top candidates. These plants harbour bioactive compounds capable of modulating the identified gene targets, supporting their use in integrative disease management. This study highlights the utility of network pharmacology in bridging genomic insights with phytotherapeutics, offering a promising direction for the development of multi-target herbal interventions for chronic diseases.

**Keywords:** Network pharmacology, INS, AKT1, TNF, IL-6, Medicinal plants, multi-target therapy, Herbal intervention

## ISOLATION AND POTENTIAL USE OF HIBISCUS ROSA-SINENSIS GUM AS A SUSPENDING AGENT

K.Sindhu, T.Vijaya, C.Krishna Mohan
Department of Pharmaceutics, School of Pharmacy,
Nalla Narasimha Reddy Education Society's Group of Institutions,
Hyderabad, Telangana, India – 500 088.
sindhukommasani@gmail.com

Hibiscus rosa-sinensis gum, a natural polysaccharide, was isolated and evaluated as a suspending agent in pharmaceutical formulations. The gum was extracted from the leaves of Hibiscus rosa-sinensis and characterized for its physicochemical properties. The suspending properties of the gum were assessed using zinc oxide suspensions, and its performance was compared with that of traditional suspending agents like acacia and tragacanth. The gum was isolated through aqueous extraction, and its viscosity, solubility, and pH were determined. Zinc oxide suspensions were prepared using different concentrations of the gum, and their sedimentation volume, redispersibility, and rheological properties were evaluated. The results showed that Hibiscus rosa-sinensis gum exhibited good suspending properties, comparable to those of acacia and tragacanth. The gum's viscosity and concentration significantly affected the stability of the suspensions. This study suggests that Hibiscus rosa-sinensis gum has potential as a natural, safe, and effective suspending agent in pharmaceutical formulations, offering a promising alternative to synthetic excipients. Further studies are needed to explore its applications in various pharmaceutical products.

## ANTIOXIDANT STUDY OF ETHANILIC EXTRACT OF CALOTROPIS GIGANTEA LEAVES

Prajwal S M, Ekta Singh
Department Of Pharmaceutical Chemistry, Aditya Bangalore Institute of Pharmacy Education & Research, Yelahanka,
Bangalore-560064, Karnataka, India.
prajwalshetty482003@gmail.com

The present study evaluates the antioxidant potential and phytochemical profile of the ethanolic leaf extract of Calotropis gigantea, a medicinal plant widely recognized for its traditional therapeutic uses. Qualitative phytochemical screening revealed the presence of alkaloids, flavonoids, tannins, saponins, steroids, terpenoids, and phenols—compounds noted for their pharmacological activities and health benefits. Antioxidant activity was assessed using in vitro hydrogen peroxide and DPPH radical scavenging assays. The extract demonstrated notable free radical scavenging effectiveness, with $IC_{50}$ values of 34.96 µg/ml for hydrogen peroxide and 39.45 µg/ml for DPPH, showing strong concentration-dependent activity despite being slightly less potent than ascorbic acid (22.59 µg/ml and 20.12 µg/ml, respectively). The findings confirm that Calotropis gigantea leaves are a rich source of natural antioxidants, which may contribute to mitigating oxidative stress and supporting overall health. These results validate the traditional use of the plant and provide scientific evidence for its therapeutic potential, highlighting its value as a basis for further development of natural antioxidant agents.

**Keywords:** Calotropis gigantea, Phytochemical screening, Antioxidant activity, Hydrogen peroxide assay, DPPH assay

## SPECTROSCOPIC CHARACTERIZATION AND ANTICANCER POTENTIAL OF PHYTOCHEMICALS FROM METHANOLIC ROOT EXTRACT OF ACHYRANTHES ASPERA

Nayomi Atkure, ANIL M. PETHE
Datta Meghe College of Pharmacy DMIHER (Deemed to be University), Wardha, Maharashtra, India 442001.
nayomiatkure6@gmail.com

The Methanolic root extract of Achyranthes aspera was throughly characterized by spectroscopy and its, anticancer potential was evaluated. Phytochemical screening identifyied a wid range of bioactive compounds including as alkaloids, flavanoids, tannins, saponins, and phenolic. Two thorough chromatography [HPLC], revealed several unique phytoconstituents peaks, suggesting a complex chemical composition. Using spectroscopic techniques such as fourier- transform infrared spectroscopy [FTIR], the structural properties of the isolated molecules were further elucidated. These techniques detected compounds like caffeic acid, ferulic acid, and derivatived of quercetin. Elements analysis was used to identify key macro-micro elements that are essential to the efficacy of treatment. Given its high phenolic and flavanoid content, the extracts potent antioxidant activity implied that it would be able to scavenge free radicals. The anticancer potential was assessed using cytotoxicity tests on a number of cancer cell lines. The methanolic root extract superiors ability to supress cancer cell proliferation and induce apoptosis validated its antiproliferative properties. These effects could be caused by thr identified phytochemicals synergistic activity. All things considered, the study shows that achyranthes asperas methanolic root extract, enhancedwith a variety of phytochemicals identified by spectroscopy, has encouraging anticancer potential. The results highlight the importance of traditional medicinal herbs in drug discovery and encourage more research into this plant's potential for use as a natural anticancer agent. The ethnomedical use of Achyranthes aspera roots is scientifically validated by this study, which also lays the groundwork for upcoming pharmacological and clinical research aimed at maximizing its therapeutic advantages.

**Keywords:** Achyranthes aspera, methanolic root extract, phytochemical characterization, spectroscopic analysis, antioxidant activity, anticancer potential/cytotoxicity.

## FORMULATION AND EVALUATION OF HERBAL LIPSTICKS

Ch.Sowjanya, T.Madhuri Latha, C.Krishna Mohan
Department of Pharmaceutics, School of Pharmacy, Nalla Narasimha Reddy Education Society's Group of Institutions,
Hyderabad, Telangana, India – 500 088.
gowrimunnur@gmail.com

This research focuses on the formulation and evaluation of herbal lipsticks utilizing natural colorants from Betavulgaris (beetroot) and Mirabilisjalapa (Four O'clock flower). Conventional lipsticks often contain synthetic dyes and chemicals that can be detrimental to health. We aim to develop a safer, natural alternative by harnessing the vibrant pigments present in these readily available plant sources. The project involved systematically extracting pigments from Beta vulgaris (beetroot) and Mirabilis jalapa using optimized methods to ensure maximum yield and color intensity. Various lipstick bases were explored, by incorporating natural waxes, oils, to achieve desirable texture, spreadability, and stability. Six formulations were optimised in a period of one month with varying concentrations of the natural colorants to achieve a different range of shades, all formulations were optimized producing unique shades of color based on concentration of pigment and variation in base composition. The prepared herbal lipsticks underwent a comprehensive evaluation, showing the range of pH between 4.2-5.1, melting point ranges between 42℃ -51℃, breaking point limits between 4-8gms with no skin irritation and surface anomalies, with acceptable sensory evaluation (e.g., appearance, odor, spreadability) to assess their quality and consumer acceptability. The research evidences all the evaluation parameters are within the limitations. This research highlights the potential of natural plant-based colorants as a sustainable and healthier alternative in cosmetic formulations, paving the way for the development of innovative and safe herbal lip care products.

**Keywords**: Herbal lipsticks, Natural colorants, Beta vulgaris, Mirabilis jalapa.

## FORMULATION OF A HERBAL GEL CONTAINING CUSTARD APPLE LEAF EXTRACT FOR THE TREATMENT OF ORAL CANCER

ARZU SHARMA

Oral squamous cell carcinoma (OSCC) is a significant global health challenge characterized by high morbidity and limited therapeutic options. This study aimed to develop a novel herbal nano gel using Annona squamosa (custard apple) leaf extract to enhance therapeutic efficacy and minimize adverse effects. Ethanolic extract of A. squamosa leaves was prepared, and its phytochemical composition was confirmed via GC-MS analysis, identifying bioactive compounds with potential anticancer properties. In silico molecular docking revealed strong binding affinities of the phytoconstituents to key oncogenic proteins. The oral nano gel formulation was optimized using a Box-Behnken design, with the optimized batch (F4) exhibiting a particle size of 282.0 nm, zeta potential of –24.3 mV, viscosity of 185.6 cPs (12 rpm), and spreadability of 23.6 g·cm/s. In vitro MTT assay on KB oral cancer cell lines demonstrated $IC_{50}$ values of 78.41 µg/mL for the crude extract and 118.01 µg/mL for the nano gel, indicating potent cytotoxicity. In vivo studies on 4NQO+ arecoline-induced oral cancer models showed significant improvements in haematological parameters, antioxidant markers and histopathological recovery with near-normal epithelial architecture. The formulation exhibited no mucosal irritation or acute toxicity at 2000 mg/kg dose and maintained stability for 30 days under ICH guidelines which confirmed the formulation robustness. These findings suggest that Custard apple leaf-based nano gel is a promising, safe, and effective alternative for OSCC management.

dr.rahul.mcpl@gmail.com

significance, standardisation and quality assessment of commercial products remain challenging. This study compares two Yashada Bhasma products from Dhootpapeshwar and Bharadwaj Pharmaceuticals,

ISBN: 978-81-980623-8-3

combining traditional Ayurvedic methods with modern analysis. Classical tests like Varitaratva, Rekhapurnata, Nirdhuma, and Apunarbhava assessed traditional quality standards. Additionally, physicochemical tests (loss on drying, ash values, pH) and advanced techniques such as SEM, FTIR, AAS, Zeta Potential, and DLS were used. Results showed that both samples met basic Ayurvedic criteria, but the Bharadwaj formulation demonstrated better compliance- finer particles (100–300 nm), greater stability (Zeta Potential: –34.5 mV), clearer ZnO FTIR spectra, and fewer impurities in ash analysis. This research confirms traditional tests with modern science and emphasises the need for integrated quality control. It highlights the value of combining disciplines to improve the credibility, safety, and global acceptance of Ayurvedic metallic formulations.

**Keywords:** Yashada Bhasma, Zinc Calx, Ayurveda.

## FORMULATION OF SAPTARANGI PLUS GEL BY DOE APPROACH AND ITS EVALUATION FOR QUALITY

Sneha Jadhav1, Mihir Narkhede1, Ashwin Kuchekar1, Chandrakant More2, Ganesh Choudhari1,
1School of Health Sciences and Technology, Dr. Vishwanath Karad MIT World Peace University, MIT Campus, Kothrud,
Pune - 411038, Maharashtra, India.
2Shri Swami Samarth Ayurvedic Pharmaceuticals, Trimbakeshwar, Dist. Nashik-422212, Maharashtra, India
snehajadhav1203@gmail.com

About 80% of the total world population now has been using Herbal medicines in the primary healthcare system, this increase in the popularity is mainly due to its less or no adverse effects which is generally considered as safe. The two of the most leading skin disorders are Psoriasis and Eczema which affects almost 8 to 25% of the global population ranging from age mostly 15 - 35. Many Conventional medicines are available in the market to treat these disorders but, most of them inhibit some or the other side effects that is why, herbal medicines are now in trend which shows less side effects and gives a promising result. The drug delivery system which is the most suitable for these types of disorders are topical gels, creams, lotions etc. Therefore, in this present study an herbal hydrogel was developed using three plant extracts such as Salacia Chinensis, Tinospora Cordifolia and Curcuma Longa. Raw material analysis was performed on these extracts by TLC plate technique for the qualitative analysis and Rf values were observed to be 0.2 for TC and 0.68 for CL. Solubility and organoleptic properties were also checked in this present study. Pre-formulation study was carried out by screening of Carbopol 940 was performed to fix the concentration to be added to prepare a hydrogel and preservatives were selected on the basis on their ability to restrict the microbial growth in various batches. 2% Carbopol 940 and methyl paraben were selected for the formulation of gel. The effect of factors (A): SC, (B): TC and (C): CL concentration on the viscosity was studied by BBD; Box Behnken Design using design expert software version 7. Seventeen Experimental runs were generated by the software and viscosities for each batch were observed as responses. Along with that Texture analysis and pH were also carried out. The range of Viscosity was found to be 118000 cps to 191000 cps, pH was recorded between 5.9 to 6.1 and Texture analysis results were observed to lie in the range of 54.5 to 68.3. Through the optimization and analysis of the data obtained from DoE, batch 13 was finalized. Process validation of initial three batches viz SPG 001, SPG 002 and SPG 003 was carried out. Based on comparative results, SPG 002 was considered to be taken forward for DPPH assay and HPTLC analysis. At 900 ppm, Ascorbic acid showed an antioxidant activity of 87.42, SC, TC and CL of 84.6, 89.66 and 82.78 respectively. The antioxidant activity of hydrogel was calculated to be 59.79 with a synergistic activity of 1.18 which confirmed that developed formulation exhibits an antioxidant property.

**Keywords:** Herbal medicines, Saptarangi Plus gel, Psoriasis, Eczema, Salacia Chinensis, Tinospora Cordifolia, Curcuma Longa, DoE, Box Behnken Design, DPPH, HPTLC

## INFLUENCE OF NONI FRUIT JUICE ON THE HYPOGLYCEMIC EFFECT OF SULFONYL UREAS

SAMHITHA J

The present study investigated the influence of Noni Fruit Juice (NFJ; 2 ml/kg bw. po.) on the hypoglycemic effect of glibenclamide (0.45 mg/kg bw. po.) in streptozotocin-induced diabetic rats. Blood glucose concentrations were measured at 0, 1, 2, 3, 4, 6, 8, 10, 12, and 16 h following drug administration using the glucose oxidase-peroxidase (GOD-POD) method. Glibenclamide alone demonstrated a maximum reduction in blood glucose at the 4th hour, whereas NFJ produced its peak hypoglycemic effect (31% reduction) at the 6th hour. NFJ alone produced a significant reduction in blood glucose levels, which may be attributed to improved insulin sensitivity and inhibition of hepatic glucose output. There is 44% and 46% in reduction of blood glucose during 6 h in single & multiple dose treatment of glibenclamide & NFJ respectively, suggesting either an additive pharmacodynamic interaction or a pharmacokinetic interaction via competitive inhibition of glibenclamide metabolism by CYP2C9 and CYP3A4. These findings suggest that NFJ potentiates the hypoglycemic activity of glibenclamide and highlight the need for caution in concurrent use of herbal formulations with antidiabetic agents.

**Keywords:** Streptozotocin, Hypoglycemia, Glibenclamide, Glipizide, Noni Fruit Juice

## PHYTOCHEMICAL SCREENING: IN-VITRO ANTIOXIDANT AND IN-VIVO ANTI-OBESITY ACTIVITY OF VACCINIUM MACROCARPON (CRANBERRY)

Lakshmi, Shweta Mishra, Gopal Rai, G.N Darwehkar
Acropolis Institute of Pharmaceutical Education and Research, Bypass Road, Square, Manglaya Sadak, Indore, Madhya Pradesh 453771
lakshmigupta@acropolis.edu.in

This study was aimed at evaluating the phytochemical profile, in-vitro antioxidant potential, and in-vivo anti-obesity activity of Vaccinium macrocarpon (cranberry), a fruit known for its rich bioactive compounds and therapeutic properties. In this research the preliminary phytochemical screening of ethanolic and aqueous extracts of Vaccinium macrocarpon was carried out to identify the presence of secondary metabolites such as flavonoids, tannins, phenols, alkaloids, glycosides, and saponins. Total phenolic content (TPC) and total flavonoid content (TFC) were quantified using spectrophotometric methods. In-vitro antioxidant assays, including DPPH radical scavenging activity, hydrogen peroxide scavenging, and ferric reducing antioxidant power (FRAP), were performed to assess free radical neutralizing potential. For in-vivo evaluation, an anti-obesity study was conducted on high-fat diet (HFD) induced obese Wistar rats. The animals were divided into groups and administered varying doses of V. macrocarpon extract for 6 weeks. Body weight, body mass index (BMI), lipid profile, and biochemical markers were monitored, along with histopathological evaluation of adipose tissue. In the in-vivo model, administration of Vaccinium macrocarpon extract led to a significant reduction in body weight gain, BMI, total cholesterol, triglycerides, and low-density lipoprotein (LDL), while increasing high-density lipoprotein (HDL) levels compared to the HFD control group. The findings demonstrate that Vaccinium macrocarpon possesses potent antioxidant activity and exhibits promising anti-obesity effects, likely mediated through its rich phytoconstituents. These results support its potential role as a natural therapeutic agent in managing oxidative stress and obesity.

Keywords: Vaccinium macrocarpon, phytochemical screening, antioxidant, anti-obesity, flavonoids, phenolic compounds

**PT-39**

## DUAL THERAPEUTIC POTENTIAL OF TYLOPHORA INDICA MERR: UNVEILING ITS PHYTOCHEMISTRY, IN-VITRO ANTIOXIDANT AND IN-VIVO ANTI-UROLITHIATIC PROPERTIES IN PRECLINICAL MODELS

Anil Kumar1, Bhargav T D2, Girish B S3, Swarooparani N C4
1. VIPS, Bangalore, Karnataka
3Adult haematolymphoid (Medical oncology), Tata Memorial center Mumbai, Maharashtra, India-400012
4Government College (Autonomous), Mandya

Tylophora indica, an Ayurvedic climber, known for its medicinal properties such as diuretic and antioxidant. However, there isn't much thorough data on its combined antiurolithic and antioxidant properties. The purpose of this work was to evaluate T. indica leaf extracts' phytochemistry, in-vitro antioxidant performance, and in-vivo

ISBN: 978-81-980623-8-3

antiurolithic potential using preclinical models. Leaves were collected, authenticated, and hydroalcoholically extracted with a Soxhlet apparatus. Phytochemical screening confirmed the presence of alkaloids, flavonoids, tannins, and glycosides. Antioxidant potential was assessed using DPPH and nitric oxide scavenging assays, yielding IC50 values of 266.06 µg/mL and 188.30 µg/mL, respectively. For in-vivo evaluation, an ethylene glycol-induced urolithiasis rat model was used, where the extract's 200 mg/kg and 400 mg/kg preventive and curative regimens were contrasted with an established medication (Cystone). The phytochemical-evaluation showed the presence of bioactive components. Significant free radical scavenging activity was shown with IC50 values of 188.30 µg/mL (nitric oxide) and 266.06 µg/mL (DPPH). In vivo, the 400 mg/kg dosage improved magnesium levels (2.0 ± 0.16 mg/dL) while significantly lowering urinary phosphorus levels (10.7 ± 0.49 mg/dL), calcium levels (8.3 ± 0.65 mg/dL), and oxalate levels (2.54 ± 2.07 mg/dL). Reduced calcium oxalate deposition and tube damage were verified by histopathological investigation in treated groups, especially with the curative 400 mg/kg dosage. T. indica's phytochemical richness probably contributes to its strong antiurolithic and antioxidant qualities.

## EVALUATION OF IN VITRO ANTI-INFLAMMATORY AND ANTI-OXIDANT ACTIVITIES OF ETHANOLIC EXTRACT OF HIBISCUS CANNABINUS ROOTS

Ms. Poornima R, Akshay P S, Varshini B D, Prajwala K P
Department Of Industrial Pharmacy, Aditya Banaglore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India -560064
MVM College Of Pharmacy, #1336/72/2 Vikas Layout, Maruti Nagar, Yelahanka, Bangalore-560064
Poornimarnaik60@gmail.com

The current study evaluated the antioxidant and anti-inflammatory properties of ethanolic extracts derived specifically from the roots of Hibiscus cannabinus (kenaf), underscoring their potential as natural alternatives to conventional synthetic agents. Antioxidant activity was determined via the DPPH radical-scavenging assay using ascorbic acid as a standard. The root extract exhibited a clear dose-dependent free-radical scavenging effect; at higher concentrations (0.8–1.0 µg/mL), its activity was found to be comparable to or slightly surpass that of ascorbic acid. Anti-inflammatory potential was assessed using the BSA assay, with aspirin serving as the reference agent. The extract again demonstrated a concentration-dependent response, and at 50 µg/mL, it nearly matched the anti-inflammatory efficacy of aspirin-suggesting robust bioactivity. These effects are likely attributed to the phytochemical constituents present in the roots, including phenolics, flavonoids, tannins, and saponins, all known to modulate antioxidant and anti-inflammatory pathways. Notably, the extract's efficacy exhibited only marginal differences when compared with standard drugs, highlighting its promise as a competitive natural alternative with potentially fewer adverse effects. Given these encouraging results, H. cannabinus root extract emerges as a promising source of bioactive for applications across pharmaceuticals, nutraceuticals, food preservation, and cosmetics. To advance its potential further, additional phytochemical characterization, mechanistic elucidation, and in vivo evaluations are strongly recommended.

**Keywords**: Hibiscus cannabinus roots, antioxidant, anti-inflammatory, DPPH assay, BSA assay, phenolics, flavonoids, saponins.

## FINGERPRINTING PROFILING OF POLYHERBAL FORMULATIONS

Ankita Priyadarshini Sahoo, G S Chakraborthy, Rakhi Mishra, Rohit Agrahari
Parul Institute of Pharmacy and Research, Parul University, Vadodara, Gujarat 391760
sahooankitapriyadarshini@gmail.com

Medicinal plants contain various phytochemical constituents, widely used in the development of therapeutic formulations. For the development of drugs that provide beneficial effects for various diseases, the correct identification and selection of herbal components are crucial as every herb has unique phytochemical constituents. High-Performance Thin-Layer Chromatography (HPTLC) and Thin-Layer Chromatography (TLC) are reliable analytical techniques for standardisation and quality evaluation of herbal drugs. In this study, fingerprinting profiling of the hydroalcoholic extract of Liquorice and Cinnamon was carried out to confirm the standardisation. Hydroalcoholic extracts of Liquorice and Cinnamon were analysed using TLC and HPTLC techniques. TLC was performed on pre-coated silica gel plates with ethyl acetate: chloroform (7:5) as the mobile phase. Rf values were determined for glycyrrhizic acid, cinnamaldehyde, and the polyherbal formulation, confirming marker compounds. Furthermore, HPTLC analysis was performed, where bands were applied with a precision applicator, developed in a chamber after a 30-minute saturation period, and scanned at 254 nm under UV detection. TLC analysis showed distinct Rf values: 0.29 for glycyrrhizic acid, 0.35 for cinnamaldehyde, and 0.27 and 0.32 for the polyherbal formulation, confirming marker compounds. HPTLC analysis further validated the reproducibility and reliability of the developed method for quality control.Fingerprinting profiling by TLC and HPTLC confirms active phytoconstituents and ensures standardisation of polyherbal formulations. The studied herbs, Liquorice and Cinnamon, possess significant therapeutic potential, including anti-inflammatory and antimicrobial activity. This study confirms the need to improve techniques to achieve faster, cost-effective detection of active constituents in polyherbal formulations.

**Keywords:** HPTLC, Liquorice, Glycyrrhizic, anti-inflammatory, anti-microbial.

## IN VITRO ANTIMICROBIAL ACTIVITY OF TULSI (OCIMUM SANCTUM) AGAINST BACTERIAL STRAINS ISOLATED FROM TOMATO (SOLANUM LYCOPERSICUM)

Sanat Ghara, Subhradwip Saha, Sourav Bera, Avijit Das, Seema K S
Department of Industrial Pharmacy, Aditya Bangalore Institute of Pharmacy Education and Research,
Bangalore, Karnataka, India – 560064.
sanatghara2016@gmail.com

Plants have long been recognized as valuable sources of bioactive compounds with significant antibacterial potential and have traditionally been used in the treatment of various diseases worldwide. Tulsi (Ocimum sanctum), widely cultivated in India for medicinal and religious purposes, is regarded as the "Queen of Herbs" due to its diverse pharmacological properties, including antioxidative, antimicrobial, antistress, antidiabetic, and antiviral activities. It is among the most important aromatic herbs utilized in the pharmaceutical industry, primarily in the form of extracts and oils. Tulsi leaf extracts exhibit strong inhibitory effects against a wide range of spoilage and pathogenic microorganisms such as Staphylococcus aureus, Pseudomonas aeruginosa, Escherichia coli, Klebsiella pneumoniae, Proteus mirabilis, Salmonella typhimurium, Salmonella typhi, Shigella dysenteriae, Bacillus pumilus, Bacillus cereus, Aspergillus spp., Candida albicans, and Penicillium spp. Notably, the antibacterial efficacy of O. sanctum extracts against Bacillus cereus, a Gram-positive rod-shaped bacterium associated with tomato (Solanum lycopersicum), has been well documented. These findings emphasize Tulsi as a potent natural antibacterial agent with promising applications in the development of vegetable cleansers to reduce microbial contamination.

**Keywords:** Ocimum sanctum (Tulsi), Medicinal plants, Antibacterial activity, Plant extracts and essential oils, Foodborne pathogens, Bacillus cereus, Natural antimicrobial agents, Vegetable cleansers.

## EXPEDITED AUTHORIZATION OF VACCINES IN PUBLIC HEALTH EMERGENCIES: INSIGHTS FROM U.S., EU, AND JAPAN

Meghana K S, Arjun M, M P Venkatesh
Centre of Excellence in Regulatory Sciences, Department of Pharmaceutics, JSS College of Pharmacy, JSS AHER,
Mysore - 570015, Karnataka, India
meghanasirigeri@gmail.com

The COVID-19 pandemic underscored the need for regulatory systems capable of rapidly authorizing vaccines while upholding safety, efficacy, and quality standards. This review critically examines three expedited pathways - the United States' Emergency Use Authorization (EUA), the

ISBN: 978-81-980623-8-3

European Union's Conditional Marketing Authorization (CMA), and Japan's Special Approval for Emergency (SAFE). A descriptive qualitative approach was adopted, drawing on official regulatory documents, peer-reviewed literature, and international health agency reports published between 2019 and 2025. Comparative analysis focused on legal frameworks, procedural timelines, eligibility criteria, and post-authorization obligations, with case studies of Comirnaty, Spikevax, and Novavax used to illustrate real-world implementation. Results show that the U.S. EUA enabled rapid approvals based on interim data with robust post-marketing safety surveillance; the EU's CMA reduced review timelines from 210 to under 150 days while mandating annual reassessments and eventual transition to full approval; and Japan's SAFE pathway facilitated approvals in as little as 58 days through reliance on foreign clinical trial data and stringent post-approval monitoring. Despite these achievements, challenges such as incomplete datasets, evolving risk-benefit profiles, and reliance on external regulatory decisions were evident. The findings demonstrate that expedited approval mechanisms can accelerate vaccine deployment without undermining regulatory rigor, provided they are supported by transparency, scientific robustness, and ongoing pharmacovigilance. For Asia-Pacific nations with constrained regulatory capacity, reliance-based strategies, digital modernization, and collaborative platforms such as the WHO Collaborative Registration Procedure and ASEAN Joint Assessments represent vital opportunities to strengthen preparedness and ensure equitable access during future health emergencies.

## FROM DESERT PLANT TO HORMONE BALANCE: ANASTATICA'S VAGINAL CYTOLOGY STORY

Nilofer A. Sayyed, Kiran S. Bhise
Department of Pharmaceutics, MCES's, Dr. P. A. Inamdar University, Allana College of Pharmacy, Pune, Maharashtra, India – 411001
nilofer.sayyed@azamcampus.org

Vaginal cytology serves as a pivotal tool in understanding the physiological changes occurring in the female reproductive tract, particularly during post-menopausal stages. In this study, we delve into the intricate dynamics of post-menopausal symptoms through a comprehensive vaginal cytology examination using female Wistar rat model. After treating with Anastatica hierochuntica extract entrapped pellets, the research focuses on the activity of the Anastatica hierochuntica extract pellets and utility of vaginal cytology in elucidating post-menopausal symptomatology and an analysis of vaginal cytological samples collected from the animal models exhibiting post-menopausal symptoms. Through systematic observation and classification of cellular morphology and patterns, the characteristic changes indicative of hormonal fluctuations and reproductive tract alterations associated with menopause were studied. The findings offer valuable insights into the utility of vaginal cytology as a non-invasive diagnostic tool for assessing post-menopausal symptoms in animal models. Furthermore, the elucidation of cellular changes provides a foundation for understanding the underlying mechanisms contributing to symptom manifestation, thus facilitating the development of targeted therapeutic interventions. In summary, this research underscores the significance of vaginal cytology in enhancing the understanding of post-menopausal symptomatology and highlights its potential as a valuable research tool for investigating reproductive health in animal models.

## DEVELOPMENT OF HPTLC FINGERPRINTS FOR CYMBOPOGON CITRATUS, OCIMUM SANCTUM, AND ASPARAGUS RACEMOSUS FOR IDENTIFICATION OF PRODUCT SAFETY

Pooja Turkani, Punit Sultanpure and Paramita Das
Department Of Pharmaceutical Chemistry, Krupanidhi college of Pharmacy, Chikka Bellandur, Bengaluru Karnataka- 560035
poojaturkani18@gmail.com

In the current study, High-Performance Thin-Layer Chromatography (HPTLC) fingerprints were developed for the identification and product safety of Cymbopogon citratus, Ocimum sanctum, and Asparagus racemosus. The isolation and identification of phytochemicals in these plant extracts was accomplished by the optimization and validation of the HPTLC method. The fingerprints that have been created can be used to standardize extracts and identify particular components. HPTLC analysis of each extracts of Cymbopogon citratus, Ocimum sanctum and Asparagus racemosus were conducted using mobile phases like Toluene: Ethyl acetate (9.3: 0.7 v/v), Toluene: Ethyl acetate: Acetic acid (4.5:5.5:0.5 v/v/v) and Ethyl acetate: Methanol: Water (7.5: 1.5: 1 v/v/v) respectively and Rf values of biomarkers were found to be 0.42(citral), 0.78(ursolic acid) and 0.45(Shatavarin IV). The results demonstrate the potential of HPTLC fingerprinting for ensuring product safety and efficacy in the pharmaceutical and herbal industries. The fingerprints can also serve as a reference for future studies and quality control purposes. The developed method is simple, rapid, and cost-effective, making it suitable for routine analysis. This study highlights the importance of HPTLC fingerprinting and method development for above plant materials in ensuring the quality and authenticity of herbal products.

**Keywords:** HPTLC fingerprinting, Cymbopogon citratus, Ocimum sanctum, Asparagus racemosus, phytochemicals.

## CRACKING THE WITHANOLIDE CODE: A COMPARATIVE STUDY OF POLYHERBAL FORMULATIONS

Rajesh Sahu, Amit Maliye, Madhav Sonekar, Chandrashekhar Chauriya
Sonekar College of Pharmacy, Mahadula, Koradi, Nagpur, Maharashtra, India – 441111
rajeshashoksahu@gmail.com

In recent years, remarkable advancements have been made in natural and Ayurvedic drug delivery systems, with the goal of enhancing the bioavailability and therapeutic potency of herbal formulations. The need for robust standardization techniques is paramount to ensure the safety, efficacy, and quality of herbal medicines. The polyherbal formulation Ashwagandhadi churna have been used in traditional medicine for centuries. It contains Withania somnifera, Piper longum, Ipomoea digitata, Piper nigrum and Zingiber officinale, which offer immunomodulatory activity with therapeutic benefits in treating general debility, stress-related disorders, digestive weakness, respiratory ailments, musculoskeletal pain and reproductive and overall health issues. This study presents a comparative analysis of a laboratory-prepared formulation of Ashwagandhadi churna and a commercially available counterpart, with a focus on the presence and quantification of withanolide as a key marker compound. The results indicated a difference in withanolide content between the lab formulation and the marketed product, highlighting variability in the quality and efficacy of herbal formulations. The findings suggest that laboratory formulations can provide more consistent and higher levels of active constituents compared to some commercial products. This research underscores the importance of standardization and quality control in herbal preparations to ensure therapeutic effectiveness.

**Keywords**: Withanolide, Ashwagandhadi, immunomodulatory, polyherbal.

## ANTIBACTERIAL AND ANTHELMINTIC ACTIVITIES OF POLYHERBAL SUSPENSION

Mr. Muralidhara R.N, Ms. Gagana H, Mr. T.N Shankar, Mr. Lohith L, Ms. Harshitha S, Mrs. Mamatha M K
Department Of Industrial Pharmacy, Aditya Bangalore Institute of Pharmacy Education & Research, Bangalore, Karnataka, India- 560064
Mallige College Of Pharmacy #71, Silvepura, Chikkabanavara Post, Karnataka, India Bengaluru-560090
manumuralidhara370@gamil.com

In the current research, polyherbal formulation of Eleusine coracana, Macrotyloma uniflorum, Phoenix dactylifera, and Prunus dulcis was formulated. The objective behind the research was to evaluate the Anti-bacterial and Anthelmintic activities of a polyherbal suspension. Prepared from seed extracts of Eleusine coracana, Macrotyloma uniflorum, Phoenix dactylifera by Soxhlet apparatus using ethanol and Prunus dulcis by maceration process using distilled water. The extracts were subjected to phytochemical screening revealed the presence of alkaloids, flavonoids, tannins, glycosides, phenols, and terpenoids. Two

ISBN: 978-81-980623-8-3

suspensions (F1 and F2) were formulated and further evaluated for Anti-bacterial and Anthelmintic activity using Agar diffusion method and Adult Worm Mortality Assay. Four different concentrations (25ul, 50ul, 75ul, 100ul) of formulations F1 and F2 were tested and obtained zone of inhibition diameters (F1= 0,0,0,2mm and F2=0,0,1,2mm) respectively was found that F2 formulation was more effective against E. coli than F1 formulation when compared to standard Amoxicillin (zone of inhibition=3mm at 100ul concentration). Formulations F1 & F2 also showed effective anthelmintic activity against earthworms by showing immobility and death at (F1=3.12 & 4.00 min and F2 =2.27 & 3.04 min) respectively when compared against standard Piperazine citrate (2.10 & 2.44 min). Therefore, poly herbal formulation has been successfully formulated as it was observed that it possesses promising Anti-bacterial and Anthelmintic activity. Further studies can be made to explore other parameters related to Anti-bacterial and Anthelmintic properties.

**Keywords:** Anti-bacterial, Anthelmintic, Eleusine coracana, Macrotyloma uniflorum, Phoenix dactylifera, Prunus dulcis, Poly herbal suspension, E. coli, Earthworms.

## STUDY OF SYMPLOCOS RACEMOSA AND ASPARAGUS RACEMOSUS EXTRACT FOR ACUTE TOXICITY IN WISTAR RATS

Diksha Joshi, Hemant Khambete, Sanjay Jain
Faculty of Pharmacy, Medi-Caps University, Indore
diksha.joshi@medicaps.ac.in

The hormonal illness known as PCOS, or polycystic ovary syndrome, affects women who are of reproductive age. The prevalence of this condition is to be between 20 and 33% in the general population. Menstrual cycle irregularities, obesity, hirsutism, acne, and aberrant biochemical profiles, including higher serum concentrations of LH, testosterone, androstenedione, and insulin, are some of these characteristics. The Present study investigates the acute toxicity of hydroalcoholic extract of Symplocos racemosa (SR) and aqueous extract of Asparagus racemosus (AR). The hydroalcoholic extracts of Symplocos racemosa were prepared by Soxhlet extraction method. The obtained extract of SR is slight sticky in appearance and the extract of AR is in powder form. The phytochemical Screening were performed for both the extracts. Extracts were evaluated for its safety profile in accordance with OECD guidelines for acute toxicity study. Healthy adult Wistar rats were administered single doses of extracts with different concentrations of 150,350,2000mg/kg body and observations were made for signs of toxicity which includes changes in behavior, body weight and mortality. The results indicate no significant signs of toxicity up to a dose of 2000mg/kg body weight with no mortality or severe adverse effects observed for all herbal extracts. The study concludes the extracts may have a favorable safety profile when administered acutely.

**Keywords:** Extract of Symplocos racemosa, aqueous extract of Asparagus racemosus, PCOS, Acute toxicity studies

**PT-49**

## PHYTOCONSTITUENTS TARGETING AMPK-MTOR PATHWAY FOR THE MANAGEMENT OF METABOLIC SYNDROME: AN INTEGRATIVE VALIDATION APPROACH

MUNJEWAR SEEMA CHANDPASHA

Metabolic syndrome (MetS) is a cluster of interrelated abnormalities including central obesity, insulin resistance, dyslipidemia, and hypertension, predisposing individuals to diabetes, cardiovascular disease, and fatty liver. Dysregulation of the AMP-activated protein kinase (AMPK) and mammalian target of rapamycin (mTOR) axis is recognized as a central event in its pathogenesis.The present work aims to explore phytoconstituents capable of modulating AMPK activation and mTOR inhibition for restoring metabolic balance. The study will employ molecular docking to predict phytoconstituent-target interactions, followed by in vitro validation using appropriate cell lines to assess glucose uptake, lipid regulation, and pathway modulation. Promising compounds will subsequently be evaluated in vivo using rat and mice models of metabolic syndrome developed through a low-protein, high-carbohydrate (LPHC) diet. Gene and protein expression analysis, along with biomarker profiling, will be performed to generate mechanistic insights. This integrative approach is expected to identify potential phytoconstituents as novel leads for safer management of metabolic syndrome.

**Keywords:** Metabolic syndrome, AMPK, mTOR, phytoconstituents, LPHC diet model

**PT-50**

## FORMULATION AND EVALUATION OF HERBAL EMULGEL CONTAINING SYZYGIUM CUMINI LEAF EXTRACT

D. Akhila, N. Swapna, C. Krishna Mohan
Department of Pharmaceutics, School of Pharmacy, Nalla Narasimha Reddy Education Society's Group of Institutions,
Hyderabad, Telangana, India-500088
devarauppalaakhila@gmail.com

The present study was to formulate emulgel using Syzygium cumini leaf extract. Polymers like sodium cardoxy methyl cellulose, carbopol 974P and xanthan gum were used as gelling agent in various proportions. Liquid paraffin was used as oil phase and a combination of Span 80 and Tween 80 were used as emulsifying agent. Various formulations were prepared by changing the gelling agent and their concentration. The prepared emulgels were evaluated for pH, spreadability co-efficient, physical stability, drug content and in-vitro drug release. Compatibility between the drug and polymers was studied by FT-IR method and there was found to be no interaction. The formulated emulgels were examined for their colour, homogeneity, consistency and phase separation after 24 hr of preparation. They were greenish, homogenous, clear and transparent and formed viscous gel preparation with a smooth homogenous appearance and there was no significant phase separation in the formulations. The pH of formulation F1-F6 was found to be in the range of 6.23-6.66. All the formulations were physically stable and have shown good spreadability coefficient in the range of 94-116 cm. In-vitro diffusion studies were carried out using phosphate buffer for all the formulations and the drug release was found to be in the range of 76.6 to 97.2%.Based on all the evaluation parameters F3 was considered as optimized formulation with good drug release of 97.2%.

**Keywords**: Emulgel, Syzygium cumini, Sodium carboxy methyl cellulose, invitro.

**PT-51**

## THERAPEUTIC POTENTIAL OF MEDICAGO SATIVA IN THE MANAGEMENT OF OSTEOPOROSIS IN FEMALE RATS

RAHUL BASAVARAJ KARUR

Alfalfa (Medicago sativa L.), widely recognized as a traditional medicine and functional food, is rich in essential vitamins, minerals, and phytonutrients beneficial for bone health. It contains vitamins A, D, E, K, calcium, magnesium, and other bioactive compounds that are known to support bone formation and mineralization. Osteoporosis, a major skeletal disorder, is often associated with conditions such as long-term heparin therapy, which induces bone resorption by stimulating osteoclast activity and inhibiting osteoblast function. The present study aimed to evaluate the anti-osteoporotic potential of ethanolic extract of Medicago sativa in female rats, with alendronate used as a standard reference drug. Experimental groups received low dose (250 mg/kg) and high dose (500 mg/kg) of M. sativa extract for six weeks. Biochemical parameters including serum calcium, phosphorus, alkaline phosphatase (ALP), and tartrate-resistant acid phosphatase (TRAP) were estimated and compared among groups. In addition, femoral length, weight, volume, density, and fourth lumbar vertebra hardness were assessed. Body weight variations during treatment were recorded, and histopathological analysis of bone was performed.Results revealed significant improvement in biochemical and bone parameters, with the higher dose (500 mg/kg) demonstrating greater efficacy compared to the lower dose (250 mg/kg). Histopathological findings further confirmed positive structural changes in bone after M. sativa treatment.In conclusion, the study demonstrates that Medicago sativa exhibits promising anti-osteoporotic activity, supporting its role as a potential functional food for the prevention and management of osteoporosis.

**Keywords:** Medicago sativa; osteoporosis, antiosteoporotic activity; heparin; biochemical parameters.

**PT-52**

## EVALUATION OF THE IN VITRO ANTIBACTERIAL AND ANTIOXIDANT ACTIVITIES OF CASTELLA TEXANA

VINITHA B

ISBN: 978-81-980623-8-3

The present study was undertaken to systematically evaluate the in vitro antibacterial and antioxidant potential of Castella texana leaves in relation to their phytochemical composition. Preliminary phytochemical screening of ethanolic and methanolic leaf extracts revealed the presence of flavonoids, phenols, tannins, terpenoids, steroids, and cardiac glycosides, compounds well recognized for their diverse pharmacological activities. Antibacterial activity was assessed by agar disk diffusion and broth microdilution methods against six clinically relevant pathogens, namely Staphylococcus aureus, Enterococcus faecalis, Klebsiella pneumoniae, Acinetobacter baumannii, Pseudomonas aeruginosa, and Enterobacter cloacae. Both extracts demonstrated significant inhibitory effects, with Gram-positive organisms exhibiting greater susceptibility than Gram-negative strains. Minimum inhibitory concentration (MIC) determinations further confirmed the bacteriostatic potential, particularly against S. aureus and E. faecalis. In parallel, antioxidant potential was investigated using DPPH radical scavenging, hydrogen peroxide scavenging, and reducing power assays. The results indicated a concentration-dependent free radical neutralization, with ethanolic extracts showing comparatively higher activity, attributable to their rich phenolic and flavonoid content. The dual observation of notable antibacterial and antioxidant activities highlights the therapeutic promise of C. texana and supports its traditional use in managing infectious diseases and oxidative stress–related disorders. These findings provide a scientific basis for further bioassay-guided fractionation, isolation, and structural characterization of active constituents, as well as safety and in vivo efficacy evaluations, to establish C. texana as a potential source of novel phytopharmaceutical agents.

**Keywords:** Castella texana, Phytochemicals, Antibacterial activity, Antioxidant potential Flavonoids

**PT-53**

## EXTRACTION AND ANALYTICAL CHARACTERISATION OF BIOACTIVE PHYTOCHEMICALS FROM NERIUM OLEANDER LEAVES USING METHANOLIC SOXHLET EXTRACTION AND SPECTROSCOPIC TECHNIQUES

Tirunalveli Praveena
Pharmaceutical analysis division,
Jagan's institute of pharmaceutical sciences

This study investigates the effective extraction and detailed analytical profiling of bioactive phytochemicals from Nerium oleander leaves using Soxhlet extraction with methanol as the solvent. Shade-dried leaf powder underwent continuous methanolic extraction to produce a concentrated crude extract enriched with secondary metabolites. UV-Visible spectroscopy of the methanolic extract showed distinct absorbance peaks characteristic of phenolic compounds, flavonoids, and other conjugated systems. Complementary Fourier-transform infrared (FT-IR) spectroscopy identified key functional groups, including hydroxyl, carbonyl, and amine, confirming the presence of alkaloids, cardiac glycosides, tannins, and saponins. Preliminary qualitative phytochemical screening further supported the presence of terpenoids, glycosides, and flavonoids. The use of methanol as the extraction solvent proved highly effective in isolating pharmacologically active constituents from Nerium oleander, laying the foundation for advanced pharmacological, toxicological, and pharmaceutical research.

**Keywords:** Nerium oleander, Soxhlet extraction, methanol extract, UV-Visible spectroscopy, FT-IR spectroscopy, phytochemical screening, bioactive compounds, alkaloids, flavonoids, cardiac glycosides, secondary metabolites.

## ULTRASOUND-ASSISTED EXTRACTION OF AGERATUM CONYZOIDES LEAVES FOR ENHANCED EXTRACT YIELD AND BIOACTIVE RECOVERY

Rubal Chahal, Vineet Mittal, Arun Nanda,
Department of Pharmaceutical Sciences, Maharshi Dayanand University, Rohtak, Haryana, India 124001.
imrubal1989@gmail.com

This study was aimed to optimize the extraction of Ageratum conyzoides (ACZ) leaves and to evaluate how the method of extraction influences the yield of extraction. In the current study, Conventional maceration was compared with ultrasound-assisted extraction (UAE), which was systematically optimized using Response Surface Methodology (RSM) with a Central Composite Factorial Design (CCFD). The RSM model identified the best UAE conditions such as sonication time of 37.78 minutes, limonene concentration of 70%, and a solvent-to-solid ratio of 26.16 mL/g, resulting in a maximum yield of 17.49%. In contrast, maceration produced lower yields under comparable settings, highlighting the advantages of ultrasound-based methods. The higher efficiency of UAE is attributed to ultrasonic cavitation, which disrupts plant cell walls and enhances solvent penetration. Evidence from Scanning Electron Microscopy (SEM) confirmed these effects by revealing significant tissue damage in the treated samples.Overall, the findings demonstrate that ultrasound-assisted extraction, when guided through RSM, is more effective and consistent than maceration for maximizing extract yield from Ageratum conyzoides. This integrated approach provides a promising framework for scaling up extraction processes and supports its application in herbal drug development.

**Keywords:** Ageratum conyzoides; extraction yield; ultrasound-assisted extraction; maceration; Response Surface Methodology (RSM); Central Composite Factorial Design (CCFD); Scanning Electron Microscopy (SEM)

## DEVELOPMENT AND EVALUATION OF A POLYHERBAL FACIAL SCRUB FOR ENHANCED ANTIMICROBIAL SKIN CARE

Chayan Kundu, Nandan Sarkar
Department of Pharmaceutical Technology,
Adamas University, Kolkata, India-700126
kchayan899@gmail.com

A polyherbal face scrub was prepared with natural coffee powder, Curcuma longa, and Azadirachta indica extracts to provide effective and affordable skincare. The formulation was assessed for colour, odour, consistency, pH, spreadability, and viscosity. Evaluation included antimicrobial assays against E. coli and Staphylococcus aureus. The results showed that the face scrub was non-irritating and satisfactory to apply. Neem extract contributed potent antibacterial properties, while Curcuma longa offered antioxidant benefits. Both together improved cleansing, exfoliation, and anti-inflammatory effects, supporting comprehensive skin health. The study highlights the importance of synergy between herbal ingredients for optimal cleansing and microbial protection. Continued standardization, stability, and biological studies could further establish the formulation as a successful herbal face scrub.

**Keywords:** Face Scrubber, Neem Extract, Curcuma longa, Antibacterial, Exfoliation

## FROM ROADSIDE TO REMEDY: BREAST CANCER ACTIVITY OF MARTYNIA ANNUA FLOWER EXTRACT

Barathraj P, Priya K, Karthiraja A S.
Department of Pharmacology, The Erode College of Pharmacy,
Erode, Tamil Nadu, India-638112.
barathrajbarath87@gmail.com

Martynia annua is often used in traditional medicine because of its medicinal properties. Flavonoids and phenolic compounds, both bioactive phytochemicals found in its flowers, have been linked to anticancer effect. Despite these claims, there is minimal scientific evidence that extracts of M. annua flowers can prevent cancer, especially breast cancer. This study used Gas Chromatography and Mass Spectrometry (GCMS) to identify the phytochemical composition of the floral ethanolic extracts and assess their cytotoxic effects on breast cancer cell lines. The powdered, shade-dried flowers were extracted with 99.9% ethanol. Flavonoids and anthocyanins, like cyanidin glycoside, luteolin, and apigenin, were identified through phytochemical profiling using GCMS. The cytotoxic potential of the extracts was assessed on breast cancer cell line MCF-7 (ER-positive), with an MTT assay. A dose-response analysis of extract treatment was done to study cell viability. Several bioactive compounds characteristic of anticancer properties were identified using GCMS. The ethanolic floral extract significantly decreased the viability of breast cancer cells in a concentration-dependent manner, It is worth mentioning that the MCF-7 cells had a greater inhibition. The cytotoxicity may be associated with the flavonoids and anthocyanins. Martynia annua flower ethanolic extract shows potent anticancer activities on MCF-7 cell lines, supporting its potential as a natural form of medicine and the need for more studies utilizing bioassay-guided fractionation and in-vivo assays.

ISBN: 978-81-980623-8-3

## NOVEL POLYHERBAL ANTIBACTERIAL AND ANTIFUNGAL CREAM: A STABLE SULPHUR-ASAFOETIDA FORMULATION FOR EFFECTIVE MANAGEMENT OF SKIN INFECTIONS

Kiran S, Ziaul Karim
Department of Pharmaceutics, Nitte College of Pharmaceutical Sciences, Nitte (Deemed to be University),
Bengaluru, Karnataka, India-560064.
kiranmalini26@gmail.com

Herbal medicine has long been considered for its therapeutic applications in the management of infectious and non-infectious skin disorders. The present work focuses on the formulation and evaluation of stable antibacterial and antifungal cream containing Gandhak (sulphur), Hing (asafoetida), Jatyadi oil and Karanji oil. The natural ingredients have been chosen for their reported antimicrobial, anti-inflammatory and wound healing properties. The cream was formulated by conventional emulsification techniques using excipients like beeswax, borax, stearic acid and cetostearyl alcohol for consistency as well as stability. The formulation was analyzed for physicochemical properties, organoleptical properties, pH assessment, spreadability, washability and stability studies. Microbiological tests were run against Staphylococcus aureus, Escherichia coli and Candida albicans. Results showed that the cream had acceptable pH (5-5.6), texture, washability characteristics and stability for 28 days without phase separation. Antimicrobial activity was determined showing the presence of substantial inhibition zones against bacterial and fungal strains confirming its effectiveness. Irritancy studies were conducted and no impairment to the skin was noticed. The results exhibits that this polyherbal cream is safe, effective and eco-friendly topical preparation for the treatment of skin infections as compared to synthetics.

**Keywords:** Polyherbal, Cream, Antibacterial, Antifungal, Effectiveness.

## A NATURAL APPROACH TO SKINCARE: FORMULATION OF A POLYHERBAL SCRUB

Vaishnavi Nawghare, Mala Mahartale
School Of Pharmacy, G H Raisoni University,
Saikheda, Madhya Pradesh, India - 480337
vaishnavinawghare770@gmail.com

Natural or herbal cosmetics are developed using natural ingredients to treat wrinkles, acne, and balance the production of oil. The major objective of this study was to develop a polyherbal scrub. This preparation's active ingredients include fenugreek (Trigonella foenum-graecum) seed powder, coconut oil, rose water, Aloe vera gel, sodium lauryl sulphate, methyl parabens, and glycerine. As a natural exfoliator, fenugreek seeds were added, and glycerine, coconut oil, and aloe vera gel provide calming and hydrating properties. The natural toner was rose water, the preservative was methyl paraben, and the cleaning agent was sodium lauryl sulphate. The formulation was prepared by mixing fenugreek powder with a gel base, and its organoleptic properties, pH, Spreadability, foamability, washability, grittiness, viscosity, stability, and skin irritation were all evaluated. According to the research, the prepared face scrub has a pleasant appearance, a pH between (5.5-6.0), good Spreadability, stable foaming, easy washing, homogeneous grittiness, and no indications of skin irritation. The study concluded that an herbal face scrub made from fenugreek is a safe, stable, and efficient alternative for synthetic scrubs in terms of cleansing and exfoliating.

**Keywords**: Herbal cosmetics, fenugreek, aloe vera, facial scrub.

**PT-59**

## DEVELOPMENT OF NEEM BARK-BASED ANTIBACTERIAL GEL: AN HERBAL APPROACH TO SKINCARE AND DERMATOLOGICAL THERAPY

Vanshita Bobde and Mitesh Sonkusare
School Of Pharmacy, G H Raisoni University,
Saikheda, Madhya Pradesh, India 480337
vanshitabobde@gmail.com

Topical drug delivery plays an important role in dermatological therapy by providing site-specific treatment while avoiding systemic side effects and improving bioavailability compared to oral administration. The present study focused on the formulation and evaluation of an antibacterial gel prepared from neem bark (Azadirachta indica), a medicinal plant widely used in traditional medicine for its antibacterial, anti-inflammatory, and wound-healing properties. Neem bark was collected, shade-dried, and extracted with methanol. The extract was incorporated into gel formulations using Carbopol 940 as the gelling agent, triethanolamine as a neutralizer, and methylparaben and propylparaben as preservatives. Three formulations containing varying concentrations of neem bark extract were prepared and evaluated for physicochemical parameters, including pH, viscosity, Spreadability, and skin irritation. Antibacterial activity was assessed using the agar well diffusion method against selected bacterial strains. The results revealed that all formulations exhibited suitable viscosity, excellent Spreadability, and a skin-compatible pH range of 5.6–6.3, ensuring patient acceptability. Skin irritation studies demonstrated the safety of the gels, showing no adverse effects. Antibacterial evaluation confirmed significant activity, with inhibition zones increasing at higher extract concentrations. These findings validate the traditional therapeutic role of neem in treating bacterial skin infections and highlight the potential of neem bark-based gels as safe, effective, and economical herbal formulations. Such gels offer promising applications in dermatology and skincare, combining traditional medicine with modern topical delivery systems.

**Keywords:** Neem bark, Azadirachta indica, antibacterial gel, herbal skincare, topical formulation

**PT-60**

## EVALUATION OF A NOVEL POLYHERBAL SERUM FOR SKIN BRIGHTENING, ANTI-AGING, AND ANTIMICROBIAL ACTIVITY

Vinit Isankar, Vanshita Bobde
School Of Pharmacy, G H Raisoni University, Saikheda,
Madhya Pradesh, India 480337
vinitisankar@gamil.com

Herbal face serum including Citrus aurantium (bitter orange), Hibiscus rosa sinensis (hibiscus), and Glycyrrhiza glabra (liquorice) was formulated and evaluated to determine its potential for enhancing skin health. It is known for its antioxidant, anti-inflammatory, and skin-brightening qualities, and also Glycyrrhiza glabra is useful in lowering skin irritation and pigmentation. Hibiscus rosa sinensis is rich in peptides, alpha-hydroxy acids, good for exfoliating and anti-aging. Citrus aurantium promotes collagen synthesis and amplifies the serum's overall skin-rejuvenating effect because of its high vitamin C concentration. Using maceration techniques, the dried plant components were extracted hydroalcoholic. The resultant extracts were mixed with glycerine, propylene glycol, aloe vera gel, and essential oils to create a serum basis. Physicochemical characteristics including pH, viscosity, spreadability, and stability under various storage circumstances were assessed for the produced formulation. The DPPH radical scavenging method was used to evaluate antioxidant activity, while the agar well diffusion method was used to test for antibacterial activity against Staphylococcus aureus. The serum had outstanding spread ability, a pH that was suitable for skin, and exceptional physical stability. Citrus aurantium added to the antibacterial activity and scent, while antioxidant tests revealed high radical scavenging activity, particularly from Glycyrrhiza glabra. Preliminary patch testing revealed no irritation or negative reactions. Three medicinal herbs are combined in this innovative herbal serum mixture to provide multipurpose skincare benefits. Its promise as an herbal cosmetic product that is safe, efficacious, and marketable is supported by the results.

**Keywords:** Herbal serum, Glycyrrhiza glabra, Hibiscus rosa-sinensis, Citrus aurantium, skincare, antioxidant, formulation

**PT-61**

## DEVELOPMENT OF A NAIL LACQUER CONTAINING SILVER NANOPARTICLES OF MULTI HERBES; NEEM, TULSI, TURMERIC, AND PAPAYA LEAF EXTRACTS FOR SYNERGETIC ANTIMICROBIAL ACTIVITY

Sheela Verma, Nidhi Malviya, Rama R Nargund, Shravan L Nargund
Nargund College of Pharmacy, Bangalore, Karnataka, Bharat
sheelaverma02@gmail.com

Nail infections such as onychomycosis are common and often resistant to conventional antifungal treatments. Herbal remedies offer promising alternatives with less side. This study aimed to develop a nail lacquer

ISBN: 978-81-980623-8-3

incorporated with silver nanoparticles of multi herbal extracts known for their antimicrobial and antifungal properties. Alcoholic extraction of Neem (Azadirachta indica), Tulsi (Ocimum sanctum), Turmeric (Curcuma longa), and Papaya leaf (Carica papaya) was carried out by maceration process. Silver nanoparticles of these individual herbal extracts were prepared by reduction reaction with silver nitrate solution and optimized for particle size (PS), zeta potential (ZP), poly dispersity index (PDI) and entrapment efficiency (EE). These nanoparticles were added in to nail lacquer prepared from Eudragit RL 100, ethyl cellulose as film formers, dibutyl phthalate as plasticizer and salicylic acid as permeation enhancer. The nail lacquer was evaluated for drying time, viscosity, non-volatility, smoothness and thickness of film, gloss, water resistance, stability and antifungal activity using the disc diffusion method against Candida albicans. The PS, ZP, PDI and EE of the nanoparticles and physicochemical properties of nail lacquer exhibited acceptable range. Uniform, glossy non-sticky coat with a drying time of 120 seconds was recorded. Antifungal testing revealed significant zones of inhibition against Candida albicans, indicating strong synergetic activity of the combined herbal extract's silver nanoparticles. The developed herbal nail lacquer demonstrated suitable, stability, and potent antifungal properties. It can be concluded that the prepared nail lacquer containing silver nanoparticles of herbal extracts has the potential of alternative to conventional antifungal nail treatments.

**Keywords:** Herbal nail lacquer, Neem, Tulsi, Turmeric, Papaya leaf, Antifungal activity, Onychomycosis

**PT-62**

## IN VIVO ANTICANCER POTENTIAL OF A POLYHERBAL FORMULATION IN MICE

Deeparani Urolagin, S. Jayakumari
Professor & HOD, Department of Pharmacology,
R R College of Pharmacy, Bengaluru, India.
urolagindeepa@gmail.com

A polyherbal formulation containing extracts from Ixora coccinea flowers, Vitis viniferae seeds, and Piper longum roots was used to investigate its in vivo anticancer effects on Ehrlich Ascites Carcinoma (EAC) cells in male Swiss albino mice. Acute and chronic toxicity studies were performed following the OECD guidelines. Over 14 days, parameters such as body weight, mortality, tumor volume, and average survival time were monitored. The mice were divided into four groups: a control group, a standard treatment group receiving vincristine, and two groups administered different doses of the polyherbal formulation (250 and 500 mg/kg). Viable tumor cell counts were determined using trypan blue and hemocytometers. The findings indicate the efficacy of the polyherbal formulation in treating Ehrlich Ascites Carcinoma in mice, indicating its potential anticancer properties. Further investigation is needed to understand its mechanisms of action and possible clinical applications in humans. Data analysis was conducted using one-way analysis of variance (ANOVA), followed by Student's t-test.

**Keywords:** Tumor, Polyherbal formulation, EAC cells, in vivo anticancer

**PT-63**

## ISOLATION, CHARACTERIZATION, AND PHARMACEUTICAL EVALUATION OF STARCH FROM BANANA PSEUDOSTEM WASTE WITH FIBER CO-PRESERVATION

Sparsha Suresh Bandekar, Nagesh Hanmantrao Aloorkar
Dr. Babasaheb Ambedkar Technological University, Lonere, Mangaon,
Raigad (M.S.), 402103, Satara College of Pharmacy,
Degaon, Satara, Maharashtra, 415004.
sparshasb@gmail.com

Banana cultivation generates substantial agro-waste, with the pseudostem alone contributing nearly 60–65% of the total biomass discarded after harvest. While this waste is often left unutilized in fields, it remains a rich source of starch and fiber—two industrially significant biopolymers. Conventional extraction approaches, however, focus on starch recovery while destroying the fibrous fraction, thereby limiting integrated utilization. In this study, pseudostems were analysed at four developmental stages (growth, development, maturity, harvest), with the harvest stage identified as optimal for starch yield. Time-course studies showed that immediate extraction within 12–24 hours post-harvest preserved starch quality, whereas prolonged retention reduced starch and nutrient stability. Four isolation techniques—grating & crushing, mechanical grinding, sugarcane juicing, and fiber decortication—were compared, each performed with a fixed water ratio. Among these, fiber decortication gave the highest starch recovery while also preserving fibers as a viable co-product.The isolated material was confirmed as starch through IR, $^{1}H$ NMR, $^{13}C$ NMR, and mass spectral analysis. Comparative rheological studies and tablet formulations demonstrated that banana pseudostem starch performs at par with maize starch as a binder and disintegrant in conventional dosage forms. This is the first systematic protocol to isolate and characterize native banana pseudostem starch while simultaneously conserving fibers, thereby unlocking dual-product recovery from agricultural waste and highlighting its potential as a sustainable pharmaceutical excipient.

**Keywords:** Banana pseudostem waste, native starch isolation, fiber co-preservation, pharmaceutical excipient, starch characterization, sustainable utilization

## DEVELOPMENT OF TOOTHPASTE FROM MARKETED KAMDHENU GOMAY BHASMA DANTAMANJAN (GO-VIGYAN ANUSANDHAN KENDRA, DEOLAPAR)

Anushri Baghele, Damodar Goupale
Department of Pharmaceutics, Anurag College of Pharmacy,
Warthi, Bhandara, India 441905
anushribaghele@gmail.com

Ayurveda, the ancient Indian system of medicine, highlights the importance of cow-derived products such as milk, curd, ghee, urine, and dung in treating various human ailments. Among these, cow dung is known for its healing properties. Toothpaste prepared from cow dung can improve dental health and protect against oral infections. Its use also makes oral care more economical and environmentally friendly. This toothpaste has been specially designed to reduce toothache and related problems. For this, the formulation was prepared by mixing toothpaste ingredients with cow dung ash. In simple terms, formulation means preparing a mixture of different substances according to a specific formula. The ingredients used to prepare the toothpaste include Kamdhenu Gomay Bhasma Dantmanjan, Gomay Bhasma, calcium carbonate, sodium saccharin, sodium lauryl sulphate, carboxymethyl cellulose, menthol, glycerin, clove oil, peppermint oil, and distilled water. Three batches were prepared (Trial-1 to Trial-3) by changing the concentration of the abrasive agent. For preparation, each ingredient was sieved and weighed carefully. All the dry powders were mixed in a mortar and pestle. Then glycerin, water, clove oil, peppermint oil, and menthol were added and triturated to make a smooth paste. Finally, the toothpaste was stored in well-sealed containers. Out of the three batches, Trial-2 showed the best results, with the right consistency, and was selected for further evaluation as per the Bureau of Indian Standards. The final product, "Kamdhenu Gomay Bhasma Dantmanjan Toothpaste," successfully combines the traditional healing benefits of its ingredients with modern oral care needs. It represents a blend of heritage and science, offering a safe, natural, and holistic solution for dental health.

## DEVELOPMENT AND EVALUATION OF A TOPICAL GEL FROM WEDELIA TRILOBATA EXTRACT

T. Mamatha, D.Aksana, M. Anjali, P. Uha Nandini, S. Gayathri
Department of Pharmaceutical Quality Assurance, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka, Secunderabad.
Telangana State, India -500017.
tmamathasnvpmv@gmail.com

The present research aims to formulate and evaluate a herbal gel using the ethanolic extract of Wedelia trilobata (now known as Sphagneticola trilobata), a plant recognized for its ethnomedicinal value and bioactive constituents. The primary goal is to assess the extract's pharmacological properties, especially antibacterial and analgesic activities, and its potential for topical therapeutic applications. Although Wedelia trilobata is widely used in traditional medicine, it remains underexplored pharmacologically, particularly in gel-based delivery systems. There is limited research on the development of a standardized, stable gel formulation using this plant's extract for effective therapeutic use. The dried powdered leaves of Wedelia trilobata was extracted by cold maceration method using ethanol as a solvent and the extract was

ISBN: 978-81-980623-8-3

subjected to physicochemical analysis (including loss on drying, ash value, and extractive values) and phytochemical screening (identifying flavonoids, alkaloids, saponins, tannins, etc.). A gel formulation was developed and evaluated for organoleptic properties, pH, spreadability, viscosity, and stability. The gel was smooth, homogeneous, and free from grittiness. The average pH was 6.48, indicating good compatibility with skin. Spreadability was measured at 4.2 g·cm/sec, suggesting ease of application. The gel showed a moderate and stable viscosity averaging 49.9 centipoise, supporting optimal consistency for topical use. In vitro antibacterial studies revealed moderate inhibition zones against Escherichia coli and Staphylococcus aureus. Analgesic activity, evaluated using the hot plate method in animal models, showed a significant increase in reaction time, indicating effective pain-relieving potential. The study demonstrates that Wedelia trilobata possesses notable antibacterial and analgesic properties when incorporated into a gel base, supporting its use as a natural alternative to synthetic formulations. The findings also emphasize the need for further research to isolate active constituents, explore mechanisms of action, and establish clinical safety. With its pharmacological promise and ecological abundance, Wedelia trilobata is a valuable candidate for future herbal drug development.

**Keywords:** Wedelia trilobata, Herbal gel, Antibacterial activity, Analgesic activity, Phytochemical screening.

## EXTRACTION AND EVALUATION OF FLAXSEED (LINUM USITATISSIMUM) MUCILAGE AS A BINDER IN TABLET DOSAGE FORM

Swati P. Jamathe, Sachin W. Lohe
Department of Pharmaceutics, Anurag College of Pharmacy
Warthi, Bhandara, Maharashtra, India-441905
swatijamthe45@gmail.com

The powders hold together by a binder to form granules. Some excipients of natural origins are currently available as an alternative over the synthetic ones in pharmaceutical formulation. The aim of this study was to isolate the mucilage from flaxseed and compare them to evaluate the binding effects. In present study an effort was made to study the efficacy of mucilage obtained from flax seeds as tablet excipient. The mucilage was extracted from selected seeds by conventional method by precipitation of soaked and blended seeds in acetone. The dried mucilage were subjected to several phytochemical and physicochemical properties. Granules were formulated by wet granulation method by using extracted mucilage as a binding agent then, punch the tablet and comparison was made against the tablet prepared with standard binder as gelatine. The tablet evaluated by various evaluation parameters of tablet dosage form. The results showed that the tablet prepared from extracted mucilage as a binder had good binding property and disintegration properties, hardness, friability all evaluated parameters were within the permissible limits. Thus, mucilage could be used as an alternative binding agent in tablet dosage form.

**Keywords**: Flaxseed, Mucilage, Natural binder, Tablet Formulation, Wet granulation, pharmaceutical excipients

## NATURAL HAIR CARE: POLYHERBAL SHAMPOO WITH ANTIOXIDANT ACTIVITY TO IMPROVE HAIR HEALTH

Pooja Kaushalye, Nishant Awandekar, Swati Lade, Mayuri Gajghate, Rashmi Trivedi, Milind Umekar
Department of Pharmaceutical Quality Assurance, Smt.Kishoritai Bhoyar College of Pharmacy, Nagpur, Maharashtra, India - 441002
kaushalyepooja@gmail.com

The present research has centered on developing a polyherbal shampoo containing hydroalcoholic extracts of which are known to be a good source of flavonoids, phenolics, saponins, and sulfur compounds, which could target hair rejuvenation and possess antioxidant properties. Ten formulations (F1-F10) of polyherbal shampoos were prepared using sodium lauryl sulfate as surfactant, xanthan gum and guar gum as thickeners, and parabens as preservatives. The physicochemical properties of all the formulations were evaluated, including pH, viscosity, surface tension, foaming ability, cleansing properties, and skin compatibility. Formulation F6 had the most acceptable cosmetic properties and the potential antioxidant activity among all formulations, following were the values of pH (5.10 ± 0.01), viscosity (293), surface tension (32.68), foaming ability (73ml), cleansing properties (dirt removal efficiency of 88%). Antioxidant activity demonstrated by DPPH free radical scavenging activity was 72.19% and the greatest ascorbic acid equivalent antioxidant capacity was 95.64 µg/ml by CUPRAC assay, the phytochemical screening of the extracts confirmed the presence of bioactive ingredients responsible for the bioactivity. This study demonstrates developing a safe and effective herbal-based alternative to conventional shampoos. The optimized formulation (F6) represents the potential prospective antioxidant contributors for managing hair-related oxidative stress concerns that can meet acceptable criteria for consumer acceptability before reaching the market.

**Keywords:** Polyherbal shampoo, Antioxidant activity, Hair and scalp protection.

**PT-68**

## FORMULATION AND EVALUATION OF HYDRO-ALCOHOLIC EXTRACT OF KALANCHOE PINNATA LEAF FOR MEDICINAL ACTIVITY

Shubhangi Thule, Minakshi Rajgire, Sanjay Wate
Anurag College of Pharmacy, Warthi, Bhandara,
Maharashtra, India -441905
thuleshubhangi@gmail.com

This study aimed to develop and evaluate a transdermal drug delivery system incorporating the hydroalcoholic extract of Kalanchoe pinnata leaves, known for their traditional medicinal properties. Extraction was carried out using a hydroalcoholic solvent system (ethanol: water) to optimize the yield of bioactive constituents. Phytochemical screening confirmed the presence of flavonoids, alkaloids, tannins, saponins, glycosides, and phenolic compounds—compounds with established anti-inflammatory and antioxidant effects. The extract was formulated into transdermal patches using the solvent casting method, with various polymeric combinations of hydroxypropyl methylcellulose (HPMC), polyvinyl alcohol (PVA), and ethyl cellulose, along with suitable plasticizers to ensure flexibility, adhesion, and uniformity. The patches were evaluated for physicochemical properties, showing desirable characteristics: brownish color, smooth texture, transparency, thickness (0.117–0.133 mm), weight variation (0.731–0.885 g), folding endurance (93.67–98.33), moisture uptake (1.165–1.305%), and drug content (90.16–96.84%). In vitro evaluations demonstrated significant biological activity. The hydrogen peroxide ($H_2O_2$) scavenging assay indicated antioxidant activity with 50.65–74.50% inhibition. Anti-inflammatory potential was confirmed via protein denaturation inhibition using bovine serum (46.32–65.73%) and egg albumin (24.47–61.40%). The study concludes that the formulated transdermal patches offer a promising, controlled-release system for delivering Kalanchoe pinnata extract. These findings support their potential use in managing inflammatory conditions while providing antioxidant benefits, paving the way for future pharmaceutical and clinical applications.

**Keywords**: Kalanchoe pinnata, transdermal patch, hydroalcoholic extract, anti-inflammatory, antioxidant.

## NEUROPROTECTIVE POTENTIAL OF QUERCETIN-ENRICHED BANANA PEEL EXTRACT VIA GABA AND NMDA RECEPTOR MODULATION: IN SILICO AND IN VITRO APPROACHES

Bismita Devi, Priyabrata Pradhan, Vineet Kumar Rai, Durgamadhab Kar, Shakti Ketan Prusty, Goutam Ghosh, Goutam Rath
School of Pharmaceutical Sciences, Siksha 'O' Anusandhan (Deemed to be University), Kalinga Nagar, Bhubaneswar-751030, Odisha, India
devibismita4@gmail.com

Neurodegenerative disorders such as Alzheimer's and Parkinson's disease are strongly linked with oxidative stress, excitotoxicity, chronic inflammation, and apoptosis. Banana peel, often considered agricultural waste, is rich in flavonoids and vitamins with potential neuroprotective effects. The present study investigated the hydroalcoholic extract of banana peel (HAEBP) for its phytochemical composition, antioxidant activity, and modulatory effects on GABAergic and glutamatergic neurotransmission, alongside its anti-inflammatory and anti-apoptotic potential. LC-MS analysis confirmed the presence of neuroactive compounds including quercetin, luteolin, and pyridoxine. In silico docking studies indicated quercetin as the most potent ligand, showing strong binding affinities with both GABA and NMDA receptors. In vitro assays demonstrated that HAEBP significantly enhanced antioxidant

ISBN: 978-81-980623-8-3

enzyme activities (SOD and catalase), increased GABA levels, and modulated neuroinflammatory and apoptotic markers—elevating Bcl-2 expression while reducing IL-1β, TNF-α, Bax, and caspase-3. The results highlight quercetin as a key contributor to these effects. Overall, HAEBP exhibits substantial neuroprotective potential through its flavonoid-rich composition, acting via antioxidant enhancement, neurotransmitter regulation, and inhibition of inflammation and apoptosis. These findings suggest HAEBP as a promising natural candidate for managing neurodegeneration, warranting further preclinical and in vivo investigations.

**Keywords:** Banana peel extract, Quercetin, Flavonoids, Neuroprotection, GABA receptor, NMDA receptor, In silico docking, LC-MS analysis

**PT-70**

**FROM FOREST TO PHARMACOLOGY: ANTIDIABETIC EFFECTS OF PTEROCARPUS MARSUPIUM IN STZ-INDUCED DIABETIC RATS**

Mohammad Khan, Chamakuri Kantlam

Pterocarpus marsupium, a widely cultivated species in India, is recognised for its nutritional value and traditional medicinal uses in conditions such as rheumatism, venomous bites, and microbial infections. In addition to these properties, the plant has been reported to contain bioactive compounds with potential antidiabetic and antioxidant effects. The present study was undertaken to evaluate the efficacy of methanolic extracts of Pterocarpus marsupium in the management of streptozotocin (STZ)-induced diabetes in albino rats, with a focus on both biochemical and histological parameters. Methodology: Diabetes was induced in albino rats using STZ, and the animals were subsequently treated with methanolic extracts of Pterocarpus marsupium at doses of 100 mg/kg and 200 mg/kg for 21 consecutive days. The therapeutic effects were assessed by analysing blood glucose, nitric oxide, serum insulin, and protein levels, as well as oxidative stress markers in pancreatic tissue. Nuclear Magnetic Resonance (NMR) and Infrared (IR) spectroscopy were employed to characterise the extract, leading to the identification of two major phytoconstituents: quercetin and kaempferol. Histological examinations of pancreatic tissues were conducted to evaluate morphological changes. Treatment with Pterocarpus marsupium extract significantly reduced blood glucose and nitric oxide levels while simultaneously increasing serum insulin and protein concentrations in diabetic rats. Antioxidant status in pancreatic tissues improved markedly, demonstrated by elevated endogenous antioxidant levels and reduced thiobarbituric acid-reactive substances (TBARS). Histological evaluation revealed that STZ-induced degenerative changes in pancreatic β-cells were ameliorated following treatment, with restoration of islet cell integrity observed in the treated groups. The findings demonstrate that Pterocarpus marsupium exhibits significant antidiabetic and antioxidant activities in STZ-induced diabetic rats. The presence of quercetin and kaempferol as active phytoconstituents suggests that these compounds contribute to the observed therapeutic effects. Restoration of pancreatic histoarchitecture and improvement of biochemical parameters further support its potential as a natural antidiabetic agent. These results highlight the feasibility of isolating and developing active components of Pterocarpus marsupium for future clinical applications, instilling confidence in its translational value for diabetes management.

**Keywords:** Antidiabetic Effect, Pterocarpus marsupium, Streptozotocin, Oral Glucose Tolarance test.

**FORMULATION AND EVALUATION OF DECOCTION OF CLITORIA Ternatea Leaves For Anti-Haemorrhoids Activity**

Pratiksha S. Raut, Suchita K. Bhoyar and Sanjay P. Wate
Department of Pharmaceutical sciences, Anurag College of Pharmacy, Warthi, Bhandara, Maharashtra, India-441905
pratiksha632o@gmail.com

Haemorrhoids are one of the most common anorectal disorders, characterized by swollen and inflamed venous structures in the rectal and anal region, leading to pain, bleeding, and discomfort. The limitations and side effects associated with conventional pharmacological treatments have directed attention toward herbal remedies with proven safety and efficacy. Clitoria ternatea has been traditionally used in Ayurvedic and folk medicine. Clitoria ternatea also known as Aparajita or Butterfly pea is considered as Medhya Drug to improve intelligence and enhance memory function. For the formulation and evaluation of the Anti-Haemorrhoids Properties of Clitoria ternatea Fresh leaves were collected, shade-dried, and subjected to aqueous extraction by decoction using leaves extract. Explore the use of Clitoria ternatea leaves extract for Anti-Inflammatory effect in treatment of Haemorrhoids. Analgesic and Wound-healing properties A decoction of Clitoria ternatea leaves was prepared for Extraction was done by decoction process. In vitro Anti-inflammatory activity of hydroethanolic extract of Clitoria ternatea leaves studied by bovine serum protein denaturation method. The Physicochemical test confirmed the presence of Alkaloids, Flavonoids, Tannins and Saponins. These phytoconstituents are responsible for Anti-Inflammatory effects. The activity of hydroethanolic extract of Clitoria ternatea leaves was compared with standard Anti-Inflammatory drug, Diclofenac.

**Keywords:** Anti-Inflammatory, Decoction, Extraction, Clitoria ternatea, Anti Haemorrhoids

**Curcumin Herbal Suppository To Treat Colorectal Cancer**

V.Poojitha, T.Vijaya, C.Krishna Mohan
Department of Pharmaceutical analysis, School of Pharmacy, Nalla Narasimha Reddy Education Society's Group of Institutions, Hyderabad, Telangana, India – 500 088.
Poojithaofficial121@gmail.com

Colorectal cancer (CRC) remains one of the leading causes of cancer-related mortality worldwide, often associated with chemoresistance and severe adverse effects from conventional therapy. Herbal bioactive compounds have gained attention as complementary approaches due to their safety profile and multifunctional pharmacological properties. Curcumin, the principal polyphenolic compound derived from Curcuma longa (turmeric), exhibits potent anti- inflammatory, antioxidant, and anti-proliferative activities, effectively targeting colorectal cancer stem-like cells and suppressing key oncogenic pathways such as NF-κB and Wnt/β-catenin. However, curcumin's clinical application is limited by poor aqueous solubility, low gastrointestinal absorption, and rapid systemic metabolism. Co-administration with piperine, an alkaloid from Piper nigrum (black pepper), enhances bioavailability up to 2000% by inhibiting glucuronidation and P-glycoprotein efflux mechanisms. Formulating a curcumin– piperine herbal suppository offers a direct rectal route of administration, bypassing first-pass metabolism and achieving higher localized concentrations in the colorectal region. Such a delivery system may enhance therapeutic efficacy, reduce systemic toxicity, and provide a non- invasive adjunct to conventional CRC treatments. The results indicate that the curcumin- piperine herbal suppository demonstrated acceptable physicochemical properties, including smooth texture,uniform drug distribution, and rectal pH compatibility. In vitro release studies showed sustained curcumin release with enhanced bioavailability when combined with piperine compared to curcumin alone. In vivo permeability studies confirmed improved mucosal absorption through rectal tissue.

**Keywords:** Colorectal cancer, Curcumin, Piperine, Chemoresistance.

**COMPUTATIONAL EVALUATION OF TRACHYSPERMUM AMMI L. SEED PHYTOCHEMICALS AS POTENTIAL ANTICANCER AGENT**

Himansu Bhusan Samal, Itishree Jogamaya Das
Department of Pharmaceutics, School of Pharmacy and Life Sciences, Centurion University of Technology and Management, Ramchandrapur, Jatni, Odisha-752050, India
Department of Pharmaceutics, Faculty of Medical Science and Research, Sai Nath University, Ranchi, Jharkhand- 835219, India
hbsamal@gmail.com

Cancer remains the second leading cause of mortality worldwide, underscoring the urgent need for safer, cost-effective therapeutic strategies. Ethnomedicinal plant such as Trachyspermum ammi (ajwain) are rich in bioactive phytoconstituents with potential anticancer properties. This study identifies and evaluates phytoconstituents from T. ammi seeds using gas chromatography-mass spectrometry (GC-MS) followed by in silico drug discovery tools. Methanol (polar) and n-hexane (non-polar) extracts yielded 66 phytoconstituents (38 from methanol extract (TA_M1-M38) and 28 from n-hexane extract (TA_H1-H28). The compounds are virtually screened against five key oncogenic targets:

ISBN: 978-81-980623-8-3

cyclin-dependent kinase 4 (CDK4), Phosphatidylinositol-3-kinase (PI3K), topoisomerase 2α or (TOP2A), mammalian target of rapamycin (mTOR) and poly (ADP-ribose) polymerase 1(PARP1). Among the identified molecules, (N-(n-benzyloxycarbonyl-dl-alanyl)-d- glucosamine) (TA_M32) had docking scores of -9.1 kcal/mol against PARP1, -8.0 kcal/mol against CDK4 and PI3K. Similarly 2,4'-Methylene biscyclohexylbisisocyanate (TA_H6) demonstrated promising affinity against PI3K (-7.2kcal/mol) and PARP1 (-7.0 kcal/mol). These finding highlights T. ammi seeds phytochemicals as promising lead compounds with favourable drug likeness and safety profiles. Integration of ethnopharmacology with computational screening provides a cost-effective approach to accelerate anticancer drug discovery.

**Keywords:** Anticancer phytochemical, Ajwain seeds extract, Gas chromatography–mass spectrometry, Molecular docking, Toxicity and drug-ability prediction

## FORMULATION AND EVALUATION OF HYDROALCOHOLIC EXTRACT OF MORINGA OLEIFERA LEAVES FOR ITS ANTI-INFLAMMATORY ACTIVITY

Pradnya Chudhari, Anshuman A. Borkar
Department of Pharmaceutical Quality Assurance, Anurag College of Pharmacy, Bhandara, Maharashtra, India-441905
pradnyachudhari2612@gmail.com

It is well known that inflammation is a defence response of our body to hazardous stimuli, such as allergens or tissue injury. We introduce some herbs with their anti-inflammatory effects. Moringa oleifera is a highly valued nutritional plant. It is well known as the 'Drumstick' or 'Horseradish tree'. The study was conducted on Moringa Oleifera leaves. The primary goal of the research was to create and assess an anti-inflammatory ointment using flavonoids from Moringa oleifera leaf extract. It is possible to link the anti-inflammatory properties of flavonoids to their suppression of the enzymes lipoxygenase and cyclooxygenase. The extraction was done using maceration. The plant shows valuable pharmacological actions such as anti-asthmatic, anti-diabetic, hepatoprotective, anti-cancer, anti-microbial, and antioxidant effects. This study provides an overview of the plant and documents its anti-inflammatory activity. In addition to Moringa oleifera leaf extract, base, emulsifying, and stabilising agents were used. The formulation was prepared using the fusion method and evaluated for spreadability, washability, pH, colour, smell, texture, non-irritating, and anti-inflammatory activity. The Moringa oleifera ointment was stable, smooth, spreadable, and had good washability with a pH of 7.21 and a yellowish-green color, showing strong anti-inflammatory activity with 63.45–99.86% inhibition in the Bovine Serum Denaturation Assay and 56.41–94.07% in the Egg Albumin Denaturation Assay. According to the study found that it serves as a substitute for synthetic and chemical anti-inflammatory medications. These results confirm that the M. oleifera plant has been historically used as a successful treatment for conditions linked to inflammation.

**Keywords:** Moringa oleifera, Inflammation, Flavonoids, Ointment, Evaluation.

## FORMULATION AND EVALUATION OF PSIDIUM GUAJAVA LEAVES EXTRACT GEL FOR ORAL APPLICATIONS

Minal Sayam, Saurabh Raghute, Kamala Chandak, Milind Umekar
Department of pharmaceutical quality assurance Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Maharashtra 441002
sayamminal@gmail.com

Psidium guajava (Myrtaceae) leaves contain abundant phytochemicals with notable antimicrobial and anti-inflammatory activities. The leaves are often chewed, used as mouth rinses, or prepared as herbal remedies to alleviate tooth pain and manage oral infections, making them suitable for oral therapeutic formulations. The phytochemical screening of guava leaves extract confirmed the presence of reducing sugar, tannins, flavonoids, saponin, proteins, and the solubility of extract is found in ethanol and water. The maximum absorption value of pure drug was found at 260nm in ethanol. The leaves were subjected to hydroalcoholic extraction in (ethanol: water,1:1) and incorporated into a gel base, various batches were prepared with varied compositions of Carbopol 934, sodium CMC, and triethanolamine. The prepared gels were then assessed for organoleptic features, pH, viscosity, spreadability, drug content uniformity, and stability. In-vitro drug release studies for the oral gel formulations showed a release of 62.08% at 4.5 hours. Antimicrobial screening at different concentrations revealed that the 30 µg/ml zone exhibited the highest zone of inhibition (6.8 ± 0.19) mm against Escherichia coli and Staphylococcus aureus. The guava leaf–based oral gel showed strong antimicrobial activity along with satisfactory pharmaceutical attributes, highlighting its potential as a safe and effective natural remedy for mouth ulcers and related oral infections.

**Keywords:** Psidium guajava, leaves extract, oral application, antimicrobial, gel formulation.

## DEVELOPMENT OF STANDARDIZATION PARAMETERS OF CLAYTONIA PERFOLIATA DONN EX WILLD WITH SPECIAL REFERENCE TO ITS PHARMACOLOGICAL APPROACHES

Sumeet Dwivedi, Satyaendra Shrivastava, G. N. Darwhekar
Acropolis Institute of Pharmaceutical Education and Research, Indore, Madhya Pradesh, India- 453771
Parijat College of Pharmacy, Indore, Madhya Pradesh, India- 452001
herbal0914@rediffmail.com

Claytonia perfoliata Donn ex Willd., commonly known as miner's lettuce, is a traditionally valued leafy herb rich in bioactive compounds. Despite its ethnomedicinal applications, systematic standardization and pharmacological validation of this plant remain limited. The present study was undertaken to develop comprehensive standardization parameters of C. perfoliata with special reference to its pharmacological potential. Standardization was carried out by evaluating macroscopic and microscopic characteristics, physicochemical constants, fluorescence behavior, and phytochemical profiling to establish reliable quality control markers. Preliminary phytochemical screening revealed the presence of alkaloids, flavonoids, tannins, saponins, and phenolic compounds, suggesting a diverse chemical composition. Quantitative estimations of total phenolics and flavonoids were performed to support its antioxidant potential. Pharmacological assessments, based on in vitro antioxidant and anti-inflammatory assays, demonstrated promising activity, correlating with the phytochemical content. These findings reinforce the traditional uses of C. perfoliata and provide a scientific framework for its therapeutic applications. The study establishes baseline pharmacognostic and pharmacological parameters that can serve as a reference standard for quality assurance, future drug development, and further in vivo investigations. Overall, the work highlights the significance of Claytonia perfoliata as a potential source of natural bioactive agents and emphasizes the need for its inclusion in evidence-based herbal pharmacopoeia.

**Keywords:** Leaves, Claytonia perfoliata, Plant Extract, Pharmacology, Flavonoids

## FORMULATION AND EVALUATION OF MICROSPHERES OF ISOLATED PIPERINE AS HERBAL REMEDY FOR TUBERCULOSIS

Deepthi Swapna P R, Junise V, Vishwanath B A
Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka,560064
Al-Shifa College of Pharmacy, Poonthavanam, Kizhattoor, Kerala 679325
deepthiswapna@gmail.com

The present study was aimed to formulate and evaluate Chitosan microspheres of isolated Piperine as a promising herbal remedy for the treatment of Tuberculosis. Piperine microspheres were prepared using ionotropic gelation method using TPP as the gelling counterion. The microspheres were evaluated for drug loading capacity, particle size analysis, Scanning Electron Microscopy, swelling index, Differential Scanning Colorimetry and % in-vitro drug release. The microspheres were found to be almost spherical, free flowing and non-aggregated and the size of spheres were ranged from 550-850µm. Among the 6 formulations, F2 was found to have better drug loading capacity of 89.02%, maximum swelling index and maximum cumulative release of 95.86%. Fickian diffusion was the mode of release for F2 formulation. From the results obtained from antimycobacterial study (REMA assay), it was concluded that the formulated microspheres (F2) possess anti-mycobacterial activity at a concentration of 100µg/ml. stability studies concluded that chitosan microspheres were stable physically and

ISBN: 978-81-980623-8-3

chemically for a period of 12 weeks because there was no change in the appearance and drug loading.

Vellalar College Of Pharmacy, Thindal, Erode-12
cmhariharanpharma@gmail.com

Medicinal plants rely on the integration of diverse approaches including botanical, phytochemicals, biological and molecular techniques. Medicinal plant drug discovery continues to offer new and important leads against different targets such as pharmacological, including anticancer activity. Medicinal plants are a rich source of bioactive phytochemicals. A single plant exhibited multiple biological properties like preventing and curing diseases, a boost of immunity, detoxification through its antioxidant property, and many more that could be attributed to its phytochemical constituents. Lawsonia Inermis plant showed the presence of various Phytoconstituents such as carbohydrates, alkaloids, tannins, phenolic compounds, flavonoids, glycosides, saponins, steroids, terpenoids, protein and amino acids. The present study deals with plant extract and respective chemical constituents for their in vitro cytotoxicity against K562 cancer cell line model as well as the mechanistic studies were determined through induction of apoptosis assay method. The data of our studies suggests that crude methanol extract of Lawsonia inermis Linn leaves showed IC50 value0.7mg/ml for MTT cellular viability assay and1.06E +06 (23.0 %) apoptosis profile of cells treated against K562 cells showed remark able cytotoxicity and anti-Proliferative activities in both the in-vitro methods tested. Furthermore, GC-MS analysis confirmed the existence of various bioactive components in the ethanol extract of lawsonia. The selected bioactive compounds were examined for their bioactivity through in silico molecular docking, which exhibited the strongest anticancer properties. Further in vivo studies may lead to the creation of a potent apoptosis and Anti-Proliferative activity of low toxicity and better therapeutic index. These findings support Lawsonia inermis linn conventional use, which is an effective source of anticancer substances that could be used in pharmaceuticals.

**ISOLATION AND CHARACTERIZATION OF SECONDARY METABOLITES FROM ENDOPHYTES ASSOCIATED WITH CALOTROPIS GIGANTEA AND NICOTIANA TABACUM**

Sai Rajesh Gunisetti, Venkata Mrudula Jakka, Girija Shankar Guntuku, Murali Krishna Kumar Muthyala
AU College of Pharmaceutical Sciences, ANDHRA UNIVERSITY, VISHAKAPATNAM—530003, Andhra Pradesh

In the ongoing research work entitled “Isolation and Characterization of Secondary Metabolites from Endophytes Associated with Calotropis gigantea and Nicotiana tabacum,” we have specifically chosen toxic plants in the area surrounding the Andhra University, Visakhapatnam and isolated the parts of the Calotropis plant and Tobacco plant, and observed the abundant growth for the Calotropis sepals and Tobacco bud comparative to other parts of the mentioned plants parts such as flowers, latex, flower paste, seeds. The preliminary tests to identify endophytes were done by Gram staining, acid-fast, spore staining, motility of bacteria by using the hanging drop method, and growth in aerobic vs anaerobic conditions. The biochemical tests and molecular diagnostic techniques are to be evaluated. The extracts of Calotropis gigantea sepals and Nicotiana tabacum buds were purified by running Wet packing Column chromatography (Normal phase), then characterized the isolated compounds by NMR spectrometry. The microbial activity is evaluated for the isolated compounds using the cup-plate method. The compounds were found to have significant Anti-microbial activity. The anti-tubercular activity by MABA assay and anti-fungal activity by agar diffusion are to be evaluated.

**PT-80**

**DEVELOPMENT AND EVALUATION OF A POLYHERBAL TABLET WITH IMMUNOMODULATORY POTENTIAL**

Swati L. Khedekar, Kailash R. Biyani
Department of Pharmaceutics, Anuradha College of Pharmacy, Chikhli, Buldhana, Maharashtra, India- 443201
Swatikhedekar1990@gmail.com

A polyherbal tablet comprising powdered extracts of Tinospora cordifolia (Giloy), Ocimum sanctum (Tulsi), and Emblica officinalis (Amla), all of which are well-known for their strong immunomodulatory and antioxidant qualities, is the main objective of the current investigation. The direct compression method was used to create the tablets because it was easy to use, economical, and appropriate for herbal compounds that are sensitive to heat and moisture.Every formulation had a thorough pre-compression assessment, which included Hausner's ratio, Carr's index, bulk and tapped density, and angle of repose. Weight variation, hardness, friability, disintegration time, and in-vitro drug release were all evaluated after compression. The outcomes showed that tablet performance was enhanced by raising the superdisintegrant concentration. In 45 minutes, batch F4 (25 mg of crospovidone) exhibited a 93.6% drug release and a disintegration time of 58 seconds. A disintegration time of 49 seconds and a drug release of 95.8% were the best overall findings for combination batch F5, suggesting that the two superdisintegrants worked in concert. Pharmacopeial limits for physical parameters were met by every batch. A viable option for oral herbal immunomodulatory therapy, the optimized formulation (F5) demonstrated improved dissolving, rapid disintegration, mechanical strength, and superior flow.

**Keywords:** Immunomodulatory, Pharmacopeial, superdisintegrant, antioxidant, crospovidone, Hausner's ratio, Carr's index.

**PHYTOCHEMICAL SCREENING AND EVALUATION OF XYLOSMA CONTROVERSA EXTRACTS FOR NEUROPROTECTIVE, ANTHELMINTIC, ANTI-OXIDANT ACTIVITIES**

Mohammad.Rawoof, Kv.Nagalakshmi
Department of Pharmacology, VJ’s College Of Pharmacy, Diwancheruvu ,533296, Rajahmundry, East Godavari, Ap, India.
alirawoofmohammad@gmail.com

Xylosma controversa a member of the Salicaceae family, is traditionally recognized in ethnomedicine for its diverse therapeutic applications. The present study aimed to perform a comprehensive phytochemical screening of its extracts and to evaluate their antioxidant, anthelmintic, and anti-neurodegenerative (anti-Alzheimer’s) activities. Phytochemical investigations revealed the presence of flavonoids, phenolic compounds, tannins, saponins, alkaloids, and glycosides. Ethanolic extracts of the plant demonstrated strong antioxidant activity, suggesting their potential in mitigating oxidative stress by the Free radical scavenging activity method (DPPH). Significant anthelmintic effects were observed in vitro, indicating possible applications in the management of parasitic infections. Furthermore, the extract contain xylocoside-G, it shows neuroprotective effect against β-amyloid neurotoxicity supporting their potential role in neuroprotection and the management of Alzheimer’s disease. The study highlights the therapeutic promise of X. controversa as a natural multi-target agent with potential applications in oxidative, parasitic, and neurological disorders.

**Keywords:** Xylosma controversa, Neurodegenerative.

vaishnavichelpelwar@gmail.com

Arthritis is a chronic and painful joint condition that can affect mobility and quality of life. Rheumatoid arthritis (RA) is one of the most serious forms of arthritis. Rheumatoid arthritis (RA) is a chronic, progressive autoimmune disease characterized by synovial inflammation, destruction of cartilage, and joint abnormalities. RA affects 0.5–1% of

ISBN: 978-81-980623-8-3

the worldwide population and significantly deteriorates patients' ability to function in their daily lives, and also causes significant health and economic burdens. Current therapy options are effective, but they have limitations in relation to bioavailability, systemic exposure, and adverse reactions. this indicates a need for innovative drug delivery systems (DDS) to provide localized therapy with sustained effects. To address the limitations of long-term therapies for chronic, progressive diseases, innovative drug delivery systems have been developed, with a focus on localized and targeted approaches such as nanoemulgel-based DDS." Nanoemulsions are submicron (20–200 nm) oil-in-water dispersions of lipids of poor water-soluble drugs that increase the solubility, stability, and bioavailability of drugs. Nanoemulsions have smaller droplet sizes, resulting in deeper penetration across biological barriers including skin and synovial membranes. Nanoemulsions combined with gels are capable of sustained release of drug, extended residence time, and also provide localized delivery to inflamed joints. When combined, this approach improves therapy, limits the frequency of dosing, and minimizes systemic toxicity. In integrating nanotechnology with localised topical drug delivery, this is how nanoemulgels are able to represent a patient-friendly, site-specific, and very efficacious treatment, providing new avenues of precision and localized treatment.

**Keywords:** nanoemulsion, autoimmune disease, sustained effects, localized therapy, patient-friendly

## IN VITRO ANTICANCER STUDY OF L-ASPARAGINASE FROM MARINE SOURCE

Ramanathan M, Rajakumari R
Department of Pharmaceutical Biotechnology, PPG College of Pharmacy, Coimbatore, Tamil Nadu, India - 641035.
official.ramanathan@gmail.com

Enzymes are biological catalysts essential for facilitating cellular reactions. Among them, L-asparaginase, a microbial enzyme, is extensively used as a chemotherapeutic agent, especially in the treatment of acute lymphoblastic leukemia (ALL). First discovered in 1922, it has since become vital in tumor therapy, particularly for ALL and lymphosarcoma, often as part of combined chemotherapy protocols. In this study, fungi isolated from Arabian Sea soil samples were screened for L-asparaginase production. Out of twelve isolates, five showed significant enzyme activity, with the $MS_4$ isolate demonstrating maximum activity at 30°C and pH 7. Over 80% of tested marine fungal strains were capable of producing the enzyme. The anticancer potential of L-asparaginase was evaluated against the AGS gastric cancer cell line using the MTT assay, revealing dose-dependent cytotoxicity with an $IC_{50}$ value of 112.58 µg/ml, confirming strong anticancer activity. Future research will focus on strain identification and optimization of enzyme yield for therapeutic applications.

**Keywords:** L-asparaginase, Enzymes, Marine fungi, Acute lymphoblastic leukemia, Anticancer.

## PHARMACOGNOSTICAL AND PHYTOCHEMICAL EVALUATION OF THE STEM OF DALBERGIA MULTIFLORA

Pruthvi N, Sivakami Sundari P
College of Pharmaceutical Sciences, Dayananda Sagar University, Devarakaggalahalli, Harohalli Kanakapura Road, Ramanagara District, Karnataka, India – 562112
Pruthvi.cognosy@gmail.com

The present study is focused on the botanical, physicochemical, and phytochemical properties of stems of Dalbergia multiflora. Dalbergia genus is widely distributed throughout tropical and subtropical regions. Traditional medical systems employ a wide variety of species in their therapy for the treatment of ringworm, leucoderma, dyspepsia, dysentery, syphilis, gonorrhea, stomach ache, leprosy, and scabies. Dalbergia multiflora is a large climbing shrub, frequently found in semi-evergreen forests belonging to fabaceae family. Dalbergia multiflora stem was evaluated for macroscopic, sensory, histological and phytochemical parameters. Physicochemical parameters such as total Ash (5.2 ± 0.1 %), acid insoluble ash (2.0 ± 0.1 %), water soluble ash (3.7 ± 0.2 %), foreign matter (Nil), loss on drying 8.1 ± 0.1 %, and extractive value was evaluated. Qualitative phytochemical analysis of petroleum ether, chloroform, ethyl acetate, ethanol, and water extracts was evaluated. The phytochemical analysis showed the presence of steroids, flavonoids, coumarin glycosides, alkaloids, phenolics, and tannins. The total flavonoid content was 65.99 ± 1.15 µg/ml, equivalent to standard quercetin. The total phenolic content was 36.72 ± 1.23 µg/ml, equivalent to standard gallic acid. HPTLC fingerprint analysis of the alcoholic extract was performed to reveal the phytoconstituents, and it showed a good resolution and separation. This data provides an essential pharmacognostic and phytochemical information for the proper identification of the drug and contributes in carrying out further research in the isolation of the potential candidates for drug discovery.

**Keywords:** Dalbergia multiflora, Qualitative analysis, Phenolic content, flavonoid content, HPTLC.

## PHYTOPHARMACOLOGICAL INVESTIGATION ON LEAVES AND SEEDS OF TRICHOSANTHES CUCUMERINA (L.)

ANJU A VARGHESE

Phytopharmacological studies on leaves and seeds of Trichosanthes cucumerina (L.), with particular emphasis on their anthelmintic activity. The systemic study on leaves and seeds of Trichosanthes cucumerina Linn. was conducted right from the authentication subjected to physicochemical standardization. Soxhlet extraction using ethanol was employed to obtain bioactive compounds, followed by phytochemical screening. The anthelmintic activity was evaluated The findings support the traditional medicinal use of T. cucumerina as a natural anthelmintic agent and highlight its potential for further pharmaceutical applications. Standardisation involves evaluation of physicochemical properties such as ash value and extractive values. Phytochemical screening of these plant extracts indicated the presence of various secondary metabolites such as flavonoids, tannins, alkaloids, and saponins.

**Keywords:** Trichosanthes cucumerina, anthelmintic activity, ethanolic extract, flavonoids, Soxhlet extraction, Pheretima posthuma, medicinal plants

## COST-BENEFITS ANALYSIS OF INVENTED PREMIX TEA WITH MARKETED GREEN/HERBAL TEA FOR CHOLESTEROL MANAGEMENT

Gautam Gundecha, Sachin Tembhurne and Shubham Gavade
Department of Pharmacology, All India Shri Shivaji Memorial Society's College of Pharmacy, Pune, Maharashtra, India - 411001.
gundechagautam14@gmail.com

Recently increasing consumption of green and herbal teas, is well known recognised for their potential health benefits, has sparkled interest in their ability to manage hypercholesterolemia, a significant risk factor for cardiovascular diseases. While many green and herbal teas are marketed for their immune-boosting and antioxidant properties, very few claim to target cholesterol management specifically. This creates an emerging opportunity for developing teas designed to address hypercholesterolemia. In response to this need, we developed an instant premix tea containing goat milk and evaluated its effectiveness in preclinically for reducing cholesterol. This study aims to conduct a comprehensive cost-effectiveness and nutritional analysis of the newly invented premix tea in comparison to existing green and herbal tea products that claim to manage cholesterol levels. This study estimates its practical viability via applying assumptions and modeling to project the potential efficacy and cost of our invented instant premix tea for human consumption on daily basis. The nutritional comparison showed that our premix tea contains significantly lower levels of fat (0.2 g/100g), carbohydrates (6.4 g/100g), and calories (40.2 kcal/100g) when compared to commercial herbal tea products, such as Society Cleanse Green Tea Detox Kahwa Premix. The results revealed that the invented premix tea demonstrated a significant reduction in cholesterol levels. Moreover, the cost analysis showed our premix tea is over 25% cheaper than other marketed teas. These findings suggest that the invented instant premix tea offers a nutritionally enriched, cost-effective, and promising alternative for the prevention and management of hypercholesterolemia.

**Keywords:** Instant premix tea, hypercholesterolemia, preclinical study, cost-effective intervention

## DESIGN AND DEVELOPMENT OF POLYHERBAL TABLET DOSAGE FORM FOR REGENERATION OF PANCREATIC BETA CELLS

ISBN: 978-81-980623-8-3

Shantanu Raut, Ruchi Khobragade, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
shantanur1511@gmail.com

The primary goal of this study was to design and develop a polyherbal antidiabetic tablet. Polyherbal antidiabetic formulation contains six herbs: Anacardium Occidentale (leaves), Cassia alata (leaves), Gymnema sylvestre (leaf), Pterocarpus Marsupium (bark), Tinospora cordifolia (stem), and Trigonella foenum-graceum (seed). A two-factor, three-level (32) factorial design was used. The amounts of croscarmellose sodium and microcrystalline cellulose in the polyherbal tablet were independent variables, while the disintegration time and hardness were dependent variables. The granules were made using the wet granulation process. Initially, the granules were examined for properties such as angle of repose, bulk density, tapped density, hausner's ratio, and compressibility index. Tablets were manufactured using an eight-station tablet punching machine and tested for weight variation, hardness, friability, thickness, disintegration test, stability, and in-vitro antidiabetic activity on the optimal formulation of polyherbal tablet is F9. The disintegration time is 10 minutes and the hardness is 3kg/mm2. The alpha amylase assay and beta-cell insulin secretion assay of polyherbal antidiabetic tablet show substantial results when compared to glibenclamide as a standard. As a result, the polyherbal anti-diabetic tablets generated increases insulin secretion, and beta cell regeneration is linked to insulin secretion in the treatment of type 2 diabetes. The stability of the formulations was assessed under accelerated temperature and humidity settings, which demonstrated that hardness and disintegration time remained unchanged within the limit for up to 1 month of testing. The polyherbal diabetes tablet is beneficial in the treatment of type 2 diabetes.

**Keywords:** Polyherbal, Antidiabetic tablet, Hardness, Disintegration, In-vitro antidiabetic assay.

## COSMECEUTICAL PEEL-OFF MASK ENRICHED WITH TRACHYSPERMUM AMMI SEED OIL AS A NATURAL ANTIOXIDANT SOURCE

Sharavana BN, Jeevika M, Shwetha Krishnamurthy
Department of Pharmaceutics, Faculty of Pharmacy, M. S. Ramaiah University of Applied Sciences, Bengaluru, Karnataka, India- 560054
shwetha.ps.ph@msruas.ac.in

Recently, cosmeceuticals have gained significant attention due to their therapeutic benefits in addition to aesthetic appeal. The present study aimed to formulate and evaluate an herbal cosmeceutical peel-off mask enriched with Trachyspermum ammi seed oil (TAO). Peel off mask was prepared by dissolving film forming agent, anti-foaming agent and stabilizer in hot water. Preservatives were added to the above mixture. Formulations were subjected to evaluations like drying time, peel off test, pH, viscosity and acute dermal irritation test. All the prepared formulations showed drying time between 7 minutes to 20 minutes, pH ranging from 5.4 - 5.8, viscosity ranging from 40 cps to 80 cps. Based on drying time and ease of application, F3 formulation was altered by addition of glycerine, honey and aloe vera gel (F13, F14 and F15 respectively). To the developed formulations, based on hydrogen peroxide scavenging activity, desired amount of TAO was added. F13, F14, F15 showed ease of application and good peelability. These formulations did not show any irritation, no development of oedema or rashes on rabbit. Formulations F13, F14, F15 were found to have 14, 17 and 20 minutes of drying time respectively. All the 3 formulations were equally good, however based on consistency on storage, F14 formulation containing honey was found to be more stable in comparison with F13 and F15. Hence F14 can be concluded as better cosmeceutical peel-off mask enriched with TAO

**Keywords:** Peel off mask, Antioxidant property, Trachyspermum ammi seed oil, honey, aleo vera

## NATURAL ANTI-ACNE THERAPY: FORMULATION AND ASSESSMENT OF GEL USING NONI AND TULSI

Neekita Balu Surwade, Lata manani, Megha chavda
Dept. of Pharmacognosy, SSR College of Pharmacy (Permanently Affiliated to Savitribai Phule Pune University), Sayli-Silvassa, Silvassa-396230, Union Territory of Dadra Nagar Haveli and Daman Diu, India.
neekitasurwade@gmail.com

The formulation of an anti-acne gel using natural extracts from Noni fruit and Tulsi leaves, both known for their medicinal properties, to provide an alternative to synthetic acne treatments. Acne vulgaris, a common dermatological condition, often requires products with antibacterial and anti-inflammatory properties. The primary objective was to develop and evaluate a gel formulation containing these natural extracts. Nine different formulations (F1 to F9) were prepared and assessed for their physical and chemical characteristics, including color, appearance, consistency, viscosity, pH, spreadability, and antimicrobial activity. The antibacterial efficacy of the gel against Propionibacterium acnes was tested using the agar well diffusion method, while antioxidant activity was evaluated to determine its radical scavenging potential. The results demonstrated significant antibacterial activity, along with strong antioxidant properties. Additionally, the gel exhibited satisfactory physical and chemical attributes, making it suitable for topical application. Overall, the formulated gel, enriched with Noni fruit and Tulsi leaf extracts, presents a promising natural alternative for acne treatment, offering antibacterial, anti-inflammatory, and antioxidant benefits in a safer and more sustainable manner compared to conventional synthetic products.

**Keywords:** anti-acne, noni fruit, Tulsi, antibacterial, natural acne treatment.

## PHYTOCHEMICAL SCREENING AND TOXICITY EVALUATION OF HIMALAYAN PENNYWORT LEAF EXTRACTS

Sumit Dakshi, Santanu Roy, Mrityunjoy Majumdar, Sourav Roy
Department of Pharmacology, Netaji Subhas Chandra Bose Institute of Pharmacy, Tatla, Chakdaha, Nadia, West Bengal, India, 741222
sumitdakshi1234@gmail.com

This study evaluates the phytochemical composition and toxicity of hydroalcoholic leaf extracts of Himalayan Pennywort (Hydrocotyle himalaica). Preliminary phytochemical screening revealed the presence of carbohydrates, saponins, and flavonoids, while alkaloids, tannins, proteins, and phenolic compounds were absent. The extract was obtained by maceration using 70% ethanol with an 8.8% yield. Toxicity was assessed using the brine shrimp lethality assay, a well-established preliminary test for bioactive compound cytotoxicity, which showed the extract to be safe up to a dose of 1.6 ml, with a 50% mortality rate only observed at higher doses. The therapeutic dose was selected as 500 mg/kg, approximately one-eighth of the lethal dose, to ensure safety. These results support the extract's safety profile and suggest further pharmacological studies on Himalayan Pennywort are warranted due to its traditional medicinal uses in heat clearance, detoxification, and dampness elimination.

**Keywords:** Himalayan Pennywort, Phytochemical screening, Hydroalcoholic leaf extract, Brine shrimp lethality assay, Toxicity evaluation.

## EXPLORING ANTI-CANCER ACTIVITY OF THE EXTRACT OF THE LEAVES OF KINGIODENDRON PINNATUM

Karunakar Hegde
Srinivas College of Pharmacy, Valachil, Post Farangipete, Mangalore-574143, Karnataka, India
khegde_sh2003@yahoo.co.in

The anti-cancer activity of the ethanolic extract of Kingiodendron pinnatum leaves was evaluated in this study. In vitro cytotoxicity analysis of the leaf extract, the effect was observed on DLA cells, EAC cells and the normal splenocytes were studied. On DLA cells the leaf extract showed an increase in cytotoxicity with increase in dose. The IC50 value of leaf extract was 77.07 µg/ml. On EAC cells the leaf extract had an IC50 value of 80.05 µg/ml and the effect on primary splenocytes of rats, the cytotoxicity was minimal found to be more than 100 µg/ml. Tumor bearing animals treated with lower dose of 200 mg/kg and higher dose of 400 mg/kg showed a significant increase in survival period of 28.83 and 29.80 days respectively when compared to control animals having a survival period of nearly 21.10 days. Animals treated with extract have more average life span and also the percentage increase in life span. The present study concluded that the ethanolic extract of Kingiodendron pinnatum leaf has significant potential anti-cancer activity. All these results clearly indicate that the crude leaf extract has a remarkable

ISBN: 978-81-980623-8-3

capacity to inhibit the growth of ascites tumor induced by EAC cell lines in a dose-dependent manner in experimental animals. Possibly the cytotoxic and antioxidant components of the extracts might be imparting antitumor efficacy. Further purification of this extract may yield a better nontoxic pharmacologically potent antineoplastic compound.

**ANTI-GOUT ACTIVITY OF SOLANUM NIGRUM LEAVES USING IN VITRO AND IN SILICO APPROACHES**

Thirumani R and Deepika V
Department of Pharmacology, Pachamuthu college of Pharmacy, Dharmapuri, Tamil Nadu, India-636701.
rthirumani2004@gmail.com

Gout is a chronic inflammatory arthritis caused by hyperuricemia and monosodium urate crystal deposition, leading to severe joint pain and disability. Current pharmacological interventions such as allopurinol and febuxostat. Solanum nigrum (Black Nightshade), a medicinal herb traditionally used in Ayurveda, possesses anti-inflammatory, antioxidant, and hepatoprotective properties that may contribute to its anti-gout potential.The present study investigates the anti-gout activity of Solanum nigrum leaves through in vitro and in silico methodologies. Ethanol and aqueous extracts of S. nigrum leaves were evaluated for xanthine oxidase inhibitory activity in vitro, revealing dose-dependent inhibition comparable to standard allopurinol. Phytochemical profiling indicated the presence of alkaloids, flavonoids, saponins, glycosides.phytosterols compounds, which may synergistically contribute to uric acid reduction.In silico docking studies were performed using major bioactive constituents such as solasodine, solamargine, and quercetin against the xanthine oxidase enzyme. Molecular docking analysis demonstrated strong binding affinities through various softwares. The combined in vitro and in silico findings support the anti-gout potential of Solanum nigrum leaves, highlighting their role as a promising natural source for novel xanthine oxidase inhibitors. These results highlight the therapeutic potential of S. nigrum as a natural alternative for gout management.

**Keywords:** Solanum nigrum, xanthine oxidase inhibition, in vitro, in silico, molecular docking.

**EVALUATION OF ANTINOCICEPTIVE EFFECT AND CNS STIMULANT EFFECT OF HYDROALCOHOLIC LEAF EXTRACT OF DEBDARU**

Mohit Kumar Prasad, Tanmoy Hor, Prodip Roy, Sourav Roy
Department of Pharmacology, Netaji Subhas Chandra Bose Institute of Pharmacy, Tatla, West Bengal, India, 741222
mkp031302@gmail.com

Pain and central nervous system (CNS) disorders pose major healthcare challenges, with many available drugs limited by side effects, dependency, and high cost. Medicinal plants have recently gained attention as safer and sustainable alternatives. Debdaru, a tree widely distributed in India, is traditionally valued in folk medicine, yet its role in pain modulation and CNS activity remains underexplored. The present study evaluated the antinociceptive and CNS stimulant potential of the hydroalcoholic leaf extract of Debdaru. Phytochemical screening confirmed the presence of flavonoids, alkaloids, tannins, saponins, glycosides, and steroids, many known for analgesic and neuroactive effects. Experimental evaluation was conducted using standard animal models, with graded doses of the extract compared to reference drugs. Antinociceptive activity, assessed by hot-plate and tail-flick methods, showed significant response times ranging from 4.95–9.63 seconds compared to 3.40–5.38 seconds in the control group, indicating notable pain-relieving potential. Similarly, CNS stimulant activity, assessed by locomotor and exploratory behavior using rota-rod apparatus, demonstrated enhanced motor coordination, with grip times of 19–45 seconds versus 3–25 seconds in the control and 5–16 seconds with standard drug caffeine. The findings suggest that Debdaru extract produces a dose-dependent reduction in pain perception along with increased motor activity. These results scientifically validate its traditional use and highlight its potential as a natural, plant-based candidate for managing pain and CNS-related disorders.

**Keywords:** Debdaru, Hydroalcoholic extract, Antinociceptive effect, CNS stimulant, Locomotor activity.

**IN-VITRO ASSESSMENT OF ANTI-ARTHRITIC POTENTIAL OF HYDRO-ALCOHOLIC ROOT EXTRACT OF INDIAN JUJUBE**

Pranay Sardar, Subhransu Sasmal, Krishanu Pramanik, Mrityunjoy Majumdar
Department of Pharmacology, Netaji Subhas Chandra Bose Institute of Pharmacy, Chakdaha, Nadia, West Bengal, India - 741222
2002pranaysardar@gmail.com

Rheumatoid arthritis is a chronic, progressive autoimmune disorder characterized by persistent joint inflammation, cartilage degradation, and bone erosion, leading to pain and functional disability. Conventional therapies provide symptomatic relief but are often associated with adverse effects and limited long-term efficacy. Hence, there is an increasing interest in the exploration of plant-based therapeutics with anti-arthritic potential. Indian jujube (Ziziphus mauritiana, family: Rhamnaceae), traditionally used in folk medicine for treating inflammatory conditions, was investigated in the present study for its possible anti-arthritic activity. The root of Indian jujube was extracted using hydro-alcoholic solvent (70:30) and subjected to in-vitro evaluation models including protein denaturation assay and membrane stabilization method, both of which mimic the pathogenic processes underlying arthritis. The extract demonstrated a concentration-dependent inhibition of protein denaturation and stabilization of red blood cell membranes, thereby indicating its potential to suppress inflammatory responses associated with arthritic progression. Results were compared with standard anti-arthritic drugs, showing that the extract exhibited significant activity, though slightly lower than the standard. The observed effects may be attributed to the presence of phytoconstituents such as flavonoids, saponins, and tannins, which are known to possess anti-inflammatory and antioxidant properties. These findings suggest that Indian jujube root extract could serve as a promising natural source for developing safer and effective anti-arthritic agents. However, further detailed studies including in-vivo models and phytochemical isolation are warranted to substantiate its therapeutic potential.

**Keywords:** Ziziphus mauritiana-hydro-alcoholic extract, anti-arthritic, protein denaturation assay, membrane stabilization method, phytochemicals

**EVALUATION OF CARDIOTROPIC EFFECT OF HYDROALCOHOLIC FLOWER EXTRACT OF HUMMINGBIRD TREE**

Kundan Datta, Amlan Das, Mrityunjoy Majumdar, Prodip Roy
Department of Pharmacology, Netaji Subhas Chandra Bose Institute of Pharmacy, Tatla, West Bengal, India
kundanduttakd2000@gmail.com

Herbal medicines continue to play an important role in modern therapeutics due to their natural origin, wide availability, and relatively safer profile compared to synthetic drugs. Hummingbird tree (Sesbania grandiflora), commonly known as Bakphool, has long been used in traditional medicine for its nutritional and medicinal properties. The present study aimed to evaluate the cardiotropic activity of the hydroalcoholic flower extract of Hummingbird tree on isolated rat heart preparations. Fresh flowers were collected, processed, and subjected to extraction using 70% ethanol through cold percolation. The extract was tested on isolated albino wistar rat hearts perfused with Krebs-Henseleit solution. The cardiac responses were compared with standard drugs such as adrenaline and acetylcholine, which exhibit positive and negative inotropic and chronotropic effects, respectively. The extract demonstrated a dose-dependent reduction in both the force and rate of contraction, indicating negative inotropic and chronotropic effects. These findings suggest the potential role of the Hummingbird tree in managing hypertension and tachycardia by reducing cardiac workload and regulating blood pressure. The results align with traditional claims and provide a scientific basis for its therapeutic application in cardiovascular disorders. However, further molecular and clinical investigations are required to elucidate the precise mechanism of action and to establish its safety and efficacy in humans.

**Keywords:** Hummingbird tree, Hydroalcoholic extract, Krebs-Henseleit solution, Cardiotropic activity, Isolated rat heart model.

Nadia, West Bengal, India – 741222.
mrinmoymanna08@gmail.com

The hydroalcoholic extract of Madagascar periwinkle (Catharanthus roseus) leaves and its tropic effects on the isolated heart of albino Wistar rats are examined in this study. Madagascar periwinkle has been widely utilized in traditional medicine because of its many pharmacological qualities. The WHO also acknowledges that medicinal plants are important sources for the creation of novel drugs. Fresh Madagascar periwinkle leaves were gathered for this experiment, extracted with 70% ethanol, and then screened for phytochemicals to confirm the presence of alkaloids and other secondary metabolites. The extract was compared to the common autonomic agents, acetylcholine and adrenaline, while the isolated rat heart model was kept in Krebs-Henseleit solution under carefully monitored conditions. The findings showed that acetylcholine had detrimental effects on both parameters, but adrenaline had a dose-dependent favourable inotropic and chronotropic effect. Curiously, the extract from Madagascar periwinkle displayed a unique profile, exhibiting dose-dependent positive chronotropic effects and negative inotropic effects. Additionally, the extract changed chronotropic activity when given with acetylcholine, but it had a synergistic impact with adrenaline, increasing cardiac activity dramatically but finally causing arrhythmia and cardiac arrest at greater concentrations. According to these results, the extract from Madagascar periwinkle shows significant cardiotropic effects, indicating that it may be useful in regulating heart function. To clarify its molecular mechanisms, establish appropriate therapeutic dosages, and assess long-term safety, more investigation is necessary.

**Keywords:** Madagascar periwinkle, Hydroalcoholic extract, Wistar rat heart, Inotropic and chronotropic effects, Cardiac arrhythmia

**FORMULATION AND VALIDATION OF HERBAL TOOTHPASTE: A NATURAL APPROACH TO ORAL CARE**

Aachal Meshram
Department of Pharmaceutical Quality Assurance, Anurag College of Pharmacy, Bhandara, Maharashtra, India-441905
meshramaachal194@gmail.com

The growing demand for safe and eco-friendly oral hygiene products has prompted the development of herbal formulations as alternatives to synthetic toothpastes. This study focuses on the formulation and validation of an herbal toothpaste designed to deliver effective oral care without artificial flavours, fluoride, or harsh chemicals. Medicinal plant extracts with established antibacterial, anti-inflammatory, and antioxidant properties were incorporated into a standard toothpaste base and evaluated against key quality parameters. The optimised formulation demonstrated a pH value of 6.5 to 7.5, ensuring compatibility with the oral environment and reducing the risk of enamel erosion. Physical property evaluation revealed moderate foaming stability, providing adequate cleansing without excessive frothing, and excellent spreadability, ensuring smooth and uniform application on the toothbrush surface. Stability studies confirmed that the product retained its physicochemical characteristics over 30 days without phase separation, colour changes, or loss of performance. Sensory analysis indicated a pleasant taste and odour, supporting high consumer acceptability. Microbial testing confirmed the absence of pathogenic contamination, while in vitro assays demonstrated significant antimicrobial activity against common oral pathogens such as Streptococcus mutans and Lactobacillus acidophilus. These findings validate the herbal toothpaste as a safe, effective, and environmentally friendly oral hygiene solution. The combination of favourable physicochemical properties, stability, and therapeutic potential highlights its suitability as a natural alternative to conventional toothpaste formulations.

**Keywords:** Herbal toothpaste, Streptococcus mutans, Lactobacillus acidophilus, Oral hygiene, antimicrobial activity

**IN-VITRO CYTOTOXICITY ASSAY OF AQUEOUS EXTRACT OF RAGS AND SEED COAT OF ARTOCARPUS HETEROPHYLLUS**

Akash L, Vidhya Arthy J, Vinochandar R, Brundha S
Department of Pharmacology, PGP College of Pharmaceutical Science and Research Institute Namakkal, Tamil Nadu, India-637 2027
akashakash542022@gmail.com

Artocarpus heterophyllus commonly known as jackfruit, is a plant with a long history of use in traditional medicine. Various parts of the plant, including the leaves, fruit, and seeds, are rich in bioactive compounds such as phenols, flavonoids, and tannins associated with a range of therapeutic properties, including antioxidant, anti-inflammatory and anticancer activity. This research will seek to determine the in vitro cytotoxic activity of an aqueous extract of Artocarpus heterophyllus against defined cancer cell lines. An aqueous extract was obtained from [define plant part, e.g., dried mature leaves] of Artocarpus heterophyllus through cold maceration method. The extract was subsequently screened for its cytotoxic activity against two human cancer cell lines, [ e.g., MCF-7 (breast cancer) and HepG2 (liver cancer)]. The cytotoxicity was assessed by the MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide) assay, which assesses cell viability and metabolic activity. The water extract of Artocarpus heterophyllus showed dose- and time-dependent cytotoxicity towards both cell lines. The extract showed significant inhibitory activity against the HepG2 cell line with IC_{50} values and against the MCF-7 cell line with IC_{50} values following treatment for 48 hours. These findings suggest that the extract is more effective against liver cancer cells compared to breast cancer cells. This study indicates that aqueous extract of rags and seed coat of Artocarpus heterophyllus is extremely active in vitro against human cancer cell lines. The dose- and cell-line-dependent activities indicate its promise as a source of new anticancer compounds. The report validates the traditional application of Artocarpus heterophyllus and presents the groundwork for future in vivo investigations and possible therapy.

**Keywords:** Maceration, aqueous extract, cytotoxicity, anticancer.

**PRELIMINARY PHYTOCHEMICAL SCREENING AND ASSESSMENT OF THE ANXIOLYTIC AND ANTIDEPRESSANT POTENTIAL OF MARSILEA QUADRIFOLIA**

Sathi Durga Prasad Reddy
VJ's College of Pharmacy, Diwancheruvu, Rajahmundry, Andhra Pradesh, India – 533296
durgaprasadreddy5012@gmail.com

CNS disorders are one of the most common ailments in the world. In that, Depression has major role as chronic disorder. Almost 10% of the population may become depressed throughout their life, according to recent survey. Various classes of Anti-depressant medications are being administered to patients for the treatment of depression. Other than this, the duration of treatment may extend for months and patients experiencing some known side effects like, decreased libido, loss of attentiveness, decreased body movements etc. Apart from this, some Herbal plant extracts like Marsilea quadrifolia are a promised treatment for Depression with rare occurrence of side effects. This article aims to assess the possible Anti-depressant and Anxiolytic potential of Marsilea quadrifolia by performing Pharmacological screening procedures on Rats that includes, Forced Swimming Test, Tail suspension test, Locomotor activity, Rotarod test (Motor Co-ordination), Elevated plus Maze, Hole board Test. Studies were performed for 21 days on both Control (Imipramine) and Test drug groups. This investigation provides evidence for the anxiolytic and antidepressant activities of Marsilea quadrifolia.

**Keywords:** Antidepressants screening methods, SSRI's, Marsilea quadrifolia, Herbal extract.

**IN SILICO AND IN VITRO EVALUATION OF PHYTOCONSTITUENTS AS INHIBITORS OF NEW DELHI METALLO-B-LACTAMASE-1 (NDM-1)**

Ajay Kumar1, Ajmer Singh Grewal2, Suresh Kumar Gahlawat1
1Department of Biotechnology, Chaudhary Devi Lal University, Sirsa, Haryana, India
2Guru Gobind Singh College of Pharmacy, Yamuna Nagar, 135001, Haryana, India
ajmergrewal2007@gmail.com

ISBN: 978-81-980623-8-3

The emergence of New Delhi metallo-β-lactamase-1 (NDM-1) in Escherichia coli poses a major public health challenge due to its ability to hydrolyze a wide spectrum of β-lactam antibiotics, including carbapenems. In this study, phytoconstituents from medicinal plants were explored as potential natural inhibitors of NDM-1 through a combination of in silico and in vitro approaches. Among the screened plants, Curcuma longa L. extracts demonstrated notable antibacterial activity, with the acetone extract showing the highest inhibition zones (8-16 mm) against NDM-1-producing Escherichia coli. A database of 144 phytochemicals from Curcuma longa L. was evaluated for drug-likeness, resulting in 96 compounds that met the selection criteria. Molecular docking identified bis-desmethoxycurcumin as the most promising inhibitor with a binding energy of -6.5 kcal/mol. Subsequent in vitro assays revealed that bis-desmethoxycurcumin exhibited synergistic effects with amoxicillin, enhancing inhibition zones from 10.33 mm to 19.67 mm, with a minimum inhibitory concentration of 25-30 µg/ml. In silico predictions further supported its favorable safety and pharmacokinetic profile. These findings suggest that bis-desmethoxycurcumin holds strong potential as an adjuvant agent to conventional antibiotics, offering a promising strategy to counter NDM-1-mediated resistance and contributing to the development of novel approaches against antibiotic-resistant infections.

**Keywords:** New Delhi metallo-β-lactamase-1 (NDM-1), NDM-1 inhibitors, Escherichia coli, Antimicrobial Resistance, Natural compounds.

## INVESTIGATING THE ANTI-ANAPHYLACTIC POTENTIAL OF ABUTILON INDICUM (L.) SWEET LEAVES USING MULTIPLE EXPERIMENTAL MODELS

Asok Kumar K, Hemalatha M, Pradeepan R
Department of Pharmacology, Sri Ramakrishna Institute of Paramedical Sciences College of Pharmacy, Coimbatore, Tamilnadu-641 044.
hemalathamuthiah1974@gmail.com

Anaphylaxis is a severe allergic reaction that poses a significant threat to life, marked by respiratory distress, bronchoconstriction, vascular collapse, shock, and potential fatality. The primary effector cells in anaphylaxis are mast cells, which contribute critically by releasing proinflammatory mediators. 5-lipoxygenase (5-LOX) catalyse arachidonic acid pathway producing leukotrienes. Abutilon indicum (L.) Sweet is traditionally recognized for treating bronchitis, piles and bladder inflammation. This study focused on evaluating the anti-anaphylactic potential of Abutilon indicum phytoconstituents (37 compounds) using in silico docking with target FcεRI and 5-lipoxygenase, in vitro 5-lipoxygenase inhibition assays, and in vivo horse serum and triple antigen-induced rat model of anaphylaxis. Molecular docking analyses was performed with AutoDock 4.2 and phytoconstituents revealed high binding energies (8.31 kcal/mol for Lupen-3-one with FcεRI and 8.28 kcal/mol for Lupen-3-one with 5-lipoxygenase), indicating strong interaction with these targets. The inhibitory potential of the ethanol fraction of leaf extract on 5-lipoxygenase was confirmed, with an IC50 of 13 µg/ml for leaf extract and 10.67 µg/ml for prednisolone. In vivo, administration of the extract to Wistar rats ameliorated anaphylactic symptoms induced by horse serum and triple antigen vaccine and this was demonstrated by improved respiratory rate, body weight, and reduction of immune markers such as IgE and CRP. These results suggest that Abutilon indicum exerts anti-anaphylactic effects possibly by suppressing inflammatory cells, reducing oxidative stress, and preventing airway inflammation, supporting its traditional use and therapeutic potential in alleviating allergic conditions.

**Keywords:** Anaphylaxis, Lupen-3-one, Lipoxygenase, Arachidonic acid

**PT-102**

## FORMULATION AND EVALUATION OF A HERBAL MOUTHWASH

Gajji Neelamma, Mighty Rose, Madhumitha, Ramesh Adepu

Oral health is a crucial component of overall well-being; however, it is frequently compromised by microbial infections, including dental caries, gingivitis, and candidiasis. Conventional mouthwashes, although effective, are often associated with side effects like tooth staining, altered taste, and mucosal irritation due to synthetic chemical agents. This study examines a novel plant-based mouthwash formulation that incorporates traditional medicinal herbs as a safer, natural alternative. The formulation consisted of hydroalcoholic extracts of Azadirachta indica (neem), Ocimum sanctum (tulsi), and Syzygium aromaticum (clove), which were selected for their well-documented antimicrobial properties. The mouthwash was evaluated for physicochemical parameters (pH, clarity, viscosity), organoleptic qualities, microbial load, and stability. Its antimicrobial activity was assessed in vitro using the agar well diffusion method against Streptococcus mutans, Lactobacillus acidophilus, and Candida albicans, and compared with a commercially available 0.2% chlorhexidine mouthwash. The polyherbal formulation was found to be physically stable, with acceptable sensory properties and no microbial contamination over 30 days. It exhibited significant antimicrobial activity, especially against S. mutans and C. albicans, with inhibition zones comparable to those of chlorhexidine. The plant-based mouthwash demonstrated promising potential as an effective and safer herbal alternative to conventional chemical oral rinses. These findings support further clinical evaluation and potential commercial development of the formulation for routine oral hygiene.

**Keywords:** Herbal Mouthwash, Antimicrobial Activity, Neem, Tulsi, Clove.

## FORMULATION AND EVALUATION OF HERBAL LIPSTICK USING NATURAL COLORING PIGMENT FROM BRASSICA OLERACEAE

Brundha S, Vinochandar R, Santhosh K,Naveen R
Department of Pharmacognosy, PGP College of Pharmaceutical Science and Research Institute, Namakkal, Tamil Nadu, India-637 207
brundhabru2001@gmail.com

Herbal Cosmetics have been a growing demand within the World Market and useful gift of nature especially for women. Herbal Cosmetics have achieved widespread popularity among the community due to its minimum side effects or no side effects. Synthetic coloring pigments may cause an allergic reaction and are found to be carcinogenic. Hence natural herbal extracts have become a great alternative to the synthetic substances. The incorporation of herbal extracts in cosmetics can minimize skin damage due to oxidative stress and thus delays aging. The intent of this study is to perform formulation and evaluation of herbal lipstick using natural coloring matter such as anthocyanins from Brassica oleracea variety capitata form rubra (purple cabbage) and many other ingredients were used in this preparation of lipstick. Different evaluation tests of herbal lipstick such as color, pH, softening point, aging, rancidity, microbiological tests and stability were evaluated and compared with the marketed standard formulation. The results indicate that a safe, stable and high-quality herbal lipstick with good force of application and breaking threshold can be formulated using plant-based ingredients This study offers a viable and eco-friendly replacement to synthetic cosmetics, paving the way for further development in the natural cosmeceuticals.

**Keywords:** Brassica olearaceae, Natural Lipstick, Anthocyanins, Beeswax, Castor oil.

## EVALUATION OF DIURETIC ACTIVITY OF ETHANOLIC EXTRACT OF JATROPHA GOSSYPIFOLIA

Pragadeesh C A, Ilanthalir S
Department of Pharmacology, PGP College of Pharmaceutical Science and Research Institute, Namakkal-637207.
pragadeeshbhagavath@gmail.com

Traditionally, herbs stimulating kidney function have been utilized to alleviate edema. The present study was undertaken to investigate the diuretic activity of the leaves of Jatropha Gossypifolia in ethanolic extract aiming to elucidate its efficacy in reducing edema. Animals of either sex were divided into four groups (six animals in each group). The control group received normal saline (2 mL/kg), while the reference group received frusemide (20 mg/kg). Group III and Group IV received the ethanolic extract of Jatropha Gossypifolia at dose levels of 200 mg/kg and 400mg/kg orally, respectively. At the end of the 24 hours, urine was collected, and total volume excreted and PH of the urine by each animal was recorded. Concentrations of urinary Na+, K+ and Cl- were determined, and the Na+/K+ ratio was calculated to make comparison among the groups. The findings demonstrated that the crude ethanolic extract of Jatropha Gossypifolia at the dose of 400mg/kg showed

ISBN: 978-81-980623-8-3

significant diuretic (P<0.01) when compared to frusemide. Acute toxicity studies will also be conducted to ensure the safety of Jatropha Gossypifolia. Promising results demonstrating diuretic activity without toxicity could pave the way for further clinical investigations, establishing the clinical relevancy of Jatropha Gossypifolia in managing edema.

**Keywords:** Jatropha Gossypifolia, Diuretic, Ethanol, Acute Toxicity, Frusemide.

## BIOWASTE TO BIOACTIVE: FORMULATING AND CHARACTERIZING A PRONIOSOMAL HAIR CARE PRODUCT FROM UPCYCLED CHICKEN FEATHERS AND REETHA FRUIT

Raslamol.K
Department of Pharmaceutics,
Holy Grace Academy of Pharmacy, Mala,
Thrissur, India- 680732.
rkofficialrtr@gmail.com

This research details the development and assessment of a proniosomal roll-on hair replenisher designed to repair damaged hair and stimulate healthy growth. The formulation uses natural compounds from the Sapindus mukorossi plant and keratin extracted from chicken feathers (Gallus gallus domesticus). Since chicken feathers are a plentiful and eco-friendly waste product rich in crude protein (keratin), their use in this cosmetic offers a sustainable and cost-effective solution. The product aims to address both hair damage and common scalp issues, such as dandruff and lice, by leveraging the natural properties of the ingredients.The saponins from Sapindus mukorossi provide natural cleansing along with antibacterial and antifungal effects for scalp protection. Keratin is delivered via a proniosomal gel, a delivery system that, while similar in structure to liposomes and niosomes, provides greater stability and absorption while minimizing skin irritation. The roll-on format enhances user experience through easier application and improved absorption of the active components.The hair replenisher's performance was systematically evaluated based on several criteria, including pH levels, viscosity, spreadability, stability, and its microbial safety profile.These tests confirmed its potential as a safe and effective cosmeceutical product for hair care.

**Keywords:** Cosmeceutical, Hair,Keratin,Liposome, Proniosomal Gel.

## IN-VITRO ANTIMICROBIAL AND ANTI-INFLAMMATORY ACTIVITY OF HYDROALCOHOLIC LEAF EXTRACTS OF SYRINGODIUM ISOETIFOLIUM SEAGRASS

Sathineedi Uma Surya Raghavi, Kavitha Dhanaraju,
Magharla Dasaratha Dhanaraju,
Department of Pharmaceutical Chemistry, GIET School of Pharmacy,
Rajamahendravaram-533296, India

This research explored the antimicrobial and anti-inflammatory activities of hydroalcoholic leaf extracts of Syringodium isoetifolium seagrass.In this work, leaves of seagrass were collected, dried and extracted with an ethanol and water mixture (70:30). The extract was enriched with bioactive substances such as polyphenol, phenol, glycoside, dicarboxylic acids, saponin, flavonoids, alkaloid and other constituents. Hence, the extract was performed for in-vitro microbicidal and anti-inflammatory by using disc diffusion technique, inhibition of egg protein denatured and membrane stabilizing activity techniques. The antimicrobial results indicated that the hydroalcoholic extract of Syringodium isoetifolium seagrass has considerable antimicrobial activity against E. coli, B. subtilis, A. flavus and A. niger. Whereas, the anti-inflammatory activity result suggested that the hydroalcoholic extract of Syringodium isoetifolium seagrass significantly controlled the inhibition of protein denatured and RBC haemolysis. The size of the zone, percentage of inhibition of protein denatured and RBC haemolysis are directly proportional to the concentration of the hydroalcoholic extract of Syringodium isoetifolium seagrass used in the invitro study.

**Keywords:** Hydroalcoholic extract of Syringodium isoetifolium seagrass; Anti-microbial activity; Anti-inflammatory activity.

## IN SILICO AND NETWORK PHARMACOLOGY STUDIES OF PHYTOCHEMICALS FROM MITRAGYNA PARVIFOLIA AS ANTI-ALZHEIMER'S AGENTS

Oviya Srinivasan, Senthil Kumar Raju, Praveen Sekar
Department of Pharmaceutical Chemistry, Swamy Vivekanandha College of Pharmacy, Tiruchengode, Namakkal,
Tamil Nadu, India – 637205.
oviyasrinivasan3@gmail.com

Alzheimer's disease accounts for 60–80% of dementia cases, making it the most common type of dementia. Mitragyna parvifolia is a medicinal plant, which contains alkaloids, terpenoids, pteropodine, speciophylline and steroids. In this study, we investigated the efficiency of phytochemicals from Mitragyna parvifolia using a network pharmacology approach. The phytochemicals were obtained from Dr. Duke's Phytochemical and Ethnobotanical database, IMPPAT, the Coconut database, Phytohub version 1.4, the Medicinal Plants database, The Natural Products Atlas and the KNApSAcK Core system databases. SwissADME, ProTox 3.0, and CardioTOXCSM webservers were used to estimate the phytochemical's physicochemical, pharmacokinetic and toxicological profiles. OSIRIS Property Explorer was used to estimate the drug score and the results demonstrated the compound's druggable nature. The network pharmacology and enrichment analyses predicted the phytochemical's suitable targets, which indicated that they would be extremely active against Alzheimer's disease, including EGFR, JAK2, ERBB2, PIK3CA, PIK3RA, STAT3 and PTNPN11. Using the Gepia2 website, the correlation analysis was carried out. Molecular docking against the chosen targets was performed using Autodock tools and the results were compared with the co-crystallized ligand and standard. Owing to the various in silico studies and drug score, the compounds Isorotundifoline, Isorhynchophylline and 16,17-dihydro-17betahydroxyisomitraphylline were highly active against the tested targets with good binding energies and interaction profiles. Thus, these compounds can be used against Alzheimer's disease. However, further in vitro and in vivo studies are warranted.

**Keywords:** Alzheimer's disease, Mitragyna parvifolia, Computational studies, Network Pharmacology, Molecular docking

## HERBAL-BASED NANOPHARMACEUTICALS FOR THE MANAGEMENT OF METABOLIC DISORDERS AND INFLAMMATION

Bharat Prashar1, and Kumar Guarve2
1Venkateshwar Institute of Pharmacy, Sai Tirupati University,
Udaipur, Rajasthan, India
2Guru Gobind Singh College of Pharmacy,
Yamunanagar, 135001, Haryana, India
drkg79@gmail.com

Metabolic disorders such as diabetes mellitus, obesity, and dyslipidemia, together with chronic inflammatory diseases, remain significant global health burdens due to their complex pathophysiology and the limited efficacy of conventional therapeutic approaches. Although synthetic drugs are available, their long-term use is often associated with adverse effects, suboptimal patient compliance, and restricted therapeutic outcomes. Herbal medicines, rich in bioactive constituents including flavonoids, alkaloids, terpenoids, and polyphenols, possess established antioxidant, anti-inflammatory, and immunomodulatory activities, thereby offering potential in the management of these conditions. Nevertheless, their clinical translation is hindered by challenges such as poor aqueous solubility, chemical instability, and limited systemic bioavailability. Nanotechnology-driven strategies provide innovative solutions by improving solubility, enhancing pharmacokinetic performance, and enabling site-specific delivery of herbal compounds. This review critically examines the development and application of herbal-based nanopharmaceuticals for the treatment of metabolic disorders and inflammatory conditions. Particular emphasis is placed on nanocarrier systems including polymeric nanoparticles, liposomes, solid lipid nanoparticles, and nanoemulsions, with reference to their formulation strategies, characterization parameters, and therapeutic efficacy. Mechanistic insights into their modulation of oxidative stress, cytokine expression, and metabolic signaling pathways are also discussed. Finally, the article addresses translational challenges and future perspectives in advancing herbal nanopharmaceuticals toward clinical practice.

**Keywords**: Herbal Nanopharmaceuticals; Metabolic Disorders; Inflammation; Nanocarriers; Liposomes; Solid Lipid Nanoparticles; Targeted Drug Delivery; Oxidative Stress; Cytokine Modulation.

deswalgeeta@gmail.com

Innate immunity serves as the first line of defense against invading pathogens and plays a pivotal role in viral infections such as SARS-CoV-2, the causative agent of coronavirus disease (COVID-19). The innate immune system triggers a biological cascade involving the complement system, which upregulates cytokines, natural killer cells, interferons, interleukins, and reactive oxygen species. COVID-19 has been shown to impair immune responses, creating the need for supportive strategies to restore immune balance. This study highlights the role of herbs and Rasayana therapy in mitigating post-COVID-19 complications. A comprehensive review of ethnopharmacological literature from major databases identifies key immunomodulatory species suitable for herbal drinks, including Ocimum sanctum Linn., Aloe vera Tourn. ex-Linn., Hibiscus rosa-sinensis Linn., Camellia sinensis L., and Calendula officinalis L. Bioactive phytoconstituents such as polysaccharides, polyphenols, and gallic acid have been reported to enhance cytokine production, improve macrophage phagocytic activity, suppress pro-inflammatory mediators including tumor necrosis factor (TNF)-α, interleukin-6, and nuclear factor kappa B, and stimulate antioxidant enzyme activity, nitric oxide, and prostaglandin E2 synthesis. These properties collectively support the modulation and enhancement of innate immunity. Future clinical research is warranted to establish the therapeutic efficacy of such herbal formulations in post-COVID-19 management.

**Keywords**: SARS-CoV-2, Immunomodulation, Innate immunity, Hibiscus rosa sinensis Linn., Camellia sinensis L., Calendula officinalis L.

**FORMULATION AND EVALUATION OF POLY-HERBAL SOAP WITH ANTI-BACTERIAL ACTIVITY**

BHONGALE ASHISH SANJAY

The ultimate aim of present work was to prepare formulation of poly-herbal soap from extract of tulsi leaves, aloe-vera leaves, vitamin E capsules and honey using glycerin soap base by melt and pour method. The formulation was evaluated for physicochemical parameters like appearance, pH, sensitivity test, foaming test, stability test. All evaluation parameters results were positive and comply with standard values. Therefore, these plant materials can be used in the preparation of herbal soap on commercial scale for acne treatment.

**BIOENZYMES FROM FRUIT PEELS AS NATURAL SANITIZERS: A PHARMACEUTICAL APPROACH TO VEGETABLE DECONTAMINATION AND SHELF-LIFE ENHANCEMENT**

Manohar Babu Kuppala, R.Vijayalakshmi, M.D. Dhanaraju
GIET School of Pharmacy, Godavari Global University, Rajamahendravaram, Andhra Pradesh, India – 533296
manohark@giet.ac.in

Vegetables are widely consumed for their nutritional and therapeutic benefits, yet their safety is compromised by pesticide residues and microbial contamination, which can lead to serious health hazards. The present study explores a pharmaceutical approach to food safety through the application of fruit peel-derived bioenzymes as natural sanitizers. Bioenzymes were prepared from grapes, orange, lemon, pomegranate, papaya, and foxtail fruit peels using a fermentation process. Their antimicrobial efficacy was tested against selected bacterial and fungal strains, revealing significant inhibitory effects. When applied to vegetables, the bioenzymes effectively reduced pesticide residues and microbial load compared to conventional washing. Moreover, treated vegetables exhibited extended shelf-life, attributed to reduced spoilage and delayed microbial growth.This dual action detoxification and antimicrobial activity highlights the potential of bioenzymes as eco-friendly, safe, and cost-effective alternatives to chemical sanitizers. The findings have direct implications for pharmacy in the domains of public health, toxicology, and nutraceutical safety, offering sustainable strategies for preventive healthcare. Bioenzymes from fruit peels thus emerge as promising natural sanitizers for household, clinical, and industrial applications, bridging pharmaceutical sciences with food safety and environmental sustainability.

**Keywords:** Bioenzymes, fruit peels, vegetable sanitization, pesticide reduction, antimicrobial activity, pharmacy in public health

**PH INDICATING SMART PACKAGING MATERIALS USING PURPLE HEART PLANT LEAF EXTRACT**

Varshitha R, Sindhu Abraham
Department of Pharmaceutics, Faculty of Pharmacy, M S Ramaiah University of Applied Sciences, New BEL Road, MSR Nagar, Bangalore – 560054
sindhu.ps.ph@msruas.ac.in

Tradescantia pallida is a tender evergreen perennial native to northeast Mexico. Tradescantia species contain high amounts of antioxidant substances, including phenolics, tannins, flavonoids, and secondary metabolites. The anthocyanins present in T. pallida are sensitive to pH changes and respond by generating different hues of colours. The study focused on extracting pH-sensitive pigments Tradescantia pallida. The extract was utilized for preparing films using polymers sodium alginate, glycerol, and sodium carboxymethyl cellulose and guar gum. Both extracts and films prepared were checked for their colorimetric pattern in various solutions ranging in pH from 2.0 to 12.0. The prepared films were evaluated for their thickness, folding endurance. The influence of factors such as temperature and light on the stability of anthocyanins in the plant extract was also studied. The extract as well as the films responded to changes in the pH by showing different colour patterns. The average thickness was found to be 0.46±0.02 mm and folding endurance was found to be 200. The observed colour changes in response to variations in pH levels indicate the extract's ability to serve as a reliable indicator of acidity or alkalinity. This finding holds significant implications for industries such as cosmetics and food packaging, where monitoring pH levels is crucial for ensuring product quality and safety. The detection accuracy and sensitivity of anthocyanin pigments can be improved, thus reducing the detection rate of false positive or false negative results. The colour stability of anthocyanin films as well as its barrier and mechanical properties can be improved

**SYNERGISTIC ANTIDEPRESSANT EFFECT OF POLYHERBAL METHANOLIC EXTRACTS IN EXPERIMENTAL MODELS**

N. ROJARAMANI, SHAILAJA ANDE2
SAROJINI NAIDU VANITA PHARMACY MAHA VIDYALAYA, Tarnaka, Secunderabad.

The present study investigates the antidepressant potential of a polyherbal formulation comprising Ocimum tenuiflorum (Tulsi), Withania somnifera (Ashwagandha), and Spinacia oleracea (Spinach). Although these plants have individually demonstrated antidepressant activity, their combined effect has not been extensively studied. Methanolic extracts of the selected plants were prepared using Soxhlet extraction and administered orally to Swiss albino mice. The antidepressant effect was evaluated using the Forced Swim Test, with Amitriptyline (10 mg/kg) serving as the standard reference drug. Phytochemical analysis revealed the presence of phenols, alkaloids, flavonoids, tannins, triterpenoids, and steroids in all three plants, suggesting possible synergistic activity. The polyherbal extract (1:1:1 ratio) demonstrated a significant reduction in immobility time, showing results comparable to Amitriptyline. These findings indicate that the formulation possesses promising antidepressant activity, supporting its potential as a natural therapeutic alternative for depression. Further studies, including clinical trials, are recommended to validate these results.

**Keywords:** Polyherbal formulation, Antidepressant activity, Soxhlet extraction, Forced Swim Test, Amitriptyline, Synergistic activity, Natural therapeutic alternative

**FORMULATION AND EVALUATION OF DECOCTION OF NYCTANTHES ARBORTRISTIS LINN FOR MANAGEMENT OF JOINT PAIN**

Mayank R. Harne, Vishakha N. Giradkar, Sanjay P. Wate
Department of Pharmaceutical Sciences, Anurag College of Pharmacy, Bhandara, Maharashtra, India – 441905
mayankharne16@gmail.com

Nyctanthes arbortristis L., a member of the Oleaceae family, is commonly employed in the creation of herbal medicine and has a variety of biological functions. It is a mythological plant having extensive medical use in Ayurveda. It contains alkaloids, flavonoids, anthraquinones, glycosides, tannins, steroids, saponins, phlobatannins, terpenoids, and so on. Its leaves contain mostly benzoic acid, fructose, glucose, carotene, amorphous resins, ascorbic acid, methyl salicylate, tannic acid, oleanolic acid, and flavanol glycoside. To extract the bioactive chemical found in the leaves of Nyctanthes arbortristis Linn and test the extract's anti-arthritic effectiveness.The Anti-inflammatory decoction is a drug used to alleviate joint discomfort. In the process of preparing and evaluating anti-inflammatory activity, an inquiry attempt including extracts of leaves of Nyctanthes arbortristis L. derived from extract of parijat .The anti-inflammatory properties of decoction leaves. The extraction was carried out using the decoction procedure. Anti-inflammatory formulation was effectively produced and met the relevant medicinal parameters. The resulting mixture is subsequently analyzed for criteria such as pH, chemical test, and in-vitro decoction testing. Stability characteristics such as visual appearance, nature, and pH of the formulations revealed that there was no significant variation during the study period.

**HERBAL-BASED SOLID SHAMPOO BARS: AN ECO-FRIENDLY ALTERNATIVE FOR SUSTAINABLE HAIRCARE**

ARFA BANU, SAURAV MANDAL, DEEPTHI SWAPNA, B A VISHWANATH
Department of Pharmaceutics, Aditya Bangalore Institute of Pharmacy Education and Research – 560064
banua4448@gmail.com

Solid shampoo bars are an eco-friendly innovation in the personal care industry, designed to replace conventional liquid shampoos with sustainable, biodegradable, and plastic-free alternatives. Unlike synthetic formulations, herbal-based shampoo bars utilize natural surfactants and plant-derived extracts to provide effective cleansing, conditioning, and therapeutic action. In our research, the solid shampoo bar formulation incorporates ingredients such as reetha and shikakai as natural surfactants, neem and hibiscus extracts for scalp health and dandruff control, aloe vera for hydration, and coconut oil for improved hair strength and shine. The prepared shampoo bars were evaluated for pH, hardness, foaming ability, cleansing efficiency, and stability. Results demonstrated that the optimized formulation maintained a hair-friendly pH (4.5–5.5), produced stable foam, showed good cleansing activity, and exhibited better consumer acceptability compared to synthetic counterparts. In addition, the use of herbal extracts minimized scalp irritation while enhancing hair texture. The eco-friendly nature of solid shampoo bars, combined with therapeutic herbal benefits, positions them as a sustainable alternative with potential for commercialization in the natural haircare industry.

**Keywords:** Solid shampoo bars, herbal extracts, eco-friendly, sustainable haircare, natural surfactants.

**FORMULATION AND ASSESSMENT OF THE ANTIMICROBIAL ACTION OF CELERY HYDROALCOHOLIC EXTRACT ON CARIES-ASSOCIATED STREPTOCOCCUS SPECIES**

T. Harini, P. Ranjitha, R. Poongavanam and A. Jansi Rani
Department of Pharmaceutical Chemistry, Pallavan Pharmacy College, Kanchipuram, India – 631502.
thangarajanjali23@gmail.com

Celery (Apium graveolens L.) is a herbal plant that possesses the chemical composition flavonoid, saponin and tannin. They have been studied for many years for their antimicrobial properties. Oral preparations have not, however, been tested for antimicrobial efficacy. The purpose of this study is to develop chewable lozenges using hydroalcoholic extract from celery leaves and assess its antimicrobial and physical characteristics. Using the molded process, chewable lozenges containing celery leaf hydroalcoholic extract are developed. This formulation had been assessed for pH determination, dissolving testing, viscosity testing, weight uniformity, chemical testing and organoleptic testing. Using Streptococcus mutans, the antibacterial activity of chewable lozenges was tested using the diffusion method. The antimicrobial activity test results indicated that the Streptococcus mutans bacteria in F1, F2, and F3 had zones of inhibition diameters of 8.8 mm, 9.0 mm, 9.33 mm respectively. When compared to its other formulations, Formulation F3 had superior antimicrobial properties.

**Keywords:** Celery, lozenges, hydroalcoholic, antimicrobial.

**FORMULATION AND EVALUATION OF ANTI-DANDRUFF HERBAL SHAMPOO**

Yashaswini M, Archana N, Ashok Kumar D Department of Pharmacognosy, S.B.D Institute of Pharmacy
yashaswinim208@gmail.com

Shampoo is a hair care product using surfactant as main compound and used for removal of oils, dirt, skin particles, dandruff, environmental pollutants, and other contaminant particles that gradually build up in hair. But this surfactant has side effects like scalp, skin irritation, hair dryness and damage. Hence Herbal antidandruff shampoos have gained significant attention as they use natural alternatives to synthetic hair care products due to their environmental sustainability and therapeutic benefits. The main objective of study is to formulate and evaluate herbal shampoos with plant derived ingredients rich in bioactive compound such as saponin, flavonoid, polyphenols etc. These phytoconstituents provide cleansing, anti-inflammatory, conditioning, antimicrobial and contributing to overall scalp health & hair strength. Here herbal shampoo of three different composition of the chosen ingredients were formulated using cold maceration method. Herbal ingredients include Aloe barbadense miller (Aloe vera) for hydration, Acacia concinna (Shikakai) and Sapindus mukorossi (Reetha) for natural cleansing, Phyllanthus emblica (Amla) for nourishment, Azadirachta indica (Neem) for antimicrobial action and Hibiscus rosa-sinensis, (Hibiscus) for hair growth stimulation. This formulated herbal shampoo (HSF1, HSF2 and HSF3) was evaluated for organoleptic character, pH, solid content percentage, foam stability test, skin irritation test, dirt dispersion and showed optimal results. By this study, we conclude that HSF 1 was effective, possessing good properties for herbal shampoo - not only clean scalp effectively but also minimize hair damage, reduce dandruff & improve hair texture without stripping oil. Further optimization study may establish the benefits of herbal shampoo for its commercial potential.

**Keywords:** Herbal Shampoo, Antidandruff, Hair Care

Salvav, Vapi, Gujarat, India – 396191
ramjadvani@gmail.com

The global nutraceutical sector has grown rapidly due to the high demand for simple, safe, plant-based health products. This study looks to address that growth by designing and standardizing a new everyday-use polyherbal nutraceutical sprinkle aiming to boost compliance among various groups of people. The formula uses plants like Emblica officinalis (Amla), Tinospora cordifolia (Giloy), Glycyrrhiza glabra (Liquorice), and Ocimum sanctum (Tulsi) known for their roles in supporting digestion, enhancing immunity, and fighting oxidative stress. To make it more appealing, the team included mannitol, a natural sweetener, along with raspberry flavor.The team created the formulation using geometric dilution and dry mixing. Key elements like moisture levels, particle size, blend uniformity, flow abilities like bulk density and Carr's index, and taste-related qualities were checked. Results showed it had good sensory appeal, remained stable, and could be reproduced. To meet the needs of kids older adults, and those with swallowing difficulties, the sprinkle format allows simple use without requiring water. Along with its

ISBN: 978-81-980623-8-3

health benefits, the product also has market perks like being easy to carry working well with functional food offering single-serve packaging options, and being adaptable to location-specific health claims.It plays a key part in the growing global market of functional foods and preventive healthcare. People are asking more for plant-based and clean-label products because it is natural, gluten-free, and non-invasive.To sum up, this polyherbal nutraceutical sprinkle is a sensible option for global commercialisation and acceptability. It blends contemporary nutraceutical developments with herbal traditions in a scalable, user-friendly, and scientifically supported manner.

Pseuderanthemum graciliflorum is also called as Pseuderanthemum andersonii or Blue twilight belonging to family Acanthaceae. The objective behind this was to evaluate anti-cancer, hepatoprotective and anti-inflammatory activity of Pseuderanthemum graciliflorum. Dried and powdered leaves are extracted and was studied using albumin denaturation, heat induced haemolysis and proteinase inhibition. This possesses significant anti-inflammatory activity. The studies with MTT assay method indicate hepatoprotective activity. The in-vitro anticancer activity in alcoholic extract of Pseuderanthemum graciliflorum was done in Daltons Lymphoma Ascites cell lines. The preliminary photochemical examination showed the presence of flavonoids, phytosterols, proteins and aminoacids. This shows significant anti-cancer, hepatoprotective and anti-inflammatory activity. The result obtained from study indicates that Pseuderanthemum graciliflorum leaves posses significant anti-cancer, hepatoprotective and anti-inflammatory activity.

**Keywords:** Dalton lymphoma ascites, MTT assay, Inhibition of albumin denaturation, Heat induced haemolysis assay, Proteinase inhibition.

**PHYTOCHEMICAL PROFILING AND ANTHELMINTIC POTENTIAL OF JATROPHA GOSSYPIIFOLIA L. LEAVES: COMPARATIVE EVALUATION WITH ALBENDAZOLE**

**S**anthosh H T, M Padmasree, B A Vishwanath.
Department of Pharmaceutics, ABIPER, Bangalore, Karnataka-560064.

Helminthiasis is still a significant public health problem worldwide, especially in the tropics, with growing resistance to man-made anthelmintics. As such, seeking effective alternatives from plants has gained significant significance. The current study examined the phytochemical content and anthelmintic efficacy of Jatropha gossypiifolia L. leaves, a medicinal shrub used extensively in folk medicine against intestinal parasites. Leafy green parts were shade dried, ground, and stepwise extracted using solvents of rising polarity. Quantitative phytochemical investigation of the methanolic extract showed rich contents of phenolics (82.5 ± 2.3 mg GAE/g extract) and flavonoids (46.2 ± 1.7 mg QE/g extract), in addition to alkaloids, tannins, saponins, and glycosides. Anthelmintic activity against adult earthworms (Pheretima posthuma) was determined at 25, 50, and 100 mg/mL using albendazole (10 mg/mL) as control. The methanolic extract exhibited highest activity with paralysis at 7.8 ± 0.3 min and death at 14.6 ± 0.5 min (100 mg/mL), which was similar to albendazole (paralysis: 6.2 ± 0.2 min; death: 12.1 ± 0.4 min). In summary, this research can introduce Jatropha gossypiifolia as a promising natural source of anthelmintic compounds and can be used in the formulation of superior anthelmintic therapy.

**Keywords:** Jatropha gossypiifolia, phytochemicals, anthelmintic activity, methanolic extract, albendazole.

**COMBINATION AND EVALUATION OF CARICA PAPAYA LEAF EXTRACT LOADED PHYTOSOMES - A NOVEL APPROACH TO TREAT DENGUE**

A.Likhita, Saritha Madepati
Vignan Institute of Pharmaceutical Technology.
chsaritha1975@gmail.com

The current research involves preparation and assessment of phytosomes of carica papaya leaf extract by solvent evaporation technique. Carica papaya leaf extract is utilized for the treatment of dengue fever. It also possesses characteristics such as anti-viral activities which can enhance the immunity in case of dengue fever. The flavonoids and the other phenolic compounds present in the leaf extract are accountable to avoid inner haemorrhage and can inhibit DEN-2 virus assembly. In the present research, the leaf extract is formulated as phytosomes which are employed for the treatment of dengue fever. The extract is formulated into phytosomes by using solvent evaporation method. The extract is standardized and FTIR studies revealed that there was no interaction between carica papaya leaf extract & soya lecithin. The formulated phytosomes were checked for particle size, zeta potential, entrapment efficiency and in vitro drug release. The research reveals that the release from phytosomes was superior to the pure leaf extract. Thus, we can conclude that carica papaya phytosomes are more useful and effective for the treatment of dengue fever as release is increased from the phytosomal drug delivery.

**Keywords:** Phytosomes, solvent evaporation, anti-viral, haemorrhage, FTIR studies,soya lecithin.

Sankar Madhab Path,
Gandhi Nagar, Panikhaiti, Guwahati, Assam, India, PIN – 781026
Purusuttamhazarika32@gmail.com

Banana peel and pulp have attracted the attention of researchers due to their abundance of bioactive compounds. Phenolic constituents in both peels and pulp parts of the fruit exhibit strong antioxidant and antimicrobial properties, making them valuable natural antioxidants with potential pharmaceutical applications. Traditionally, banana peels have been promoted for wound healing, particularly in burns, and addressing disease conditions, such as depression, underscoring their therapeutic significance. The chemical composition of banana peel and pulp is diverse, including phenolic compounds, alkaloids, flavonoids, tannins, saponins, glycosides, sterols, triterpenes, carotenoids, and catecholamines. This assorted composition supports a wide range of biological potential, including provitamin A supplementation, antioxidant activity by activation of endogenous enzymes, reduce lipid peroxidation, and modulate various signalling pathways involved in oxidative stress through phenolic/flavonoid constituents, and possible benefits in Parkinson's disease owed to their content of L-dopa and dopamine. With their richness of health-promoting bioactive molecules, banana peel and pulp represent promising raw materials for phytomedicine and even conventional drug development. By utilizing these resources, banana fruit residues, often overlooked as waste, could open up new avenues and become valuable resources for the food, pharmaceutical, and related industries. Finally, banana peel and pulp are versatile bio-resources with significant therapeutic and industrial potential, highlighting the importance of their systematic exploration and application in various fields.

**Keywords:** Antimicrobial, Antioxidant, Banana peel, Bioactive compounds, Therapeutic benefits

The purpose of the work was to formulate and characterize the herbal salve containing ayurvedic herbs. Salve is formulated by using beeswax, coconut oil and eucalyptus oil by Fusion method. The Herbs-Nagarmotha, Manjista, Curcumin and Madhuyasthi are used as they contain ayurvedic importance for the preparation of herbal salve with

ISBN: 978-81-980623-8-3

suitable base such as beeswax, and vehicle-coconut oil for the purpose of skincare. The prepared salves are characterized for IR studies, production yield, DSC, SEM. The percentage yield of formulation was from 83.34 - 97.62%. The DSC studies are revealed that the drug and base are compatible with each other during preparation. The changes in the physical properties of the formulated salves are not observed. Herbal salves show good consistency and spreadability, non-greasy, homogeneity. No evidence of phase separation during study period is observed. The prepared salve is tested by applying an area (1sq.cm) on the left hand dorsal surface. The cream was applied to the specified area and time was noted. Irritancy, erythema, edema was checked for regular intervals up to 24 hours and reported. Furthermore, the formulation remained stable during short- term stability testing. In conclusion, the developed herbal salve promises overcoming the limitations associated with oral administration.

**Keywords:** Nagarmotha, Curcumin, Manjista, painrelief, Anti-inflammatory.

## VITEX TRIFOLIA LINN : COMPARATIVE ANTI TUBERCULAR ACTIVITY OF ETHANOLIC EXTRACT VS. FREEZE DRIED CONCOCTION

Krutika Khode, Hina Sawarbandhe, Sandeep Gadhwe
Department. of Pharmaceutical Quality Assurance, Sinhgad College of Pharmacy, Vadgaon Bk., Pune, MS, India- 411041.
khodekrutika@gmail.com

Tuberculosis (TB) continues to be a major global health challenge, with rising drug resistance highlighting the urgent need for novel therapeutic options from natural sources. Vitex trifolia Linn. A medicinal plant traditionally used in Ayurveda, has demonstrated promising anti-tubercular activity. The present study aimed to compare the chemical profile and anti-tubercular activity of ethanolic extract and freeze-dried concoction of Vitex trifolia Linn. Along with their formulations using different carriers. Plant material was authenticated and processed to prepare both extract types. Chemical profiling was carried out using High-Performance Thin-Layer Chromatography (HPTLC) and spectroscopic techniques. Anti-tubercular efficacy was evaluated by Microplate Alamar Blue Assay (MABA) against Mycobacterium tuberculosis, and toxicity was assessed using the Brine Shrimp Lethality Assay (BSLA).Results indicated that both preparations shared a comparable phytochemical profile, rich in alkaloids, flavonoids, terpenoids, and phenolic compounds. The freeze-drying process preserved phytoconstituents without significant alterations. Anti-tubercular activity studies revealed strong inhibition, with Minimum Inhibitory Concentration (MIC) values of 1.6 µg/mL for ethanolic extract, freeze-dried concoction, and milk-based formulation. However, the ghee formulation showed reduced potency with an MIC of 12.5 µg/mL.In conclusion, Vitex trifolia Linn. exhibits potential as a natural anti-tubercular agent, with both ethanolic extract and freeze-dried concoction demonstrating significant activity and consistent chemical composition. These findings provide scientific validation for its traditional medicinal use and suggest its applicability in the development of plant-based formulations for TB management.

**Keywords:** Vitex trifolia, tuberculosis, anti-tubercular activity, photochemistry, MABA assay.

## DEVELOPMENT AND CHARACTERIZATION OF POLYHERBAL FORMULATION FOR THE TREATMENT OF HAEMORRHOIDS

Swathi H
Department of Pharmaceutics, Al Shifa College of Pharmacy, Poonthavanam (PO), Perinthalmanna, Malappuram, Kerala-679325
hknairswathi@gmail.com

The purpose of the present investigation is to formulate and evaluate a polyherbal cream for the treatment of haemorrhoids using herbs, available locally and used traditionally and to deliver proper evidence for its pharmacological effect. Haemorrhoids, also known as piles, are swellings containing enlarged blood vessels that are found inside or around the bottom (the rectum and anus). In this project three plant extracts are used for the preparation of anti-haemorrhoidal polyherbal formulation. The three plants used are Holoptelea integrifolia, Mimosa pudica, Clerodendrum infortunatum. Due to various side effects, drug interactions, and the high costs of synthetic drugs, interest in herbal medicines is increasing day by day. Among the population, the variety of plants used against haemorrhoids is quite high. For example, 241 medicinal plants are used to treat haemorrhoids in various regions of the world. The polyherbal cream was formulated and physicochemical evaluation and pharmacological evaluation was done. In this study,the polyherbal cream were prepared at various concentrations and evaluations were done. After that the anti-haemorrhoidal property were proved by animal studies. All the formulations were found to be neutral pH and on physical evaluation the formulations were found to be optimum in terms of cream;consistency, viscosity, Spreadability and extrudability. Animal study is carried out which showed satisfactory result. Polyherbal cream containing Holoptelea integrifolia,Mimosa pudica,Clerodendrum infortunatum were successfully prepared and obtained cream showed acceptable pH, consistency,viscosity,spreadability and extrudability. The invitro and in vivo studies has given positive results for the ant haemorrhoidal property of the polyherbal cream.It showed that all the parameters of the polyherbal cream was within in the acceptable limit. A further experiment is required to isolate the possible bioactive compound from hydroalcoholic fraction of polyherbal extract and to evaluate the isolated compounds on haemorrhoid model.

## EVALUATION OF ANTICONVULSANT EFFECT OF MYRISTICA FRAGRANCE BY THE FOKLORE OF VIDHARBHA REGION

Rucha a Ingle, Kailas Biyani
Department Of Pharmacology, Anuradha College Of Pharmacy, Chikhli. Dist- Buldhana. 443001 Maharashtra, India
rucha.jadhao@gmail.com

Convulsions are a form of neurological illness that is grouped together under the umbrella word "convulsions." An individual who is having a seizure may experience a loss of consciousness as a consequence of the sudden rise in the level of electrical activity that takes place in their brain during the seizure. This may be caused by the seizure itself. Significant unfavorable long-term repercussions, such as persistent visual field abnormalities brought on by vi GABA's trim and aberrant pigmentation of the retina brought on by retigabine, have resulted to a decline in the prescription of some antiepileptic medications that is not insignificant. These bad long-term implications include permanent visual field anomalies. These unfavorable aftereffects of prolonged exposure are being held responsible for the drop. Medications derived from plants that are used in the management of delusions have no side effect. Maximal Electroshock Convulsion (M.E.S) Test, Pentylenetetrezole (PTZ) Influence Convulsion Test are methods use for Analysis of Phytochemicals the aroma of myristica revealed that ethanolic extract of myristica fragrance has a variety of phytochemicals, including alkaloids, flavonoids, carbohydrate derivatives, steroidal glycosides, saponins, glycosides, tannins, and terpenoids. Phytochemical analysis proved the existence of various active chemical constituents in Myristica Fragrance ethanolic take out. These constituents, which include alkaloids, saponines, flavonoids, steroids, and carbohydrates, have shown evidence of antiepileptic activity against the influence of M.E.S. convulsions. There are a number of different molecular mechanisms that drugs may use to either stop the spread of convulsions or raise the threshold at which convulsions start.

**Keywords:** Epilepsy, Ethanolic, Myristica Fragrance, Convulsion.

## DEVELOPMENT AND EVALUATION OF SOME NOVEL HERBAL FORMULATION

Abubakar Salam Bawazir, Sumaiya Zubair Khan
Y.B Chavan college of pharmacy, CSN, Aurangabad, Maharashtra, India
abubakar.bawazir@gmail.com

In the current research, herbal capsule containing Trigonella foenum-graecum (Fenugreek) seeds and and Musa paradisiaca (Green Banana) fruits with peels was formulated. The objective of the research was to assess the antidiabetic activity by In -vitro and In- vivo model and Design and optimization of dosage form to achieve synergism. The selected herbal drugs were extracted subjected to phytochemical evaluation by

ISBN: 978-81-980623-8-3

HPTLC fingerprint analysis and LCMS. Pharmacological studies including In -vitro study and In -vivo antidiabetic study on animals were performed. The extracts were formulated to capsule by calculating HED, formulation was design and optimized. The HPTLC fingerprint and HR-LCMS analysis confirmed the presence of marker compounds: diosgenin in HETFS and quercetin in EMPF. In-vitro evaluation using α-amylase inhibitory assay, where the 1:2 and 2:1 ratios exhibited synergistic inhibitory effects. The diabetes was induced by streptozotocin and nicotinamide to evaluate antidiabetic activity. Among the tested ratios, the 1:2 ratio demonstrated potent synergistic antidiabetic effect. The dose determined from the In-vivo animal study was converted to the human equivalent dose (HED) following FDA guidelines. The 1:2 ratio of extracts was selected for optimization and formulation of capsules. Formulation showed optimal disintegration time, IC50 value, and % alpha-amylase activity, with stability and consistency confirmed by accelerated studies and HPTLC analysis. The simplified two-drug formulation offers a standardized and effective alternative to complex multi- drug antidiabetic therapies existing in the market. Additionally, the formulation provides the benefit of lesser side effects with economic viability.

**Keywords:** Trigonella foenum-graecum, Musa paradisiaca, Synergism, HED, Antidiabetic Capsule.

## EVALUATION OF ANTIHELMINTIC AND ANTIFUNGAL ACTIVITY OF POLYPODIM VULGARE

B Vivek, Ishika Toor, Aarthi K
Department of Pharmacology, Vidya Siri College of Pharmacy, Off Sarjapur Road, Bengaluru-560035, Karnataka

In the current research, attempts have been made to evaluate the antihelmintic and antifungal activity of Polypodium vulgare (PV). PV has been exploited in traditional herbal medicine as an expectorant and laxative. The objective behind this research is exploring the antihelmintic and antifungal properties of PV by using aqueous, ethanolic and ethyl acetate extracts in various concentrations. Extracts of PV were subjected to phytochemical analysis followed by antihelmintic assessment based on time of paralysis and death in Eisena foetida (adult earthworm). Eisena foetida was subjected to concentrations of 30mg/ml and 40mg/ml of the above mentioned respective solvents. Piperazine citrate (10mg/ml) was used for comparative analysis of antihelmintic activity. To assess the antifungal property, fungi selected were Aspergillus niger and Candida albicans. This study was performed as per NCCLS guidelines using Cup-Plate method. The extracts were subjected to standard antifungal screening procedure by agar gradient method. The standard drug for comparative analysis was flucanozole (2mg/10ml). The test concentrations of solvents used were 100mg/ml, 150mg/ml and 200mg/ml respectively. The Sabouraud's agar plates were incubated accordingly, followed by recording values of zone of inhibition. The alkaloids present in PV interfere with nerve transmission, leading to paralysis. Tannins and flavonoids present in PV binds to protein present on worm cuticle leading to cell damage and cell death. Saponins and tannins found in PV create pores on cell membrane of candida cells leading to leakage of cell contents. Thus, our results show potential in incorporating PV into drugs used as antihelmintic and antifungal.

**Keywords:** Polypodium vulgare, antihelmintic activity, antifungal activity, NCCLS guidlines, in-vitro

## PHYTOPHARMACOLOGICAL SCREENING OF SYNEDRELLA NODIFLORA FOR BIOLOGICAL POTENTIAL

Rajat Ghosh, Rishav Mazumder, Ajay Kumar Jaiswal
Department of Pharmacy, Tripura University (A Central University), Suryamaninagar, Tripura (W)-799022, INDIA
rajatghosh@tripurauniv.ac.in

Synedrella nodiflora (Linn.) Gaertn. an ethnomedicinally important subshrub, has been traditionally utilized by different ethnic communities for treating inflammation, liver disorders, asthma, and diabetes. This study aimed to examine its phytoconstituents, and evaluate its antioxidant, antidiabetic, antibacterial potential as well as cytotoxicity. Hydro-ethanolic extract was prepared using cold maceration and subsequently fractionated via liquid-liquid extraction of the aerial part of the plant. The crude extract exhibited IC50 values of 478.74 µg/mL and 370.20 µg/mL, respectively against Vero and HepG2 cells in MTT assay. The n-butanol fraction exhibited significant bioactivity with IC50 values of 59.37 µg/mL and 48.428 µg/mL for α-amylase and α-glucosidase, respectively, and 46.64 µg/mL in DPPH assay. Moderate antibacterial activity was observed with zones of inhibition ranging from 9-12 mm against P. aeruginosa, E. coli, B. subtilis and S. aureus. Phytochemical analysis revealed the presence of phenolics, flavonoids, glycosides, saponins, and tannins. Quantitative assays confirmed high levels of phenolics (42.16 mg GAE/g), flavonoids (28.06 mg QE/g), and glycosides (27.77 mg DE/g) in the n-butanol fraction. Subsequently, UPLC-QTOF-MS analysis of n-butanol fraction showed the presence of different secondary metabolites. Furthermore, molecular docking studies revealed that secondary metabolites 3-hydroxy-5-methyl phenol-1-O-β-D-(6'-galloyl) glucopyranoside and 2-(3,4-Dihydroxyphenyl)-3,4-dihydro-2H-chromene-3,5,7-triol possessed favorable interactions with the respective enzymes with docking scores of -8.434 kcal/mol (3A4A) and -7.346 kcal/mol (1B2Y), respectively.

**Keywords**: Synedrella nodiflora, antioxidant, antidiabetic, UPLC-QTOF-MS, molecular docking

## COMPUTATIONAL AND EXPERIMENTAL EVALUATION OF PHYTO-CONSTITUENTS FOR THE DEVELOPMENT OF AN ANTI-ASTHMATIC FORMULATION

Kiran Heera Makhija, N. S. Vyawahare, S. S. Sadar
Department of Pharmacology, Dr. D. Y. Patil College of Pharmacy Akurdi, Pune
Kiranmakh16@gmail.com

Asthma, a chronic inflammatory airway disease and the 11th leading cause of death in India, poses a growing health burden with increasing prevalence among young and adult populations. Current therapies provide only symptomatic relief and are often associated with side effects, underscoring the urgent need for novel therapeutic strategies. This study integrates computational and experimental approaches to explore phytochemical-based alternatives for asthma management. A systematic literature survey was conducted to identify bioactive phytoconstituents, which were subsequently analyzed through network pharmacology to map their interactions with asthma-related molecular targets and signaling pathways. The network analysis revealed critical hubs and multi-target interactions suggestive of therapeutic relevance. To further validate these findings, molecular docking studies were performed, confirming strong binding affinities and stable interactions of selected phytochemicals with key asthma-associated targets, thereby reinforcing their potential efficacy. Based on these results, the most promising phytoconstituents were formulated into a novel preparation and subjected to preclinical evaluation using experimental animal models. The formulation will be demonstrated for anti-asthmatic activity, supporting the predictive accuracy of the computational analysis. This integrative strategy not only provided a comprehensive understanding of asthma pathophysiology but also identified promising phytoconstituents with multi-target actions, advancing the concept of phytochemical-based therapeutic development. The findings establish a robust foundation for future in vitro and in vivo investigations to optimize formulation, assess safety, and validate efficacy, ultimately contributing toward the development of a novel, effective, and safer treatment option for asthma.

**Keywords:** Chronic Airway Inflammation, Bioactive Compounds, Target Identification, computational Pharmacology, Preclinical Evaluation

## FORMULATION AND EVALUATION OF BETEL LEAF HERBAL FACIAL SCRUB FOR SKIN HEALTH AND CLEANSING

Ms. Kalyani B. Sahare, Akansha Markad
Dr. D. Y. Patil College of Pharmacy Akurdi, Pune, 411044

Herbal skincare products have gained popularity due to their natural, skin-friendly, and environmentally sustainable benefits. This study focuses on the formulation and evaluation of a betel leaf-based herbal facial scrub, utilizing natural exfoliants and therapeutic plant-derived ingredients. Betel leaf (Piper betel) is renowned for its antimicrobial, antioxidant, and anti-inflammatory properties, making it a valuable addition to skincare formulations. The scrub was prepared using natural exfoliating agents such as rice powder, along with other essential

ISBN: 978-81-980623-8-3

ingredients like Carbopol 934 (gelling agent), triethanolamine (pH adjuster), and rose water (fragrance). The optimized formulation (F3) was assessed according to a number of criteria, including organoleptic properties, pH, irritancy, washability, and formability. The results showed that F3 had a smooth and uniform texture, with a greenish colour and pleasant fragrance. The pH of 6.84 indicated skin compatibility, ensuring mildness for topical application. Irritancy testing confirmed that the scrub was non-irritating, as no signs of redness or oedema were observed. Washability tests demonstrated easy removal without leaving any residue, while formability tests indicated moderate foaming, enhancing the cleansing experience. Overall, the betel leaf herbal facial scrub exhibited excellent stability and effectiveness, offering an eco-friendly and skin-beneficial alternative to conventional exfoliating products. The study highlights the potential of herbal-based formulations in promoting sustainable skincare solutions. Further research can explore its long-term effects on skin health and its potential for commercialization in the natural cosmetics industry.

**Keywords:** Herbal skincare, betel leaf (Piper betel), facial scrub, natural exfoliant, skin health, eco-friendly, sustainable cosmetics, pH, irritancy, formability.

## FROM NATURE, FOR NATURE: NATURE PROTECTOR INCENSE STICK

Mote Vaibhav Bhausaheb, Sachin Bhagwat Aglawe, Nitin Jain
Rashtrasant Janardhan Swami College of Pharmacy, Kokamthan, Kopargaon, Maharashtra, India, 423601.
vaibhavmote15012002@gmail.com

In recent years, increasing awareness of the harmful effects of synthetic room fresheners and disinfectants has created a demand for natural and eco-friendly alternatives. The present study aimed to develop and evaluate a herbal dhoop (incense stick) formulated with natural ingredients such as Kapoor Tulasi, Bhimsen camphor, cow dung, cow milk, marigold flowers, and cow ghee. The need for this formulation arises from its potential to provide relaxation, mental clarity, health benefits, and mosquito-repellent activity while promoting sustainable and ethical practices. The objectives of the study were focused on environmental purification, aromatherapy, spiritual applications, and eco-friendly fumigation practices**.** Evaluation was carried out through various parameters**.** Sensory evaluation was conducted with 20 students, who assessed smell, smoke, and appearance**.** Physical evaluation indicated a dark brown color and a Havana-type odor. Phytochemical analysis revealed the presence of carbohydrates, alkaloids, glycosides, and flavonoids, while amino acids were absent. Mosquito repellency tests demonstrated significant positive activity. Microbiological tests further indicated its potential for air purification, whereas burning performance tests confirmed efficient combustion properties. Thus, the formulated herbal dhoop can serve as a safe, eco-friendly, and multifunctional alternative suitable for fumigation in hospital wards, microbiological laboratories, and households. It combines the benefits of air purification, aromatherapy, spiritual well-being, and mosquito repellency, making it a sustainable solution for modern needs.

**Keywords:** Herbal dhoop, Eco-friendly fumigation, Mosquito repellent, Air purification

## UNVEILING THE MULTIFACETED BENEFITS OF HIPPOPHAE RHAMNOIDES (SEA BUCKTHORN): FROM TRADITIONAL MEDICINE TO MODERN THERAPEUTICS

Kajal Karmore, Tiruppati Rasala, Shubham Kamble
The Royal Gondwana College of Pharmacy, Nagpur

Sea buckthorn (Hippophae rhamnoides), a deciduous shrub native to Europe and Asia, has attracted growing scientific attention due to its remarkable nutritional and therapeutic potential. Its berries, seeds, and leaves are rich in bioactive compounds, including vitamins C, A, E, and K, flavonoids (quercetin, kaempferol), essential fatty acids (omega-3, -6, -7, -9), phenolic acids, carotenoids, phytosterols, and amino acids. This diverse phytochemical profile underlies its broad pharmacological actions—antioxidant, anti-inflammatory, anticancer, hepatoprotective, cardioprotective, neuroprotective, and dermatological. Traditionally valued in Tibetan, Chinese, and Greek medicine, sea buckthorn has found modern uses in nutraceuticals, cosmeceuticals, and functional foods. Its potent antioxidant activity, primarily due to high vitamin C and polyphenol content, helps neutralize free radicals and mitigate oxidative stress. Oil extracted from its seeds and pulp promotes skin regeneration, hydration, and anti-inflammatory effects. Additionally, it shows promise in managing metabolic disorders like diabetes and hyperlipidemia and supports cardiovascular health by improving lipid profiles and regulating blood pressure. Preclinical studies indicate anti-cancer potential through apoptosis induction and tumor growth suppression. While its health-promoting effects are well-documented, clinical validation is needed to determine standardized dosing, safety, and interactions. This review highlights sea buckthorn's phytochemistry and therapeutic promise, positioning it as a valuable agent in integrative medicine.

**Keywords**: Sea buckthorn, Hippophae rhamnoides, antioxidant, anti-inflammatory, phytochemicals, nutraceutical, medicinal plant.

## EXPLORING BIOACTIVE METABOLITES FROM BACILLUS SUBTILIS ISOLATED FROM THE SEEDS OF ARGEMONE MEXICANA

Shobha Singarapalle, Murali Krishna Kumar Muthyala
Pharmaceutical Chemistry Division, A.U. College of Pharmaceutical Sciences, Andhra University, Visakhapatnam, Andhra Pradesh 530003, India

This study investigates the potential of endophytic bacteria, which reside in plant tissues without causing harm, as sources of bioactive compounds. We isolated Bacillus subtilis from the seeds of Argemone mexicana and identified it through 16S rRNA sequencing. The bacteria were cultivated using submerged fermentation; after incubation, the fermentation broth was centrifuged and extracted using ethyl acetate. The extract was further purified through column chromatography, yielding bioactive compounds, including para-hydroxy phenyl propionic acid **1** and three diketopiperazine derivatives: 2-cyclo(L-phe-L-pro) **2**, cyclo-(L-leucyl-trans-4-hydroxy-L-proline) **3**, and (3-(7-hydroxy-1,4-dioxooctahydropyrrolo[1,2-a]pyrazin-3-yl)propanoyl)-L-leucine **4**. Compounds **1**, **2**, **3**, and **4** were evaluated for their antibacterial and anti-TB properties, showing strong efficacy against both Gram-positive and Gram-negative bacteria, along with considerable anti-tuberculosis activity against the Mycobacterium tuberculosis H37Rv strain, with a Minimum Inhibitory Concentration (MIC) of 12.5 µg/mL. This research emphasizes the potential of Bacillus subtilis from Argemone mexicana as a promising source of bioactive compounds for developing antimicrobial and anti-tuberculosis drugs.

**Keywords:** Anti-tubercular drugs; Argemonemexicana; Bacillus subtilis; Bioactive compounds; Endophytic bacteria; Fermentation.

## FLAVONOID-ENRICHED NANOGEL OF TERMINALIA ARJUNA BARK EXTRACT: A NOVEL PHYTOPHARMACEUTICAL APPROACH FOR HEMORRHOID TREATMENT

**KAMALESH MISTRY1, CHANDRASHEKAR THALLURI2**
1Research Scholar, Faculty of Pharmaceutical Science, Assam down town University (AdtU), Gandhinagar, Panikhaiti, Guwahati-781026, Assam.
2Associate Professor, Faculty of Pharmaceutical Science, Assam down town University (AdtU), Gandhinagar, Panikhaiti, Guwahati-781026, Assam.
drkamaleshmistry@gmail.com

Anorectal disorder which comprises of piles or hemorrhoids is characterized by the inflammation, vascular dysfunction and oxidative stress causing pain, swelling and bleeding from the rectum. Conventional treatments, including corticosteroids and surgical interventions, normally constitute limitations, which however frequently include recurrence and side effects. However due to their safety and efficacy, phytopharmaceuticals are being looked at as possibilities in hemorrhoidal management in recent years. In this study, a flavonoid enriched nanogel from Terminalia arjuna bark extract was formulated and is known to have potent antioxidant, anti inflammatory and venotonic properties among all well documented medicinal plants. Using a nanoemulsion based method for formulation, a biocompatible polymeric system was used to optimize the nanogel to improve flavonoid stability, biodegradability, controlled release and increased dermal penetration. The formulation was characterized and comprised measurement of particle size, zeta potential, viscosity, entrapment

ISBN: 978-81-980623-8-3

efficiency, and in-vitro release kinetics. A nanogel size of roughly 120 nm was obtained for the optimized nanogel, ensuring skin absorption and also providing sustained release. Under accelerated and real-time conditions, in vitro anti inflammatory assays and in vivo hemorrhoidal model the therapeutic efficacy was studied; The stability studies also showed high physicochemical stability with retention of flavonoid integrity greater than 6 months. In animal models, the nanogel substantially suppressed pro-inflammatory markers, improved microvascular circulation and accelerated wound healing, and much more than conventional anti-hemorrhoidal formulations. On patients with grade I and II hemorrhoids clinical studies showed substantial pain relief, less swelling and improved patient compliance when compared with available topical treatments. These findings indicate that use of flavonoid enriched Terminalia arjuna nanogel might be a promising phytopharmaceutical alternative for the hemeroid management due to high bioavailability, focused delivery and diminished recurrences.

**Keywords:** Terminalia arjuna, Flavonoid-Enriched Nanogel, Hemorrhoid Treatment, Phytopharmaceuticals, Nanoemulsion.

## FORMULATION AND EVALUATION OF HERBAL LIP BALM USING NATURAL WAXES AND EXTRACTS

Safa Khatib and Rajat Sayyed
MCES Dr. P. A. Inamdar University Allana College of Pharmacy
safakhatib0706@gmail.com

The increasing popularity of herbal therapies and the use of plant-based ingredients have stimulated the development of herbal lip balms. This study focuses on the formulation and evaluation of a herbal lip balm using natural waxes and herbal extracts with emollient, healing, and antioxidant properties. Structural components of the formulation, consistency, and stability were achieved using beeswax and carnauba wax. Shea butter and coconut oil were incorporated for their excellent moisturising effects and were further enhanced with aloe vera, tulsi, and rose herbal extracts for their emollient, healing, and antioxidant properties.The formulation steps of the lip balm were the combination of melter oil and wax, and then herbal extracts were incorporated. The mixture was finally placed into a mould and allowed to set at room temperature. Further evaluation of the lip balm formulation included pH, melting point, spreadability, homogeneity, stability under a variety of storage conditions, and skin irritation tests.The results indicated that the herbal lip balm formulation retained ideal textural and spreadability properties while maintaining stability with no phase separation.

**Keywords:** Herbal lip balm, natural waxes, herbal extracts, cosmetic formulation, stability testing.

## HERBAL DEPIGMENTATION CREAM USING LICORICE AND SAFFRON

Sara Shaikh and Rajat Sayyed
M.C.E society, Dr PAI university, Allana College of Pharmacy, camp, Pune-411011
Ssarashaikh9@gmail.com

Hyperpigmentation of skin due to excessive production of melanin is caused due to various factors like UV exposure, hormonal changes, aging. Chemical based depigmenting agents like hydroquinone and kojic acid shows various long term adverse effects. In this study herbal depigmentation cream is formulated which consist two natural herbs Licorice (Glycirrhiza glabra) and Saffron (Crocus sativus) which is known for their skin lightning properties. Licorice root extract consist of glabridin which is tyrosinase inhibitor and reduces the melanin production. Saffron consist safranal which reduces the oxidative stress. The cream has been prepared using o/w emulsion base incorporating extracts of licorice and saffron. Evaluation such as pH, viscosity, spreadibility is conducted. In vitro tyrosinase inhibition assay was performed for assessing the depigmenting potential. The results show the acceptable physicochemical properties and tyrosinase inhibition, which causes melanin suppression. A skin irritation study on humans indicated that product is non-irritant. The herbal formulation is promising alternative for the depigmenting creams. Further clinical trials are recommended to evaluate long-term effects and consumer acceptability.

**Keywords:** Herbal depigmentation, Licorice, Saffron, Tyrosinase inhibition, Skin lightening.

## AYURVEDIC DRUGS AND THEIR MODERN APPLICATIONS: BRIDGING TRADITION WITH CONTEMPORARY THERAPEUTICS

Sana Tamboli and swapnil dounde
MCESS Allana College of pharmacy

Ayurveda, the ancient Indian system of medicine, has provided a comprehensive framework for health and healing for over 5,000 years. Rooted in holistic principles, Ayurvedic formulations use natural herbs, minerals, and plant-based compounds that promote balance among the body's physiological systems. In recent decades, there has been a resurgence of interest in Ayurvedic drugs, driven by the increasing demand for natural, safe, and sustainable alternatives to synthetic pharmaceuticals. This highlights the scientific validation and modern applications of key Ayurvedic formulations and bioactive compounds. Notable examples include Ashwagandha (Withania somnifera) for adaptogenic and neuroprotective effects, Guduchi (Tinospora cordifolia) for immunomodulation, and Boswellia serrata for anti-inflammatory action. These natural compounds are now being studied using advanced techniques such as pharmacognosy, molecular docking, clinical trials, and nanoformulation delivery systems. Modern pharmaceutical research has begun to decode the mechanisms behind these traditional remedies, allowing for the integration of Ayurvedic principles into evidence-based medicine. Additionally, the global nutraceutical and wellness industries are increasingly embracing Ayurvedic drugs in the development of herbal supplements, cosmeceuticals, and functional food. This paper underscores the importance of standardization, quality control, and regulatory frameworks in translating Ayurvedic drugs into modern healthcare solutions. By combining traditional wisdom with scientific innovation, Ayurveda holds significant potential to address chronic diseases, stress-related disorders, and lifestyle ailments in the 21st century.

**Keywords:** Ayurveda, Ayurvedic drugs, phytopharmacology, traditional medicine, herbal therapeutics, modern applications, Ashwagandha, Tinospora cordifolia, Boswellia, evidence-based Ayurveda, integrative medicine, Indian pharmacopeia.

## DEVELOPMENT OF HERBAL DEWORMERS FROM INDIGENOUS PLANTS FOR LIVESTOCK

Hamza sayyed , Rajat sayyed

Parasitic infestations in farm animals have a great impact on animal well-being and productivity, particularly in rural and farming societies. Traditional anthelmintics are usually costly and resistant to development, necessitating the development of novelstrategies. This research is concerned with the development of a low-cost, environmentallyfriendly herbal dewormer based on local plant materials like Carica papaya (papaya seeds), Azadirachta indica (neem leaves), and Areca catechu (betel nut).The chosen plants are classically recognized for their anthelmintic property and were prepared in powdered and aqueous extract forms. Phytochemical screening revealed the presence of active principles such as tannins, alkaloids, and flavonoids, which are said to disrupt the energy metabolism and neuromuscular activity of gastrointestinal parasites.The herbal preparation was orally administered to infected animals (under veterinary guidance), and efficacy was determined in terms of fecal egg count reduction (FECR) for 14days. Results indicated a dramatic reduction in parasitic load, with papaya seed and neem extract combination being the most effective. No side effects were noted, pointing out the safety of the herbal drug. This method provides a promising, low-cost alternative to the chemical dewormers, particularly in resource-constrained rural settings. The role of pharmacists in the standardization, quality control, and awareness of such veterinary herbal formulations is crucial. Future work includes optimizing dosage formsand conducting controlled field trials to validate efficacy across species.

## FORMULATION AND EVALUATION OF HERBAL FACE WASH

Roshan Bashir Inamdar and Rajat Sayyed
MCE's PAIU Allana college of pharmacy Pune- 411001
roshanbinamdar05@gmail.com

ISBN: 978-81-980623-8-3

The increasing awareness of natural skincare has led to the demand for herbal-based cosmetics. This study focuses on the formulation and evaluation of an effective herbal face wash using natural ingredients such as neem (Azadirachta indica), tulsi (Ocimum sanctum), aloe vera (Aloe barbadensis), and orange peel extract. These herbs were selected for their proven antimicrobial, anti-inflammatory, antioxidant, and skin-soothing properties. The face wash was formulated using a gel base and evaluated for key parameters including pH, viscosity, spreadability, foaming ability, stability, and microbial load. The final formulation showed desirable cosmetic properties and was well-tolerated on human skin during preliminary trials. The study concludes that herbal face wash formulations offer a safe and effective alternative to synthetic products and hold promising potential for commercial development with minimal side effects.

**FORMULATION AND EVALUATION OF HERBAL FACE CREAM**

V Vasu Naik
Hindu College of Pharmacy, Guntur – 522002

The present study was point out with the object of preparing the Herbal face cream that reduces acne, pimples and improves the skin moisture, and nourishment for the skin. Herbal face cream was formulated with the aqueous extract of Myristica fragrans and Zingiber officinale that are commonly used for the acne, pimples, skin nourishment. The main challenge lies in the selection of natural material which can be rationally justified and comparable to that of synthetic material. In present study our aim is to develop an Herbal face cream which would be natural. The Herbal face cream was prepared by Tituration method and further Evaluated for various evaluation parameters such as Physical properties, Determination of pH, Spreadability, Viscosity, Washability, after feel test, Greasiness, Irritancy test, Stability test. The Herbal face creams show the good physical appearance with faint yellow Color, Smooth consistency, pleasant odor, and Semi-solid state. The pH of theF3 was found to be 5.9. The Viscosity and Spreadability of the F3 was found to be 3489Cps and15.0g.cm/s. The F3 was not observed of any phase separation and easily washable with tap water. After feel test for the F3 was found to be good, not shown any irritation, greasiness and no separation.

**Keywords:** Herbal face cream, Myristica fragrans, Zingiber officinale.

**PT-142**

**FORMULATION AND EVALUATION OF HERBAL MOUTHWASH FOR ORAL HYGIENE**

SAMIYA MUSTAFA SHAIKH

Oral hygiene is an essential part of overall health, and mouthwashes are commonly used assupportive agents to control oral bacteria, reduce bad breath, and maintain freshness. However,most commercially available mouthwashes contain chemical ingredients such as chlorhexidine and alcohol, which may cause side effects like burning sensation, staining of teeth, altered taste, and mucosal irritation with long-term use. Due to these drawbacks, herbal alternatives aregaining popularity for being safer and more compatible with the body. This study aims toformulate and evaluate a herbal mouthwash using natural ingredients such as Ocimum sanctum(Tulsi), Azadirachta indica (Neem), Syzygium aromaticum (Clove), and Mentha piperita(Peppermint). These plants are well-known for their antimicrobial, anti-inflammatory, and antioxidant properties. The formulation process involved aqueous extraction of the plant materials followed by filtration and blending in suitable proportions. The final product wasevaluated for pH, appearance, taste, stability, and antimicrobial activity. Results showed that the herbal mouthwash effectively reduced oral microbial load and had good taste acceptability with no side effects. Therefore, this herbal formulation offers a promising, cost- effective, and safe alternative to synthetic mouthwashes, especially for long-term use in maintaining oral health andhygiene.The results of the evaluation showed that the herbal mouthwash exhibited significant antimicrobial activity, acceptable organoleptic properties (taste, color, smell), and was stable over a period of time without the need for synthetic preservatives. No signs of irritation or discomfort were reported by volunteers during trial use.In conclusion, the developed herbal mouthwash offers a safe, effective, and economical alternative to chemical-based formulations. It not only supports oral hygiene but also minimizesside effects, making it suitable for long-term daily use.

**Keywords:** Herbal mouthwash, Oral hygiene, Natural ingredients, Osmium sanctum (Tulsi), Azadirachta indica (Neem), Syzygium aromaticum (Clove), Mentha piperita (Peppermint)

**FORMULATION AND EVALUATION OF A HERBAL LIP BALM ENRICHED WITH BEETROOT/HIBISCUS EXTRACTS**

Nishat Rawoot and Rajat Sayyed.
MCE'S Dr PAIU of Allana College of Pharmacy.
Azam Campus, Pune-411001.

With increasing interest in natural and sustainable skincare, this project focuses on creating a herbal lip balm using beetroot (Beta vulgaris) and hibiscus (Hibiscus rosa-sinensis) extracts. Both ingredients offer natural pigmentation and are rich in antioxidants and skin-nourishing compounds like flavonoids and organic acids. Combined with a moisturizing base of beeswax, coconut oil, and shea butter, the formulation helps hydrate lips, improve texture, and add a natural tint. Essential oils enhance aroma and antimicrobial properties. The balm's effectiveness is evaluated through tests for texture, pH, melting point, spreadability, and stability. Patch testing ensures skin compatibility, while antioxidant activity may be analyzed using DPPH assay. This student-led research promotes "green cosmetics" by blending Ayurvedic wisdom with eco-conscious formulation. The result is a safe, biodegradable lip balm that not only looks good but also supports lip health—meeting consumer demand for clean, functional, and sustainable personal care products.

**Keywords:** Herbal lip balm, Beetroot, Hibiscus, Antioxidants, Natural skincare.

**NATURAL SUNSCREEN**

Aliya Ansari, Swapnil Dounde

Excessive exposure to ultraviolet (UV) radiation from the sun can lead to various skin problem, including sunburn, premature aging and increased risk of skin cancer. While synthetic sunscreens are widely available, they often contain chemical ingredients that may cause skin irritation or environmental harm. As a result, the demand for natural, plant- based sunscreens is increasing due to their safety, biocompatibility, and eco-friendliness. This study focuses on the formulation and evaluation of a herbal ingredients such as Aloe vera, Turmeric (Curcuma longa), Green tea extract (camellia sinensis), and Coconut oil, which are known for their UV-protective, antioxidant, and skin-soothing properties. The formulation was tested for Sun Protection Factor (SPF) value using spectrophotometric analysis, along with physical stability, spreadability, and skin compatibility. The results revealed that the natural sunscreen

ISBN: 978-81-980623-8-3

exhibited significant SPF value and was well-tolerated on the skin indicating its effectiveness as a safe and eco-friendly alternative to commercial sunscreens.

**Keywords:** Natural sunscreen, UV protection, Herbal formulation, SPF, Skincare

**PT-146**

**HERBAL MOUTH WASH**

Rehan Shaikh and Swapnil Dounde

Oral hygiene is essential for maintaining general health and preventing dental problems such as plaque, gingivitis, and bad breath. While chemical-based mouthwashes are widely used, they may cause side effects like staining, altered taste, and mucosal irritation with prolonged use. Herbal alternatives offer a safer and more natural option, utilizing the therapeutic properties of medicinal plants. This study aimed to extract active compounds from selected herbs- Neem (Azadirachta indica), Tulsi (Ocimum sanctum), Clove (Syzygium aromaticum), and Guava leaves (Psidium guajava)-and formulate an effective herbal mouthwash. Extraction was carried out using aqueous and hydroalcoholic methods. The mouthwash was evaluated for physical characteristics (pH, taste, clarity), stability, and antimicrobial activity against common oral pathogens. Results showed that the herbal formulation was stable, palatable, and demonstrated strong antimicrobial effects, indicating its potential as a natural and safe alternative for oral hygiene MAINTENANCE

**Keywords:** Herbal mouthwash, Oral hygiene, Medicinal plants, Antimicrobial activity, Plant extraction

**FORMULATION AND EVALUATION OF HERBAL FACE CREAM FOR SKIN NOURISHMENT**

Zuhair Patel And Dr. Rajat Sayyed

The increasing awareness of side effects associated with synthetic cosmetic ingredients has led to a growing interest in herbal cosmetic formulations. This study focuses on the formulation and evaluation of a herbal face cream using natural ingredients known for their skin-nourishing properties. The cream was prepared using aloe vera, turmeric extract, neem oil, rose water, and beeswax. These ingredients were selected for their anti-inflammatory, antibacterial, antioxidant, and moisturizing properties. The formulation process involved emulsion preparation techniques, and the final product was subjected to various evaluation parameters including pH, viscosity, spreadability, stability, and skin irritation tests. Results indicated that the cream was physically stable, had a pleasant appearance and fragrance, and caused no irritation on the skin. The herbal ingredients provided hydration and improved skin texture upon regular use. This project supports the concept that herbal cosmetics can be a safer alternative to chemical-based products. It also opens new avenues for further research into plant-based ingredients in skincare formulations, especially for sensitive or acne-prone skin types.

**EXPLORING THE THERAPEUTIC PROPERTIES OF HOPEA PARVIFLORA: A PROMISING HERBAL RESOURCE**

Surabhi S M, Pinki Verma, B A Vishwanath
Department of Pharmacology, Aditya Bangalore Institute of Pharmacy Education &Research,
Yelahanka, Bangalore -560064, Karnataka, India
harinibabu147@gmail.com

Hopea parviflora, a lesser-known plant from the Dipterocarpaceae family, has been traditionally utilized in Indian folk medicine. Modern pharmacological investigations have highlighted its rich phytochemical profile, including flavonoids, phenolics, terpenoids, and resveratrol-like stilbenoids. These compounds contribute to a broad range of therapeutic activities such as antioxidant, antidiabetic, anti-inflammatory, and antimicrobial effects. Hydroalcoholic extracts of H. parviflora leaves have shown dose-dependent inhibition of carbohydrate-digesting enzymes (α-amylase and α-glucosidase), similar to acarbose. In vivo studies in diabetic rats demonstrated significant reductions in fasting blood glucose levels [Sathishkumar et al., 2020].The plant extract has demonstrated strong free radical scavenging activity in DPPH and FRAP assays. It also significantly reduced paw edema in rat models, suggesting an anti-inflammatory effect [Priya et al., 2018].

**Keywords:** Antidiabetic, antioxidant, Hopea parviflora.

**PREPARATION & EVALUATION OF BLUE BOOM TEA: NATURAL'S COLOURFUL ELIXIR**

Shreya Moreshwar Rahele
Chhatrapati Shivaji College of Pharmacy Deori, Maharashtra. India
shreyarahele@gmail.com

Diabetes mellitus is a chronic metabolic disorder characterized by elevated blood glucose levels and associated complications. Natural plant-based therapies are gaining attention as supportive treatments due to their safety and therapeutic potential. Clitoria ternatea, commonly known as butterfly pea, has been traditionally used for its antioxidant and anti-inflammatory properties. Currently, the development of Butterfly pea flower has not been widely carried out because many people do not know the benefits of the Butterfly pea flower. The utilization of the Butterfly pea flower in the food sector has been carried out in several countries. Synthetic antidiabetic medications, though effective, often produce undesirable side effects. The preparation of blue tea using Clitoria ternatea offers a natural, palatable, and functional beverage alternative with potential anti-diabetic effects. Rich in anthocyanins and flavonoids.The objective of this study is to formulate and evaluate a herbal blue tea using Clitoria ternatea with the aim of exploring its potential anti-diabetic properties. Herbal tea is prepared using dried petals of Clitoria ternatea, which are dried in a tray dryer at 60°C for 2 hours. To enhance the flavor and quality of the tea, 1% ginger powder is added to a total weight of 1 gram. So, in the present study the analysis carried out is in the form of organoleptic test such as the colour, taste, texture, aroma, and overall acceptability of herbal blue tea. Blue tea prepared from Clitoria ternatea exhibits promising anti-diabetic potential based on in vitro assays. It offers a safe, herbal alternative for adjunct diabetes management. Further in vivo and clinical validation is recommended.

**Keyword**: Clitoria ternatea, Blue tea, Anti-diabetic, Herbal formulation, Phytochemicals.

**FORMULATION AND EVALUATION OF HERBAL BASED ANTI PIGMENTATION CREAM**

Puja C. Kawade, Samruddhi T. Torane, Samrudhi S. Chavan
Dept of Postgraduate in Pharmacy, SVPM'S College of Pharmacy, Malegaon (BKII) Baramati Dist Pune 413115 Maharashtra, India
pujakawade999@gmail.com

A common dermatological issue called hyperpigmentation is defined by the darkening of specific skin regions brought on by an excess of melanin synthesis. Numerous factors, including extended sun exposure, hormone abnormalities, post-inflammatory reactions, and specific drugs, can cause it. Synthetic drugs like hydroquinone, corticosteroids, or retinoids are frequently used in conventional therapies; while they may have short-term advantages, they can also have long-term negative effects such skin irritation and sensitivity. As a result, there is growing interest in plant-based herbal formulations as safer and more environment friendly substitutes for cosmetic and dermatological purposes.Using extracts of four medicinal plants—turmeric (Curcuma longa), mulberry (Morus alba), aloe vera (Aloe barbadensis miller), and liquorice (Glycyrrhiza glabra)—this study investigates the conceptual creation of a natural topical cream designed to help diminish hyperpigmentation. These components were chosen because of their historical use and documented qualities that may aid in melanin management and skin lightening. Glabridin, a well-known tyrosinase inhibitor found in liquorice, may aid in lowering the synthesis of melanin. Aloevera helps to hydrate, regenerate, and reduce inflammation in the skin. The anti-inflammatory and antioxidant properties of turmeric, which are abundant in curcumin, are helpful in halting oxidative stress-induced pigmentation. By disrupting tyrosinase activity, mulberry extract is also known to have the ability to decrease melanin formation. These components are intended to be combined in the formulation to create a well-balanced, skin-friendly cream base that satisfies consumer demand for herbal, chemical-free skincare products. Formulation was evaluated

ISBN: 978-81-980623-8-3

for spreadability, organoleptic properties, stability etc.Future perspectives are needed to claim safety and efficacy of the product. This formulation's basic aim was in creating safe, all-natural, and efficient hyperpigmentation treatments with herbal components.

**Keywords**: Hyperpigmentation, turmeric, mulberry, aloevera, liquorice

## ETHNOLOGICAL VALIDATION OF ASHWAGANDHA GHRITA WITH REFERENCE TO MURCCHANA SAMSKARA AND ITS POTENTIAL IN DIABETIC COMPLICATIONS

Gauri Pai Angle, Shailendra S Gurav
Department of Pharmacognosy, PES's Rajaram Bandekar College of Pharmacy, Ponda, Goa University
Department of Pharmacognosy,Goa College of Pharmacy, Panaji, Goa, Goa University
gauri.angle@gmail.com

Ashwagandha Ghrita (AG) is a traditional Ayurvedic preparation of cow ghee and Withania somnifera, which is traditionally recognised for general debility, hyperglycemia, and fertility issues. This research aimed to establish the significance of the murcchana process for improving ghrita's therapeutic efficacy in preventing diabetic retinopathy and nephropathy, which was demonstrated through its superior ability to modulate glycemic and lipid parameters, boost cytoprotection, and inhibit key enzymatic pathways.The preparation of AG was based on the traditional Sarasangraha text, while Ashwagandha Murcchana Ghrita (AGM) was a modified, optimized formulation that incorporated the murcchana samskara for enhanced properties.Comprehensive analysis of AG and AGM included HPTLC to confirm Withaferin A, a bioactive marker for standardization and GC-MS for profiling. The antidiabetic effects and impact on retinopathy and nephropathy were then assessed using established in-vitro and in-vivo methods. In diabetic rats, both AG and AGM significantly mitigated diabetes by maintaining body weight ($p<0.01$) and reducing blood sugar ($p<0.001$) and HbA1c levels ($p<0.001$), with AGM being more potent.AGM uniquely improved the dyslipidemic profile ($p<0.001$), provided a stronger defense against oxidative stress ($p<0.001$), and inhibited key enzymes ($p<0.05$-aldose reductase, $p<0.01$-sorbitol dehydrogenase), suggesting a more comprehensive therapeutic effect. The murcchana samskara serves as a critical process for augmenting the therapeutic potential of ghritas, leading to superior outcomes in glycemic control and dyslipidemia. The technique enhances the formulation's cytoprotective and antioxidative actions, offering a more effective strategy for preventing diabetic retinopathy and nephropathy, which validates its ethnopharmacological use in managing diabetic complications.

**Keywords:** Ghrita, Murcchana, Withaferin A, Diabetic retinopathy, Diabetic Nephropathy

**PT-152**

## PHYTOCHEMICAL SCREENING AND PHARMACOLOGICAL EVALUATION OF MAMMEA SURIGA KOSTERM. BARK FOR ANTI-ULCER ACTIVITY

Smita D. Madagundi, Sneha Savant,
Prasanna V. Habbu, Venkatrao Kulkarni
PG Department of Pharmacognosy and Phytochemistry;
SET's College of Pharmacy, Dharwad
PG Department of Pharmacology; SET's College of Pharmacy, Dharwad
smitamadagundi@gmail.com

Gastric ulcer is a prevalent gastrointestinal disorder that can lead to serious complications such as perforation, hemorrhage, and an elevated risk of gastric cancer. Helicobacter pylori infection is a primary causative factor, while additional contributors include smoking, alcohol consumption, NSAID use, ischemia, hypoxia, and oxidative stress, all of which impair the gastric mucosal barrier and promote ulcer development. This study aimed to carry out a pharmacognostical evaluation, in vitro antioxidant and in vivo antiulcer activities of the hydroalcoholic bark extract of Mammea suriga Kosterm (HBMS). Bark samples were subjected to pharmacognostic analysis and Soxhlet extraction. Antioxidant activity was assessed using DPPH radical scavenging, hydroxyl radical scavenging, and reducing power assays. Antiulcer effects were evaluated in an ethanol-induced gastric ulcer rat model, with sucralfate as the standard drug. Phytochemical screening confirmed the presence of glycosides, flavonoids, tannins, steroids, and coumarins. Total phenolic and flavonoid contents exhibited 78.87 mg/g (gallic acid equivalent) and 93.18 mg/g (quercetin equivalent), respectively. HBMS displayed a concentration-dependent antioxidant effect. In vivo studies showed HBMS markedly decreased the ulcer index from 5.26 ± 0.55 in the control group to 2.39 ± 0.38** at 200 mg/kg ($p< 0.01$) and 1.98 ± 0.82*** at 400 mg/kg ($p<0.001$), corresponding to ulcer inhibition rates of 49.24% and 57.47%, respectively, compared to 59.83% inhibition with sucralfate. These findings indicate that HBMS possesses strong antioxidant and gastroprotective properties, likely attributed to its phenolic and flavonoid constituents, highlighting its promise as a natural antiulcer therapeutic candidate.

**Keywords:** Mammea suriga, antioxidant, antiulcer, ethanol-induced ulcer

## SOLVENT-DEPENDENT PHYTOCHEMICAL AND ANTIDIABETIC ACTIVITY OF MORINGA OLEIFERA LEAF EXTRACTS

Dharshini A, Ramanathan M, Ethiraj T, and Revathi R
Pannai College of Pharmacy, Dindigul -624005.
(Affiliated by TN DrMGR MU, Chennai) Research Scholar,
Sri Balaji Vidyapeeth University, Pudhuchery.
ethirajecp@gmail.com

This study investigates the effect of solvent polarity on the extraction efficiency, phytochemical composition, and biological activities of Moringa oleifera leaf extracts, with a focus on their potential role in diabetes management. Successive maceration was conducted using solvents of increasing polarity—hexane, ethyl acetate, ethanol, and water. Phytochemical analysis revealed that each solvent selectively extracted different classes of bioactive compounds. The ethyl acetate extract (MOLEaE) was particularly rich in flavonoids, phenolic compounds, tannins, and saponins—phytoconstituents widely known for their antioxidant and antidiabetic effects. Biological assays showed that MOLEaE exhibited the strongest antioxidant activity ($IC_{50}$= 123.28 µg/ml), potent anti-inflammatory action ($IC_{50}$ = 122.01 µg/ml), and significant α- amylase inhibition (64.09%), supporting its potential to reduce oxidative stress, inflammation, and hyperglycemia—critical parameters in diabetes pathophysiology. In comparison, the hexane extract (MOLHE), containing primarily non-polar steroids, showed limited antioxidant but moderate anti-inflammatory activity. The study highlights the importance of solvent choice in maximizing the yield of therapeutically relevant phytochemicals. Ethyl acetate, a moderately polar solvent and Generally Recognized as Safe (GRAS) by the US FDA, was found to be the most effective for isolating pharmacologically active compounds.

**Keywords:** Moringa oleifera, Solvent polarity, Phytochemicals, Antioxidant activity, Anti-inflammatory activity, α-Amylase inhibition, Diabetes management.

**PT-154**

## EVALUATION OF IN-VITRO ANTI-ASTHMATIC ACTIVITY OF IPOMOEA SAGITTIFOLIA BURM.FIL.

M.Bala Athikesavan, P.Balasubramaniyan, T.Shri Vijaya Kirubha

athikesavan819@gmail.com

Plants have been a cornerstone of traditional medicine for centuries. Many modern medicines have been developed from plant-based compounds. It contains phytoconstituents like alkaloids, glycosides, flavonoids and terpenes, etc. They are playing a vital role in prevention and treatment of illness. Asthma is a chronic inflammatory disease affecting million peoples in worldwide. Traditional medicine plants have been a vital source of anti-asthmatic activity. In this research actually based on leaves of ipomoea sagittifolia. Burm. in this plant belonging to the, Family:convolvulaceae, Common name:Purple heart glory, Synonym: Ipomoea hastata, Geographical source: Australia, Africa, India. This leaf contains alkaloids (like indole, ipobscurine(A&B), phenolicglycolipids, flavonoids, tannins, sterols, terpenoids, saponins, reducing sugar and coumarins. Evaluate the phytoconstituents of Ipomoea sagittifolia contains phenolic terpenoids and sterols have anti-asthmatic activity. These plants also possess the anti-inflammation, bronchodilator action, anti-oxidant, anti-arrhythmic activity. Extraction of phytoconstituent from Ipomoea sagittifolia is done by soxhlet apparatus method. Investigation of Ipomoea sagittifolia is anti-asthmatic

ISBN: 978-81-980623-8-3

activity may leads to development of novel therapeutic agent for asthma management, providing a natural and potentially safer alternative to existing treatments. Finally this study will be focusing on the isolating and characterizing the bioactive compounds responsible for the therapeutic effects, having the way for development of novel plant based treatment for asthma.

**Keywords**: Ipomoea sagittifolia, phytoconstituent, anti-asthmatic activity, evaluation and soxhlet apparatus

**PHYTOCHEMICAL AND PHARMACOLOGICAL INSIGHTS INTO GINKGO BILOBA L: BRIDGING TRADITIONAL MEDICINE AND MODERN RESEARCH**

S. Gopika, P. Guru, T. Shri Vijaya Kirubha
Department of Pharmacology, Mother Teresa College of Pharmacy
Illupur, Pudukkottai-622 102.
gsmgobiga@gmail.com

Ginkgo biloba L. (Ginkgoaceae), commonly known as a "living fossil," is one of the oldest living tree species and has been utilized for centuries in traditional medicine. Both its leaves and nuts have been prescribed for the treatment of a wide range of ailments, including pulmonary diseases, alcohol abuse, bladder inflammation, heart and lung dysfunction, and skin infections. G. biloba has transitioned from traditional herbal preparations to modern standardized formulations. Currently, the plant is available in various forms on the market, including concentrated extracts and isolated bioactive compounds such as terpenoids, flavonoids, bioflavonoids, and organic acids. These constituents are associated with diverse pharmacological activities, including antioxidant, anti-inflammatory, neuroprotective, and circulatory-enhancing effects. Despite its significant medicinal potential and widespread commercial use, there is a notable lack of updated, comprehensive reviews integrating its phytochemistry, ethnobotany, and pharmacology. Existing studies are often fragmented, focusing on isolated aspects rather than providing a holistic understanding of the plant's therapeutic scope. This review aims to fill that gap by compiling and critically analyzing current literature on the phytochemical composition, traditional uses, and Pharmacological properties of G. biloba. Special Emphasis is placed on the role of its bioactive Constituents in disease prevention and Management, as well as safety considerations associated with its use. In the future, biloba could evolve into high-tech, personalized brain and vascular health solutions using nano-formulations, patches, and AI-linked dosing. It may also expand into sustainable consumer products, such as focus drinks, skincare, and zero-waste farming innovations.

**Keywords:** Ginkgo biloba, ethnobotany, medicinal plants, antioxidant, herbal protection.

**PT-156**

**PHYTOCHEMICAL SCREENING, ANTIOXIDANT POTENTIAL AND ANTIMICROBIAL ACTIVITY OF EUONYMUS TINGENS**

Maneesha Pathak, Archana N Sah
Department of Pharmaceutical Sciences, Sir J.C. Bose Technical Campus, Bhimtal, Kumaun University, Nainital, India- 263136.
pathakmahi986@gmail.com

Euonymus tingens Wall. (family: Celastraceae) is a traditionally important Himalayan medicinal plant known for its ethnopharmacological uses. The present study was undertaken to compare and evaluate the phytochemical composition, antioxidant potential, and antimicrobial activity of ethyl acetate and 95% ethanolic extracts of E. tingens. Total Phenolic Content (TPC) and Total Flavonoid Content (TFC) were estimated by Folin–Ciocalteu and aluminum chloride methods, respectively. The 95% ethanolic extract found to be higher TPC (6.20±0.04 GAE/g) and TFC (8.24±0.10 mgQE/g) compared to the ethyl acetate extract (5.82±1.2 mg GAE/g and 6.92±0.06 mg QE/g, respectively). The in-vitro antioxidant activity was assessed using DPPH, H2O2, NO, and FRAP assays. The ethanolic extract exhibited stronger free radical scavenging potential with $IC_{50}$ values of 52.12 µg/mL (DPPH), 60.47 µg/mL (H2O2), 64.03 µg/mL (NO), and FRAP 72.02 µg/mL, while the ethyl acetate extract showed comparatively moderate antioxidant activity ($IC_{50}$: 58.06 µg/mL (DPPH) and 68.21 µg/mL (H2O2), 78.05 µg/mL and FRAP 86.04 µg/mL. Antimicrobial activity was evaluated against Gram-positive and Gram-negative bacteria, and fungal strains using the Agar disk diffusion method. The ethanolic extract demonstrated maximum inhibition, with zones of 26 mm against Staphylococcus aureus and 12 mm against pseudomonas aeruginosa whereas the ethyl acetate extract showed moderate activity (20 mm and 10 mm, respectively). Both extracts exhibited mild antifungal effects against Candida albicans. The study concludes that 95% ethanolic extract of Euonymus tingens possesses higher phenolic and flavonoid content, antioxidant capacity, and antimicrobial efficacy compared to the ethyl acetate extract, supporting its potential for phyto-pharmaceutical applications.

**Keywords:** Euonymus tingens, Total phenolic content, Flavonoids, Antioxidant activity, Antimicrobial activity.

**PT-157**

**COMPUTATIONAL PHARMACOKINETIC PROFILING OF PLANT-DERIVED COMPOUNDS FROM COCCINIA GRANDIS FOR ULCERATIVE COLITIS MANAGEMENT**

M.Ayyanar, Dr.P.Natarajan
Department of Pharmacology
Sankaralingam Bhuvaneswari College of Pharmacy, Sivakasi-626130

Ulcerative colitis (UC) is a chronic inflammatory bowel disease characterized by recurrent inflammation and mucosal injury, for which current therapeutic options often present limited efficacy and adverse effects. Natural phytochemicals represent a promising alternative due to their multitarget therapeutic potential and favorable safety profiles. In this study, an in silico ADMET screening was performed on five bioactive phytochemicals from Coccinia grandis—β-Amyrin, Lupeol, Isomultiflorenol, β-Sitosterol, and Taraxerol—to evaluate their pharmacokinetic and drug-likeness properties in the context of UC therapy. Using the SwissADME platform, absorption, distribution, metabolism, and excretion parameters were systematically assessed, alongside Lipinski's rule of five and gastrointestinal (GI) absorption profiles. All selected phytochemicals demonstrated favorable ADME characteristics, including high GI absorption, optimal molecular weight, and compliance with major drug-likeness rules, indicating good oral bioavailability and systemic accessibility. Furthermore, predicted cytochrome P450 interactions and lipophilicity values suggested acceptable metabolic stability with minimal pharmacokinetic limitations. The findings underscore that Coccinia grandis phytochemicals possess promising pharmacological potential, supporting their candidature as orally active agents for ulcerative colitis. These results provide a computational basis for subsequent experimental validation and contribute to the rational design of phytochemical-based therapeutics for inflammatory bowel disorders.

**Keywords:** ADMET screening, Coccinia grandis, phytochemicals, ulcerative colitis, SwissADME, pharmacokinetics, drug-likeness

**SYNERGISTIC HERBAL EXTRACT FROM THE MUCILAGE OF CHIA SEEDS, BASIL SEEDS, FLAX SEEDS.**

Grace Sowmya Peethala, Sathi Paul Mondal
Department of pharmacology, Raghu college of Pharmacy, Dakamarri (v), Bheemunipatnam Mandal, Visakhapatnam, India – 531162.
gracesowmya@2004gmail.com

The present study aimed at developing a combined extract from mucilage of chia(Salvia hispanica), basil(Ocimum basilicum), and flax(Linum usitatissimum) seeds. It studied the anti-inflammation and antioxidant activities of the formulated herbal extracts. Chia, basil, and flax seeds have a complex phytochemical profile, confirmed with FTIR, TLC, and solubility studies. It includes functional groups of alkaloid, carbohydrates, esters, and phenolic compounds.Best solubility in acidic media was demonstrated by the herbal mixture through pharmacognostic and phytochemical analyses.This establishes its probable bioavailability and effectiveness via the oral route. It was confirmed by paper chromatography that the presence of alkaloids was detected.The in vitro experiments showed a high degree of biological activity at different parameters. Antioxidant activity inhibition was at its maximum, at 300 mg/mL,with scavenge activity against 84.92% hydrogen peroxide,which indicates a strong potential in fighting oxidative stress. The presence of alkaloids was confirmed by paper chromatography. FTIR and UV spectroscopy data confirmed the presence of functional groups characteristic of pharmacologically active

ISBN: 978-81-980623-8-3

phytochemicals such as alcohols, esters, aromatic rings, and amides.HRBC membrane stabilization method serves as a reliable in vitro model for anti-inflammatory potential assessment. This structural insight underpinned the medicinal potential of this formulation, particularly in the oxidative and inflammatory condition. In vitro studies also indicated very significant biological activity against some parameters.

**Keywords:** Synergistic, Anti-inflammatory, Anti-oxidant, UV Spectroscopy, FTIR.

**PT-159**

## FORMULATION AND VALIDATION OF CURCUMIN-FORTIFIED GROUNDNUT MILK FOR FATTY LIVER MANAGEMENT

K.Indhumathi, T.Shri Vijaya Kirubha
Department of Pharmacognosy, Mother Terasa College of Pharmacy
Illuppur, PudukkottaiTamilnadu-622 102
Indhumathi3007005@gmail.com

Curcumin-Fortified Groundnut Milk (CFG-Milk) was developed and validated as a novel functional formulation for the dietary management of non-alcoholic fatty liver disease (NAFLD). Each 200 mL serving was standardized to contain groundnut extract (10 g), soy protein (8 g), microencapsulated curcumin (200 mg), piperine (5 mg) to enhance bioavailability, and soluble fiber (1 g psyllium husk). The formulation was processed by homogenization and pasteurization, with microencapsulation ensuring curcumin stability and palatability. Quality validation confirmed high monounsaturated fatty acid content, retention of bioactive curcumin, low peroxide values, and microbial safety, with aflatoxin screening of peanut raw materials ensuring compliance. Sensory evaluation indicated good acceptability, while stability testing demonstrated minimal phase separation over 14 days under refrigeration. A 12-week pilot clinical validation in adults with imaging-confirmed NAFLD showed that daily consumption of CFG-Milk produced greater reductions in hepatic fat (MRI-PDFF) and significant improvements in liver enzymes (ALT, AST), insulin resistance (HOMA-IR), and lipid profile compared to placebo, without adverse effects. Mechanistically, the formulation integrates hepatoprotective and anti-inflammatory properties of curcumin, bioavailability enhancement by piperine, lipid-modulating effects of groundnut MUFA, and metabolic benefits of soy protein and soluble fiber. These findings suggest that CFG-Milk is a safe, palatable, and effective nutraceutical adjunct for fatty liver management.

**Keywords:** Groundnut milk, Curcumin, Piperine, Non-alcoholic fatty liver disease (NAFLD).

**PT-160**

## PHYTOCHEMICAL PROFILING AND QUANTITATIVE ANALYSIS OF ALKALOIDS IN METHANOLIC EXTRACTS OF ZINGIBER OFFICINALE RHIZOMES

D.Naga Mani, Raveesha Peeriga
Department of Pharmacognosy and Phytochemistry, V.V.Institute of Pharmaceutical Sciences, Gudlavalleru, Andhra Pradesh, India-521 356
6305787499d@gmail.com

Ginger (Zingiber officinale) is a widely studied medicinal plant, recognized for its diverse bioactive compounds, particularly alkaloids, which exhibit significant pharmacological activities. The present study aimed to characterize and quantify the major alkaloids present in ginger rhizomes using phytochemical screening, spectrophotometric analysis, and high-performance liquid chromatography (HPLC). Freshly authenticated rhizomes were subjected to methanol maceration, yielding 0.704% (w/w) crude extract. Qualitative tests with Mayer's, Wagner's, and Dragendorff's reagents confirmed the presence of alkaloids, while spectrophotometric analysis estimated the total alkaloid content at 18.45 ± 1.27 mg atropine equivalents/g extract. HPLC profiling identified four principal alkaloids: 6-gingerol (10.73 ± 0.85 mg/g), 6-shogaol (10.42 ± 0.47 mg/g), 8-gingerol (3.81 ± 0.32 mg/g), and 10-gingerol (3.45 ± 0.43 mg/g), with calibration curves showing excellent linearity ($r^2 > 0.95$). The predominance of 6-gingerol and 6-shogaol supports their well-documented anti-inflammatory, antioxidant, and anticancer properties, while 8- and 10-gingerol contribute antimicrobial and metabolic regulatory effects. These findings not only validate the extraction and analytical methodologies employed but also provide a comprehensive alkaloid profile of ginger, reinforcing its traditional medicinal value and potential therapeutic applications.

**Keywords**: Zingiber officinale, Alkaloids, Methanol extraction, HPLC, 6-gingerol, 6- shogaol

## DEVELOPMENT AND IN-VITRO EVALUATION OF A POLYHERBAL FORMULATION FOR THE MANAGEMENT OF OSTEOMYELITIS

S.Harini, Shri Vijaya Kirubha.T
Department of Pharmacognosy,Mother Terasa College of Pharmacy
Illuppur, Pudukkottai, Tamilnadu-622 102.
hariniisenthi@gmail.com

Osteomyelitis, a severe bone infection predominantly caused by Staphylococcus aureus and Pseudomonas aeruginosa, is difficult to treat due to poor vascularization, biofilm formation, and rising antibiotic resistance. Polyherbal formulations, combining the synergistic action of multiple medicinal plants, provide a promising alternative by integrating antimicrobial, anti-inflammatory, and osteogenic effects. In this study, a polyherbal formulation comprising Curcuma longa (curcumin), Azadirachta indica (neem), Tinospora cordifolia (guduchi), and Withania somnifera (ashwagandha) was developed and evaluated for antimicrobial, anti-biofilm, and bone-regenerative potential. Phytochemical analysis confirmed the presence of alkaloids, flavonoids, terpenoids, and phenolics. In-vitro antimicrobial assays revealed significant inhibitory activity against S. aureus (23.6 ± 0.7 mm) and P. aeruginosa (21.4 ± 0.5 mm), with minimum inhibitory concentrations ranging from 62.5–125 µg/mL. The polyherbal formulation demonstrated 78.2% biofilm inhibition at sub-MIC levels, surpassing individual extracts. Osteoblast-like MG-63 cell assays indicated enhanced proliferation (1.6-fold increase) and alkaline phosphatase activity, suggesting stimulation of bone formation. Collectively, the results highlight that the polyherbal formulation possesses dual antimicrobial and osteogenic properties, making it a strong candidate for the management of osteomyelitis. Further studies involving nanoformulation and in-vivo validation are warranted to optimize bone-targeted delivery and therapeutic outcomes.

**Keywords:** Polyherbal formulation, Osteomyelitis, Antimicrobial activity, Biofilm inhibition, Bone regeneration.

## PHYTOCHEMICAL PROFILING AND THERAPEUTIC EVALUATION OF SAPONINS FROM DECALEPIS HAMILTONII ROOTS

Vishnu.P, Balasubramanian.P, Shri Vijaya Kirubha.T
Department of Pharmacognosy,Mother Terasa College of Pharmacy
Illuppur, Pudukkottai- 622 102
vishnuvetri210@gmail.com

Decalepis hamiltonii, a medicinal plant traditionally used in ayurvedha and siddha exhibits potent antioxidant activity primarily due to polyphenolic compounds present in its roots. The goal of this study was to extract saponins from the tuberous root of D.hamiltonii and assess their potential clinical applications, which included anti-oxidant, anti-bacterial, anti-thrombotic and anti-cancer properties. Surprisingly the results of this study revealed that the extracted saponins have excellent anti-oxidant activities, as demonstrated by 2, 2-diphenylpicrylhydrazyl (DPPH), hydrogen peroxide (H2O2) and nitric oxide (NO) scavenging assays. The anti-oxidant potential of the roots was measured using various in vitro assays. Among the extracts, the methanolic and aqueous extract showed high anti-oxidant activity measured as scavenging of DPPH, superoxide hydroxyl radicals and ellagic acid. Nonethless, at a concentration of 100g/ml, crude saponin had excellent anti-bacterial activity particularly against gram (+ve) bacteria (staphylococcus aureus, bacillus subtilis) and gram (-ve) bacteria (Escherichia coli, Salmonella typhi).The crude saponin also possess an outstanding anticancer activity. Overall the findings conclude that crude saponin derived from D.hamiltonii tuberous root could be used in pharmaceutical formulations. Future research will focus on isolation active compounds, testing, safety and effectiveness, clinical trials for safety and efficacy and exploration of its interaction with conventional drugs to maximize its therapeutic benefits.

**Keywords:** Scavenging, Phytochemical extraction, saponins, anti-oxidant, Diphenylpicrylhydrazyl (DPPH).

ISBN: 978-81-980623-8-3

**HPTLC-BASED QUALITATIVE PROFILING OF ESSENTIAL OILS AND TANNINS IN IPOMOEA SAGITTIFOLIA LEAF EXTRACT**

N. Kavya varshitha and P. Raveesha
Department of Pharmacognosy
V. V. Institute of Pharmaceutical sciences, Gudlavalleru
Andhra Pradesh, India. 521356
Kavyavarshitha28@gmail.com

HPTLC fingerprinting is also a very efficient and easy to interpret method than HPLC for the identification of qualitative phytochemicals exist in extract samples. Ipomoea sagittifolia (Burn. f.), which was earlier employed by ancients in their medicine parlance due to its many reported curative properties harbour essential oils as well as tannins that may propel its medical value. Hence the authentication or identification of phytoconstituent is imperative for the quality checks in compliance with Current Good Manufacturing Practices (cGMP). The overall research agenda of this study is to establish HPTLC finger printing of the bioactive compounds containing secondary metabolites such as essential oils and tannins of the methanolic leaf extract of I. sagittifolia. The running of the plates and development, documentation, densitometry, and documentation were done with help of CAMAG HPTLC system that included a Linomat 5, TLC visualizer, and a Scanner 4. UV analysis at 254 and 366 nm showed several peaks in the chromogram hence, the existence of various phytochemicals. The results were therefore analyzed in terms of height of peaks, areas under the peaks, and relative retention factors with regard to the extraction of essential oils and tannins.

**Keywords**: Phytoconstituents, Essential oils, HPTLC-fingerprints, Chromatogram.

**PT-164**

**ANTIMICROBIAL ACTIVITY OF ASPARAGUS RACEMOSUS WILLD FROM ROOT EXTRACT – A MEDICINAL PLANT**

S.Krishnaraj, P.Balasubramanian, T.Shri Vijaya kirubha
Department of pharmacognosy, Mother Terasa College of Pharmacy
Illupur, Pudukkottai, Tamilnadu – 622 102
krishnaraj062005@gmail.com

Asparagus racemosus Willd, commonly known as Shatavari, it means " who possesses a hundred husbands or acceptable to many"has been used as amedicine. It is a widely recognized medicinal plant in traditional Ayurvedic medicine, valued for its diverse therapeutic properties. This study investigates the antimicrobial potential of root extracts of A. racemosus against selected bacterial and fungal strains. Various solvent extracts including methanol, chloroform, acetone, and aqueous preparations were evaluated using the agar well diffusion method. The methanolic extract exhibited the most significant antimicrobial activity, particularly against Escherichia coli, Staphylococcus aureus, and Candida utilis, with notable zones of inhibition and low minimum inhibitory concentrations (MICs). Phytochemical screening revealed presence of bioactive compounds such as alkaloids, flavonoids, tannins, saponins, and phenols, which are known to contribute to antimicrobial efficacy. These findings support traditional use of A. racemosus in treating infections and highlight its potential as a natural source for developing plant-based antimicrobial agents. Further studies on isolation and characterization of active constituents may pave the way for novel therapeutic applications in combating microbial resistance. Some different solvents like petroleum ether, methanol, chloroform, Acetone, and water against positive bacteria like bacillus subtilis, E coli, Pseudomonas. The experiment carried out in the selected medicinal plant root. The results are discussed with the available literature.

**Keywords:** Asparagus racemosus, Antimicrobial activity, Solvent extraction, Antifungal, Bacterial infection.

**PT-165**

**PHYTOCHEMICAL-CD81 INTERACTION STUDIES FOR HIV REGULATION USING MOLECULAR DOCKING**

Jonnalagadda Sharmila Rani, Dr. Raveesha Peeriga
Department of Pharmacognosy, V.V. Institute of pharmaceutical sciences,Seshadri Rao knowledge village, Gudlavalleru,
Andhra Pradesh, India-521356
Jsharmilarani999@gmail.com

This study investigates the potential of Masilinic Acid, a natural compound derived from the clove plant (Syzygium aromaticum), as an inhibitor of HIV regulation through its interaction with the CD81 antigen, a protein involved in viral entry. The research was conducted in silico using computational tools including PyMOL, PyRx, and Protein Plus to evaluate the binding interactions between Masilinic Acid and CD81.Molecular docking studies revealed binding affinities of -6.4, -6.2, and -5.7 kcal/mol, indicating strong and stable interactions between the compound and the target protein. Additionally, Root Mean Square Deviation (RMSD)values of 0, 1.885, and 1.952 Å suggest that the docked conformations were accurate and reliable. These results point to a consistent and meaningful interaction between Masilinic Acid and CD81.Further interaction analysis conducted with Protein Plus confirmed the presence of significant molecular interactions, such as hydrogen bonding and hydrophobic contacts, reinforcing the hypothesis that Masilinic Acid can effectively bind to CD81 and potentially interfere with HIV's mechanism of entry or regulation. To assess its suitability as a drug candidate, Lipinski's Rule of Five was applied. Masilinic Acid was found to have a molecular mass of 472 g/mol, three hydrogen bond donors, four hydrogen bond acceptors, a log P value of 6.2, and molar refractivity of 134. While the log P slightly exceeds the typical threshold (indicating higher lipophilicity), the compound largely complies with drug-likeness criteria.Overall, the results suggest that Masilinic Acid holds promise as a potential antiviral agent by targeting CD81 to disrupt HIV activity. These findings support further investigation through experimental validation and may contribute to the development of alternative strategies in HIV treatment.

**Keywords:** Masilinic Acid, Clove plant, CD81 antigen, HIV virus.

**DEVELOPMENT AND EVALUATION OF FENUGREEK-TULASI LOADED HERBAL MICROBEADS FOR SUSTAINED ANTI-DIABETIC EFFECT**

Yallapragada Pranathi, T.Sravani
Department of Pharmaceutics, V.V.Institute of Pharmaceutical Sciences,
Seshadri Rao Knowledge Village, Gudlavalleru,
Andhra Pradesh, India-521356
ypranathi2003@gmail.com

Diabetes mellitus is a chronic metabolic disorder marked by persistent hyperglycemia due to impaired insulin secretion or action. Herbal therapies are increasingly explored for their safety, affordability, and multi-targeted mechanisms. This study reports the development of sustained release herbal microbeads containing fenugreek (Trigonella foenum-graecum) and tulasi (Ocimum sanctum) extracts to overcome drawbacks of conventional dosage forms such as rapid release and low bioavailability. Microbeads were prepared using ionotropic gelation with sodium alginate and calcium chloride, and selected batches were coated with chitosan to enhance mucoadhesion and prolong release. The formulations were evaluated for morphology, particle size, entrapment efficiency, swelling behavior, in-vitro release, and anti-diabetic activity via α-amylase and α-glucosidase inhibition assays. Results indicated spherical beads with satisfactory entrapment efficiency and uniform size distribution. In-vitro studies demonstrated sustained release of herbal actives over 8–12 hours, with chitosan-coated beads exhibiting slower release and stronger mucoadhesion compared to uncoated beads. Enzyme inhibition assays confirmed notable anti-diabetic activity, highlighting the synergistic potential of fenugreek and tulsi extracts. Stability testing revealed that the formulations retained integrity under standard storage conditions. Overall, fenugreek-tulasi microbeads represent a promising sustained release herbal delivery system that may enhance therapeutic efficacy, reduce dosing frequency, and improve patient compliance in diabetes management.

**Keywords:** Fenugreek, tulsi, sustained release, anti-diabetic, microbeads

Soil being a major reservoir for microorganisms it is a source of interest for isolation of antibiotic producing organisms. The emergence of

ISBN: 978-81-980623-8-3

antibiotic resistance and need for better, broad Spectrum antibiotics is always in high demand. In the present study, antibiotic producing bacteria were isolated from a local soil sample. Total ten soil samples were collected from local pond aseptically and subjected to serial dilution. Crowded plate technique was employed for the isolation of the colony. Total five isolated were isolated which exhibited zone of inhibition around the colony. The isolated colonies were subjected to morphological, microscopical and biochemical characterization. All five colonies were found to be gram positive, non-sporulating organisms and found they belong to the Actinobacteria class. The isolated colonies were subjected to screening for antimicrobial activity against Escherichia coli, Pseudomonas aeruginosa, Staphylococcus aureus, Bacillus subtilis and Yeast by perpendicular streak method. The primary screening results conclude that except one colony all have good antimicrobial activity. One colony found to be highly potential activity which had inhibition towards gram positive, gram negative, sporulating and fungal activity. This study may contribute in providing information on the antibiotic producing microorganisms in soil. Further characterization, purification, and structural Elucidation are recommended to know the novelty, quality and commercial value of these antibiotics.

**Keywords:** Crowded, plate technique, Actinobacteria, primary screening, antimicrobial activity.

## IN SILICO EVALUATION OF PHYTOCONSTITUENTS FROM MYXOPYRUM SMILACIFOLIUM BLUME AGAINST THE INFLAMMATORY MEDIATOR TNF-A

K.V.N.S. Aishwarya, Raveesha Peeriga
Department of Pharmacognosy and Phytochemistry, V.V. Institute of Pharmaceutical Sciences Gudlavalleru, Andhra Pradesh, India -521356.
aishwaryakuthani154@gmail.com

Secondary metabolites in plants have been used in health care for the treatment of various ailments since ancient times. The current study was carried out to investigate on phyto constituents in Myxopyrum smilacifolium against an inflammatory mediator TNF-α. Ligand and protein pdbqt files were prepared and docking was done by using Autodock 4.0 and Biovia Studio Visualizer. The docking finding revealed that Myxopyroside shown -5.1 kcal/mol which is high and mere significant docking score of natural immunosuppressive capsaicin and standard drug Methylprednisolone of -4.8 kcal/mol and -5.4 kcal/mol respectively. The obtained results were proven to posses the inhibition activity against TNF-α. The evaluated pharmacokinetic parameters of the only 3 phytoconstituents obeyed Lipinski's rule of 5. Exploration of simulation studies on Myxopyroside are in need to ensure inhibition of inflammatory mediator TNF-α. rewrite this paragraph

**Keywords:** Autodock 4.0; Smilacifolium; Myxopyroside; TNF-α; Lipinski's

## EXPLORATORY DEVELOPMENT OF COSTUS IGNEUS NEUTRACEUTICAL CONFECTIONS FOR ANTIDIABETIC BENEFITS

Sankeerthana Dasari, Sai Datri A
Department of Pharmaceutical Technology, V.V. Institute of Pharmaceutical Sciences, Seshadri Rao Knowledge Village, Gudlavalleru, Andhra Pradesh, India- 521 356.
sankeerthanadasari23@gmail.com

This study aims to develop and evaluate the efficacy of herbal lollipops incorporating Costus igneus extract for diabetes management. The powdered Costus igneus material was subjected to extraction using ethanol by Soxhlet extraction method. The extract was filtered and concentrated under reduced pressure to obtain a concentrated extract. Various formulations of herbal lollipops were prepared using different concentrations of Costus igneus extract, along with suitable excipients like stevia, binder and colors. The formulated lollipops showed the uniformity in weight and thickness. The hardness of all formulated lollipops was found within the standard range up to 9.65 to 10.50 kg/cm2.From the in-vitro drug release study, it was found that the formulations of lollipops containing corn syrup in the concentrations of 100, 90 and 80 mg showed the maximum drug release at 30 minutes. Among those formulations' formulation F9 showed 100.6% of drug release. The in-vitro release kinetic study of the optimized formulation (F9) was found to be first order. The release of the dosage form follows the diffusion and dissolution mechanism and Non-Fickian diffusion mechanism. These findings suggest that herbal lollipops containing Costus igneus hold promise as a novel and effective alternative for managing diabetes.

**Key words-:** Costus igneus, Diabetes, Soxhlet extraction, herbal lollipops.

## PRECLINICAL EVALUATION OF A NUTMEG FORMULATION AS A SLEEP-AID AND PAIN-RELIEF AGENT

Rama R Nargund, Hitesh L R, Shachindra L Nargund, Srikanth B
Department of Pharmacology, Nargund College of Pharmacy, Bnagalore, Karnataka, India
rama.nargund@nargund.edu.in

Preclinical evaluation was conducted to assess the analgesic, sedative, and anxiolytic effects of a nutmeg formulation developed by Durmeric Naturaceuticasl Pvt, Ltd., Madhurai, using adult male swiss albino mice. Acute oral toxicity studies, performed in accordance with OECD 425 guidelines using rats, demonstrated that the formulation was well tolerated at a limit dose of 2000 mg/kg, with no observed adverse effects or mortality. Hematological, biochemical, and histopathological analyses of vital organs confirmed the formulation's safety profile, with all values remaining within established physiological norms. The analgesic potential of the nutmeg formulation was evaluated by both the acetic acid-induced writhing and Eddy's hot plate methods. Dose-dependent inhibition of writhing responses was observed, with inhibition rates ranging from 49% to 77%, comparable to standard analgesics like diclofenac sodium and pentazocin. In the hot plate assay, a significant increase in pain threshold was detected, with the peak response seen at 1.5 hours post-administration, confirming both peripheral and central analgesic actions. For sedative and anxiolytic evaluation, the hole board and traction tests were employed. The nutmeg formulation elicited a dose-dependent decrease in anxiety markers, with minimal impact on skeletal muscle relaxation, making it a promising candidate. The findings highlight the formulation's potential as a multi-target natural therapy for pain and anxiety without central motor impairment. These results encourage further clinical exploration of nutmeg-based interventions in pharmaceutical applications.

**Keywords:** Nutmeg formulation, writhing, pain, anxiety

## NOVEL BAMBOO FIBER PATCH FOR TOPICAL BACTERIAL WOUND HEALING

Aarya Rajendra Menkudale, Divya Shukla, Abhijith K Shahji, Shaila Angela Lewis
Department of Pharmaceutics,
Manipal College of Pharmaceutical Sciences,
MAHE, Manipal, 576104
aarya1.mcopsmpl2024@learner.manipal.edu

A novel bamboo fiber-based patch for wound healing was developed in this study by incorporating silver nanoparticles (AgNPs) and self-propelled tranexamic acid (sp-TXA). The aim was to develop a multifunctional patch that possesses antimicrobial and hemostatic properties and can overcome the demerits associated with conventional wound dressings. Alkali treatment was used to extract bamboo fibers, which were characterized with an average diameter of 76 µm, well-suited for wound dressing. $CaCO_3$ microparticles were synthesized for sp-TXA delivery, with a Z-average size of 416.4 nm and zeta potential of –19.7 mV. Green synthesis of AgNPs with Bacillus subtilis was established by UV–Vis spectroscopy, showing an absorption peak at 420 nm, and particle size distribution of 225 nm (85%) and 48 nm (15%). A PVA-based dual-component patch with an average thickness of ~1 mm and folding endurance >50, indicating good mechanical stability, was prepared. The antibacterial activity of the patch was further evaluated against E. coli, P. aeruginosa, and S. aureus. In conclusion, a novel, biodegradable patch that combines bamboo fibers, AgNPs, and sp-TXA was formulated successfully, indicating significant potential in enhancing the healing of wounds along with antibacterial and hemostatic assistance.

**Keywords:** Bamboo fiber, nanoparticles, tranexamic acid, wound healing, transdermal patch.

## TOXICITY PROFILING BASED ON ADME AND STRUCTURAL PROPERTY OF ZIZIPHUS OENOPOLIA

Nelumbo Nucifera1, Prateek Kar2

ISBN: 978-81-980623-8-3

, Prabhudatta Mohapatra1, Mihir Kumar Kar1
1Sri Jayadev College of Pharmaceutical Sciences, Naharkanta, Bhubaneswar, Odisha 752101
2Al Ameen College of Pharmacy, Bengaluru, Karnataka, 560027
mihirkar@gmail.com

Ziziphus oenopolia (L.) Mill., a medicinal plant widely used in traditional systems for treating gastrointestinal, febrile, and inflammatory conditions, possesses a rich array of phytoconstituents with potential therapeutic relevance. However, limited data exist on the pharmacokinetic and toxicological profiles of its bioactive compounds. This study aimed to evaluate the drug-likeness, ADME (absorption, distribution, metabolism, and excretion) characteristics, and toxicity risks of three major cyclopeptide alkaloids—Zizyphine A, Zizyphine C, and Zizyphine F—using in silico tools. Phytoconstituents were identified through the IMPPAT database, and their structural data were analyzed via SwissADME, pkCSM, and ProTox-II platforms. All compounds exhibited favorable lipophilicity (Log Po/w: 2.21–2.82), acceptable hydrogen bonding parameters, and one Lipinski rule violation due to high molecular weight (>500 g/mol). ADME analysis indicated good intestinal absorption (69–74%), limited blood-brain barrier permeability, and selective CYP3A4 metabolism without major CYP inhibition. Toxicity screening predicted low hepatotoxic, nephrotoxic, and carcinogenic risk; however, respiratory toxicity and immunotoxicity were observed in all three compounds, with mutagenicity predicted for Zizyphine C and F. This study supports the utility of in silico approaches in prioritizing phytochemicals for drug development and offers a scientific basis for the continued pharmacological exploration of Z. oenopolia.

**Keyword:** Cyclopeptide alkaloids, ADME, Tox prediction, Drug-likeness

**PT-173**

## PHYTOCHEMICAL SCREENING AND IN-VITRO ANTI- INFLAMMATORY ACTIVITY OF AQUEOUS ETHANOLIC EXTRACT OF DRIED LEAVES OF CROTALARIA VERRUCOSA

J. Subba Rao, S. Ravichandra
Chebrolu Hanumaiah Institute of Pharmaceutical Sciences
Chowdavaram, Guntur-19, A.P., India

The main aim of this study was to determine the pharmacognostic, phytochemical parameters and to determine the anti-inflammatory activity of the aqueous extract of Crotalaria verrucosa leaves. The aq. ethanolic plant extracts of leaves of Crotalaria verrucosa were prepared using the standard maceration method. Then conducted phytochemical screening by various pharmacognostic tests and in-vitro anti-inflammatory activity by protein denaturation method. The preliminary phytochemical analysis revealed that the aq. ethanolic leaf extract of Crotalaria verrucosa were shown positive results towards to carbohydrates, glycosides, phenols, flavonoids, proteins and amino acids and revealed the ethanolic extract showed the positive results towards carbohydrates, glycosides, phenols, proteins and amino acids. We conducted and reported the Inhibitory concentration (IC50) of anti-inflammatory activity was found at concentration of 240 mg/mL

**Key Words:** Crotalaria verrucosa, Pharmacognosy, Phytochemistry, Anti-inflammatory activity, denaturation

## FORMULATION AND EVALUATION OF A POLYHERBAL HAIR EMULGEL FOR HAIR GROWTH

Lidiya V S, Deepa Cherian, Anupama K V, Sruthy M
College of Pharmaceutical Sciences, Govt. Medical College,
Trivandrum, Kerala, India – 695011
lidiyavs23@gmail.com

The study aimed to formulate and evaluate a polyherbal hair emulgel that combines the therapeutic efficacy of medicinal plants with the formulation advantages of an emulgel system. The formulation incorporated guava leaf extract, lavender oil, virgin coconut oil, aloe vera juice, and banana powder, each selected for hair growth–promoting, conditioning, and scalp-nourishing properties. Guava leaves were extracted using a hydroalcoholic method and evaluated for vitamin C, alkaloids, and saponins. Lavender and virgin coconut oils were tested for refractive index and peroxide value, while aloe vera and banana powder underwent phytochemical identification. An oil-in-water emulsion was prepared by the dry gum method using virgin coconut oil as the base and then incorporated into a Carbopol 934 gel matrix to form the emulgel. The product was evaluated for pH, viscosity, spreadability, washability, homogeneity, and stability. The optimized formulation showed a pH of 4.12 (suitable for scalp application), viscosity of 8250 cps (ensuring easy spreadability), and spreadability of 4.761 g.cm/s. It exhibited excellent washability and uniform texture. Stability studies were carried out for one month, shorter than ICH-recommended periods, due to academic time constraints, revealed no significant changes in appearance, pH, or viscosity. The results indicate that the developed polyherbal hair emulgel is stable, safe, and potentially effective in promoting hair growth, offering a natural alternative to synthetic hair care products with improved patient compliance.

**Keywords:** Polyherbal formulation, Hair emulgel, Hair growth, Herbal cosmetics, Emulsion

## COMPARATIVE PHYTOCHEMICAL PROFILING AND CARDIOPROTECTIVE EVALUATION OF HYDRO ETHANOLIC FLOWER EXTRACTS OF AVERRHOA BILIMBI AND CAJANUS CAJAN: IN VITRO, IN SILICO AND ANALYTICAL APPROACHES.

Pradeepa P, Devi Thamizhanban, T Sengottuvel, K Lakshmi
Chettinad School of Pharmaceutical Sciences, Chettinad Hospital and Research Institute, Chettinad Academy of Research and Education,
Kelambakkam-603103, Tamil Nadu, India.
pradeepaprabhakaran2@gmail.com

The study aimed to analyze the chemical constituents of Cajanus cajan and Averrhoa bilimbi hydro ethanolic(50:50) flower extracts, particularly flavonoids and phenolic compounds and evaluate their Cardioprotective potential through analytical, in vitro, and in silico approaches. Preliminary phytochemical screening of the ethanolic flower extracts of Cajanus cajan and Averrhoa bilimbi revealed the presence of major secondary metabolites such as flavonoids, phenolics, tannins, saponins, terpenoids and alkaloids indicating their rich phytochemical composition. The extracts were subjected to TLC, HPTLC and LC-MS analysis using TLC plate, CAMAG TLC SCANNER-3 and Q-TOF, which revealed diverse bioactive compounds including luteolin, apigenin, quercetin, genistein, cajanin, vitexin, isovitexin, longistylin A and longistylin C from Cajanus cajan and Averrhoa bilimbi. Total phenolic content (TPC) and total flavonoid content (TFC) were determined, with Cajanus cajan showing 76.45 mg GAE/g and 47.18 mg QE/g, while Averrhoa bilimbi exhibited 87.62 mg GAE/g and 52.34 mg QE/g respectively. In vitro studies demonstrated significant antioxidant activity by DPPH, ABTS and lipid peroxidation inhibition assay. In silico molecular docking and interaction studies were performed using Schrodinger software against key cardiovascular targets such as Angiotensin Converting Enzyme (ACE), HMG-CoA reductase and MAPK which showed strong binding affinities for compounds like luteolin, cajanin, myrcetin, longistylin A and longistylin C supported by favorable binding energy profiles. These findings confirm that both extract rich in phenolics and flavonoids, exhibit potent cardioprotective properties validated by chemical profiling.

**Keywords:** flower extracts, phytoconstituents, antioxidant, cardioprotective.

## BLACK SEED OIL AND ROSE HIP OIL- BASED NANOEMULGEL FOR EFFECTIVE TREATMENT OF ACNE INCLUDING SCARS

Sevanth R, Aishwarya Reddy
Acharya & BM Reddy College of Pharmacy,
Bengaluru- 560107, Karnataka, India
sevanthgowda2050@gmail.com

Acne is a common inflammatory skin condition caused by hormonal imbalance, environmental factors, or bacterial infection by P. acnes in the presence of excess sebum. Although not life-threatening, acne significantly affects psychological and social well-being, and conventional treatments often result in scarring and hyperpigmentation. The present study explores a novel lipid-based nanoemulsion gel containing retinoid, black seed oil and rose hip oil for the effective management of acne and related scars. Preformulation studies, including calibration curve estimation, stability testing, and FTIR compatibility analysis, were conducted, followed by preparation of the nanoemulsion using spontaneous emulsification. The formulation was

ISBN: 978-81-980623-8-3

characterized for thermodynamic stability, particle size, and other relevant parameters. Carbopol as gelling agent was selected to incorporate the nanoemulsion, and the resulting gel was evaluated for viscosity, extrudability, and in-vivo skin irritation. Efficacy was assessed by treating pustules in comparison with a marketed formulation. The nanoemulsion gel demonstrated stability, compatibility, and was non-irritating, while its nanoscale size and zeta potential (-30 to +30) facilitated enhanced penetration into the stratum corneum, resulting in superior efficacy in reducing acne and scars. The study confirms that the developed nanoemulsion gel is safe, stable, and effective, highlighting the potential of nanotechnology-based topical formulations in dermatological therapy.

**Keywords:** Acne scars, Nanoemulgel, Characterization, Blackseed oil, Rose hip oil.

**FORMULATION OF ANTI-FUNGAL NANOEMULSION FILM USING CHRYSANTHEMUM INDICUM. L FLOWER EXTRACT**

Sanjai kumarJ, Seema.P
Department of Pharmacognosy, PPG college of Pharmacy,
Saravanampatti, Coimbatore-641035, Tamil Nadu, India
jsanjai005@gmail.com

The rise of antibiotic-resistant fungi underscores the need for innovative antimicrobial solutions. This study develops and characterizes a nanoemulsion film infused with Chrysanthemum indicum Linn flower extract (CIE), leveraging its antifungal properties. Phytochemical analysis of CIE revealed a rich composition of bioactive compounds. A high-energy emulsification method yielded a stable nanoemulsion film with optimized droplet size, polydispersity index, and zeta potential. In vitro assays demonstrated the film's potent antifungal activity surpassing that of the crude extract. This enhanced efficacy is attributed to improved solubility and bioavailability of CIE's phytoconstituents.

**Keywords:** Chrysanthemum indicum.L, Antifungal nanoemulsion film, Topical antimicrobial agent, Skin infections.

**PHYTOSOMAL GEL OF BARLERIA PRIONITIS: FORMULATION AND EVALUATION**

B.L.Prasanna, Saritha Medapati
Vignan Institute of Pharmaceutical Technology,
Visakhapatnam, Andhra Pradesh, India-530049.
chsaritha1975@gmail.com

The Barleria prionitis Lin, known as Vajradanti& Porcupine flower, is widely used in traditional medicine. Vajradanti means strong teeth in Hindi. The medicinal properties of Vajradanti plant are well reported in Ayurveda. The use of herbal products in the field of medicine has gained popularity in recent years. In India, herbal plants are used as a regular source of medicine. Plants, such as Turmeric, Ashoka and Triphala, are some common household names being widely used nowadays. One such name is Barleria prionitisL. Or Vajradanti, having antiarthritic, anti-inflammatory and anti-fertility properties. The leaves of this flower are also believed to provide relief in tooth ache. So these properties lead us to theuse of this shrub in the remedy of dental diseases. The aim of this study was to prepare the phytosome of Barleria Prionitis and evaluate it. Different phytosome complexes of Barleria Prionitis containing molar ratio of 1:0.5,1:1and1:1.5of Barleriaprionitis leaf extract and soya lecithin were prepared by the injection method. The phytosome was characterized by SEM, DSC and FTIR. These phytsomes were further formulated into gel form and phytsomal gel was prepared and evaluation test were performed. In vitro studies for these formulations were conducted for 8hrs and formulation F2 shows better release among all the formulation with 75.53% and all the evalution test like appearance, Ph, viscocity, spreadability were with in limits.

**Keywords:** BarleriaPrionitis, vajradanti, phytosome, porcupine, Soya Lecithin.

**PT-179**

**BIOFILM INHIBITION AND ANTIOXIDANT POTENTIAL OF STANDARDIZED POMEGRANATE PEEL EXTRACT FOR ORAL HEALTH APPLICATIONS**

Sabarish K
Department of Pharmaceutics, PPG College of Pharmacy,
Coimbatore-641035, Tamil Nadu, India

Dental caries remains one of the most prevalent global oral health problems, primarily caused by Streptococcus mutans biofilm formation and acidogenesis. The limitations of synthetic antimicrobials, including side effects and resistance, highlight the need for safe and effective herbal alternatives. Pomegranate (Punica granatum) peel is rich in polyphenols, particularly punicalagin and ellagic acid, known for their potent antioxidant and antimicrobial activities.The present study aims to evaluate the antioxidant and anti-biofilm potential of standardized pomegranate peel extract and to establish a correlation between its phenolic content and pharmacological activity. The extract will be characterized for total phenolic and flavonoid content (Folin–Ciocalteu and $AlCl_3$ assays) and optionally profiled using HPTLC for ellagic acid. Antioxidant activity will be assessed through DPPH radical scavenging assay, while anti-biofilm efficacy will be evaluated against S. mutans using a crystal violet microplate assay, along with assessment of acidogenesis (pH and lactate production). Preliminary results suggest significant antioxidant activity and dose-dependent inhibition of biofilm formation, with phenolic content contributing directly to the observed efficacy. This study concludes that standardized pomegranate peel extract shows promising potential as a natural alternative for oral health management. The findings support its application in the development of herbal oral-care formulations such as mucoadhesive films or gels.

**Keywords:** Pomegranate, Punicalagin, Antioxidant, Biofilm, Streptococcus mutans, Oral health

**THERAPEUTIC INSIGHTS INTO TERMINALIA PANICULATA ROOTS: ANALGESIC, ANTI-INFLAMMATORY, AND ANTIPYRETIC ACTIVITIES**

Biki Ghosh, Mitali Sahoo
Department of Pharmaceutical Chemistry, Netaji Subhas Chandra Bose Institute of Pharmacy, Chakdaha, Nadia, West Bengal – 741222
Bikighosh690@gmail.com

The present study aimed to investigate the analgesic, anti-inflammatory, and antipyretic potential of the ethanolic root extract of Terminalia paniculata Roth. (Combretaceae). Fresh roots were shade-dried, powdered, and subjected to maceration with 90% ethanol to obtain the extract. The extract was administered orally at doses of 200 and 400 mg/kg body weight, and its pharmacological activities were assessed using established experimental models. Analgesic effects were evaluated by acetic acid-induced writhing, tail immersion, and formalin-induced paw licking assays. Anti-inflammatory activity was determined using the carrageenan-induced rat paw edema model, while antipyretic activity was assessed through yeast-induced pyrexia in rats. The extract demonstrated marked analgesic activity by significantly reducing the number of writhes in the acetic acid test, prolonging reaction time in the tail immersion model, and inhibiting both the neurogenic and inflammatory phases of pain in the formalin assay. A pronounced anti-inflammatory effect was observed in the carrageenan-induced paw edema model, indicating a role in acute inflammation. Additionally, the extract significantly reduced elevated rectal temperature in yeast-induced pyrexia, suggesting antipyretic efficacy. Overall, the findings reveal that the ethanolic root extract of Terminalia paniculata possesses significant analgesic, anti-inflammatory, and antipyretic activities, which appear to involve both central and peripheral mechanisms. These results support its traditional use and highlight its potential as a natural therapeutic agent.

**Keywords:** Terminalia paniculata, Aspirin, Ibuprofen, Paracetamol, Acute toxicity studies.

In the current research antiacne cream was formulated from the ethanolic extracts of Colocasia esculanta leaves. The objectives behind this research was to evaluate its antibacterial activity against acne causing bacteria like Staphylococcus aureus, Escherichia coli and

ISBN: 978-81-980623-8-3

Pseudomonas aeruginosa. At first the leaves of Colocasia esculenta extracted by ethanol solvent using Soxhlet method of extraction. Then the extract was tested for its antibacterial activity against acne causing bacteria followed by the formulation and evaluation of Antiacne cream using disc diffusion method against Staphylococcus aureus. Escherichia coli and psudomonas aeruginosa. The antibacterial activity of ethanolic extract of Colocasia esculenta leaves against Staphylococcus aureus, Escherichia coli and psudomonas aeruginosa was found with zone of inhibition of 20 mm, 21mm and 20 mm. The formulated W/O cream showed good homogeneity, spreadability and antibacterial properties. Therefore the formulated cream has a potential in the treatment of acne as Staphylococcus aureus is a common acne causing bacteria while E. coli is responsible for skin infection.

**Keywords:** Colocasia esculenta, Ethanolic extract, Acne vulgaris, Antibacterial, Zone of Inhibition

## VALORIZATION OF BANANA WASTE: IN VITRO ANTIOXIDANT PROPERTIES OF PEELS AND SEEDS

Rishita Das and Trideep Saikia
School of Pharmaceutical Sciences, Girijananda Chowdhury University, Hatkhowapara, Azara, Assam, India – 781017
rishitadas2205@gmail.com

Agro-industrial byproducts are gaining attention as source of natural bioactive agents. Banana being the chief-most fruit crop generates enormous quantities of wastes such as peels and seeds. This paper investigates the in vitro antioxidant properties of various parts of three local banana cultivars from Guwahati, Assam, so as to determine their valorization potential. Methods: Fresh banana plant parts (fruit, peel, and seed) were dried and extracted by both hot (Soxhlet) and cold maceration methods with petroleum ether, methanol, and ethyl ether. The antioxidant potential of the extracts was determined broadly by free radical scavenging methods against DPPH, ABTS, NO (Nitric Monoxide), and also FRAP (Ferric Reducing Antioxidant Power). The total phenolic content (TPC) was determined using the Folin-Ciocalteu reagent with a view to correlate it with bioactivity. Results: Methanolic extracts show consistently highest activity. The seed extracts have the maximum total phenolic content (195.62 µg GAE/mg) and, hence, the highest antioxidant activity. They showed the best inhibition percentages of 79.2%, 88.4%, and 89.4% in DPPH, ABTS, and NO radical scavenging assays at their highest tested concentrations. Conclusion: This study reaffirms that underutilized banana byproducts, especially the seeds, are well endowed with phenolic compounds exhibiting excellent antioxidant activities. These outcomes suggest the potential of banana waste being a cheap raw material for natural nutraceuticals to combat oxidative stress.

**Keywords**: Banana byproducts, Antioxidant activity, Phenolic compounds, Nutraceutical potential, Free radical scavenging.

## FORMULATION AND EVALUATION OF WOUND HEALING HERBAL OINTMENT

Chandana J, A. Geethalakshmi, Lekhana H T, Bonagiri Sannitha
Department of Pharmaceutics, Harsha college of Pharmacy, Nelamangala, Bangalore, India

With the development of medical science, wound care is continually changing by adopting traditional and alternative medicine due to the advent of multi-resistant organisms and a decline in modern antibiotics. In this study, ointments were created based on an analysis of the effectiveness of plant extracts in treating wounds. Codieaum varigeatum chosen as herbal plants. The alcoholic extract is added with appropriate proportion in ointment base and evaluated for physicochemical evaluations, including appearance, pH, spreadability, viscosity, washability and anti-microbial activity. The physical characteristics remained unchanged, and the pH was within acceptable limits (about pH 7). During this study period, the formulations demonstrated good consistency, and good spreadability (2.5cm-3.1cm). The viscosity of ointments was discovered to be inversely proportional to the rate of shear (rpm), increasing when the rate of shear was decreased. The ointment exhibited significant zone of inhibition conforming the synergistic antimicrobial activity of the herbal ointment F1(0.1cm), F2(0.5cm),F3 (0.3cm),F4(0.9cm) the result of the study of F4 formulation shows more significant pH and positive results when compared to other formulations which help to establish these formulations effective in wound healing management. During a stability study conducted for three months at (40 °C and 75 5% RH) in accordance with ICH guidelines, the ointments were found to be stable. From the current study, it can be inferred that ointment containing herbal extracts with wound-healing properties can be created and used to provide a skin barrier.

**Keywords:** Codieaum varigeatum, wound healing, herbal ointment, antimicrobial activity

## FORMULATION AND EVALUATION OF POLYHERBAL HYDROGEL TO TREAT ACNE

Rukhaiya C R , A Geethalakshmi, Aditi saha, Anil kumar S
Department of Pharmaceutics, Harsha College of Pharmacy, Nelamangala, Karnataka, India-562123
afnanaii8042@gmail.com

Acne vulgaris is a prevalent chronic inflammatory disorder of the pilosebaceous units, affecting adolescents and young adults. The condition's pathophysiology involves excess sebum secretion, follicular hyperkeratinization, and colonization by Cutibacterium acnes, leading to comedones, papules, and cysts. Conventional treatments, such as retinoids and antibiotics, are often associated with side effects, necessitating the development of safer alternatives. This study aimed to formulate and evaluate a polyherbal anti-acne gel utilizing Vinca rosea, Curcuma longa, and Aloe vera, known for their antimicrobial, anti-inflammatory, and wound-healing properties. Excipients like Hydroxypropyl Methylcellulose (HPMC), Carbopol 934, and Triethanolamine were incorporated to ensure gel stability, spreadability, and patient acceptability. Physical examination of the formulations showed a saffron to bright yellow color, strong odor, semisolid state, and smooth texture. Homogeneity tests confirmed the absence of lumps and syneresis, with formulation F4 exhibiting superior clarity and smoothness. The pH values, ranging from 5.86 to 6.40, were within the skin-compatible range. Spreadability was highest for F4 (11.6 g·cm/sec), followed by F3 (11.5 g·cm/sec), indicating efficient application properties. Overall, formulation F4 demonstrated promising physical, rheological, and application properties, making it a potential candidate for further development as a polyherbal topical gel. This approach offers a safe and effective alternative for the management of acne vulgaris.

**Keywords:** Acne vulgaris, Polyherbal gel, Vincarosea, Curcuma longa, Aloe vera, Hydrogel, Herbal formulation, Anti-inflammatory.

## FORMULATION AND DEVELOPMENT OF HERBAL EMULGEL FOR THE MANAGEMENT OF CANDIDIASIS

Onkar G. Jadhao, Rohini S. Ghodke,
Nishant B. Awandekar, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
jadhaoonkar02@gmail.com

Candidiasis is a fungal infection caused mainly by Candida albicans, an opportunistic yeast that overgrows under immunocompromised or imbalanced conditions. It commonly affects the oral cavity, skin, and genital tract, and in severe cases can lead to systemic infections. The present study aimed to develop a novel herbal emulgel formulation for the treatment of candidiasis. Conventional topical formulations such as creams and ointments are often limited by greasiness, poor spreadability, and inadequate penetration. Topical delivery was chosen to achieve localized action, minimize systemic side effects, and improve patient compliance. Emulgel systems, combining the benefits of emulsions and gels, overcome these drawbacks and enhance drug stability and skin permeability. Extract was obtained using Soxhlet extraction and confirmed to contain alkaloids, flavonoids, saponins, and withanolides with reported antifungal activity. A $3^2$ factorial design was applied to optimize the emulgel using Carbopol 940 as a gelling agent and a Span 80–Tween 80 system as emulsifiers. The optimized formulation exhibited suitable pH, viscosity, spreadability, and drug content. In-vitro and ex-vivo diffusion studies indicated sustained drug release, while antifungal evaluation by agar well diffusion demonstrated significant inhibition of C. albicans, comparable to clotrimazole. These findings suggest that W. Somnifera extract based emulgel is a promising topical herbal formulation for effective management of candidiasis.

**FORMULATION AND EVALUATION OF ANTI-AGING HERBAL CREAM**

A. Geethalakshmi, Bhoomika K S, Chinthana G C, Sandhya K
Department of Pharmaceutics, Harsha college of pharmacy,
Nelamangala, Bangalore, Karnataka, India – 562123
bhoomikashrusti@gmail.com

Herbal cosmetics are the preparations which are used to beautify and enhance the human appearances. The aim of present research was to formulate and evaluate the anti-aging herbal cream, containing plant extracts prepared by using water in oil method for the purpose of reducing wrinkles, nourishing and moistening the skin. The Anti-aging cream prepared by using the extract of Neem, extract of Aloe-vera, extract of Tulsi, extract of Papaya and extract of Turmeric. Quality evaluation of the formulated product was assessed by using different evaluation methods. The cream was subjected to various evaluation parameters including organoleptic characteristics, irritancy, washability, pH, penetration, stability, and phase separation tests. The results revealed that the formulated cream exhibited smooth texture, off-white to pale-yellow colour, pleasant Odor, and semisolid consistency. It produced no signs of irritation, redness, or itching during the irritancy test. The pH was found to be 8.1, suitable for topical application. The formulation showed good washability, easy skin penetration within 15–20 minutes, and no evidence of phase separation, confirming stability during the study period. Additionally, the herbal extracts imparted moisturizing, soothing, and collagen-promoting effects that aid in reducing wrinkles and improving skin elasticity. Overall, the anti-aging herbal cream demonstrated stability, safety, and efficacy, making it a cost-effective natural alternative to synthetic products for maintaining youthful and healthy skin.

**Keywords:** Aloe-vera Extract, Neem Extract, Tulsi Extract, Turmeric Extract, Papaya Extract.

**FORMULATION AND DEVELOPMENT OF HERBAL GEL-LOADED NANOSPONGES FOR TREATMENT OF PSORIASIS**

Vishal Chafle, Sejal Ukey, Rashmi Trivedi,
Nishant Awandekar, Milind Umekar
Department of Industrial Pharmacy, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee Nagpur- 441002.
chaflevishal1@gmail.com

Psoriasis is a chronic immune-mediated skin disorder characterized by scaly plaques, hyperproliferation of keratinocytes, and immune dysregulation. Conventional therapies, including corticosteroids, immunosuppressants, and biologics, are often limited by systemic side effects, poor patient adherence, and inadequate skin penetration. These challenges highlight the need for safer and more effective topical approaches. This study focuses on a nanosponge-based topical gel formulated with Uncaria tomentosa extract, a natural compound with strong anti-inflammatory and immunomodulatory properties. Studies have shown that U. tomentosa downregulates inflammatory mediators such as IL-6 and NF-κB while also exhibiting antioxidant and COX-2 inhibitory effects. In vivo evaluation in a psoriasis model demonstrated that the nanosponge gel provided superior anti-inflammatory activity and enhanced skin repair compared to the control and extract-only groups. Safety assessments confirmed the absence of irritation, and stability testing confirmed consistent formulation properties throughout one month

**Keywords:** Psoriasis, Uncaria tomentosa, Nanosponge gel, Topical delivery, Anti- inflammatory

**TRADITIONAL AYURVEDIC PLANTS IN HERBAL SOAP FORMULATION: A STUDY ON SKIN CARE EFFICACY**

Umesha.B, Surya, Pradeep, A. Geethalakshmi
Department of Pharmaceutics, Harsha College Of Pharmacy
Nelamangla, Karnataka, India-562123
umeshumesh94982@gmail.com

Neem (Azadirachta indica) is a revered herb widely used in traditional medicine for its multifaceted therapeutic properties. Its potent antibacterial, antifungal, and anti-inflammatory compounds make it an ideal active ingredient in soap formulations. The incorporation of neem into soap provides a natural and effective means to cleanse the skin, mitigate skin infections, and soothe inflammation. This project explores the efficacy of neem-based soap in harnessing these properties for enhanced dermatological benefits.Neem leaves have been traditionally used to treat various skin conditions, including eczema, psoriasis and acne. The herbal neem soap was made by blending 36.4% palm oil,9.1%coconut oil, 27.3%sodium hydroxide, 9.1% neem oil extract, and 18.2% neem aqueous extract which formed a pale yellow soap base. The herbal neem soap's properties were evaluated, showing:Moisture Content: 4.02%, indicating a relatively low water content that can contribute to a longer shelf life. pH Value: 8-10, which is within the suitable range for human skin, minimizing irritation risks. Total Fatty Matter: 57.40%, suggesting a good balance between cleansing and moisturizing properties. Free Caustic Alkali: 0.44%, indicating a relatively safe level for skin use.The results of this study confirm that the soap can serve as a therapeutic alternative for managing common skin problems, leveraging neem's natural efficacy to promote skin health and hygiene.This supports its use not just for daily cleansing but also as a beneficial treatment for various dermatological concerns.

**Keywords:** Azadirachta indica, antibacterial, anti-inflammatory, herbal soap.

**PT-189**

**FORMULATION AND EVALUATION OF CAROM SEED HERBAL KAJAL**

A Geethalakshmi, Sahana T R, Patel Anup Pradeep, Sharma Shivam
Department Of Pharmaceutics, Harsha College of Pharmacy,
Nelamangala, Bangalore, Karnataka, India -562123
trsahana19@gmail.com

Kajal, a traditional eye liner also known as kohl or Surma, offers several benefits, including being patient-friendly, water-resistant, stable, and cost-effective. It's a staple in women's beauty cosmetics due to its medicinal effects on the eyes. Various types of kajal exist, named after their main ingredients, such as charcoal, castor oil, ghee, camphor, and almond. This study aimed to prepare and evaluate herbal kajal using natural ingredients, prioritizing safety and efficacy. The herbal kajal was formulated with carom seeds, triphala powder, and other excipients like camphor, castor oil, almond oil, cow ghee, and honey, providing benefits beyond beautification, including cooling, moisturizing, and nourishing effects, as well as reducing the risk of eye disorders. The prepared kajal underwent several evaluation tests, including appearance, colour, texture, pH determination, spreadability, eye irritation, stability, and colour intensity comparison. The results showed compatibility with eye physiology, indicating the potential of herbal kajal as a safe and beneficial cosmetic product. By enhancing general eye functionality with simple and safe beautifying cosmetics, this study supports the development of herbal kajal as a daily cosmetic that not only beautifies but also cares for the eyes. The use of natural ingredients and emphasis on safety and efficacy make herbal kajal a promising alternative to traditional products.

**Keywords:** Herbal kajal, Carom seeds, Triphala powder, Eye irritation test, pH, Stability.

**EVALUATION OF IN-VITRO ANTI-INFLAMMATORY ACTIVITY OF PERILLA FRUTESCENS SEED EXTRACT USING CELL- FREE ENZYME ASSAYS**

Sharini Y S, Andrew Gnanaprakasam J,
Mr. Keinoumayum Amjad khan, A. Geethalakshmi

Perilla frutescens (L.) Britt., a member of the family Lamiaceae, is an important herb native to East Asia, including China, Korea, Japan, and India, particularly in Manipur, Meghalaya, Arunachal Pradesh, Nagaland, Uttarakhand, Sikkim, and Assam. The leaves and seeds of Perilla frutescens are rich in phytochemicals such as flavonoids, phenolic compounds, terpenoids, triterpenoids, polyunsaturated fatty acids (α-linolenic acid, linoleic acid), volatile compounds, tannins, and alkaloids, which contribute to its diverse biological activities. Phytochemical screening using ferric chloride and Liebermann's tests confirmed the presence of phenolic compounds, notably rosmarinic acid. Rosmarinic acid, a key phenolic compound, exhibits potent anti-inflammatory properties by inhibiting pro-inflammatory cytokines. Beyond anti-inflammatory effects, Perilla frutescens has been reported to possess antioxidant, antimicrobial, anti-allergic, anticancer, and antidiabetic

ISBN: 978-81-980623-8-3

activities. In this study, we evaluated the anti-inflammatory potential of methanolic, ethanolic, and aqueous seed extracts of Perilla frutescens using an in vitro protein denaturation inhibition assay. Statistical analysis was performed using Two-Way ANOVA to assess the effects of extract type and concentration on inhibition activity. The results revealed significant differences ($p < 0.05$), confirming that both treatment type and concentration had a strong influence on protein denaturation inhibition. These findings highlight the therapeutic potential of Perilla frutescens seeds, particularly the role of rosmarinic acid, as a natural source of anti-inflammatory agents. Further in vivo studies are needed to substantiate these results and explore the clinical applicability of Perilla frutescens-derived compounds.

**Keywords:** Perilla frutescens, Anti-inflammatory, Rosmarinic acid, Protein denaturation, Two-way ANOVA.

## REVOLUTIONIZING AYURVEDIC DOSHA DIAGNOSIS: FROM TRADITIONAL NADI PARIKSHA TO AI-DRIVEN ANALYSIS

Trupti Dule, Vinita Kale, Suankit Harane, Milind Umekar
Department of Regulatory Affairs, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, India- 441002
truptidule@gmail.com

Ayurveda identifies health and disease states through the balance or imbalance of the three Doshas, Vata, Pitta, and Kapha, with Nadi Pariksha (pulse examination) serving as a central diagnostic tool. Traditional pulse reading, though effective, is subjective and dependent on practitioner expertise. Recent advancements in artificial intelligence and sensor technologies offer the potential to standardize and modernize this ancient practice. Pressure sensors, piezoelectric sensors, and optical sensors can digitize pulse signals, while signal processing methods such as Fast Fourier Transform and wavelet analysis extract features including rhythm, frequency, and morphology. These features are then analyzed using artificial intelligence models ranging from supervised machine learning techniques such as Support Vector Machine, Random Forest, Decision Tree, Logistic Regression, and k-nearest neighbor to deep learning methods like Convolutional Neural Network and Recurrent Neural Network for dosha classification and Prakriti assessment. This integration reduces variability, improves reproducibility, and enables scalable, objective diagnosis. Importantly, artificial intelligence-driven approaches such as wearable-based platforms can provide continuous monitoring, preventive insights, and personalized therapeutic recommendations, thereby strengthening Ayurveda's role in modern predictive and preventive healthcare. While artificial intelligence enhances diagnostic precision and expands research opportunities within Traditional Medicine, it cannot substitute the experiential knowledge of expert Vaidyas. Instead, it should function as a complementary tool that bridges classical wisdom with modern healthcare innovations. By combining ancient diagnostic frameworks with contemporary artificial intelligence–driven analysis, Ayurveda can evolve into a more accessible, standardized, and globally integrated healthcare system, contributing to holistic, patient-centered wellness.

## FORMULATION AND EVALUATION OF TURMERIC EXTRACT LOADED GRAPESEED OIL EMULGEL

Shibanth Nath and Srijita Chakrabarti
Faculty of Pharmaceutical Science, Assam down town University, Sankar Madhab Path, Gandhi Nagar, Panikhaiti, Guwahati, Assam, India, PIN – 781026.
shibanthnath103@gmail.com

The rise of antibiotic resistance and side effects linked to synthetic antimicrobials have driven the search for safer, biocompatible alternatives in topical drug delivery. Herbal medicines, with their natural origin, minimal adverse effects, and better therapeutic benefits, have gained increasing interest. The present study reports the formulation and evaluation of an antimicrobial emulgel containing turmeric (Curcuma longa) extract and grapeseed oil (GSO) as bioactive agents. Turmeric, rich in curcumin, exhibits antimicrobial, antioxidant, anti-inflammatory, and wound-healing properties, while GSO, a lightweight natural oil, provides antimicrobial efficacy, polyphenolic antioxidants, and skin-nourishing benefits. The emulgel was prepared by incorporating turmeric extract-loaded GSO based emulsion into a hydrogel using Tween 80, Span 80, and Carbopol 940. Physicochemical properties of the developed formulation including appearance, pH, viscosity, spreadability, extrudability, and stability were assessed. The optimized emulgel showed desirable consistency, good spreadability (2.1 ± 0.23 cm), a skin-compatible pH (5.87 ± 0.05), swelling index (45.3 ± 1.71%), and viscosity (1813.05 ± 246.7 cP). Antimicrobial testing by agar well diffusion revealed inhibition zones of 9.5 ± 1.25 mm (Staphylococcus aureus), 9.75 ± 0.63 mm (Escherichia coli), and 9.5 ± 0.75 mm (Pseudomonas aeruginosa). The activity was superior to emulgel containing only GSO, highlighting the synergistic effects of turmeric and grapeseed oil. Overall, the study demonstrates that turmeric-GSO emulgel is a safe, effective, and irritation-free herbal formulation with potential as a sustainable topical therapy for microbial skin infections, reducing the risk of resistance.

**Keywords:** Antimicrobial assesment, emulgel, grapeseed oil, in vivo skin irritation, turmeric extract

**PT-193**

## A REVIEW: MEDICINAL PLANTS WITH EFFICACOUS ANTIDIABETIC POTENTIAL

A.David joseph, P.Balasubramaniyan, T.Shri Vijiya kirubha
Department of Pharmacognosy, Mother Terasa College of Pharmacy, Illupur, Pudukkottai, Tamilnadu – 622 102.
dj3868461@gmail.com

Diabetes mellitus is a chronic metabolic disorder characterized by persistent hyperglycemia due to impaired insulin secretion, insulin action, or both. Its global prevalence continues to rise, posing serious health and economic burdens. Although synthetic antidiabetic drugs are widely used, they often come with adverse effects and limited long-term efficacy. This has led to increased interest in medicinal plants as alternative or complementary therapies. Numerous plants used in traditional medicine have demonstrated significant antidiabetic potential, supported by both preclinical and clinical studies. Notable examples include Gymnema sylvestre, Momordica charantia, Trigonella foenum-graecum, Tinospora cordifolia, and Azadirachta indica. These plants exert hypoglycemic effects through various mechanisms such as stimulating insulin secretion, enhancing peripheral glucose uptake, inhibiting intestinal glucose absorption, and reducing oxidative stress. Their efficacy is largely attributed to bioactive compounds like flavonoids, alkaloids, terpenoids, and glycosides, which modulate key pathways in glucose metabolism. Despite promising results, challenges remain in standardizing plant extracts, determining optimal dosages, and ensuring safety and efficacy through rigorous clinical trials. Integrating ethnobotanical knowledge with modern pharmacological research could pave the way for novel, plant-based antidiabetic therapies that are both effective and accessible. This review underscores the therapeutic relevance of medicinal plants and advocates for continued scientific exploration to validate traditional claims and develop sustainable interventions for diabetes management.

**Keywords:** Medicinal plant, Anti diabetic activity, Hypoglycemic effect, Herbal therapy, Oxidative Stress.

## ANTIULCER AND LAXATIVE POTENTIAL OF POLYSACCHARIDES FROM DELONIX REGIA

Remeth Jacky Dias, Kailas Krishnat Mali, Savita Shivaji Mali.
Government College of Pharmacy, Vidyanagar, Karad 415124.
rjdias75@gmail.com

Ulcers are a major global health problem, affecting nearly 10–15% of the population. Peptic ulcers, particularly gastric and duodenal ulcers, may progress to severe complications, including malignancy, if left untreated. Polysaccharides from natural sources are increasingly recognized for their gastroprotective and laxative effects. This study investigated the antiulcer and laxative activities of polysaccharides extracted from the ripe seed pulp of Delonix regia (DRSP) using experimental animal models. DRSP was extracted via ethanol precipitation and characterized by phytochemical screening, ATR-FTIR, TGA, and XRD analyses. Antioxidant activity was determined using free radical scavenging assays. Acute oral toxicity was assessed according to OECD Guideline 423.

ISBN: 978-81-980623-8-3

Antiulcer activity was evaluated in ethanol- and ibuprofen-induced rat models by measuring gastric content, acidity, ulcer index, and histopathology. Laxative activity was studied in a loperamide-induced constipation model and further validated using a charcoal meal gastrointestinal transit test. DRSP was confirmed as a neutral, swallowable polysaccharide exhibiting characteristic functional groups and a semi-crystalline structure. It showed notable antioxidant activity ($IC_{50}$: 639.47 µg/mL) and was safe at 2000 mg/kg in acute toxicity studies. In ulcer models, DRSP (300–600 mg/kg) significantly reduced gastric volume, free acidity, ulcer score, and ulcer index, while increasing gastric pH, protection percentage, and mucosal healing. In constipated animals, DRSP improved laxation by enhancing moist fecal weight and gastrointestinal transit ratio, with efficacy comparable to bisacodyl. These findings demonstrate that DRSP possesses dual antiulcer and laxative effects, likely mediated through antioxidant and cytoprotective mechanisms, supporting its potential as a natural therapeutic agent.

**Keywords:** Delonix regia; antiulcer; laxative; polysaccharides.

**PT-195**

## LIPOSOMAL ENCAPSULATION OF BRIDELIA RETUSA EXTRACT: DEVELOPMENT, OPTIMIZATION, AND CHARACTERIZATION FOR ENHANCED HERBAL DRUG DELIVERY

Dharshan Murugan, Nandhini Sundaresan
Department of Pharmacognosy, Sri Ramachandra Faculty of Pharmacy, Sri Ramachandra Institute of Higher Education and Research (DU), Porur, Chennai- 600 116.
nandypharma1787@gmail.com

Bridelia retusa Spreng. (Family: Euphorbiaceae), commonly known as Asan or Aghan, is widely distributed in the warmer regions of India. Traditionally, different parts of the plant are used to treat rheumatism, viral infections, snake bites, and for contraceptive purposes. However, the poor solubility and stability of its bioactive constituents limit its clinical application. Liposomal drug delivery systems offer a promising strategy to improve solubility, bioavailability, and controlled release of herbal extracts.The present study aimed to develop and optimize liposomal formulations of Bridelia retusa extract using the thin-film hydration technique.Liposomes were prepared using soy lecithin and cholesterol, followed by hydration and sonication to reduce particle size. The formulations were characterized for particle size, polydispersity index (PDI), and zeta potential using a Zetasizer. Encapsulation efficiency (EE%) was determined spectrophotometrically (UV-Vis). Morphology was assessed using Transmission Electron Microscopy (TEM), while additional characterization included thermal stability and structural analysis. The optimized liposomes showed nanoscale particle size with a narrow distribution (PDI < 0.3) and a zeta potential of less than –30 mV, confirming colloidal stability. Encapsulation efficiency ranged between 70–85%, indicating efficient loading of phytoconstituents. TEM analysis revealed spherical, multilamellar vesicles. The liposomes demonstrated good thermal stability and an amorphous structure, suggesting suitability for stable formulation development. Liposomal encapsulation of Bridelia retusa extract significantly enhances its stability and delivery potential. This nanocarrier system represents a promising herbal drug delivery platform with potential therapeutic applications. Further pharmacological investigations are required to validate its efficacy and explore its clinical applications.

**Keywords:** Bridelia retusa, liposomes, thin-film hydration, encapsulation efficiency, herbal drug delivery

**PT-196**

## FORMULATION AND EVALUATION OF METHANOLIC EXTRACT OF CHENOPODIUM ALBUM LOADED INVASOMES

Ishan Aboti, Neelam Dighe, Nilakshi Mahakalkar, and Jasmine G. Avari
Department of Pharmaceutical Sciences, Rashtrasant Tukadoji Maharaj Nagpur University, Nagpur – 440033
ishanaboti@gmail.com

The aim of the study is to formulate Chenopodium album loaded invasomes. Vesicular drug delivery systems are the carriers for drug targeting that improvises therapeutic efficacy. These carrier systems deliver the drug at a pre-determined rate. Several drug carrier systems such as invasomes, liposomes, niosomes, proniosomes, ethosomes etc. increases the penetrability of the drug at the affected site. Invasomes are composed of phospholipids, ethanol and terpenes that serves as a key for increasing the penetrability of the herbal extract. The phytochemical screening of methanolic extract of Chenopodium album said to have mainly the presence of flavonoids, saponins and alkaloids. The HPLC chromatogram shows to have the presence of kaemferol and quercetin in 0.193 and 0.003%w/w respectively. The methanolic extract of Chenopodium album was formulated into invasomes by mechanical dispersion method. The characterization of invasomes showed the particle size, polydispersity index(PDI), zeta potential and Entrapment Efficiency. The particle size analysis showed that as the concentration of ethanol increases that results in the decrease in particle size. F2 formulation showed the optimized formulation of 245.8 nm in particle size, 0.331 PDI and (-)7.57 mV zeta potential. The %EE of Chenopodium album ranged from 50-72%. The SEM photograph revealed surface morphology and also showed spherical and oval shape. The Chenopodium album loaded invasomes were prepared and characterize successfully and it can be also concluded that invasomes can serve as a depot formulation for dermally active compounds.

**Keywords:** nanotechnology, Quercertin, Kaemferol, Invasomes.

## FROM TRADITION TO THERAPEUTICS: ANTIVENOM ACTIVITY OF ALANGIUM SALVIFOLIUM

Yelmame Om Suresh, Aditya Ambadas Shirsat, Sachin Bhagwat Aglawe
Rashtrasant Janardhan Swami College of Pharmacy, Kokamthan, Kopargaon, Ahilyanagar, Maharashtra, India,423601
omsyelmame@gmail.com

Snakebite and scorpion sting remain serious public health problems in many parts of India, often leading to severe illness or even death if not treated in time. Traditional systems of medicine have long used plants as natural remedies to counter venom toxicity. Among these, Alangium salvifolium (Ankola), a small deciduous tree belonging to the family Alangiaceae, has gained importance for its potential antivenom activity. Different parts of the plant, especially the roots, bark, and seeds, are used in Ayurveda and folk practices for treating poisonous bites. The seed oil is well known for its protective effect in snake and scorpion envenomation, while the root and bark extracts are applied in traditional formulations to reduce swelling, pain, and toxic effects caused by venom. Phytochemical studies have shown the presence of alkaloids such as alangine and alangicine, along with flavonoids, tannins, and saponins, which may play a role in neutralizing venom toxins. Experimental studies indicate that plant extracts may help in stabilizing cell membranes, reducing oxidative stress, and counteracting neurotoxic effects of venom. These findings scientifically support the age-old use of the plant as an antivenom agent.Although promising, more in-depth research is still required to confirm its safety, exact mechanism of action, and effectiveness through clinical studies. If validated, Alangium salvifolium could become a valuable complementary therapy in managing venomous bites, especially in rural areas where access to commercial antivenoms is limited.

**Keywords:** Alangium salvifolium, Antivenom activity Snakebite,scorpion sting, Phytochemicals, Traditional medicine

## FORMULATION AND EVALUATION OF SHANKHPUSHPI EFFERVESCENT TABLETS A MEMORY BOOSTER

SHRISHTI REDDY
Shri Shahu Maharaj college of pharmacy, Naubad, Bidar

The increasing demand for herbal-based nutraceuticals has directed attention towards developing innovative dosage forms that enhance patient compliance, stability and therapeutic efficiency. Convolvulus pluricaulis(commonly known as Shankhpushpi) is a well-known “Medhya Rasayana” in Ayurveda, used for its nootropic, memory enhancing, anxiolytic and neuroprotective activities. As per recent studies, Convolvulus pluricaulis is a mixture of compounds like – Scopolatin,Kaemferol, Quarcatin& hydroxycinnamic acid, which work by interacting with neurological pathways, promoting neurite outgrowth and neuroprotection, leading to improved memory and cognitive function. Conventional dosage forms often suffer limitations like poor palatability, low patient compliance and stability issues so, to overcome these problems we prepared effervescent tablets which is a novel alternative as it improves patient acceptability by offering rapid

ISBN: 978-81-980623-8-3

dispersion, mask unpleasant taste, enhance bioavailability through faster disintegration. The present study focuses on the formulation and evaluation of Shankhpushpi effervescent tablets prepared using powdered drug, by combining an effervescent base, sodium bicarbonate with acids, citricand tartaric acid, balanced with suitable excipients.These are used to ensure sufficient binding hardness and flow properties without compromising effervescence. Evaluation parameters included Organoleptic characteristics, hardness, friability, weight variation, effervescent time, pH of reconstituted solution. Effervescence time was found to be within 60-120 seconds, producing a palatable solution with acceptable taste masking. The study concludes that Shankhpushpi effervescent tablets represent a promising novel dosage form that combines traditional herbal knowledge with modern pharmaceutical technology, offering enhanced patient compliance, stability and therapeutic effectiveness.

**Waste To Wealth: Cellulose Nanofibers Obtained From Banana And Onion Peels**

Komal Bhosale, Priyanka Bankar, Tanaji Nandgude
Department of Pharmaceutical Sciences, JSPM University, Wagholi-Pune, Maharashtra, India -412207
komalbhosale23.sdsr@jspmuni.ac.in

This study focuses on the extraction and characterization of cellulose nanofibers (CNFs) from banana peel and onion peel, two abundant agricultural wastes. CNFs were isolated through sequential chemical treatments, including alkaline, bleaching, and acid hydrolysis, followed by mechanical homogenization and lyophilization. The extracted nanofibers were analyzed using FTIR spectroscopy, particle size analysis, zeta potential measurement, differential scanning calorimetry (DSC), and field emission scanning electron microscopy (FESEM). Results revealed that banana peel-derived CNFs exhibited smaller particle size (86.3 nm), higher stability (zeta potential -0.12 mV), and better performance compared to onion peel-derived CNFs (226.2 nm, -0.3 mV). DSC analysis showed higher thermal stability in onion peel CNFs (179.7 °C) than banana peel CNFs (285.3 °C). The morphological analysis confirmed the porous structure and high surface area of the nanofibers, making them suitable for biomedical, pharmaceutical, and material reinforcement applications. The findings highlight the potential of converting agricultural waste into high-value nanomaterials, promoting sustainability and circular economy practices.

**INVESTIGATION OF ANTIARTHRITIC EFFECTS OF ETHANOLIC EXTRACT FROM MYXOPYRUM SMILACIFOLIUM LEAVES**

A.Lavanya, Raveesha Peeriga
Department of Pharmacognosy and Phytochemistry, V. V. Institute of Pharmaceutical Sciences, Gudlavalleru, Andhra Pradesh, India-521 356
angirekulalavanya343@gmail.com

Herbal medicines continue to play a vital role in primary health care owing to their safety, efficacy, and cost-effectiveness. The present study was conducted to evaluate the anti-arthritic activity of the ethanolic leaf extract of Myxopyrum smilacifolium Blume. Leaves were collected, shade-dried, and extracted using ethanol. The extract was assessed for anti-arthritic potential using the Complete Freund's Adjuvant (CFA)-induced arthritis model in Wistar albino rats (150–200 g, either sex). Animals were divided into five groups of six rats each. Arthritis was induced with CFA, followed by treatment with the ethanolic extract at doses of 200 mg/kg and 400 mg/kg, while Diclofenac sodium (10 mg/kg) served as the standard. Parameters evaluated included paw edema, knee diameter, paw thickness, hematological indices, and radiographic joint changes. Phytochemical characterization was performed using IR, NMR, and mass spectrometry. The 400 mg/kg dose significantly ($P < 0.001$) reduced paw edema and joint inflammation, increased RBC and hemoglobin levels, and decreased WBC count and rheumatoid factor levels. Radiographic analysis confirmed recovery of joints, while phytochemical studies identified myxopyroside, an iridoid glycoside, as a key constituent. These findings suggest that the ethanolic leaf extract of M. smilacifolium exhibits significant anti-arthritic activity, likely attributed to myxopyroside.

**Keywords**: Myxopyrum smilacifolium Blume, antiarthritic, Myxopyroside, Freund's adjuvant, Radiography.

anushiyats7@gmail.com

The study involved extraction, identification, and evaluation of pharmacological activity of Artocarpus hirsutus Lam seeds, commonly known as Wild jack is a greatly valued medicinal plant, which belongs to the plant family Moraceae. Typically growing 20–25 m tall and up to 5m in girth, Artocarpus hirsutus is a tall, evergreen tree with edible, bright yellow, ovoid, spine-covered fruits and white, ovoid seeds. It grows well in any kind of soil and needs a warm, humid climate with lots of rainfall. It is found throughout the Western Ghats, from North Karnataka to the Malabar Coast and Travancore. Hortus Malabaricus, the oldest printed book on Asia's natural plant wealth, mentions it in its third volume provides extensive documentation of the medicinal benefits of Artocarpus hirsutus, also known as wild jack, which is native to Kerala. Preliminary phytochemical screening studies indicated the presence of flavonoids, saponins, tannins, glycosides, and alkaloids. This study estimated the anti-inflammatory prospective of ethanolic seed extract of Artocarpus hirsutus Lam. The invitro anti-inflammatory activity done by inhibition of protein denaturation method and protinase inhibitory method. The result indicates that the seed extract of Artocarpus hirsutus Lam possesses major anti-inflammatory activity.

**Keywords:** Artocarpus hirsutus, phytochemicals, Therapeutic effects, Anti-inflammatory activity.

**ECO-NANOTECHNOLOGY WITH PANCHAGAVYA**

Arpita Bhajipale, Pranoti Kamdi, Vinita Kale, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee

Nanotechnologies are new areas of research focusing on affecting matter at the atomic and molecular levels. Nanotechnologies are able to significantly improve medical diagnostics by making them less expensive and convenient. The use of copper nanoparticles as therapeutic agents could be in particular advantageous because human body has an efficient system to deal with metabolism of copper since it is a micronutrient. Panchagavya is a term used in Ayurveda to describe five important substances obtained from cow namely urine, dung, milk, ghee and curd Synthesis of copper nanoparticle (CuNPs) with biological properties plays an important role in the development of scientifically valuable product. In this study, biosynthesis of copper nanoparticles using Indian traditional medicine, Panchagavya is used which is eco-friendly, simple, cost effective and non-toxic.Copper nanoparticles have gained much attention due to its high electrical conductivity, high melting point, low electrochemical migration behaviour and it is a cheaper metal compared to other metals such as silver, gold, platinum and palladium. An added advantage of copper nanoparticles is that they oxidize and form copper nanoparticles, and are relatively stable in terms of both chemical and physical properties. Copper sulphate (25 mM) solution was mixed with Panchagavya filtrate for the synthesis of copper nanoparticles. The Nano metallic dispersion was characterized ultra violet spectrophotometer, Fourier transmission infrared ray spectroscopy, X-ray diffraction, Dynamic light scattering, Laser Raman, scanning electron microscope, High resolution transmission electron microscope, X-ray fluorescent microscope. In addition, we studied the antioxidant and also cytotoxicity activity. The characterization results revels that the copper nanoparticles are round shaped in the size 98 nm (nm) with −34.4mv stability.

**GREEN SYNTHESIS OF SILVER NANOCOMPOSITES USING MEDICINAL PLANT EXTRACT FOR PHARMACEUTICAL APPLICATION**

Maithili Nagpure, Gayatri Lohe, Vinita Kale,
Rashmi Trivedi, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee - 441002
mainagpure@gmail.com

The rise of antibiotic-resistant infections has created the need for alternative antimicrobial agents. Silver nanoparticles (Ag NPs) have attracted considerable interest due to their strong antibacterial potential. Green synthesis methods provide an environmentally safe and cost-effective substitute for traditional chemical approaches. This work emphasizes, the green synthesis of silver nanocomposites using Syzygium aromaticum (clove) extract, which acts as a reducing and stabilizing agent. Clove is rich in phenolics, flavonoids, and eugenol that enable rapid reduction of silver ions ($Ag^+$) into stable Ag NPs .Characterization of the synthesized nanocomposites was performed, using UV-Visible spectroscopy, FTIR, XRD, and SEM. UV-Visible spectroscopy confirmed the nanoparticle formation and demonstrated that the standard curve of clove extract in ethanol obeyed Beer-Lambert's law within 20–100µg/ml. FTIR confirmed the functional groups involved in stabilization, XRD validated the crystalline nature, and SEM revealed spherical morphology with uniform dispersion in the 20–50 nm range. The synthesized nanocomposites showed promising antibacterial activity through mechanisms including microbial membrane disruption and reactive oxygen species generation. This clove-mediated method highlights a green, sustainable, and efficient route for nanoparticle synthesis, supporting the development of novel antimicrobial agents with broad applications in biomedical and pharmaceutical fields.

**Keywords**: Green synthesis, silver nanocomposites, clove extract, antibacterial activity, Eugenol.

3The Tamil Nadu Dr M G R Medical University, Guindy,
Tamil Nadu, India.

Mosquito-borne diseases such as malaria and dengue continue to pose severe public health threats in India, contributing to high morbidity, mortality, and socio-economic burden. Conventional repellents often suffer from chemical toxicity and environmental hazards, necessitating the development of eco-friendly alternatives. In this study, silver nanoparticles (Ag-NPs) were biosynthesized using aqueous leaf extract of Fioria vitifolia via a green synthesis route, where plant phytochemicals acted as natural reducing and stabilizing agents. Characterization by UV–Vis, XRD, FTIR, TGA, FESEM, EDX, and HR-TEM confirmed the formation of stable, crystalline Ag-NPs with well-defined morphology. In vitro biological studies demonstrated significant antibacterial activity against Escherichia coli (17 mm) and Staphylococcus aureus (15 mm), antioxidant potential in DPPH (68.53 %) and ABTS (69.10 %) assays, anti-inflammatory activity (MSM = 75.6 % at 250 µg/mL), and anticancer effects against A231 cells (IC50 = 38.47 µg/mL). Photocatalytic degradation efficiency reached 88.1 % for indigo carmine dye within 100 min, while zebrafish embryo toxicity assays confirmed safety at 100 µg/mL. The Ag-NPs were further formulated into a mosquito repellent cream, which in vivorepellent tests revealed to provide 96.7 % protection against Aedes aegypti and Anopheles stephensi. GLP OECD 6-pack studies and evaluations in 100 healthy volunteers (biochemical, histopathological, and urine analyses) confirmed that the cream was non-irritant, non-toxic, and skin safe. Collectively, these findings suggest that F. vitifolia-mediated Ag-NPs not only possess multifunctional biomedical properties but also offer an environmentally sustainable and effective solution for mosquito repellent cream development, targeting malaria and dengue prevention in endemic regions of India.

**Keywords:** Fioria vitifolia, Ag-NPs, Green synthesis, Mosquito repellent cream, Human Trials.

**BIOFABRICATION, BIOLOGICAL INVESTIGATION AND FORMULATION OF TOPICAL COSMETICS UTILIZING BIMETALLIC NANOPARTICLES DERIVED FROM PHOENIX DACTYLIFERA.**

Hiba Thahsina P, Abdul Vajid K
Department of pharmaceutics, Moulana College of pharmacy,
Perinthalmanna, Kerala, India, 679322

Biofabrication, a cutting-edge branch of biotechnology, enables the precise design and construction of biologically functional materials using living cells and biomaterials for therapeutic and cosmetic applications. With the growing focus on sustainability, green nanotechnology has gained attention, particularly in the eco-friendly synthesis of nanoparticles. This study focuses on the green synthesis of bimetallic nanoparticles (BNPs) using the aqueous extract of Phoenix dactylifera (date palm), a plant rich in bioactive compounds. The BNPs were prepared by reacting the plant extract with metal salts, followed by purification through filtration and centrifugation. The synthesized nanoparticles were characterized using UV-Vis spectroscopy, FTIR, and SEM to confirm their structural and morphological properties. The BNPs were further evaluated for antimicrobial and antioxidant activities and incorporated into a stable topical cosmetic formulation. The formulations were optimized and assessed for key physicochemical parameters, including pH, spreadability, and viscosity, to ensure stability and suitability for skin application. Safety and biocompatibility evaluations were conducted to align with regulatory standards, confirming their non-toxic nature. This study highlights the potential of Phoenix dactylifera-based BNPs as innovative ingredients for cosmetic applications, supporting skin health and appearance while promoting environmentally sustainable approaches. The findings contribute to the expanding field of Biofabrication, opening avenues for further research in cosmetics and allied sectors.

**Keywords:** biofabrication, bimetallic nanoparticles, Phoenix dactylifera, topical cosmetics, biological investigation

Sri Balaji Vidyapeeth University, Pudhuchery.
ethirajecp@gmail.com

Moringa oleifera, a well-recognized medicinal plant, has been traditionally employed for its nutritional and therapeutic values. The present study was undertaken to explore the pharmacoeconomic perspective and the biological potential of Moringa oleifera water extract, with particular emphasis on its antibacterial, antioxidant, and anti-inflammatory properties. The plant material was authenticated by a botanist, and extraction was performed using the Soxhlet method with water as a solvent, ensuring an economical and sustainable process. The extract was subjected to phytochemical screening, fluorescence analysis of crude powder and extract, and UV spectral studies to confirm the presence of bioactive constituents. Biological evaluation included antibacterial testing against Escherichia coli (Gram-negative) and Streptococcus spp. (Gram-positive), where the extract demonstrated significant inhibitory activity comparable to sodium fusidate ointment. In addition, antioxidant and anti-inflammatory assays revealed encouraging results, further supporting the wound-healing potential by reducing oxidative stress and local inflammation. The findings highlight the promising role of Moringa oleifera as an affordable therapeutic source with multiple pharmacological benefits. Collectively, this study suggests that Moringa oleifera water extract could serve as a cost-effective alternative for wound healing therapy, offering the combined advantages of antibacterial, antioxidant, and anti-inflammatory activities along with its well-established antidiabetic properties.

**Keywords:** Moringa oleifera, Antibacterials, Antioxidant activity, Anti-inflammatory activity, Diabetes management.

**PREPARATION AND EVALUATION OF NUTRACEUTICAL USING INDIAN TRADITIONAL KNOWLEDGE FOR MANAGEMENT OF ALZHEIMER'S LIKE CONDITIONS**

Shyamalendu Tripathy, Aina Singh Dhurve
School of pharmacy, Parul University, Vadodara, Gujarat

Different rasayanas are described in our traditional texts for enhancement of cognition and protecting the psychological co-morbidities associated with them like agitation, stress and depression. Ghrita being lipophilic in nature helps inmicrocirculation of nutrient to different cells and transporting the active constituents to different cells and tissues increasing their potency several times.This article aims to evaluate the possible Nootropic potential of the ghrita prepared from the combination of some household spices like Cinnamon (Cinnamomum verum), Ginger (Zingiber officinale), Garlic (Allium sativum), Curcumin(Curcum longa) and to provide probable scientific explanations for their use. Herbs for ghrita like were collected freshly during the month of February. Ghrita was prepared by taking 1part of kalka (bolus of herbs), 4 parts of pure cow ghee and 16 parts of drava dravya (swarasa). Nootropic potential of the ghrita was evaluated by Radial arm maze, Actophotometer, Rota-Rod Test (Motor Co-Ordination) and Elevated plus Maze (EPM) Test. From Irwin schedule of preliminary psychopharmacological screening it was observed that though gritha and standard drug donepezil have some effect on reactivity, alertness, grooming they are not significant as compare to the control. The transfer latency in Radial arm maze test was reduced by 30.25% upon treatment of medicinal ghrita for a period of 30 days. It produced significant reduction in the fall of time in rota-rod test and decreases the locomotor activity in actophotometer test as compare to control at the end of 30 days study in a 5 minute observation. The results of this investigation suggest the possible nootrophic potential of medicinal ghrita which can be translated as a neutracutical for used in cognitive deficit population.

**PT-208**

**FROM PLANTS TO NANOMEDICINE: THERAPEUTIC POTENTIAL OF SENNA BIOACTIVES IN LUNG CANCER**

Tanish khandare, Yashwant nakhate
SCHOOL OF PHARMACY, GH RAISONI UNIVERSITY, AMRAVATI, MAHARASHTRA

This investigation highlights the potential of Senna species as promising phytopharmaceutical candidates for lung cancer treatment, particularly against A549 cell lines. Ethanolic extracts of Senna underwent phytochemical analysis, which revealed a rich profile of anthraquinones including emodin, aloe-emodin, rhein, chrysophanol, and sennosides along with various flavonoids and phenolic compounds. These constituents are associated with significant cytotoxic, antioxidant, and pro-apoptotic effects. Molecular docking studies indicated that emodin and aloe-emodin exhibit notable binding affinities (−8.2 to −9.5 kcal/mol) with crucial oncogenic targets such as EGFR, Bcl-2, Caspase-3, and PI3K/Akt, supporting their potential role in disrupting lung cancer progression pathways. To address challenges of solubility and bioavailability, advanced drug delivery systems, including liposomes, polymeric nanoparticles, and solid lipid nanoparticles, were formulated, enhancing both stability and targeted cytotoxic activity in A549 cells. Overall, the study underscores the therapeutic value of Senna-derived compounds and demonstrates that combining extraction, phytochemical profiling, molecular docking, and formulation provides a robust framework for the development of novel plant-based anticancer therapies.

**Keywords:** Senna Bio actives, Nanomedicine, Flavonoids and Anti-cancer therapies.

**PT-209**

**THERAPEUTIC POTENTIAL OF VITAMINS AND MINERALS IN VITILIGO: A NUTRACEUTICAL APPROACH**

Sumedha vinchurkar, b.v. nagarjuna yadav
School of pharmacy, g h raisoni university, amravati, Maharashtra

According to recent developments in pathogenesis, it is an autoimmune disease that is impacted by cellular disintegration, hormones, genetics, metabolism, and oxidative stressors. Between 0.5 and 2% of people worldwide suffer from vitiligo, an acquired skin pigmentation disorder. Melanocytes in the skin and mucous membranes cause vitiligo. The condition's precise cause is yet unknown. Topical steroids and PUVA (psoralen with ultraviolet of oral vitamins and minerals) are currently the most widely used treatments for vitiligo. It has recovered from a number of human ailments. The majority of research agrees that sun exposure, folic acid, and vitamin B12 work well together to support regimentation. Furthermore, because zinc and phenylalanine supplements are involved in the melanin formation pathway, they have demonstrated a therapeutic impact on vitiligo when used in conjunction with topical steroid UV-B (ultraviolet B) therapy. We can therefore draw the conclusion that vitiligo patients have lower levels of vitamin B12, vitamin C, vitamin D, vitamin E, zinc, copper, and other vitamins and minerals. This suggests that these vitamins and minerals, along with other antioxidants, are necessary to be taken in addition to treatments for vitiligo, and that further research is necessary to fully examine their effects. This finding could prove beneficial in identifying a cure or treatment for vitiligo.

**Keywords:** Vitiligo, Vitamins, Minerals, Neutraceuticals and Melanocytes.

**PT-210**

**OPTIMIZATION AND ASSESSMENT OF DYE EXTRACTION FROM BAUHINIA PURPUREA FLOWERS VIA RESPONSE SURFACE METHODOLOGY**

Doppalapudi Sandeep, Suryadevara Vidyadhara
Department of Physiology and Pharmacology, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh, India – 522019.
pharmacydeepu@gmail.com

Natural dyes are more durable, eco-friendly, and easy to use compared to synthetic dyes. The purpose of the research is to employ response surface methodology to extract and assess dyes from Bauhinia purpurea flowers. Three variables; temperature, time, and solvent were selected which influence extraction. Temperature was set between 30-60oC, and solvents like distilled water, methanol, and methanol-to-water mixture were chosen. A time range of 30 to 70 minutes was established for extraction. The parameters for 16 runs with R-Software (version 4.4.0) was set using central composite design of response surface methodology. Light, washing, and rubbing fastness tests were used to assess the dyes coloring effects. The antibacterial properties of isolated dyes were examined. Using central composite design and maceration, dyes were extracted from Bauhinia flower petals. The observed yield of extracted dyes ranged from 0.11 to 0.75g. The dyes were dark maroon to black in colour. Dyes have flavonoids, steroids, and carbohydrates. With a t-value of 6.2710 and p value of 0.0007 (<0.001), the intercept with highest yield showed a significant statistical difference. The parameters' two-way interactions indicated p-value of <0.05. Data validation between predicted and observed yields exhibited minimal error. Application of ferrous sulfate as mordant for improved light, washing, and rubbing fastness was supported by coloring capabilities of XV dye. Bauhinia dye revealed increase in zone of inhibition on both gram-positive and gram-negative bacteria with an increase in dose. The, current research concluded that band-aid preparation may make use of dye produced from Bauhinia purpurea flowers.

**Keywords:** Bauhinia purpurea, Flowers, Central Composite Design, Dyes, Anti-bacterial.

**EVALUATION OF PARACETAMOL INDUCED HEPATOPROTECTIVE ACTIVITY OF DIFFERENT EXTRACTS OF QUISQUALIS INDICA LINN FLOWERS**

Shaijal Sharma, Hemalatha K
Department of Pharmacognosy & Phytochemistry,
Acharya & B. M. Reddy College of pharmacy.
Bangalore-560107, Karnataka. India.
shaijalh.22.bpha@gmail.com

To evaluate the hepatoprotective activity of different extracts of Quisqualis indica Linn flowers against paracetamol induced hepatotoxicity. The petroleum ether, ethyl acetate and ethanolic flower extracts was obtained by successive maceration process. These extracts were concentrated, dried under vacuum and subjected to preliminary qualitative chemical investigation, further screened for paracetamol

ISBN: 978-81-980623-8-3

induced Hepatoprotective activity using Wistar rats (200-250 g) of either sex. A control group was treated with paracetamol orally by suspending in 5 % CMC. Hepatotoxicity was induced by administrating paracetamol (3mg/kg), silymarin (25mg/kg) a marketed product was taken as standard and other groups were treated with three different extracts 200 mg/kg single dose for 3 days. After 3 days the same serum was analyzed for Alanine aminotransferase (ALT), Aspartate aminotransferase (AST), Alkaline phosphate (ALP) and Bilirubin. The results reveal that, hepatic enzymes ALT, AST, ALP and bilirubin in serum was significantly (P<0.01) increased in paracetamol treated animals when compared to control. Ethyl acetate and ethanolic extracts shown more significantly (P<0.01) decreased the levels of AST, ALP and bilirubin (P<0.01) 93.3 ± 3.4, 86.0 ± 0.9, 139.7±0.7, 1.7± 0.1 and 95.1±3.4, 89.0±3.0, 141.6±0.7, 1.7±0.5 respectively when compared to control. Whereas petroleum ether extract showed moderate significant (P<0.05) activity. Silymarin (25mg/kg) treated animals also showed significant decrease in AST (P<0.01), ALT, ALP and bilirubin (P<0.01). It was concluded from the result that, the ethyl acetate and ethanol extracts exhibited more significant (P<0.01) hepatoprotective activity, whereas petroleum ether showed moderate activity (P<0.05) against paracetamol induced hepatoxicity in rats.

**Keywords:** Hepatoprotective, Paracetamol, Quisqualis indica, Silymarin.

## EXPLORING THE POTENTIAL OF HERBAL EXTRACTS IN IMMUNOMODULATORY FORMULATIONS: A NEW APPROACH

Harshu M. Randai, Mr. Sumit S. Kolte, Dr. Vinod Thakare
Nagpur College of Pharmacy, Nagpur, Maharashtra.
harshurandai1@gmail.com

The immune system plays a crucial role in maintaining homeostasis and defending against infections, making immunomodulation a key area of interest in healthcare. Herbal extracts, rich in bioactive compounds, have gained significant attention for their potential to enhance immune responses while minimizing adverse effects. This review explores the potential of herbal extracts in immunomodulatory formulations, highlighting their mechanisms of action, efficacy, and safety. Traditional medicinal plants such as Echinacea purpurea, Withania somnifera, Curcuma longa, and Panax ginseng have demonstrated immunomodulatory properties through various pathways, including cytokine regulation, enhancement of macrophage activity, and modulation of T-cell responses. Advances in phytochemical research have identified key active compounds, such as alkaloids, flavonoids, and polysaccharides, that contribute to their immunostimulatory effects. Recent developments in formulation technologies, including nanoencapsulation and bioavailability enhancement strategies, have further improved the efficacy of herbal immunomodulators.However, challenges such as standardization, variability in bioactive composition, and clinical validation need to be addressed to ensure their widespread acceptance and therapeutic reliability. This review underscores the importance of scientific validation of herbal extracts in immunomodulatory formulations, advocating for a multidisciplinary approach combining traditional knowledge with modern research techniques.Herbal immunomodulators represent a promising avenue for enhancing immune health in a natural and sustainable manner.

## RECENT TRENDS IN NUTRACEUTICALS: AN ALTERNATIVE OR A COMPLEMENT TO PHARMACEUTICALS

Bina Gidwani1, Shiv Shankar Shukla1,
Ravindra Kumar Pandey1, Amber Vyas2
1Columbia Institute of Pharmacy, Raipur, Chhattisgarh
2University Institute of Pharmacy, Pt. Ravishankar Shukla University, Raipur, Chhattisgarh
beenagidwani@gmail.com

Nutraceuticals offer a distinct, often complimentary approach to health and wellness than drugs. Nutraceuticals prevent disease and promote well-being, whereas drugs treat it. Nutraceuticals combine "nutrition" and "pharmaceutical." It includes any food or food component that prevents or treats disease. Established pharmaceutical businesses and startups compete in the Indian nutraceutical sector. The Indian nutraceuticals market is expected to increase due to a shift towards preventative healthcare and consumer health awareness. The Indian dietary supplements industry is estimated to reach $30 billion by 2035, growing 8.1% year between 2025 and 2035. An alternative or Complement: Best practices often involve both. A pharmaceutical can treat an active disease, but nutraceuticals can support the body, promote health, and lower the chance of relapse or future sickness. Nutraceuticals will rise due to post-pandemic health awareness and personalised medicine and technology. Nutraceuticals are pharma's future and driven by the desire to be healthier. It offers a viable natural option with efficacy and safety in the products for the betterment of health. Recently the emphasis is focused on nutraceutical with meal replacement therapy or pills, immuno-modulators, prophylaxis powders, inorganic mineral supplements etc. concerning the safety of nutraceuticals includes their toxicity studies, genotoxicity and carcinogenicity, drug interaction and contaminants. In future India will be a strong market for nutraceuticals as the players in the industry will be a combination of large multi-nationals.

**Keywords:** nutraceuticals, pharmaceuticals, herbal supplement, dietary, phytochemical.

## PHYTOCHEMICAL SCREENING AND EVALUATION OF ANTIOXIDANT, TOTAL FLAVONOID, AND PHENOLIC CONTENTS IN METHANOLIC EXTRACT OF CARALLUMA ADSCENDENS WHOLE PLANT

Kotaiah Silakabattini, S. Vidyadhara
Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdavaram, Guntur, Andhra Pradesh -522 019

This study analyzed the methanolic extract of the whole Caralluma adscendens plant for its phytochemicals, antioxidant activity, total flavonoid content (TFC), and total phenolic content (TPC). Phytochemical screening confirmed the presence of important secondary metabolites. Antioxidant potential was evaluated using DPPH and nitric oxide scavenging assays, showing significant radical scavenging activity with IC50 values of 198.436±0.24 µg/ml (DPPH) and 203.712±0.387 µg/ml (nitric oxide), indicating a dose-dependent effect. The TPC and TFC were quantified as 77.23±0.54 mg gallic acid equivalents (GAE) and 65.18±1.73 mg quercetin equivalents, respectively. This demonstrates that Caralluma adscendens methanolic extract contains substantial antioxidant compounds, including phenolics and flavonoids.

**PT-215**

## GREEN SYNTHESIS, CHARACTERIZATION, AND ANTIMICROBIAL EVALUATION OF COPPER SULFATE AND FERRIC SULFATE NANOPARTICLES DERIVED FROM MANGIFERA INDICA LEAF EXTRACT

Bhavesh Yadav, Ishwari Choudhary, Harish Gupta, D. K. Pradhan
Raigarh College of Pharmacy, Raigarh C.G. India 496001
Bhaveshyadav520@gmail.com

Mangifera indica L. (Anacardiaceae) is a widely cultivated fruit tree native to South and Southeast Asia and valued worldwide for its edible fruit and medicinal properties. Mango leaves, in particular, are rich in bioactive compounds with reported anticancer, antidiabetic, antioxidant, hepatoprotective, anti-obesity, and lipid-lowering activities. The use of plant extracts for nanoparticle synthesis has emerged as an eco-friendly and sustainable alternative to conventional chemical and physical methods, offering advantages such as reduced toxicity, lower cost, and enhanced biocompatibility. The present study focuses on the green synthesis of copper sulfate and ferric sulfate nanoparticles using M. indica leaf extract and compares their physicochemical and biological properties. Fresh mango leaves were thoroughly washed, shade-dried, and ground with a mortar and pestle to obtain a crude extract. The synthesis was carried out by adding aqueous solutions of copper and ferric salts dropwise to the extract under continuous stirring until a characteristic color change indicated nanoparticle formation. The resulting suspensions were centrifuged to separate the nanoparticles from unreacted materials and plant debris. The synthesized nanoparticles were characterized using ultraviolet–visible (UV–Vis) spectroscopy, transmission electron microscopy (TEM), X-ray diffraction (XRD), and zeta potential analysis to determine their optical properties, morphology, crystalline structure, and surface charge, respectively. Furthermore, their antimicrobial activity was evaluated against a panel of selected microorganisms to assess their potential biological

ISBN: 978-81-980623-8-3

applications. This study is expected to provide insights into the effect of different precursor metal salts on nanoparticle properties and to promote the sustainable production of functional nanomaterials through plant-based synthesis.

**Keywords:** green synthesis; copper sulfate nanoparticles; ferric sulfate nanoparticles; plant extract; comparative study.

**PHYTOCHEMICAL INSIGHTS AND PHARMACOLOGICAL VALIDATION OF ANTI-ALLERGIC AND WOUND-HEALING ACTIVITIES OF POLYALTHIA LONGIFOLIA**

M PRIYA DHARSHINI

This study investigated the phytochemical profile and potential anti-allergic and wound-healing properties of Polyalthia longifolia, a plant widely recognized in traditional medicine. Phytochemical screening confirmed the presence of alkaloids, flavonoids, glycosides, and phenolic compounds, extracted using solvents of varying polarity. The extracts demonstrated notable pharmacological potential, with ethanol extract showing the highest anti-allergic activity by effectively inhibiting protein denaturation and reducing histamine release in vitro. Chloroform extract was evaluated for wound-healing activity using the L929 murine fibroblast cell line, where it significantly promoted fibroblast migration and proliferation, enhancing wound closure in a dose-dependent manner. These findings suggest that Polyalthia longifolia leaves possess bioactive constituents with promising anti-allergic and wound-healing effects. These findings underscore the therapeutic potential of Polyalthia longifolia leaves while highlighting the importance of dosage optimization to maximize efficacy and minimize toxicity.

**DEVELOPMENT AND EVALUATION OF A BEETROOT-BASED COSMECEUTICAL CREAM FOR SKIN BRIGHTENING**

Sudarshan Karad, Dr. Laxmikant Borse, Dr. Kuldeep Vinchurkar

Sandip Institute of Pharmaceutical Sciences

This innovative cosmetic cream formulation harnesses the natural potency of beetroot extract, renowned for its rich betalain content and powerful antioxidant properties. Designed to revitalize dull and tired skin, the product aims to promote an even-toned, radiant complexion while offering protective benefits against environmental stressors. Beetroot, being a rich source of vitamins (A, C, and folate), helps in detoxifying the skin and improving blood circulation, resulting in a healthy glow. Combined with emollients and stabilizers, this formulation ensures excellent skin compatibility, smooth texture, and enhanced absorption. The formulation is water-based and free from harsh chemicals, making it suitable for all skin types, including sensitive skin. Its natural pinkish hue and hydrating feel provide a luxurious application experience. This cream not only nourishes and hydrates but also aligns with the growing demand for plant-based, eco-friendly skincare solutions, offering consumers an effective and safe herbal alternative in modern cosmetology.

**Keywords:** Beetroot Extract, Betalains, Antioxidant Cream, Herbal Skincare, Natural Cosmetics, Skin Brightening, Eco-friendly Formulation, Detoxifying Cream, Plant-based Skincare, Water-based Cream, Sensitive Skin Friendly, Vitamin-rich Formulation, Radiant Complexion

**FORMULATION AND EVALUATION OF A HERBAL GEL FOR THE TREATMENT OF MOUTH ULCER**

Sayali Chavan, Sushant chinchole, Ganesh shevalkar.
Sandip institute of pharmaceutical sciences, Nashik

Mouth ulcers, also known as aphthous ulcers or canker sores, are painful lesions of the oral mucosa that significantly affect eating, speaking, and overall oral health. Conventional treatments often rely on corticosteroids or antiseptic formulations, which may cause adverse effects with long-term use. Herbal medicine offers a safe, effective, and natural alternative, providing antimicrobial, anti-inflammatory, antioxidant, and wound-healing properties without harmful side effects.This project focuses on the formulation and evaluation of a herbal gel using selected medicinal plants such as Azadirachta indica (Neem), Psidium guajava (Guava), Ziziphus jujuba (Jujube), and Ocimum sanctum (Tulsi). The prepared formulation will be assessed for physicochemical parameters (pH, spreadability, viscosity, stability, homogeneity) and biological activities (antimicrobial, anti-inflammatory, irritation testing). The expected outcome is the development of a stable, non-toxic, and patient-friendly herbal gel that provides symptomatic relief, promotes healing, and offers a steroid-free alternative for the management of oral ulcers.

**Keywords**: Mouth ulcer, Herbal gel, Neem, Guava, Jujube, Tulsi, Anti-inflammatory, Wound healing, Oral formulation.

**PREPARATION OF HERBAL ANTIFUNGAL WIPES**

Tanmay Dalvi, Mokshada Bhavsar, Dr.Ganesh Shevalkar,
Dr.Kuldeep Vinchurkar, Dr.Lakshmikant Borse
Sandip Institute of Pharmaceutical Sciences.

Fungal infections represent a significant public health challenge due to their recurrent nature and the increasing resistance associated with synthetic antifungal agents. Herbal formulations, enriched with bioactive phytoconstituents, have emerged as promising alternatives owing to their efficacy, safety, and minimal side effects. The present work focuses on the preparation of herbal antifungal wipes as a novel, convenient, and patient-friendly dosage form for the prevention and management of fungal infections.In this study, essential oils with well-documented antifungal activity—namely neem oil, tea tree oil, clove oil, turmeric oil, and lavender oil—were selected as active ingredients. These oils were incorporated into a suitable wipe base along with preservatives to enhance stability and extend shelf life. The formulation was prepared by impregnating nonwoven wipe material with the optimized herbal solution, followed by appropriate packaging to maintain efficacy and prevent microbial contamination. The prepared wipes combine the therapeutic potential of herbal extracts with the practicality of disposable wipes, offering a safe, eco-friendly, and cost-effective alternative to conventional antifungal products. This formulation holds promise for improving personal hygiene, ensuring ease of application, and contributing to the growing demand for herbal healthcare products in modern therapeutics.

**Keywords:** Herbal antifungal wipes, Essential oils, Fungal infections, Phytoconstituents, Novel dosage forms Eco friendly formulation

**PT-220**

**ANTHELMINTIC POTENTIAL OF MORINGA OLEIFERA GUM: A NATURAL REMEDY AGAINST PARASITES**

Tanuj Sujit Jain, kuldeep vinchurkar, Laxmikant borse
Sandip institute of pharmaceutical sciences, Sandip foundation
tanujj819@gmail.com

Moringa oleifera, a fast-growing tropical tree of the family Moringaceae, is valued for its high nutritional content and diverse medicinal properties. The present study evaluates the anthelmintic activity of Moringa oleifera gum using Indian earthworm Pheritima posthuma as an experimental model. Gum samples were collected and authenticated, and extracts were prepared using petroleum ether, methanol and chloroform. Phytochemical screening revealed the presence of saponins, proteins, phenols, glycosides and flavonoids, while volatile oils, starch and steroids were absent. Anthelmintic activity was assessed by recording the time required for paralysis and death of worms in comparison with standard drug Albendazole (0.15 mg/10 ml) and normal saline as control. All extracts demonstrated dose-dependent activity, with the petroleum ether extract showing the fastest onset of paralysis (7.06 min) and death (11.40 min), followed by methanol and chloroform extracts. The results indicate that the gum of Moringa oleifera possesses significant anthelmintic properties, comparable to the standard drug. The activity is attributed to the presence of bioactive constituents such as glycosides and phenolic compounds. This study supports the traditional use of Moringa species in treating helminthic infections and suggests its potential for development as a natural anthelmintic agent after further pharmacological and toxicological evaluations.

**Keyword:** Moringa oleifera, Anthelmintic activity, Gum extract, Pheritima posthuma, Chloroform extract, Phytochemicals, Natural deworming agent.

**RUBIA CORDIFOLIA AND CAMELLIA SINENSIS: A SYNERGISTIC HYDRATING HERBAL FACE SERUM FOR SKIN CARE**

Majo Joseph and Rosemol K John

ISBN: 978-81-980623-8-3

Department of Pharmaceutics, Nirmala College of Health Sceince,
Chalakudy, Thrissur, India- 680311.
majojosephvj@gmail.com

Cosmetic serum is a highly concentrated formulation based on water or oil that penetrates quickly into the deeper skin layers, protecting the skin from oxidative damage caused by free radicals. This study aimed to formulate and evaluate a synergistic herbal face serum containing Rubia cordifolia and Camellia sinensis. Extraction and preliminary phytochemical screening were conducted using aqueous extracts, followed by physicochemical evaluation of the serum. The prepared serum is a blend of natural ingredients that penetrate the epidermis, hydrate the skin, and improve complexion and skin tone. It enhances skin texture, leaving it soft and fair. The formulation included Rubia cordifolia, Camellia sinensis, glycerine, hyaluronic acid, and xanthan gum. Physical and chemical parameters such as colour, appearance, viscosity, globule size, spreadability, and antioxidant activity were evaluated. The optimized F5 batch showed no residue formation, was easy to wash off, and demonstrated effective skin hydration and protection.

**Keywords:** Rubia cordifolia, Camellia sinensis, Oxidative damage protection, Synergistic Hydrating Serum

## PHYSICOCHEMICHAL AND PHARMACOLOGICAL PROFILING OF ANCYCLUS PYRETHRUM AND CHLOROPHYTUM BORIVILIANUM

Anju Anant and shashikant chandraker
Shri Rawatpura Sarkar university Raipur Chhattisgarh, Columbia institute of pharmacy Raipur Chhattisgarh India 492101
Anjuanant4@gmail.com

Bioactive molecules discovered in medicinal plants are extensive and support of both conventional and contemporary therapeutic uses. Among the ,chlorophytum borivilianum (safed Musli) and Anacyclus pyrethrum (Akarkara ) are well known for their ethnomedical significance, the goal of the current investigation was to assess and contrast these two plant'physicochemical and pharmacological characteristics. Moisture content, ash and extractive values, p H, and phytochemical screening for alkaloids, saponins, glycosides, flavonoids,tannins, and sterols were all parts of the physicochemical characterizations process. Reviewing well established in vitro and in real life studies on aphrodisiac, immunomodulatory, neuropharmacological,anti-inflammatory ,and anti-oxidant properties was a technique used for pharmacological testing. The findings that C.borivilianum a high content of saponin and steroidal glycosides ,supporting its adaptogenic immunomodulatory,and arthritis quelities.A pyrethrum root extract are rich in alkaloid, primary which contribute to neurostimulant and aphrodisiac effects. Synergistic therapeutic potential was found through comparative pharmacological profiling, especially in the treatment of arthritis, sexual dysfunction , and stress. The quality and purity of crude medication were validated using standardization measures, which can help create herbal medicines that consistently work. This thorough analysis establishes a scientific foundation for the traditional application of these plants and emphasizes their importance as significant phytotherapeutics resources. To determine their place in evidence –besed phytomedicine, more research involving toxicity profiling.

## THE EFFECT OF HERBAL NUTRACEUTICALS ON HUMAN HEALTH

Shivani Sawarkar, Awdhut Pimpale
Tulsiramji Gaikwad Patil College of Pharmacy,
Maharashtra, India - 441108
shivanisawarkar786@gmail.com

Nutraceuticals are nutrients, or components of nutrients, that play a significant role in adapting and maintaining regular physiological functions necessary to sustain a healthy human life. Nutritional fibers, probiotics, prebiotics, polyunsaturated fatty acids, antioxidants, spices, phytochemicals, and other diverse kinds of herbal or natural nutrients can all be categorized as nutrient items utilized in nutraceuticals. The healthcare branch focused on all features of nutraceuticals, ranging from systematic parts to medical trials, from efficiency studies to valuable effects on well-being status. Nutraceuticals describe themselves as a natural and essential component of our daily diet. These nutraceuticals aid in the fight against some of the most pressing health issues of the day, including obesity, heart disease, cancer, osteoporosis, arthritis, diabetes, and cholesterol. Herbal nutraceuticals are utilized as a potent weapon for maintaining health and fighting major, chronic diseases that are brought on by poor nutrition, thereby encouraging the best health, longevity, and quality of life.

**Keywords:** Nutraceuticals, Nutrients, Well-being, Health.

## MOSQUITO LARVICIDAL POTENTIAL AND COMPARATIVE EVALUATION OF ASIAN WEEDS CASSIA ALATA LINN, ZEPHYRANTHES MINUTA (KUNTH) D. DIETR. AND PARTHENIUM HYSTEROPHORUS LINN.

Mukesh Kumar Sharma, Ajazuddin
School of Pharmacy, Rungta International Skills University,
Bhilai, Chhattisgarh, INDIA
mukesh.rcpsr@gmail.com

Although synthetic mosquito larvicidal agents have been widely used, they exhibit deteriorating effects on health and the environment. Therefore, as an alternative and safe approach, we attempted to explore the mosquito larvicidal potential of leaves of weeds Cassia alata Linn (CA), Zephyranthes minuta (Kunth) D. Dietr. (ZM) and Parthenium hysterophorus Linn (PH). Weeds were evaluated by protocol prescribed by WHO 2005 against 4th instar larvae of Aedes aegypti, Anopheles subpictus, and Culex quinquefasciatus. Ethanol, diethyl ether and n-hexane leaf extracts were studied in preliminary screening for their larvicidal potential at 20, 40, 80, 160, 320 and 640 mg/l concentrations. Larvicidal activities were performed using the petri dish method taking batches of 25 larvae. The larval mortality was observed after 12 and 24 hr of the treatment. Log probit analysis (95% confidence level) was performed as a statistical tool using AAT Bioquest to reveal LC50 and LC90 values. PH shows maximum efficacy in comparison to other weeds as LC50 values of PH alcoholic extracts against Aedes aegypti were minimum (22.42±1.50) in comparison to other weed extracts, and it is close to the LC50 (10.66±0.90) of standard larvicidal compound N,N-diethyl-meta-toluamide (DEET). Further, with the other two species Anopheles subpictus and Culex quinquefasciatus, the PH extracts in diethyl ether and n-hexane show minimum LC50 values of 23.67±1.10 and 22.42±1.50 respectively. The results of the present investigation suggest that PH possesses remarkable larvicidal potential specifically for Aedes aegypti and Culex quinquefasciatus, the most commonly found species in developing and underdeveloped Asian countries.

**Keywords:** Cassia alata, Parthenium hysterophorus, Zephyranthes minuta, Mosquito larvicides, Aedes aegypti, Culex quinquefasciatus

## GREEN SYNTHESIS OF COPPER OXIDE NANOPARTICLES USING JUSTICIA GENDARUSSA BURM.F. LEAF EXTRACT FOR ANTI-INFLAMMATORY AND ANTIOXIDANT ACTIVITY

Shibani Kashyap, Jessica Kalita and Bitu Gogoi
Department of Pharmaceutical Chemistry, NETES Institute of Pharmaceutical Science, NEMCARE Group of Institutions,
Mirza, Kamrup, Assam- 781125
kashyapshibani71@gmail.com

In this study, copper oxide nanoparticles (CuO-NPs) were successfully synthesized via a green approach using the aqueous leaf extract of Justicia gendarussa Burm.F. The primary aim was to evaluate the impact of eco-friendly synthesis on nanoparticle formation, characterization, and in-vitro biological activities, with a focus on anti-inflammatory and antioxidant effects. The synthesized CuO-NPs were characterized using Fourier Transform Infrared Spectroscopy (FTIR) and UV-Visible spectroscopy. Dynamic light scattering analysis revealed an average particle size of 921.7 nm, while UV-Vis spectra showed a characteristic absorption peak at 263 nm. FTIR analysis confirmed the presence of functional groups associated with copper oxide formation, without indications of undesirable interactions, suggesting effective capping and stabilization by plant biomolecules. The biological potential of CuO-NPs was assessed through anti-inflammatory activity by inhibition of protein denaturation and antioxidant activity using DPPH radical scavenging assays. The nanoparticles exhibited notable anti-inflammatory and antioxidant properties, with $IC_{50}$ values marginally higher than those of

ISBN: 978-81-980623-8-3

reference standards, indicating promising bioactivity. The study establishes that Justicia gendarussa extract serves as a potent, natural reducing and stabilizing agent in the synthesis of CuO-NPs. These nanoparticles demonstrate potential therapeutic applications in managing inflammation and oxidative stress-related conditions. However, further investigations are warranted to elucidate the underlying mechanisms, bio-distribution, and long-term safety profiles of these nanoparticles to ensure their safe and effective use in biomedical applications

**Keywords:** Copper oxide nanoparticles, Justicia gendarussa, green synthesis, anti-inflammatory activity, antioxidant activity.

**GREEN APPROACHES TO CELLULOSE RECOVERY FROM BANANA PSEUDOSTEMS: PROCESS OPTIMIZATION AND INDUSTRIAL POTENTIAL**

Gokul Rajasekaran, Periyasamy Parthiban
gokulrj2224@gmail.com

Global banana production exceeds 116 million tons per year, generating enormous agricultural waste in the form of banana pseudostem leftovers. These lignocellulosic wastes provide significant prospects for sustainable biomass valorization, especially cellulose extraction—a process previously inhibited by the removal of lignin and hemicellulose.This study aims to optimize environmentally friendly extraction parameters for cellulose recovery from banana pseudostems and assess the purity and potential industrial applications of the obtained cellulose.Response Surface Methodology (RSM) was used to optimize pretreatment factors such as NaOH and $H_2O_2$ concentrations, as well as microwave-assisted radiation time. To ascertain the purity and structural characteristics of the extracted cellulose, Fourier Transform Infrared Spectroscopy (FTIR), X-Ray Diffraction (XRD), and Scanning Electron Microscopy (SEM) were used.The optimized extraction process resulted in cellulose recovery of over 82%, with low hemicellulose and lignin residuals. Characterization investigations showed the cellulose's excellent purity and favorable morphological characteristics.The study highlights the potential of this green and effective technology for high-yield cellulose extraction from banana pseudostems for industrial uses such as environmentally friendly adsorbents, thermal insulation, and soundproofing materials.

**Keywords:** Cellulose Extraction, Banana Pseudostems, Green Chemistry, Response Surface Methodology, Industrial Biomaterials

**PT-227**

**MODIFICATION OF NATURAL POLYMERS FOR PHARMACEUTICAL, BIOMEDICAL AND ENVIRONMENTAL APPLICATIONS**

SNEHA DILIP TIPUGADE

Synthetic polymers, being prepared with the help of chemicals have a side effect on the atmosphere as well as on human beings. Natural polymers, such as polysaccharides, proteins, and nucleic acids, are components of biological systems responsible for performing a wide range of essential functions. Biodegradable natural polymers have been investigated extensively as the best choice for encapsulation and delivery of drugs. The research has attracted remarkable attention in the pharmaceutical industry. Natural polymers have received more attention because of their advantages over synthetic polymers such as abundant availability, low cost, biodegradability and non-toxicity. However, natural polymers suffer some limitations such as drop-in viscosity upon storage, uncontrolled hydration, solubility, inability to perform under high temperature and pressure (thermal stability), etc. These disadvantages of natural polymers can be overcome by chemical modification of natural polymers by crosslinking, blending, interpenetrating polymers networks, polymer grafting, and so on. Graft copolymerization is one of the most commonly employed polymer modification methods used to prepare hybrid polymers from natural and synthetic polymers. Graft copolymerization is a very significant technique to add hybrid properties in backbone of polymers. The grafting generally initiated through the formation of free radical centers on the polymer backbone as well as monomer.

**PT-228**

**BOTTLE GOURD EFFERVESCENT TABLETS: A NOVEL APPROACH TO NUTRACEUTICAL LIVER SUPPORT**

Borusu Balavendra Srinivas, Gummadi Rama Krishna
Department of pharmaceutics, Aditya University, Surampalem, Andhra Pradesh, India – 533437
borusubalavendrasrinivas@gmail.com

The present innovation relates to a novel nutraceutical formulation developed as an effervescent tablet comprising bottle gourd (Lagenaria siceraria) powder as its principle active ingredient. This formulation is aimed at promoting liver health, supporting detoxification, and enhancing overall wellness.Effervescent properties are achieved through the combination of citric acid and sodium bicarbonate, while sweetening agents such as mannitol and sorbitol are incorporated to improve palatability and encourage consumer compliance. Direct-compression excipients are included to aid in processing and ensure consistency of the large dosage form.The effervescent tablet is manufactured using a direct compression technique, a method that not only simplifies production but also provides effective protection against moisture and enhances the stability of active compounds. Each optimized tablet, with an average weight of 450 mg, demonstrates rapid disintegration within three minutes, complete effervescence, acceptable hardness, and friability appropriate for oral dosage forms. The solution formed upon disintegration maintains a pH range that is both safe and organoleptically pleasing. The formulation further complies with Indian Pharmacopeia standards for friability and weight variation, ensuring quality and reliability. Its effervescent delivery platform improves bioavailability, enhances convenience of use, and offers increased consumer acceptability. The integration of bottle gourd powder with optimized excipients and an effective manufacturing approach distinguishes this formulation as a novel, patentable nutraceutical product.

**Keywords:** Nutraceutical formulation, Effervescent tablet, Detoxification, Bottle gourd (Lagenaria siceraria), Direct compression.

**PT-229**

**DUAL LAYER HERBAL TOPICAL SYSTEM FOR RINGWORM TREATMENT AND SKIN PIGMENTATION MANAGEMENT**

Ansari Yasir Hasan, Afzal Anees Shaikh
Department of Pharmaceutics,HK College of Pharmacy, Mumbai, Maharashtra, India-400102
ansari.yasir_24-26@hkcp.edu.in

A bilayer topical patch was developed to provide dual therapeutic benefits in the management of ringworm and associated post-inflammatory hyperpigmentation through the synergistic action of herbal essential oils. The first polymeric layer, designed for direct skin contact, was incorporated with two essential oils in synergism to exert potent antifungal activity. The upper layer was formulated with bioactive compounds targeting hyperpigmentation, thereby addressing a common sequela following antifungal therapy. Physical characterization of the patch demonstrated favorable tensile strength, uniform thickness, and sustained drug release, confirming its structural integrity and suitability for topical application. In vitro diffusion studies validated effective and controlled transdermal delivery of active constituents over an extended period. Antimicrobial activity, assessed against Trichophyton rubrum, showed strong inhibitory and fungicidal effects, further supported by Minimum Fungicidal Concentration (MFC) assays. Molecular docking studies corroborated these results, revealing favorable interactions of active compounds with fungal protein targets. Safety evaluation via the chorioallantoic membrane (CAM) assay and trypan blue cytotoxicity assay confirmed the biocompatibility of the bilayer system. Furthermore, tyrosinase inhibition assays established the patch's potential in reducing hyperpigmentation, while anti-inflammatory testing demonstrated significant attenuation of inflammatory markers. Collectively, the results highlight the bilayer patch as a multifunctional, biocompatible, and effective transdermal delivery system offering both antifungal and skin-tone restorative benefits. This innovative approach may serve as a promising alternative for holistic management of superficial fungal infections with cosmetic relevance.

**Keywords:** Bilayer topical patch, Ringworm, Hyperpigmentation, Herbal essential oils, Antifungal activity, Trichophyton rubrum

**ANTIPYRETIC EFFECTS OF OXALIS EXTRACTS**

Nilesh Kumar, Amit Agrahari
Praduman Singh Shikshan Prashikshan Sansthan Pharmacy College, Basti, U.P. -272001

ISBN: 978-81-980623-8-3

mpharmnilesh@gmail.com

This study investigated and compared the antipyretic effects of ethyl acetate and ethanol extracts from two Oxalis species: Oxalis corniculata and Oxalis latifolia. The experiment used a pyrexia model induced by Brewer's yeast in test subjects. A control group received only the pyretic agent, allowing for a baseline comparison against the extract-treated groups. Before pyrexia induction, all subjects had normal body temperatures. Following the yeast injection, their temperatures significantly rose, confirming the establishment of fever. The test extracts were then administered, and body temperatures were monitored every two hours to assess their antipyretic efficacy. The results demonstrated a dose-dependent effect, with higher concentrations of the extracts showing a more pronounced reduction in fever. The most significant antipyretic activity was observed with the ethyl acetate extract of Oxalis latifolia at a concentration of 500 mg/ml. This was followed in efficacy by the ethyl acetate extract of Oxalis corniculata. The ethanol extracts of both species showed a lesser, but still notable, antipyretic effect, with Oxalis latifolia again proving more potent than Oxalis corniculata. These findings suggest that the active antipyretic compounds in these plants are more effectively extracted by ethyl acetate and are present in higher concentrations in Oxalis latifolia. This research provides valuable data on the traditional medicinal uses of these plants and points to their potential as sources for new antipyretic drugs. This activity may be due to the presence of Flavonoids, Alkaloids and Tannins as their secondary metabolite.

**Keywords:** Pyrexia Model, Dose-dependent effect, Secondary Metabolite

## HEPATOPROTECTIVE EFFECT OF ELAEOCARPUS GANITRUS LEAF EXTRACT AGAINST PARACETAMOL-INDUCED LIVER INJURY IN WISTAR RATS

P.Richa Misritha, K.Kavya Sudha
PharmD, Department of pharmacology, Ratnam Institute Of Pharmacy, Nellore, Andhra Pradesh.
Department of pharmacology, Ratnam Institute Of Pharmacy, Nellore, Andhra Pradesh

Paracetamol (acetaminophen) overdose is a major cause of drug-induced hepatotoxicity, characterized by oxidative stress, hepatocellular necrosis, and elevated liver enzymes. Elaeocarpus ganitrus (Rudraksha), valued in Ayurveda, has shown antioxidant and anti-inflammatory properties, but its Hepatoprotective potential remains underexplored. The study evaluated the Hepatoprotective activity of E. ganitrus leaf extract against paracetamol-induced liver injury in Wistar rats. The animals were divided into five groups: a normal control, a paracetamol-impaired control (2 g/kg, p.o.), a standard silymarintreated group (50 mg/kg, p.o.), and two E. ganitrus leaf extract treatment groups (200 and 400 mg/kg, p.o.). After 7 days of treatment, Hepatoprotective activity was assessed by measuring serum biochemical markers [SGOT, SGPT, ALP, total bilirubin, and total protein] and by histopathological evaluation of liver tissues. Paracetamol intoxication caused a marked elevation of SGOT (186.5 ± 8.2 U/L), SGPT (172.4 ± 7.9 U/L), ALP (226.7 ± 10.5 U/L), and total bilirubin (2.14 ± 0.11 mg/dL) compared to the control group ($p < 0.001$). SGOT (92.3 ± 6.1 U/L), SGPT (88.7 ± 5.8 U/L), ALP (118.6 ± 8.7 U/L), and bilirubin (0.86 ± 0.09 mg/dL) were all significantly reduced when E. ganitrus leaf extract (400 mg/kg) was administered, and total protein levels were restored to close to normal (6.9 ± 0.4 g/dL). The Hepatoprotective effect was comparable to the silymarin-treated group. Histopathological studies confirmed reduced necrosis, fatty changes, and restored hepatic architecture in extract-treated animals. The findings indicate that Elaeocarpus ganitrus leaf extract exerts significant Hepatoprotective activity against paracetamol-induced liver damage, likely due to its antioxidant phytoconstituents. This supports its traditional use and potential development as a natural therapeutic for liver disorders.

**Keywords:** Elaeocarpus ganitrus, Leaf extract, Hepatoprotective activity, Paracetamolinduced hepatotoxicity, Wistar rats, Silymarin

## ETHOSOMAL FORMULATION OF PUNARNAVA LEAF EXTRACT FOR TARGETED ANTIMICROBIAL THERAPY IN BOVINE MASTITIS

Mudavath Prasanth Naik and Ramakrishna Gummadi
Department of Pharmaceutical Sciences, School of Pharmacy, Aditya University, Aditya Nagar, Surampalem, Kakinada -533437
mudavathprasanth3@gmail.com

Bovine mastitis continues to pose a major challenge in the dairy industry, with staphylococcus aureus recognised as a predominant pathogen. This study investigates an ethosomal delivery system incorporating Punarnava (Boerhaavia diffusa) leaf extract to enhance therapeutic performance against S. aureus. The plant is rich source of alkaloids, flavonoids, and phenolic acids, all with established antimicrobial activity. Encapsulation of these bio actives within ethosomal composed of phospholipids, ethanol, propylene, glycol, cholesterol, glycerine and mannitol improved solubility, permeability and bioavailability while maintaining extract stability. The ethosomal formulation enabled deeper penetration of phytoconstituents through bacterial membranes, producing a stronger inhibitory effect compared with both crude extract and convention antimicrobials. Minimum inhibitory concentration (MIC) assays demonstrated a substantial reduction in the required dose, confirming enhanced potency. Furthermore, the excipient matrix supported vesicle integrity, sustained drug release, and consistent antimicrobial action offering practical applicability in veterinary treatment. This Punarnava-based ethosomal system represents a plant derived, biocompatible, and sustainable strategy for mastitis management. By coupling natural antimicrobial properties with an advanced delivery platform, it offers a viable alternative to synthetic antibiotics resistance in dairy herbs. Its distinctive composition, controlled release profile and proven efficacy against S. aureus also highlight potential for intellectual property protection and translational use in veterinary medicine.

**Keywords**: Bovine mastitis, Staphylococcus aureus, boerhaavia diffusa, ethosomal, minimum inhibitory concentration, antimicrobial activity.

## QUANTITATIVE PHYTOCHEMICAL PROFILING AND IN VITRO ANTIOXIDANT POTENTIAL OF RHUS CHINENSIS MILL. FRUITS FROM THE SIKKIM HIMALAYAN REGION

Surabhi Mandal, Faruk Alam, Bhupendra Shrestha
Faculty of Pharmaceutical Science, Assam down town University, Panikhaiti, Guwahati, Assam, 781026, India
Dept. of Pharmaceutical Analysis, Himalayan Pharmacy Institute, Majhitar, Rangpo, East Sikkim, 737136, India
surabhizofficial@gmail.com

Rhus chinensis Mill., a deciduous tree belonging to the family Anacardiaceae, is prevalent throughout China, Japan, and northeastern India, including Sikkim and Manipur, among other places. The purpose of this study was to examine the phytochemical profile and antioxidant capacity of several extracts made from Rhus chinensis Mill. fruits. The fruits were collected, authenticated and then successively extracted using Soxhlet utilising solvents with varying degrees of polarity, such as n-hexane, chlorofom, methanol, and 70% methanol-water. Additionally, maceration was used to prepare a water extract. Quantitative analysis revealed the methanol extract had the highest Total Phenolic Content (126.943 ± 2.763 mg GAE/g) while the hydro-alcoholic extract had the highest Total Flavonoid Content (29.116 ± 3.436 mg RtE/g). DPPH and hydrogen peroxide scavenging assays, along with the measurement of the extracts' total antioxidant content, were used to assess their antioxidant potential. The methanol extract had the strongest antioxidant activity, with $IC_{50}$ values equivalent to the standard quercetin in the DPPH and hydrogen peroxide scavenging assays of 17.9 ± 3.55 µg/mL and 22.57 ± 5.676 µg/mL, respectively. Additionally, the maximum total antioxidant concentration (58.60 ± 1.5 mg AAE/g) was found in the methanol extract. These results indicate that Rhus chinensis Mill. fruits have the potential to be a natural antioxidant source and encourage further research into their possible therapeutic applications.

**Keywords:** Rhus chinensis Mill., Quantitative analysis, In Vitro antioxidant activity.

## EVALUATION OF IN-VITRO AND IN-SILICO ANTI-DIABETIC ACTIVITY OF THE PLANT JUSTICIA GENDARUSSA BURM.F

Nilanjana Thakuria, Muslek Uddin Mazumder
NETES Institute of Pharmaceutical Science, Mirza, Kamrup, Assam- 781125

ISBN: 978-81-980623-8-3

nilanjana3579@gmail.com

Justicia gendarussa Burm f., a medicinal plant with diverse pharmacological actions, was evaluated for its antidiabetic potential through in-vitro, in-silico, and network pharmacology approaches. Diabetes mellitus, marked by chronic hyperglycemia, leads to severe complications, and current synthetic drugs are limited by high costs and adverse effects, driving interest in plant based alternatives. In-vitro assays demonstrated α-amylase and α-glucosidase inhibitory activity of the extract, indicating a role in carbohydrate metabolism. Phytochemical screening identified active compounds, which were docked against key-diabetic targets (α-amylase, α-glucosidase, and DPP-IV), showcasing strong binding affinities and suggesting inhibitory potential. ADMET profiling predicted good pharmacokinetics, drug-likeliness, and safety. Network pharmacology revealed multiple interactions with diabetes related targets, highlighting multitarget activity. The plant's contituents may act through enzyme inhibition, insulin signaling modulation, and oxidative stress reduction. These findings validate its traditional use and suggest J. gendarussa as a promising candidate for novel phytotherapeutics, warranting further in-vivo and clinical studies.

**Keywords:** Justicia gendarussa, pharmacological activities, phytochemical constituents, network pharmacology.

**PT-235**

## PHYTOCHEMICAL CHARACTERIZATION AND ASSESSMENT OF WOUND HEALING ACTIVITY OF ARTEMISIA VERLOTIORUM LAMOTTE LEAVES

Pratistha Phukan, Moziihrii Chache, Koushik Nandan Dutta
Department of Pharmacognosy, NETES Institute of Pharmaceutical Science, NEMCARE Group of Institutions, Shantipur, Mirza, Kamrup, Assam-781125
pratisthaphukan@gmail.com

This study explores the phytochemical composition and wound healing activity of Artemisia verlotiorum Lamotte, a traditionally used medicinal plant for skin ailments in Northeast India. Leaves were collected from Dimapur, Nagaland, authenticated by the Botanical Survey of India, and subjected to pharmacognostical analysis for botanical confirmation. Sequential solvent extraction was performed, and the resulting extracts were analyzed using Thin Layer Chromatography (TLC), High-Performance Thin Layer Chromatography (HPTLC), and High-Resolution Liquid Chromatography-Mass Spectrometry (HR-LCMS). Phytochemical investigation revealed the presence of bioactive compounds such as flavonoids, phenolic acids and sesquiterpene lactones phytoconstituents known for their antioxidant, anti-inflammatory and antimicrobial properties. Antioxidant assay demonstrated the strong radical scavenging activity indicating extracts potential of lower oxidative stress a crucial component of wound healing. Its safety for tropical application was validated by acute cutaneous toxicity test. Significant gains in wound contraction, tissue regeneration, and re-epithelialization were shown in in vivo wound healing investigations. Positive interactions between key phytoconstituents and proteins involved in wound repair were revealed by complementary in silico molecular docking, which may point to potential molecular processes. The ethnomedical application of A. verlotiorum for wound care is supported by these results, which also highlight the wider therapeutic potential of native plants from Northeast India. The development of formulations, clinical validation, and active ingredient isolation are future directions.

**Keywords:** Artemisia verlotiorum Lamotte, HR-LCMS, HPTLC, In vivo study.

**PT-236**

## PHYSICOCHEMICAL AND PHYTOCHEMICAL CHARACTERIZATION OF DICHROSTACHYS CINEREA (L.) LEAVES

HASAN MOHAMED.K, SHYAM S.S, THILAGAM.E, VIJAYAKUMAR.S
JKKMMRF'S ANNAI JKK SAMPOORANI AMMAL COLLEGE OF PHARMACY NAMAKKAL DISRTRICT, TAMIL NADU
hasanmohame105@gmail.com

Herbal plants are invaluable natural resources, providing therapeutic compounds used globally in traditional and modern medicine. Dichrostachys cinerea (L.) Wight and Arn. Belongs to the family Fabaceae is a notable herb in Indian and African medicine, traditionally used to treat ailments such as headaches, diabetes, and arthritis. Its leaves and bark contain active compounds with anti-inflammatory properties. The leaves of Dichrostachys cinerea (L.) Wight and Arn. were collected from a forest near Hosapete, Karnataka, authenticated and shade-dried before being powdered and stored for extraction. In the present study physicochemical analyses, phytochemical, Thin Layer Chromatography (TLC) and fluorescence analysis were conducted. The leaves of Dichrostachys cinerea (L.) Wight and Arn. physicochemical analyses are total ash, water soluble ash, sulphated ash, acid insoluble ash, moisture content, alcohol soluble extractive and watersoluble extractive values were obtained. The qualitative phytochemical analysis revealed the presence of carbohydrates, tannins, flavonoids, phenolic, and saponins were present in both alcoholic and water extracts. TLC profile revealed the presence of flavonoids in both extracts. Dried powderd leaves was treated with a number of different reagents which showed characteristic fluroscence. The present study establishes the medicinal and therapeutic application the plant. The diagnostic characters not only facilitate the identification of the crude drug, also helpful to determine the quality and purity of the plant material.

**Keywords:** Physicochemical, phytochemical, flavonoids, Dichrostachys cinerea.

## IN-HOUSE PREPARATION AND STANDARDIZATION OF HERBAL HYDRATING FACEMASK

Rohit Chaudhary, Paramsingh Battiya, Faizan Ansari, Priyanka Mohite, Nirmal Kasekar
MGM School of Pharmacy, Kamothe, Navi Mumbai.
mohite.priyanka0307@gmail.com

Face mask is the cosmetic face mask that directly delivers active ingredients to the skin for intensive, Short-term treatment. The mask is designed to form a barrier that trap moisture and allow ingredients to penetrate more deeply in skin compared to moisturizers/skincare products. Gel-based masks are skincare product which forms a gel like consistency, used for hydration, soothing, and refreshing the skin.Cosmetic formulation which are available in the market having high amount synthetic chemical agent which are harmful to face and body. To avoid this harmful effect herbal excipients were used to formulate face mask which providing hydrating, soothing and motorizing effect to skin.The constituent were extracted from herbal ingredients such as papaya, rice water, cucumber, turmeric, sandalwood. They were purchased from the local area and were grinded, filtered, mixed homogenously and then evaluated for parameters including organoleptic, physicochemical, rheological features, phytochemical, stability, and irritancy examination.The filtrate was used to make face this pack showed good flow property which is suitable for a face pack. Organoleptic evaluation showed that the pack is smooth and pleasant smelling powder. Rheological findings justified the flow properties of the pack as it was found to be free flowing and non-sticky in nature. The results proved that the formulation was stable on all aspects. Irritancy test showed the negative. Stability tests performed revealed the inert nature of the pack.Thus, in the present work, we formulated a pack, which can be easily made with the easily available ingredients. It showed all the benefits of a face pack and further optimization studies are required on its various parameters to find its useful benefits on the human beings.

**Keywords:** Skin, Hydrating Herbal face pack, Standardization.

## FORMULATION AND EVALUATION OF POLY HERBAL GEL OF CITRUS SINUSES

Lugalapu Likitha, Suresh Babu Emandi
Department of Pharmacognosy, Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry, East Godavari District, Andhra Pradesh, India-533102.
likithalugalapu1207@gmail.com

Herbal medicines are still the mainstay of about 75-80% of the world's population, mainly in developing countries, for primary health care because of better cultural acceptability, better compatibility with human body and lesser side effects. Herbal medicines consist of plant or its part to treat injuries, disease or illnesses and are used to prevent and treat diseases and ailments or to promote health and healing. It is a drug or preparation made from a plant or plants and used for any to such purpose. Herbal medicines are the oldest form of health care known to

ISBN: 978-81-980623-8-3

mankind. Gel formulations prepared with Carbopol 934, HPMC K 100 M and Xanthan gum showed good homogeneity, no skin irritation, good stability and anti- inflammatory activity. However, the Xanthan gum based gel proved to the formula of choice, since it showed the highest percentage of Extrudability, good spreadability and rheological properties. Gels are defined as semi rigid systems in which the movement of the dispersing medium is restricted by an interlacing three-dimensional network of particles or solvated macromolecules of the dispersed phase. The word ''gel'' is derived from ''gelatin,'' and both ''gel'' and ''jelly'' can be drawn back to the Latin gelu for ''frost'' and gel are, meaning ''freeze'' or ''congeal.'' This origin indicates the essential idea of a liquid setting to a solid-like material that does not flow, but is elastic and retains some liquid characteristics.

**Keywords:** Polyherbal gel, Formulations and Evaluation, Synthetic compounds, Preservatives.

**DEVELOPMENT OF TRANSDERMAL PATCHES USING A NATURAL POLYMER, MORINGA OLEIFERA GUM**

Abha Rani, Kirti Rout, Pooja Patra, Harish Gupta
Raigarh College of Pharmacy, Raigarh Chhattisgarh, India ,496001
abhasidar@gmail.com

The problems with oral medicine administration in particular were addressed by the transdermal drug delivery system. To provide a specific dosage of medication via the skin and into the bloodstream, a transdermal patch—a medicated adhesive patch—is put to the skin. It promotes the healing of an injured bodily component. Transdermal drug delivery has an advantage over other delivery methods such as oral, topical, intravenous i.m., etc. because the patch enables controlled medication dispensing into the patient, typically by melting thin medication layers embedded in the adhesive or by a porous membrane covering a reservoir. The primary disadvantage of transdermal administration methods is that only drugs with tiny molecules may readily pass through the skin and be administered in this manner due to the skin's strong barrier. Careful polymer selection is required to regulate the drug loading, rate of release, and length of release. The most crucial factor to take into account when choosing a polymer is the drug-polymer interaction. The food, pharmaceutical, and other sectors are heavily researching moringa gum, a polysaccharide exudate derived from the stem of the plant Moringa oleifera.

**Keywords:** Transdermal, Delivery System, Natural Polymer, Patch, Moringa, Gum.

**NEUTRACEUTICALS- ROLE IN PREVENTION AND TREATMENT OF HEART DISEASES**

A.Hima Bindu, V. Swathi,
Department of Pharmacology and Pharmacy Practice, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu,
Vijayawada, A.P., India-521108
himabinduande2005@gmail.com

Nutraceuticals are food products, or their components, that offer health benefits beyond basic nutrition, often by preventing or treating disease. "Nutrition" and "Pharmaceutical," encompasses everything from whole foods containing bioactive compounds like antioxidants and omega-3 fatty acids to fortified foods and dietary supplements such as vitamins, probiotics, and herbal extracts. Heart disease reflects to a few cardiovascular disorders. Varied pathophysiological events observed in different cardiovascular conditions. At the tissue level during metabolism, this dynamic is highly sensitive to change, and it does so very rapidly. Numerous enzymatic and hormonal mechanisms, acting like transistor switches, are available to manage this extraordinary dynamic situation. Oft cited evidence shows that nutrition, when properly understood and used, can control as much as 70-85% of the premature mortality caused by cardiovascular disease. This nutrition is ideally powered by whole foods from the plant kingdom, with nutrients acting wholistically in the body in a way to benefit all disease subtypes, even though effect size and outcome responses for each heart disease subtype may differ.

**Keywords:** Nutraceuticals, bioactive compounds, enzymatic and hormonal mechanisms, mortality.

**RECENT TRENDS OF THE FORMULATION AND THERAPEUTIC POTENTIAL OF POLYHERBAL SYSTEMS IN MODERN HEALTHCARE**

Tilesh Sahu, Ishwari Choudhary, Aakash Gupta, D.K. Pradhan
Raigarh College of Pharmacy, Raigarh C.G. India 496001
tileshsahu15@gmail.com

Polyherbal formulations, comprising synergistic combinations of multiple medicinal herbs, have remained integral to traditional systems like Ayurveda, Siddha, and Unani for managing complex diseases. Modern scientific advances have validated their multi-targeted mechanisms, superior efficacy, and reduced toxicity profiles compared to single-herb or synthetic drugs. Classical formulations such as churna, kwath, asava, and arishta continue to be foundational, while recent innovations incorporate nanocarrier-based delivery systems, chromatographic standardisation, and integration into cosmeceuticals and nutraceuticals, thereby expanding their therapeutic horizons. Polyherbal systems have shown promising anti-diabetic activity through β-cell regeneration and insulin sensitisation, immunomodulatory and anti-inflammatory effects by enhancing macrophage function and cytokine regulation, and antimicrobial-antioxidant actions effective against multidrug-resistant pathogens. Despite these advantages, challenges such as standardisation, quality control, and limited clinical validations persist. Their incorporation into regenerative medicine, functional foods, and global healthcare standards highlights their transformative potential. This review underscores that polyherbal formulations, combining traditional wisdom with modern scientific validation, offer safe, effective, and holistic therapeutic alternatives, addressing the global demand for evidence-based natural healthcare.

**Keywords:** Polyherbal systems; nanocarriers; synergistic effects; therapeutic potential.

**FORMULATION OF HERBAL CONSTITUENTS LOADED OINTMENT AS A DUAL DRUG DELIVERY SYSTEM FOR THE TREATMENT OF VITILIGO**

Simran Gangotri, Ishwari Choudhary, D.K. Pradhan
Raigarh College of Pharmacy, Raigarh C.G. India 496001
simrangangotri122@mail.com

Vitiligo is a progressive skin disorder characterized by the loss of melanocytes, leading to depigmented patches. Current treatments have limited efficacy due to poor skin penetration and slow melanocyte stimulation. This study aims to develop a dual drug delivery ointment incorporating Psoralea corylifolia (bakuchiol) for melanogenesis stimulation and piperine (from Piper nigrum) for enhanced bioavailability and skin penetration, providing a synergistic therapeutic effect.A dual-phase herbal ointment was formulated using a hydrophobic ointment base incorporating an oil-in-water emulsion for controlled drug release. The bioactive compounds, Psoralea corylifolia extract (rich in bakuchiol) and piperine, were incorporated. The ointment was evaluated for physicochemical properties, pH, viscosity, and spreadability. Particle size analysis of the emulsion phase ensured optimal dispersion. In vitro drug release studies demonstrated sustained delivery, while Franz diffusion cell studies assessed skin permeability. Stability studies were performed under accelerated conditions.The optimized formulation exhibited excellent spreadability, pH compatibility, and a biphasic drug release pattern ensuring prolonged action. Ex vivo skin permeation studies confirmed enhanced penetration of both bioactives, with piperine significantly improving the absorption of Psoralea corylifolia. The dual drug delivery system provided superior therapeutic outcomes compared to conventional treatments. The Herbal Constituents Loaded ointment effectively enhanced drug penetration, melanocyte stimulation, and repigmentation, offering a promising herbal alternative for vitiligo management.

**Keywords:** Vitiligo, Psoralea corylifolia, Piperine, Dual drug delivery, Herbal ointment.

**HERBAL IN-SITU GEL BASED ON HEAT-SENSITIVE POLYMERS FOR THE TREATMENT OF GLAUCOMA**

Aakash Gupta
Raigarh College of Pharmacy, Raigarh Chhattisgarh, India ,496001
guptaaakash170@gmail.com

ISBN: 978-81-980623-8-3

Glaucoma is the second most common cause of blindness and permanent visual loss worldwide. Although it is the primary risk factor for glaucomatous optic neuropathy, elevated intraocular pressure (IOP) is not usually an indication of glaucoma. There are numerous herbal formulations on the market for the therapy of glaucoma, although they have drawbacks including low therapeutic response and bioavailability, short retention periods, etc. The use of an in situ gel-forming ocular medication delivery device can get over these restrictions. When exposed to physiological eye temperature, the temperature-sensitive in situ gel formulations undergo a phase shift from liquid to semisolid gel. At room temperature, these liquids flow freely and are simple to inject into the eye like drops. Poloxamer 407 and Poloxamer 188 are examples of thermosensitive polymers, which can react to temperature changes by becoming soluble in water at low temperatures and insoluble at higher ones. The introduction to various in-situ gel formation techniques, drug release mechanisms, polymers used in formulations, general preparation techniques such as the cold and hot methods, various in-situ gel system applications, and in-situ gel evaluation are the main topics of this review.

**Keywords:** Glaucoma, In-situ gel, Heat sensitive Polymers, Herbal Formulation.

**PT-244**

## DETERMINATION OF ALLELOPATHIC POTENTIAL ON GERMINATION AND GROWTH OF CHILLI PLANT

Abhijit Karanje, Gautam Bade, Kavita Yadav, Yogesh Kharat
Department of Pharmacognosy,
Marathwada Mitra Mandal's College of Pharmacy,
Thergaon, Pune-411033 (M.S.), India
abhijit.karanje@mmcop.edu.in

Allelochemical are natural compounds which effects the growth of surrounding plants. These compounds usually develop in plants, soils, and other surrounding organisms. Furthermore, these molecules vary from plant to plant and with changes in biotic and abiotic situations. The present study was aimed, determination of allelopathic potential on germination and growth of chilly plant and its impact on secondary metabolite. The herb plant designed as the allelochemical recipient in this study is red chilly (Capsicum anuum L). The chilly seeds were used single variety. In order to determine the chilly plants germination rate and growth by using treatment Spiritual music, Korean music, ice, fumes and polluted water in a laboratory Condition. The germination rate were studied and the pharmacognostic study involving physicochemical and phytochemical parameters were detected. The extraction process was performed using cold maceration method and methanol as a solvent, to obtain extracts of Capsicum annum leaf. Chromatographic analysis involved thin layer chromatography (TLC) and high performance thin layer chromatography (HPTLC). Our study confirmed, the sound vibrational techniques helps the plant to grow healthy and disease free. The research works proves that music therapy grown medicinal plants well- being, while spiritual music helps to better growth of plants compared to Korean music. The findings of this study confirmed that cow dung fumes treatment given plant shows less adverse effect while polluted water and ice treatment given plant shows negative effect on seed germination, growth, morphology, microscopy and chromatographic analysis.

**Keyword:** Allelochemicals, Germination, Spiritual, Korean music, HPTLC.

## DESIGN AND CHARACTERIZATION OF GREEN TEA EXTRACT NANOEMULGEL DERMATOLOGICAL APPLICATION

Butola Sakshi Narendra Singh, More Chinmayee, Manisha Karpe.
BHARATI VIDYAPEETH'S COLLEGE OF PHARMACY,
SECTOR 8, C.B.D BELAPUR,
NAVI MUMBAI – 400614.
manisha.karpe@bvcop.in

This study aimed to design and characterize a green tea extract (GTE)-loaded nanoemulgel for enhanced dermatological applications. Green tea extract, enriched with polyphenolic compounds such as epigallocatechin gallate (EGCG), possesses strong antioxidant, anti-inflammatory, antimicrobial, and anti-aging activities. However, its poor aqueous solubility and limited skin permeability restrict its therapeutic potential when applied topically. To overcome these limitations, a nanoemulgel was formulated by incorporating GTE-loaded nanoemulsion into a Carbopol 940 gel base. Optimization was carried out using a 2×2 factorial design, with oil (ethyl oleate) and surfactant (Tween 80 with PEG 400) concentrations as independent variables. The optimized nanoemulgel exhibited a mean droplet size of 115.8 nm, low polydispersity index (0.24), zeta potential of –4.6 mV, and high drug content (92.35 ± 1.12%). Rheological and physicochemical assessments demonstrated desirable viscosity (558 cP), spreadability, and skin-compatible pH (6.3–6.5). In vitro release studies showed sustained release with 68.06% cumulative drug release over 12 hours, while stability studies confirmed formulation robustness without phase separation. These findings indicate that the developed nanoemulgel significantly improves the solubility, stability, and dermal penetration of GTE, making it a promising, safe, and patient-friendly topical delivery system for therapeutic and cosmeceutical applications.

**Keywords:** Green tea extract, nanoemulgel, epigallocatechin gallate, topical drug delivery, dermatological application, antioxidant, sustained release, cosmeceuticals.

## NOVEL HERBAL BASED BANDAGE LOADED WITH ROHITAKA TECOMA UNDULATA AND CURCUMA AMADA FOR TOPICAL INFLAMMATION CONTROL

Aher Shivam Nivrutti, Marina g. D'Souza,
Lakshmikanth Borse, Kuldeep Vinchurkar
Sandip Institute of Pharmaceutical Sciences
shivamaher96k@gmail.com

Inflammation and muscle pain are widespread conditions that compromise mobility, reduce comfort, and slow down recovery. Swelling of muscles due to inflammation is especially debilitating and often requires localized therapy for effective relief. Conventional anti-inflammatory treatments, while effective, may cause side effects and poor patient acceptability, prompting interest in natural alternatives. In this project, herbal bandages were formulated incorporating Rohitaka (Tecoma undulata Roxb.) bark, traditionally known as Ragatrodha, and Ambe Halad (Curcuma amada Roxb.) rhizome, both esteemed in Ayurveda for their anti-inflammatory, analgesic, and healing properties.The bark of Tecoma undulata is noted for reducing muscle swelling and alleviating inflammation, while Curcuma amada provides strong anti-inflammatory, muscle pain–relieving, and tissue-healing actions. To enhance patient comfort, menthol and camphor were also incorporated into the herbal paste, imparting a cooling and soothing effect that complements the anti-inflammatory action. The prepared paste was integrated into the absorbent pad of sterile bandages, allowing both protection of the affected site and localized delivery of active phytoconstituents.The bandages were evaluated for physical integrity, paste retention, sterility, and therapeutic performance. The results demonstrated that the herbal bandages were stable, adhered well, and showed significant efficacy in reducing muscle swelling, alleviating localized pain, cooling inflamed tissues, and minimizing inflammation. This suggests that such medicated herbal bandages may serve as a safe, natural, and patient-compliant alternative for managing muscle inflammation and associated discomfort.

**Keywords**: Herbal based bandage, Tecoma undulata (Rohitaka/Ragatrodha), Curcuma amada (Ambe Halad), Menthol, Camphor, Anti-inflammatory, Muscle pain relief, Swelling reduction, Wound healing, Topical therapy, Natural formulation.

## DETERMINATION OF PHYTOALEXIN RESPONSE IN CHILLI PLANT FOR PLANT GROWTH PROMOTION AND EXPRESSION OF DEFENCE.

Prasad Kadam, Manohar Patil, Yogesh Kharat, Gautam Bade
Department of Pharmacognosy,
Marathwada Mitra Mandal's College of Pharmacy,
Thergaon, Pune-411033 (M.S.), India
prasad.kadam@mmcop.edu.in

The leaves of Capsicum annuum were subjected to biotic (fungal and bacterial) and abiotic (chemical) treatments inducing the accumulation of phytoalexins, which are low molecular weight antimicrobial compounds produced by plants in response to pathogenic stress. These compounds function as a part of the plant's innate immune system, conferring resistance against invading pathogens and external harmful

ISBN: 978-81-980623-8-3

factors. Capsicum annuum seeds were germinated and grown until the 16–17 leaf stage under controlled conditions before being divided into treatment groups exposed to fungi, bacteria, and chemical elicitors, with untreated plants serving as controls. The elicitor treatments triggered a pronounced accumulation of phytoalexins compared to controls. Phytoalexin presence and variation were analyzed using chromatographic techniques, including thin layer chromatography (TLC) and high-performance thin-layer chromatography (HPTLC). HPTLC fingerprinting revealed distinct band patterns corresponding to different phytochemical responses, with major peaks indicative of capsaicin or related compounds. These findings support the defensive role of phytoalexins in Capsicum annuum and suggest their potential as biomarkers for plant defense responses. Further studies employing advanced analytical techniques are recommended to precisely characterize these compounds.

**Keywords:** Capsicum annuum, Phytoalexins, Elicitors, Biotic stress, Abiotic stress, HPTLC

**PT-248**

**DEVELOPMENT AND EVALUATION OF A CHEWABLE HERBAL TABLET CONTAINING GINGER AND PEPPERMINT EXTRACTS FOR NAUSEA**

Mausam Nirmalkar, Ishwari Choudhary, D.K. Pradhan
Raigarh College of Pharmacy, Raigarh C.G. India 496001
mausamnirmalkar758@mail.com

Nausea is common in motion sickness, pregnancy, and gastrointestinal disorders, and conventional antiemetics can cause side effects and low acceptability. Zingiber officinale (ginger) and Mentha × piperita (peppermint) possess documented antiemetic and carminative properties. This study aims to develop and evaluate a chewable tablet combining standardized ginger and peppermint extracts to provide a palatable herbal alternative. The extracts were blended with mannitol, microcrystalline cellulose, xylitol, crospovidone, flavoring, and suitable glidants and lubricants, then compressed directly into chewable tablets. Planned evaluations include weight variation, hardness, friability, disintegration, content uniformity, assay of gingerols and menthol by validated HPLC and GC methods, dissolution in simulated saliva and gastric fluid, microbial testing, stability under ICH conditions, and organoleptic assessment. This approach seeks to produce a standardized, patient-friendly formulation for effective management of nausea.

**Keywords:** Chewable tablet; Ginger extract; Peppermint extract; Herbal antiemetic; Nausea management

**PT-249**

**DEVELOPMENT AND EVALUATION OF A POLYHERBAL TOOTHPASTE CONTAINING MISWAK, BABOOL, FENNEL, CLOVE, SALT AND CARDAMOM**

Kirti Sahu, Ishwari Choudhary, Harish Gupta, D.K. Pradhan
Raigarh College of Pharmacy, Raigarh C.G. India 496001
Kirtisahusahu84@mail.com

Oral diseases such as dental caries, gingivitis and halitosis remain prevalent worldwide, and many commercial toothpastes contain synthetic antimicrobials and abrasives that may cause adverse effects with prolonged use. Herbal ingredients with documented antimicrobial, anti-inflammatory and astringent properties can provide a safer and more acceptable alternative. Miswak (Salvadora persica), babool (Acacia arabica), fennel (Foeniculum vulgare), clove (Syzygium aromaticum), salt and cardamom (Elettaria cardamomum) have all been traditionally used for oral care. This study aims to formulate and evaluate a polyherbal toothpaste combining these six ingredients. Standardized extracts or finely powdered forms of the herbs are incorporated with a suitable base of calcium carbonate, glycerin, sorbitol, sodium carboxymethylcellulose, surfactant and flavoring agents. The prepared toothpaste will be evaluated for physicochemical parameters (appearance, pH, viscosity, spreadability, foamability, abrasiveness), microbial quality, and content uniformity of selected marker compounds. Antimicrobial activity against common oral pathogens and stability under accelerated conditions will also be assessed, alongside sensory evaluation for taste, texture and overall acceptability. The formulation strategy seeks to produce a standardized, effective and palatable herbal toothpaste that harnesses multiple traditional ingredients to support oral hygiene and fresh breath.

**Keywords:** Polyherbal toothpaste; Miswak; Babool; Clove; Oral hygiene

**PT-250**

**FORMULATION AND EVALUATION OF NARINGENIN-BASED NUTRACEUTICAL TABLETS FROM CITRUS PEEL EXTRACT**

Sakshi sakharam more

The present study focuses on the formulation and evaluation of a nutraceutical tablet using naringenin, a flavonoid extracted from the peels of citrus fruits (Citrus reticulata). Naringenin is a bioactive compound known for its potent antioxidant, anti-inflammatory, and anticancer activities, but its poor aqueous solubility and low bioavailability limit therapeutic application. In this work, naringenin was isolated from orange albedo through Soxhlet extraction and subsequently hydrolyzed to obtain naringenin. The purified extract was incorporated into a tablet formulation with excipients such as mannitol, microcrystalline cellulose, povidone K30, and magnesium stearate. The prepared tablets were subjected to standard evaluation parameters including hardness, friability, weight variation, disintegration time, and dissolution profile. Results demonstrated that the formulated nutraceutical tablets exhibited acceptable physicochemical properties and improved dissolution performance compared to the pure compound. This study highlights the potential of developing citrus-derived herbal nutraceuticals as a cost-effective and natural approach for the management of oxidative stress-related disorders and chronic diseases such as cancer and diabetes.

**Keywords:** Nutraceuticals, Naringenin, Flavonoids, Citrus peel extract, Antioxidant.

**PT-251**

**HERBO-SYNTHETIC EMULGEL OF NEEM OIL AND MICONAZOLE NITRATE: A NOVEL APPROACH IN ANTIFUNGAL THERAPY.**

Aboli gopalrao kawane

Superficial fungal infections are among the most common dermatological problems worldwide, often causing discomfort, itching, and relapse due to incomplete treatment. Conventional topical formulations such as creams and ointments, though effective, frequently show limitations including poor penetration, greasy texture, and reduced patient acceptability. To overcome these drawbacks, novel delivery systems like emulgels have gained attention. Miconazole nitrate, a widely used synthetic antifungal, demonstrates strong activity against dermatophytes and Candida species. However, its effectiveness can be restricted by inadequate skin retention and limited diffusion through the stratum corneum. Neem oil, derived from Azadirachta indica, has been traditionally employed for its antifungal, antibacterial, and wound-healing properties. Combining miconazole nitrate with neem oil in an emulgel system offers the potential for dual therapeutic action—enhancing antifungal efficacy while also providing anti-inflammatory and skin-soothing benefits.The proposed formulation of miconazole nitrate–neem oil emulgel integrates the structural advantages of emulsions and gels, resulting in improved drug release, enhanced stability, ease of application, and better patient compliance. Evaluation parameters will include physical appearance, pH, viscosity, spreadability, drug content uniformity, in-vitro release, antifungal activity, and stability studies. These tests aim to confirm that the formulation not only retains its physicochemical stability but also provides prolonged residence time on the skin with improved therapeutic outcomes. This work emphasizes the synergy between synthetic and herbal components in a single topical delivery system. By combining miconazole nitrate with neem oil in an emulgel base, the study aspires to present a safe, cost-effective, and patient-friendly alternative for managing superficial fungal infections, thereby addressing both efficacy and compliance issues in current topical therapies.

**Keywords:** Emulgel, Miconazole nitrate, Neem oil, Antifungal activity, Topical delivery, Synergistic therapy, Skin retention, Patient compliance In-vitro release Stability studies.

ISBN: 978-81-980623-8-3

tanvikurhekar24@gmail.com

The present study presents a sustainable and efficient approach for the valorization of dried sugarcane peels, an abundant agricultural residue, into high-value bioactive compounds. Our work focuses on a novel sequential solvent extraction protocol to isolate sugarcane wax and subsequently purify policosanol. To maximize yield, a saponification step with ethanolic potassium hydroxide was developed to effectively release the long-chain aliphatic alcohols. Comprehensive structural analysis using IR, UV-Vis, and LCHRMS confirmed the successful isolation of policosanol, with a high concentration of the key constituents octacosanol (C28) and tricontanol (C30). This robust and reproducible method not only addresses agricultural waste but also provides a pathway to obtain a valuable nutraceutical precursor with significant hypocholesterolemic and pharmacological properties. The findings from this research lay a critical foundation for scalable biorefinery technologies, paving the way for practical applications in the pharmaceutical and functional food industries.

**Keywords:** Sugarcane wax, policosanol, hypocholesterolemic, octacosanol, tricontanol.

## DEVELOPMENT OF TRADITIONAL-BASED HAIR OIL FOR HAIR REJUVENATION AND ALOPECIA MANAGEMENT

Neha S, Agilandeswari Devarajan, Supriya Mana,
Ashly Merin George, Harshitha Nehru
Department of Pharmaceutical Sciences, MVM College of Pharmacy, Bengaluru, Karnataka, India-560064
nehasgowda53@gmail.com

The increasing popularity of herbal cosmetics, particularly herbal hair oils, can be attributed to their perceived effectiveness and low side effects. The primary objective of this study was to develop and evaluate a traditional-based hair oil formulation designed to address common hair concerns, including hair loss, dandruff, baldness, premature graying, and dry hair, ultimately leading to hair rejuvenation and alopecia management. Hair oil formulation was prepared by boiling a precise combination of herbal ingredients, including Phyllanthus emblica, Allium cepa, Lawsonia inermis, Murraya koenigii, Eclipta alba, Azadirachta indica, Centella asiatica, Hibiscus rosa-sinensis, Ricinus communis L. oil, and Olea europaea oil, in cold-pressed Cocos nucifera oil. The developed formulation was subjected to evaluation, encompassing phytochemical analysis, geographical assessment, organoleptic properties, and measurement of physicochemical parameters such as pH, viscosity, specific gravity, acid value, and saponification value. Stability studies as per ICH guidelines and advanced analytical techniques such as Gas Chromatography-Mass Spectrometry (GC-MS) were conducted, along with an in-vitro hair follicle study. Pharmacological assessment in Albino Wistar rats demonstrated that the developed herbal hair oil was more effective in promoting hair length growth and rejuvenation compared to the synthetic minoxidil control, confirming its stability and safety for topical application.

**Keywords:** Traditional, Hair rejuvenation, Alopecia management, Stability studies, Gas Chromatography, Dandruff control, Physicochemical parameter

## GUAVA (PSIDIUM GUAJAVA) SEED OIL: BIOSYNTHESIS, BIOACTIVE COMPOSITION, AND SUSTAINABLE APPLICATIONS

Prathyusha GV, Shobha Singarapalle
Pharmaceutical Chemistry Division, Jagan's Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh. Nellore, Andhra Pradesh, India.
gvenkataramanareddy577@gmail.com

Guava (Psidium guajava L.), a tropical fruit widely cultivated in many regions, is a rich source of bioactive compounds. The seeds, often discarded as waste, contain valuable oil with promising pharmaceutical, nutraceutical, and cosmetic applications. Biosynthesis of guava seed oil involves natural metabolic pathways where fatty acids, phytosterols, and polyphenols accumulate within the seed tissue. The oil is especially rich in linoleic acid, oleic acid, carotenoids, and tocopherols, which contribute to its antioxidant, antimicrobial, and anti-inflammatory properties. Recent studies highlight eco-friendly extraction methods, including cold pressing and green solvents, that preserve the natural integrity of the oil. Utilizing guava seed oil not only adds value to agro-industrial by-products but also supports sustainable resource management. Its biosynthetic profile and functional properties position guava seed oil as a potential candidate for use in functional foods, skincare formulations, and novel drug delivery systems. Guava (Psidium guajava) is a common tropical fruit, and its seeds, usually thrown away, contain useful oil. This guava seed oil is formed naturally in the seed and is rich in healthy compounds like linoleic acid, oleic acid, vitamin E, and antioxidants. These provide the oil with many benefits such as protecting cells, reducing inflammation, and fighting germs. The oil can be extracted by eco-friendly methods like cold pressing. Using guava seed oil is not only good for health and skincare but also helps reduce waste by turning fruit seeds into valuable products.

**Keywords:** Guava (Psidium guajava), Seed oil, Biosynthesis, Fatty acids (linoleic acid, oleic acid), Antioxidants, Vitamin E (tocopherols), Eco-friendly extraction

## PHYTOCHEMICAL INSIGHTS AND PHARMACOLOGICAL POTENTIAL OF TERMINALIA CHEBULA: AN INTEGRATIVE ANALYTICAL PERSPECTIVE

Sireesha Gurrala, Surendra Jugguru
Pharmaceutical Chemistry Division, Jagan's Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh. Nellore, Andhra Pradesh, India.
siri96472@gmail.com

Terminalia chebula Retz. (Haritaki in Ayurveda; Karakkaya in Telugu), A prominent member of the family Combretaceae holds a revered place in traditional systems of medicine such as Ayurveda, Unani, and Siddha. Celebrated as a versatile "wonder drug," it exhibits a broad spectrum of pharmacological activities, including antioxidant, antimicrobial, laxative, anti-inflammatory, and hepatoprotective effects. These therapeutic properties are largely linked to its diverse array of bioactive phytoconstituents, such as tannins, flavonoids, glycosides, phenolic acids, and alkaloids. Among them, chebulagic acid, chebulinic acid, gallic acid, and ellagic acid stand out as key compounds contributing to its medicinal effectiveness. Modern analytical methods, including chromatographic techniques (HPTLC, HPLC, GC–MS) and spectroscopic methods (UV–Vis, FTIR, NMR), are employed for accurate profiling, standardization, and validation of these constituents. This review reaffirms the traditional claims surrounding T. chebula and highlights the integration of advanced analytical strategies with phytopharmacological research, paving the way for innovative drug development and standardized herbal formulations.

**Keywords:** Terminalia chebula, Haritaki, Karakkaya, phytoconstituents, chebulagic acid, chebulinic acid, gallic acid, ellagic acid, chromatographic techniques, spectroscopic profiling, phytochemistry, pharmacological activities, herbal drug standardization.

## ISOLATION, PURIFICATION AND CHARACTERIZATION OF BIOACTIVES FROM SHILAJIT: A MODERN APPROACH TO ETHNOMEDICINES

Sharath Jagadish, Guru raj GM, Paramita Das Shilajit

A traditional Ayurvedic medicine, is rich in phytocompounds with potential therapeutic benefits. This study aimed to isolate, purify, and characterize phytocompounds from Shilajit using a combination of chromatographic and spectroscopic techniques. The results revealed the presence of Ethyl ferulate bioactive compounds. The isolated compounds obtained to be 250 mg and their Rf value was found to be 0.44. These compounds were isolated and purified using techniques such as column chromatography and high-performance liquid chromatography (HPLC). Characterization of the isolated compounds was performed using spectroscopic techniques, including Fourier transform infrared (FTIR) spectroscopy, Nuclear magnetic resonance (NMR) spectroscopy and Mass spectroscopy the molecular weight of the compound was found to be 222.24 g/mol respectively. The study provides valuable insights into the chemical composition of Shilajit and its potential therapeutic applications. The isolated and characterized phytocompounds may serve as a basis for further research into their pharmacological properties and potential uses.

**Keywords:** Shilajit, isolation, column chromatography, ethyl ferulate.

**OPTIMIZED BIOGAS PRODUCTION FROM KITCHEN WASTE USING INOCULUM RECYCLING, METHANOGENIC BACTERIA, AND SUBSTRATE SIZE REDUCTION**

Manohar Babu Kuppala, P.Bandeswararao, MD. Samshad Nafisha, P. Charishma Pranitha, B. Ravi Kumar
Dept of Pharmaceutical Biotectnology, GIET School of Pharmacy, Rajamahendravaram, Andhra Pradesh, India – 533296
manohark@giet.ac.in

Biogas production has gained global attention as a renewable source of sustainable energy amidst rising concerns over fossil fuel depletion and greenhouse gas emissions. Currently, large-scale adoption of biogas technology remains limited due to long fermentation periods, variable gas composition dominated by carbon dioxide and methane, and a lack of optimized processes for consistent yields. In the present study, process optimization was explored to overcome these limitations using kitchen waste as the primary substrate. To accelerate fermentation, inoculum from a previous batch was added, thereby increasing the microbial population and minimizing the lag phase. Furthermore, supplementation with methanogenic bacteria enhanced methane enrichment, while substrate pretreatment through particle size reduction improved enzymatic activity and microbial accessibility. These interventions significantly shortened fermentation time and boosted methane yield compared to conventional practices. Despite its proven benefits, biogas technology is not yet widely practiced due to factors such as inconsistent feedstock availability, insufficient technical knowledge, and high operational costs for large-scale deployment. Nevertheless, with advancing microbial biotechnology, efficient waste management strategies, and growing demand for green energy, optimized biogas production holds immense potential as a scalable and eco-friendly alternative to fossil fuels in the future.

**PT-258**

**FORMULATION AND EVALUATION OF HERBAL SHAMPOO OF ALLIUM CEPA**

Sambangi Vijaya Mohini, Suresh Babu Emandi
Department of Pharmacognosy, Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry, East Godavary District, Andhra Pradesh, India-533102.
sambangivijaya24@gmail.com

This study focuses on the formulation, evaluation, Hibiscus rosa-sinensis herbal shampoos incorporating Allium cepa and other natural ingredients. Herbal shampoos are gaining preference due to their minimal side effects, absence of harmful chemicals like sulfates, and their benefits for hair care. The formulation process included ingredients such as Allium cepa powder, aloe vera gel, soap nut, gelatin, lemon juice, rose water, and propyl paraben. The study aimed to assess the shampoo's physicochemical properties, antimicrobial activity, and effectiveness compared to commercial shampoos. Evaluation parameters such as pH, viscosity, foam stability, surface tension, and dirt dispersion were measured. Results indicated that herbal shampoos provided conditioning, dandruff prevention, and improved hair texture while being safer and environmentally friendly alternatives to synthetic shampoos. This research highlights the potential of herbal shampoos as effective and sustainable hair care solutions.

**Keywords:** Herbal shampoo, Natural and Healthy, Allium cepa, Natural Ingredients Physicochemical properties, conditioning, evaluation of shampoo.

**PHYTOCHEMICAL PROFILING AND ANTIOXIDANT POTENTIAL OF MONSTERA DELICIOSA: IMPLICATIONS FOR PHARMACEUTICAL RESEARCH**

A Ramkumar, Suresh Nimushakavi, Rajesh E Jesudasan
School of Pharmacy, The Assam Kaziranga University, Jorhat, Assam, India

Monster deliciosa is a tropical fruit, originated from the tropical forests of southern Mexico and Panama, belongs to the family Araceae. The plant contains several bioactive compounds with distinct pharmacological properties. The present study investigates the preliminary phytochemical screening (alkaloid, flavonoid, tannin phenol, saponin, terpenoids, glycoside, steroids, carbohydrate and protein) and in vitro antioxidant activities methods like 1,1-diphenyl-2-picrylhydrazil radical (DPPH), 2,2'-azino-bis (3-ethylbenzothiazoline-6-sulfonic acid (ABTS) and Ferric Reducing Antioxidant Power (FRAP) of different solvent (chloroform, ethyl acetate, ethanol methanol and aqueous) of M. deliciosa fruit. Phytochemical analysis revealed the aqueous extract was rich in alkaloids (774.12±0.617 µg/mL) and saponins (549.27±0.991 µg/mL). Flavonoids were prominent in both ethyl acetate (3444.54±0.485 µg/mL) and aqueous (4919.86±0.727 µg/mL) extracts. Tannins and proteins were found in the ethanol (36.53±0.073 µg/mL and 320.67±0.009 µg/mL, respectively) and methanol (68.29±0.277 µg/mL and 340.22±0.960 µg/mL, respectively) extracts. Phenols were present in the ethyl acetate (790.42±0.163 µg/mL) and aqueous (870.62±0.273 µg/mL) extracts. Glycoside, terpenoid, steroid and carbohydrate were present in all five extracts. The in vitro antioxidative potential of M. deliciosa fruit was evaluated at concentrations of 20, 30, and 40 µg/mL using DPPH radical scavenging, ABTS, and ferric reducing antioxidant potential assays. Ethyl acetate extracts of M. deliciosa fruit demonstrated superior activity in DPPH and ABTS assays, highlighting the solubility of their bioactive compounds and potent antioxidant properties. In contrast, the aqueous extract showed better activity in the FRAP assay. The fruit of M. deliciosa exhibited significant potential activity.

Ploy herbal Toothpaste is commonly used product by all individuals. Ploy herbal Toothpaste is generally used for cleaning of teeth and mouth. It is also used to treat many disorders of teeth. Many dentists recommend to use toothpaste to treat disorder like sensitivity, Chronic gingivitis etc Polyherbal toothpaste with natural ingredients is more acceptable in public opinion than chemical-based synthetic formulations in the current oral dental care scenario due to their safety and efficacy in reducing dental caries and preventing other dental disorders to which this generation is prone. In this composition, we use, cinnamon oil, Neem, pomegranate peel, all of which have never been used before in any research. These extracts have anti-ulcer, anti-caries, anti-bacterial, and remedial properties, as well as certain unique properties including anti-cancer and anti-fungal. Herbal toothpastes were evaluated to determine important physical characteristics such as pH, stability, Extrudability, spread ability, foam ability, and homogeneity to develop a more effective and stable product. The novelty of this project is to overcome teeth problems to minimizing adverse effect of synthetic drug by using polyherbal ingredients.

**Keywords:** Herbs, polyhebral tooth paste, formulation, evaluation of tooth paste, antiseptic activity.

**A COMPARATIVE STUDY OF MYROBALAN EXTRACTS WITH STANDARD ASCORBIC ACID**

Ashwitha M, Satish H, Ashish Rai, Malviya Nidhi, Abdul Naim

Ascorbic acid is commonly called Vitamin C which as several physiological action on various disease like skin care and also to maintain blood vessel, bones and cartilage which is also much used in scurvy. As we are in exploration of Ascorbic acid in vegetative source, so we had a selected the fruit Myrobalan under the Biological Source: Terminalia chebula of family: Combretaceae. On the executing the UV analytical work for different concentration of Myrobalan fruit alcohol and water extracts in comparision with standard Ascorbic acid at 258nm, on investigation and by plotting the linearity curve, i.e., concentration vs absorbance of both fruit extracts and standard, then on comparison with the standard, found that fruit Myrobalan water extract as a good source of Ascorbic acid.

**Keywords:** Myrobalan, Terminalia chebula, Ascorbic acid.

ambekartitiksha@gmail.com

Depression is a multifactorial psychiatric disorder linked with oxidative stress, monoaminergic imbalance, and behavioral dysfunction. The present study investigated the antidepressant potential of life-style modification approach with Ocimum tenuiflorum (Tulsi) and exercise against chronic unpredictable mild stress and dexamethasone-induced depression in rats. Behavioral assessment using the Open Field Test revealed a marked reduction in exploratory behavior in the induction group, with inner zone entries dropping to 3.0 ± 0.63 compared to 57.0 ± 8.09 in controls ($p \leq 0.001$). Similarly, sucrose consumption in the Sucrose Preference Test declined significantly to 19.90 ± 8.44 ml versus 59.65 ± 4.02 ml in controls, indicating severe anhedonia. In the Novelty-Suppressed Feeding Test, food intake reduced to 1.01 ± 0.24 g compared to 4.75 ± 0.40 g in controls, reflecting heightened anxiety. Biochemical analysis demonstrated dopamine depletion from 3.68 ± 0.06 µg/ml (control) to 1.53 ± 0.07 µg/ml in the induction group, alongside elevated malondialdehyde (MDA) levels, signifying oxidative damage. Treatment with Tulsi (20 mg/kg) restored dopamine to 2.87 ± 0.05 µg/ml and reduced MDA significantly ($p \leq 0.001$). Exercise alone improved sucrose preference to 73.32 ± 4.23 ml, while the combined Tulsi + Exercise group showed synergistic efficacy, normalizing dopamine levels and restoring behavioral parameters compared to standard fluoxetine-treated levels. Histopathology further confirmed neuroprotective effects with preserved cortical and hippocampal architecture. In conclusion, Tulsi and exercise exhibit significant antidepressant-like activity through dopaminergic restoration, antioxidant action, and behavioral improvement. Thus life-style modification demonstrates superior efficacy, suggesting a promising integrative strategy for managing depression.

**Keywords:** Ocimum tenuiflorum (Tulsi), Depression, Exercise, life style modification, Oxidative stress

**DEVELOPMENT, CHARACTERIZATION, AND COMPARATIVE ANALYSIS OF POLYHERBAL NUTRACEUTICAL TABLETS PREPARED BY WET GRANULATION**

Srija Sravani P, P Lakshmi Prasanna, M.S.R.Bapiraju, K Venkateswararaju
Department of Pharmaceutical Technology, Shri Vishnu College of Pharmacy, Bhimavaram, Andhra Pradesh, India- 534202.
srijapeddinti2@gmail.com

Polyherbal nutraceuticals represent a synergistic approach to improving human health by combining traditional botanicals with modern formulation techniques. The present study aimed to develop nutraceutical tablets containing Amla, Cinnamon, Ginger, Liquorice, Tulasi, and Mentha using wet granulation, with a focus on enhancing mechanical strength, dissolution, antioxidant potential, and microbial safety. Standardized herbal extracts were blended with lactose, starch, and magnesium stearate, followed by wet granulation using optimized binder concentrations. Granules were assessed for flowability and compressibility before compression into tablets. Pharmacotechnical parameters including weight variation, hardness, friability, disintegration, and dissolution were evaluated in simulated gastric fluid (pH 1.2), intestinal fluid (pH 6.8), and water. Further tests included pH measurement, organoleptic properties, microbial contamination (aerobic count, yeast, mould), antioxidant potential using DPPH radical scavenging assay, and accelerated stability studies under ICH conditions for 60 days. Tablets exhibited uniform weight (492 ± 23 mg) and satisfactory hardness (4.2 ± 0.5 kg/cm²) with friability below 0.8%. Disintegration occurred within 17.6 ± 2.2 minutes across all media, with complete dissolution in 8 minutes. The pH remained stable at 5.08 ± 0.02, while microbial counts complied with pharmacopoeial limits. Antioxidant activity was significantly higher in tablets (87% inhibition) compared to unformulated powders (69%). Stability testing confirmed no notable changes in physicochemical or functional parameters. Tablets were greenish-brown, round, and aromatic. The optimized wet granulation process produced polyherbal nutraceutical tablets with excellent uniformity, stability, safety, and enhanced functional activity. These findings support their potential for commercial nutraceutical applications and future clinical validation.

**Keywords:** Polyherbal, Nutraceutical, Wet granulation, Antioxidant.

**PT-264**

**ANTI-ADDICTIVE POTENTIAL OF MELISSA OFFICINALIS IN ALCOHOL DEPENDENCE**

Devayani Agrawal, Ashit Ramteke, Shilpa Deshpande
Department of Pharmacology, Priyadarshini J. L. College of Pharmacy, Electronics zone building, MIDC, Hingna Road, Nagpur – 440016
agrawaldevayani@gmail.com

Alcohol addiction and reinstatement remain pressing public health challenges, with current pharmacotherapies such as naltrexone and acamprosate offering limited efficacy and significant side effects. This study explores the pharmacological evaluation of Melissa officinalis (Lemon Balm), a traditionally used anxiolytic and antioxidant herb, for the treatment of alcohol addiction and reinstatement. Experimental studies were conducted using male Sprague Dawley rats subjected to the ethanol addiction and Ethanol Preference Paradigm (EPP), Conditioned Place Preference (CPP), Open Field Test (OFT), and Elevated Plus Maze (EPM) models. In the induction phase, ethanol exposure significantly reduced exploratory behavior, with open-arm time in EPM decreasing to 93 ± 5.21 sec compared to 157.66 ± 25.40 sec in controls ($p \leq 0.001$), indicating heightened anxiety. Dopamine depletion was observed, dropping from 3.68 ± 0.06 µg/ml in controls to 1.53 ± 0.07 µg/ml post-induction. Treatment with Melissa officinalis extract produced dose-dependent improvements: high-dose treatment restored dopamine to 2.79 ± 0.04 µg/ml and increased open-arm exploration to 131.66 ± 8.73 sec, approaching near standard drug performance. Additionally, lipid peroxidation and stress-induced relapse behaviors were significantly reduced ($p \leq 0.001$). Mechanistically, rosmarinic acid and triterpenes in Lemon Balm may enhance GABAergic transmission, inhibited NMDA overactivity, reduced corticotropin-releasing factor (CRF) expression, and elevated BDNF levels, thereby modulating both stress and reward pathways. These findings position Melissa officinalis as a promising phytopharmacological candidate with multi-target neuroprotective action for alcohol addiction management. Its anxiolytic, dopaminergic, and antioxidant effects support its translational potential as a safer, cost-effective alternative to existing therapies.

**Keywords:** Melissa officinalis (lemon balm), Alcohol addiction, Dopamine, Ethanol Preference Paradigm

**PT-265**

**IN SILICO EVALUATION OF PORTULACA PILOSA PHYTOCONSTITUENTS TARGETING MULTIFACTORIAL DISEASES**

Vodnala Sai Malavya, Vinutha Kuchana
Department of Pharm.D., Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Hyderabad, Telangana India 500017
saimalu008558@gmail.com

These days, complementary or alternative medicine (CAM) is often perceived as a form of traditional medicine. Consequently, neglecting to document and identify effective herbs for treating various diseases could hinder future disease control programs.The study aimed to conduct molecular docking analysis of the phytoconstituents of Portulaca pilosa, including Quercetin, Rutin, Naringenin, Luteolin and Kaempferol with target proteins associated with lung cancer, anti-hyper lipidemic and anti-inflammatory. Many diseases, such as cancer, diabetes, and neurodegenerative disorders, are complex and involve multiple biological pathways. Targeting a single molecule with a single drug may not be effective in treating these diseases. A multi-targeted therapeutic approach that targets multiple disease-associated molecules simultaneously has the potential to be more effective and have fewer side effects.This involved utilizing Chemsketch software for molecular structure depiction, Auto dock PYRx software for in-silico docking analysis, and Discovery Studio 3.1 for visualization of binding interactions.The molecular docking analysis, conducted using Auto dock PYRx software and visualized with Discovery Studio 3.1, reveals that these phytoconstituents exhibit excellent binding to proteins with PDB IDs 2ITY, 1T02, and 5COX, surpassing the standard drugs Simvastatin, Erlotinib and Aspirin in terms of docking scores. This suggests that the phytoconstituents have the potential for significant biological activity,

ISBN: 978-81-980623-8-3

particularly in the treatment of lung cancer, Hyperlipidemic and Inflammatory conditions. The study underscores the importance of documenting and identifying effective herbal remedies for future disease control efforts.

**Keywords:** Molecular Docking, Auto dock PYRx, Chem Sketch, Phytoconstituents.

## RECENT TRENDS IN MICROGREENS: OPPORTUNITIES AND INNOVATIONS

Mayank Tapadia, Kamala Chandak, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee

Microgreens are nutrient-dense, edible young plant seedlings with high levels of vitamins, minerals, beneficial phytochemicals like flavonoids and carotenoids, and other antioxidants, making them a popular functional food. Microgreens have emerged as a significant trend in nutrition and modern agriculture. Their popularity is driven by health benefits, aesthetic appeal, and diverse flavors, which are enhanced by sustainable cultivation methods like vertical farming and hydroponics. Recent studies have shown that microgreens can contain nutrient levels up to 40 times higher than their other mature counterparts thereby positioning them as a functional food for health-conscious consumers. Increasing consumer awareness of nutritional benefits is pushing demand. People with lifestyle diseases, fitness enthusiasts, and those wanting fresher, pesticide-free greens are key demand segments. Additionally, market expansion is evident, with microgreens being incorporated into smoothies, dietary supplements, and functional food products. Advancements in LED lighting and automation enable efficient urban and household production. Consumer demand has also driven innovation in packaging and shelf-life extension through biodegradable materials and cold-chain improvements. While challenges like perishability and cost exist, ongoing research and market growth in health-focused products suggest microgreens will play a larger role in the food system. Microgreens represent a significant trend at the intersection of nutrition, agriculture, and sustainability. Their dense nutrients, versatility, and adaptability to urban farming are key drivers of their growth, positioning them as an increasingly important component of future food systems.

**Keywords**: Microgreens, functional foods, nutrient-rich-crops, sustainable agriculture

## ANTIOXIDANT PROFILING OF INDIGENOUS PLANTS: A COMPARATIVE APPROACH

Shreya Rudra, Leemol Varghese
Department of Pharm D, Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka, Secunderabad, Telangana, 500017.
shreyarudra24@gmail.com

The use of herbal medicines has a long and documented history across the globe. Antioxidants are compounds that can prevent the damage to cells caused by free radicals. Free radical is a type of unstable molecule that is made during normal cell metabolism. In this study we have selected Murraya koenigii (Rutaceae) and Nyctanthes arbor-tristis (Oleaceae) leaves for evaluation of Antioxidant potential.The main aim of our project is to extract active constituents from indigenous plants by using two different solvents and perform antioxidant activity. Scavenging activity of the plant extract by Hydrogen peroxide (H2O2) was determined by the method of Ruch.et al. Plant extract (4 ml) prepared in distilled water at various concentration was mixed with 0.6 ml of 4 mM H2O2 solution prepared in phosphate buffer (0.1 M pH 7.4) and incubated for 10 min. The absorbance is taken at 230 nm. Ascorbic acid is used as positive control. It has been reported that compounds such as flavonoid, which contain hydroxyls, are responsible for the radical scavenging effects of most plants. Phytochemical screening of the extract of the leaves of the selected plants contains phenolic compounds. Phenolic compounds are used as antioxidant agents, which act as free radical terminators. We can conclude that the selected plants and their extracts show many secondary metabolites such as Phenolic compounds, tannins, terpenoids, resins, carbohydrates etc. The methanolic extracts of combined leaves has shown significant antioxidant activity when compared to that of acetone extract. It is used as easily accessible source of natural antioxidant.

**Keywords:** Antioxidants, Secondary metabolites, Phenolic compounds, Ascorbic acid

## IN VITRO INVESTIGATION OF ANTIOXIDANT, ANTI-INFLAMMATORY, AND CARDIOPROTECTIVE ACTIVITIES OF SIDA ACUTA ETHANOLIC EXTRACT

1,2Abdullaah Syedali, 1,2Suresh Velayudam
1Department of Pharmacology, KKMMRF Annai JKK Sampoorani Ammal College of Pharmacy, Komarapalayam, Namakkal, Tamil Nadu, India.
2The Tamil Nadu Dr M G R Medical University, Guindy, Tamil Nadu, India.

Sida acuta, a shrub from the Malvaceae family, has traditionally been used to manage ailments such as fever, infections, and inflammation. This study investigates the in vitro antioxidant, anti-inflammatory, and cardioprotective potential of the ethanolic extract of Sida acuta (SA ET). Preliminary phytochemical screening revealed the presence of flavonoids, phenols, alkaloids, tannins, steroids, and carbohydrates. Quantitative analysis showed that SA ET contains a high total flavonoid content of 71 mg at 100 µg/ml and a total phenol content of 110 mg at 600 µg/ml, supporting its potential antioxidant capacity. In the DPPH assay, SA ET demonstrated strong radical scavenging activity with 74% inhibition at 50 µg/ml and an $IC_{50}$ of 48.53 µg/ml, compared to the standard ascorbic acid ($IC_{50}$ = 33.73 µg/ml). The FRAP assay further confirmed its antioxidant potential, with OD values of 0.23 at both 100 and 300 µg/ml concentrations. Anti-inflammatory activity assessed via the protein denaturation method showed 38% inhibition at 150 µg/ml, with an $IC_{50}$ of 112.62 µg/ml, outperforming the standard diclofenac sodium ($IC_{50}$ = 121.29 µg/ml). Cardioprotective activity was evaluated using in vitro cardiomyocyte protection assays under oxidative stress conditions. Pre-treatment with SA ET significantly reduced $H_2O_2$-induced cytotoxicity in H9c2 cells, increasing cell viability by 68% at 100 µg/ml, compared to untreated cells. Moreover, SA ET significantly decreased intracellular ROS levels and preserved mitochondrial membrane potential, indicating protective effects against oxidative stress-induced cardiac injury. These findings suggest that Sida acuta ethanolic extract exhibits significant antioxidant and cardioprotective activities along with moderate anti-inflammatory effects, supporting its potential use in the management of oxidative stress-related cardiovascular disorders.

**Keywords:** Sida acuta, Antioxidant, Cardioprotective, Anti-inflammatory, DPPH Assay, Total Phenol, Flavonoids, Phytochemical Screening, H9c2 Cells

## EVALUATION OF ANT UROLITHIC AND ANTIOXIDANT ACTIVITIES OF GLOCHIDION VELUNTINUM LEAVES

Samreen, D. Suresh
Department of Pharmacology
Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka, Hyderabad, Telangana, India

Urolithiasis is a multifactorial condition characterized by urinary stone formation, primarily due to supersaturation of calcium, oxalate, phosphate, and uric acid in urine. Current therapeutic agents have limitations such as recurrence and adverse effects, which necessitate the development of effective and safe herbal alternatives.The present study aimed to evaluate the anti-urolithiatic activity of the polyherbal formulation Rensol in experimental rat models.Male Wistar rats were divided into groups and subjected to three different urolithiasis models: sodium oxalate–induced acute study, glycolic acid–induced chronic preventive study, and ethylene glycol–induced chronic curative study. Rensol was administered at doses of 100 mg/kg and 200 mg/kg by oral or intraperitoneal routes depending on the model. Biochemical parameters such as calcium, phosphate, oxalate, and uric acid levels were estimated in urine, serum, and kidney homogenates to assess anti-urolithiatic efficacy. In the sodium oxalate acute model, intraperitoneal administration of Rensol significantly reduced serum and urinary levels of calcium, phosphate, oxalate, and uric acid. In the glycolic acid and ethylene glycol chronic models, oral administration produced similar significant reductions, with improved kidney biochemical profiles compared to disease control groups. The treatment effectively normalized altered parameters, suggesting both preventive and curative effects. The polyherbal formulation Rensol demonstrated significant

ISBN: 978-81-980623-8-3

anti-urolithiatic activity in all experimental models, attributed to its ability to normalize biochemical parameters and inhibit stone-forming constituents. These findings highlight its potential as a safe and effective herbal therapy for urolithiasis.

**Keywords:** Rensol, Anti-urolithiatic, Polyherbal formulation, Wistar rats.

**PHYTOCHEMICAL PROFILING AND ANTIDIABETIC ACTIVITY OF MANGO LEAVES**

A. UDAYA SRI, M. Prasad Rao, BV Narasimha Rao
Department of Pharmacology,
Medarametla Anjamma Mastan Rao College of Pharmacy,
Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
udayasrialudasu798@gmail.com

Diabetes mellitus is a chronic metabolic disorder characterized by impaired insulin secretion, insulin resistance, and hyperglycemia, posing a significant global health challenge. Current pharmacological treatments, though effective, are often costly and associated with adverse side effects, prompting interest in safer, natural alternatives. Mango leaves (Mangifera indica), traditionally used in folk medicine, have gained scientific attention due to their rich phytochemical profile, particularly mangiferin, flavonoids, and tannins. These bioactive compounds are reported to exhibit hypoglycemic potential through multiple mechanisms. Proposed actions include stimulation of insulin secretion, enhancement of peripheral glucose uptake, inhibition of carbohydrate-digesting enzymes such as α-amylase and α-glucosidase, and attenuation of oxidative stress through antioxidant properties. Preclinical investigations in animal models support these mechanisms, showing significant reductions in fasting blood glucose levels, improvement of pancreatic β-cell function, and protection against diabetes-related complications. Despite promising experimental evidence, the transition from preclinical findings to clinical application remains limited. Critical gaps persist in understanding the optimal dosage, long-term safety, and pharmacokinetics of mango leaf extracts in human subjects. Therefore, well-designed clinical trials are essential to validate efficacy, establish standardized formulations, and ensure safety for therapeutic use. Overall, mango leaves represent a cost-effective, plant-based strategy with potential to complement existing diabetes management approaches, particularly in resource-limited settings.

**Keywords:** Diabetes mellitus, Mango leaves, Hypoglycemic effect, α-amylase, α-glucosidase, Antioxidant, Natural therapy.

**HERBAL GUMMIES FOR DIURETIC AND ANTI-LITHIATIC ACTIVITY**

Aditi Rajendra Ahire, Marina D'Souza,
Kuldeep Vinchurkar, Laxmikant Borse
Sandip Institute of Pharmaceutical Sciences
aditiahire05@gmail.com

Kidney stones continue to be a major global health concern, often leading to severe discomfort, recurrent episodes, and complications that reduce quality of life. Conventional treatment approaches, including surgical procedures and synthetic diuretics, though effective, are frequently associated with high costs, invasiveness, and undesirable side effects. This has fueled growing interest in natural and patient-friendly alternatives. The present project focuses on the development of herbal gummies as a novel dosage form for managing kidney stone formation through diuretic and anti-lithiatic activity. Gummies are chosen for their superior palatability, convenience, and potential to improve patient compliance compared to traditional herbal preparations. The study involves the selection of proven herbal ingredients, formulation of gummies, and their systematic evaluation through pharmacological and analytical methods.By integrating traditional herbal knowledge with modern formulation science, the project aims to create a safe, effective, and acceptable dosage form that can serve as a supportive therapy for kidney stone management. This innovative approach is expected to contribute to improved therapeutic outcomes and enhance patient adherence.

**Keywords:** Herbal gummies, diuretic activity, anti-lithiatic activity, kidney stones, natural formulation, patient compliance

**PT-272**

**A NOVEL HERBAL CANDY FOR EFFECTIVE ANTI-INFLAMMATORY AND ANALGESIC ACTIVITY, ENSURING PATIENT COMPLIANCE, SAFETY, AND EFFICACY**

Rushikesh Sandip Ambilwade, Marina Dsouza,
Kuldeep Vinchurkar, Laxmikant Borse
Sandip Institute of Pharmaceutical Nashik
rushikeshambilwade54@gmail.com

The increasing interest in herbal medicines has highlighted the need for novel, patient-friendly dosage forms that combine safety, efficacy, and convenience. Conventional herbal formulations such as tablets, capsules, and decoctions are often associated with poor taste, gastrointestinal irritation, and reduced patient compliance, especially among pediatric and geriatric populations. To address these challenges, this study proposes the development of a novel herbal candy dosage form for effective anti-inflammatory and analgesic activity. The formulation incorporates selected medicinal plants with scientifically validated therapeutic potential, such as Curcuma longa (turmeric), Zingiber officinale (ginger), Syzygium aromaticum (clove), and Boswellia serrata (frankincense). These herbs are known for their potent anti-inflammatory and analgesic effects, along with a favorable safety profile. By embedding these herbal extracts into a sugar-based or sugar-free candy matrix, the dosage form ensures improved palatability, ease of administration, and on-the-go usage. The candy platform provides the dual advantage of enhancing patient acceptance while ensuring consistent therapeutic delivery. This approach addresses common limitations of conventional herbal medicines by offering a stable, pleasant-tasting, and portable alternative. Furthermore, the natural excipients used in the formulation minimize adverse effects while maintaining bioactivity. Such a dosage form is expected to improve adherence in both acute and chronic inflammatory conditions, making it particularly suitable for populations where compliance is a major concern.In conclusion, herbal candy represents a promising innovation that unites traditional healing with modern pharmaceutical technology, ensuring safety, efficacy, and patient satisfaction.

**Keywords:** Herbal candy, novel dosage form, anti-inflammatory, analgesic, patient compliance, palatability, safety, efficacy.

**PT-273**

**PHARMACISTS ROLE IN PERSONALIZED NUTRITION AND NEUTRACEUTICAL COUNSELLING**

T.Sireesha, M. Prasad Rao
Department of Pharmacy Practice,
Medarametla Anjamma Mastan Rao College of Pharmacy,
Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
sirishasirisha08581@gmail.com

As healthcare shifts toward personalized and preventive approaches, the role of pharmacists is expanding beyond traditional medication management to include personalized nutrition and nutraceutical counselling. Pharmacists, with their in-depth knowledge of pharmacokinetics, pharmacodynamics, and patient-specific factors, are uniquely positioned to guide individuals in the safe and effective use of dietary supplements, functional foods, and nutraceuticals. This emerging role supports the growing demand for individualized health solutions that integrate nutrition with conventional therapy. Personalized nutrition involves tailoring dietary recommendations based on genetic, metabolic, and lifestyle factors. When combined with evidence-based nutraceutical counselling, this approach has the potential to optimize therapeutic outcomes, manage chronic diseases, and improve overall wellness. Pharmacists can assess nutrient-drug interactions, recommend appropriate supplements, monitor for adverse effects, and educate patients on the quality and efficacy of various nutraceutical products. The integration of this service into pharmacy practice requires updated competencies, interprofessional collaboration, and regulatory clarity. Moreover, pharmacists can play a key role in combating misinformation in the nutraceutical market by offering scientifically sound, patient-cantered advice. This positions them as vital contributors to holistic healthcare teams focused on prevention, wellness, and patient empowerment. As the scope of pharmacy practice continues to evolve, personalized nutrition and nutraceutical counselling represent significant opportunities for pharmacists to expand their impact on public health.

## TURNING INULIN INTO INNOVATION: BIOTECHNOLOGICAL POTENTIAL OF BACILLUS SONORENSIS

VENKATESH KAMATH B, SWARNABH CHATTERJEE
Department of Pharmaceutical Biotechnology, Manipal College of Pharmaceutical Sciences, Manipal Academy of Higher Education, Manipal-576104, Karnataka, India

In the present study, the inulolytic activity of a novel bacterial isolate was confirmed by growth on inulin agar, followed by molecular identification through 16S rRNA sequencing, which revealed 99.76% similarity to Bacillus sonorensis. Although discovered only two decades ago, B. sonorensis remains a promising candidate for biotechnological research due to its close resemblance to B. licheniformis, a well-known inulolytic bacterium. The isolate exhibited inulinase activity of 0.3 U/mL and demonstrated unique phenotypic traits, including Gram-positive, motile, rod-shaped morphology with yellowish-cream slimy colonies, catalase positivity, starch utilization, and brown pigment production on tyrosine agar. Notably, unlike the standard 3% NaCl tolerance reported in Bergey's Manual, the wild and mutant strains of the isolate showed substantial growth at 7% and 10% NaCl, respectively, suggesting enhanced halotolerance.Optimization studies highlighted the influence of cultural parameters on enzyme activity. The isolate exhibited maximum inulinase activity at pH 7–8 and temperatures of 40–50 °C, indicating thermostability. Inulin as a carbon source significantly enhanced enzyme production, while glucose caused catabolite repression. Organic nitrogen (casein) and inorganic nitrogen (potassium nitrate) further supported enzyme yield. These findings underscore the potential of the isolate as an efficient inulin-degrading organism with applicability in industrial bioprocesses and as a sustainable alternative in keratin hydrolysis.Future investigations will focus on strain improvement using chemical mutagenesis to enhance yield and exploring the antimicrobial potential of sonorensin protein from B. sonorensis. This work positions the isolate as a valuable resource for enzyme-based biotechnological applications and healthcare innovations.

**Keywords:** Inulin, Halotolertant, Bacillus sonorensis, Optimisation

## HERBAL MUCOADHESIVE PATCHES: A CATECHU-BASED APPROACH FOR MOUTH ULCER TREATMENT

Maheen Ismail Mulla, Yogendra Salunke,
Alina bi Shaikh, Suraj Kumbhar,
Department of Pharmaceutics, H.K College of Pharmacy,
Mumbai-400102.Maharashtra, India.
Maheen.mulla2002@gmail.com

Recurrent aphthous stomatitis, commonly known as mouth ulcers, leads to significant discomfort, interfering with daily activities such as eating and speaking. Conventional treatments typically provide only symptomatic relief and may carry potential systemic side effects. Herbal therapies offer an attractive alternative due to their multi-targeted therapeutic properties. Acacia catechu (Catechu), a medicinal plant rich in tannins, flavonoids, and phenolic compounds, demonstrates notable antioxidant, anti-inflammatory, and wound-healing activities, making it a promising candidate for localized oral therapy. In this study, an aqueous extract of Acacia catechu was prepared and standardized through phytochemical and physicochemical evaluations. Its in-vitro acid neutralizing capacity (ANC) ranged from 4.3 to 5.0 mEq/5 ml, exceeding the FDA-recommended minimum of 3.5 mEq/5 ml, indicating significant antacid activity. Mucoadhesive patches were developed using HPMC E50 and sodium CMC as film-forming polymers, PEG 400 as a plasticizer, and peppermint oil as a flavoring agent. The optimized patches demonstrated consistent weight (0.0066 g), uniform thickness (~0.19 mm), high folding endurance (>100), neutral pH (~7), residence time exceeding 4-8 hours .These findings indicate that catechu-based mucoadhesive patches provide a safe, effective, and patient-friendly dosage form for the management of mouth ulcers. The localized delivery allows prolonged action at the site of the lesion, avoids first-pass metabolism, and enhances patient compliance, offering a viable herbal therapeutic alternative for oral ulcer management.

**Keywords:** Acacia catechu, mucoadhesive patches, oral ulcers, herbal formulation, anti-ulcer activity.

## Assessment Of The Antibacterial Activity Of Crude Leaf Extracts Of Monoon Longifolium Against Neisseria Gonorrhea

Santosh R. Butle, Mrudul G. Dange
Department of Pharmaceutical Chemistry, School of Pharmacy, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, India – 431601
butlesr@gmail.com

In this study, for the first time, we report the systematic profiling of bioactive phytoconstituents by HR-LCMS and antigonorrhea activity on the basis of an in vitro anti-Neisseria gonorrhoeae assay of glacial acetic acid extracts of M. longifolium leaves. The bacteria that cause gonorrhea, sometimes known as "claps" in sexual relationships, are Neisseria gonorrhoeae. This study investigated the potential of treating gonorrhea via the herbal remedy Monoon longifolium. Bacteria cause an inflammatory reaction by colonizing and invading the lower and upper genitourinary tract epithelium. This leads to a localized influx of macrophages and polymorphonuclear leukocytes (PMNs). HR-LCMS analysis of glacial acetic acid extracts of M. longifolium leaves revealed 62 bioactive compounds 43 in positive ionization mode and 19 bioactive compounds in negative ionization mode. We evaluated the phytochemical and biological properties of the leaf extract of Monoon longifolium in the present study. Six distinct solvents were used for the extraction of leaves according to their polarity indices. The presence of phenols, reducing sugars, carbohydrates, and alkaloids was confirmed by preliminary phytochemical analysis. Subsequently. Afterward, the desired bacterial cells were treated for an in vitro study of the antigonorrheal action of the glacial acetic acid extract of a leaf of Monoon longifolium. Each crude extract inhibited Neisseria gonorrhoeae in a concentration-dependent manner. Compared with those of other solvents, the glacial acetic acid extracts of leaves are more potent.

**Keywords:** Monoon longifolium, Neisseria gonorrhoeae, HRLCMS, Antibacterial activity

## DIARYLHEPTANOIDS: NATURAL SCAFFOLDS FOR ANTICANCER DRUG DISCOVERY

Gazanfar Ahmad, Neerupma Dhiman, Asif Ali
College of Pharmacy JSS University Noida,
C:20/1 Sector 62 Noida Uttar Pradesh
Amity Institute of Pharmacy, Amity University, Noida, UP, India-201301
Division of Medicinal Chemistry, CDRI Lucknow India

Diarylheptanoids are an important class plant based secondary metabolites which have been reported for biological activities like antioxidant, anti-inflammatory, and anticancer activities. With the ability to modulate certain anticancer pathways, they can serve as promising leads for cancer treatment with low toxicity. In the current study we observed that acetyl derivative of Myricanol exhibited anticancer activity against various cell lines, with the most potent effect on MCF-7 cell Line. Mechanistic studies demonstrated that molecule induced mitochondrial-mediated apoptosis via ROS generation, loss of mitochondrial membrane potential, and G0/G1 cell cycle arrest. Apoptosis was associated with Bcl-2 downregulation and caspase cascade activation. Flow cytometry confirmed a dose-dependent rise in apoptotic cells, reaching about 20% at 30 µM of the molecule.

**Keywords**: Diarylheptanoids, Myrica esculenta, Anticancer, Apoptosis, Cell-cycle arrest.

## DEVELOPMENT AND EVALUATION OF A POLYHERBAL HAIR OIL FOR ENHANCING HAIR GROWTH AND REDUCING HAIR FALL

Subiya Fatema Mansoor Ahmed Kazi, Shaikh Gazi,
Md.Rayees Ahmad, Pathan Muzakkir
Dept. of Pharmaceutical Chemistry, R.P. College of Pharmacy Alani, Dharashiv, MH, 413501

Hair care is an important aspect of personal health, with a growing demand for products that are both effective and safe. Hair loss and poor hair health are widespread concerns, often resulting in psychological

ISBN: 978-81-980623-8-3

distress, scalp irritation, and allergic reactions. Increasing awareness of the risks associated with chemical-based hair care products has led to a surge of interest in herbal alternatives, valued for their natural origin and minimal side effects. Our research highlights a high prevalence of hair-related issues such as hair fall, dandruff, dryness, and premature greying, which are frequently worsened by the use of synthetic hair care products. This underscores the need for a reliable, safe, and affordable solution, particularly for individuals sensitive to synthetic compounds. This study focuses on the formulation of a polyherbal hair oil utilizing medicinal plants including Emblica officinalis (Amla), Hibiscus rosa-sinensis, Eclipta alba (Bhringraj), Moringa oleifera, fenugreek seeds, curry leaves, and guava leaves. These ingredients were chosen based on their well-documented benefits in enhancing hair nourishment and stimulating hair follicles. The herbal hair oil was prepared through various established methodologies. The prepared oil was evaluated for parameters such as pH, viscosity, stability, organoleptic properties, specific gravity, and acid value. Testing revealed that the oil maintained its stability, exhibited no phase separation or rancidity, and possessed favorable sensory characteristics. Preliminary trials indicated notable improvements in hair texture, reduced hair fall, and promoted new hair growth. The results of initial hair growth initiation tests were promising, leading to further screening of the oil's hair growth activity. In summary, the formulated polyherbal hair oil presents a safe, cost-effective, and promising alternative to synthetic hair care products. It effectively addresses common hair concerns and supports healthy hair growth.

**Keywords:** polyherbal formulation, herbal extract, hair growth promotion, natural product formulation, phytochemical evaluation.

## PHYTOCHEMICAL AND INVITRO BIOLOGICAL EVALUTION OF N-HEXANE EXTRACT OBTAINED FROM LEAVES OF PROBOSCIDEA LOUISIANICA

Nakka Hemalatha, Pavan Kumar Samudrala
AUTDR HUB, SHREE
VISHNU COLLEGE OF PHARMACY, BHIMAVARAM
hemalathar.mpharm@gmail.com

World Health Organization define Traditional herbal medicines as naturally occurring, plant-derived substances with minimal or no industrial processing that have been used to treat illness within local or regional healing practices As per the mainstay of about 75 -80% of African and Asian population depends on traditional medicines for their primary health. In our present work we studied the the phytochemical, invitro anticoagulant and thrombolytic properties of Proboscidea lousianica plant leaves n-hexane extract of phytochemical screening showed the presence of alkaloids, glycosides, flavonoids, phytosterols, saponins. Anticoagulant activity o tested using prothrombin time with 10,20 50,100ug/ml and thrombolytic activity is carried out by clot lysis test the n-hexane extract of probosidea leaves was proven to have significant anticoagulant properties at concentration 20 ,50 and 100µg/ml compared to normal and negative control. The extract however was not significant at 10 mg/ml but still demonstrated some anticoagulation effect. It also revealed a significance thrombolytic activity at 1000µg/ml, when compared to negative and positive control indicating ability to lyse blood clot. It was proved that by our analysis that significant anticoagulant and thrombolytic activity.

**Keywords:** anti-coagulant, thrombolytic, n-hexane, Proboscidea lousianica.

## NETWORK PHARMACOLOGY TO EVALUATE ANTIDIABETIC POTENTIAL OF PHYTOCHEMICALS FROM THE ADENANTHERA PAVONINE

Manjushree B. Gunjegaonkar , Sonali P. Babar, Kalyani G. Pawar

Network pharmacology provides a holistic platform to explore the antidiabetic potential of phytochemicals by elucidating their multi-target and multi-pathway mechanisms. This approach integrates computational prediction of molecular targets of bioactive compounds with protein-protein interaction network construction and pathway enrichment analyses. Applying network pharmacology to phytochemicals isolated from Adenanthera pavonina i.e. epicatechin, quercetin, kaempferol, gallic acid, tannins, saponins, alkaloids, and β-sitosterol tells their interactions with key diabetes-related proteins. Experimental validation further confirms the stable binding and pharmacological potential of these compounds. Therefore, network pharmacology serves as a powerful tool to unravel the complex biological interactions underlying the antidiabetic effects of phytochemicals, guiding the development of plant-based therapeutics for diabetes management. This integrated approach effectively uncovers the multitarget mechanisms of plant phytochemicals in diabetes management and may guide experimental and clinical research toward novel plant-based therapies.

**Keywords:** Network pharmacology, diabetes management, novel plant-based therapy, phytochemicals, Adenanthera pavonine.

## EVALUATION OF ANTHELMINTIC ACTIVITY OF HERBAL FORMULAION

Kavya, Vishal Babushetty, Chaitali, Mateen
Department of Pharmacology,
Sri Siddhalingeshwar College of Pharmacy, Bidar- 585404
Karnataka (INDIA)

Parasitic worms are called helminths. Among the most common illnesses in humans in developing countries the parasitic infestation was caused by intestinal helminths and protozoan parasites. Helminths are more frequently responsible for gastrointestinal illnesses in modern nations. In endemic nations, intestinal parasites significantly increased the morbidity and mortality. Anthelmintics are drugs that may act locally to expel worms from the GIT or systemically to eradicate adult helminths or development forms that invade organs and tissues. The present study aims to investigate and compare the anthelmintic activity of herbal formulation containing ethanolic extract of Tamarindus Indica Seeds and Ocimum Sanctum leaves with individual extracts of Tamarindus Indica Seeds and Ocimum Sanctum leaves and with standard group (Albendazole). The anthelmintic activity was tested on Indian adult earthworm (Pheretima posthuma), by adult worm immobility assay. The study involved the determination of time of paralysis and time of death of the worms. Herbal formulation of ethanolic extracts of TIS and OSL at the concentration of 50 mg/ml showed very significant activity as compared to their individual extracts and nearly equipotent to the standard drug Albendazole 50mg/ml. The time of paralysis and death time was observed as 25.04 ± 72.34 and 39.59 ± 111.03 respectively. From the obtained results it was confirmed that herbal formulation of Tamarindus Indica Seeds and Ocimum Sanctum leaves, showed better anthelmintic activity at concentrations of 50mg/ml as compared to the activity of their individual extracts.

**Keywords:** Anthelmintic, Tamarindus Indica, Ocimum Sanctum. Albendazole.

## HEALING WITH GREENS: PHARMACIST-LED PATIENT COUNSELLING ON VEGETABLE-BASED DISEASE MANAGEMENT

Pandu.P, Venkatesh.A, M.Prasad Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet,
Andhra Pradesh, India-522601
vk3158414@gmail.com

Vegetable-based nutrition has long been recognized as a cornerstone of preventive and therapeutic health care. Diets rich in green vegetables provide essential micronutrients, antioxidants, and phytochemicals that modulate immunity, reduce oxidative stress, and contribute to chronic disease prevention. However, patients often remain unaware of the clinical value of dietary modifications, relying heavily on pharmacological interventions. Pharmacists, as accessible healthcare providers, play a crucial role in bridging this gap by delivering structured patient counselling on evidence-based dietary strategies. This study emphasizes the role of pharmacist-led counselling in promoting vegetable-based disease management, highlighting its potential in conditions such as diabetes, hypertension, cardiovascular diseases, obesity, and gastrointestinal disorders. By integrating nutritional education into pharmaceutical care, pharmacists can empower patients to adopt sustainable lifestyle changes, improve medication adherence, and reduce polypharmacy-related risks. Counselling sessions are designed to focus on practical approaches, including portion control, selection of green leafy vegetables, incorporation of seasonal produce, and addressing misconceptions about diet-disease relationships. The approach not only enhances patient understanding but also encourages

ISBN: 978-81-980623-8-3

self-care and holistic healing. Incorporating "greens" into therapeutic counselling models aligns with the global shift toward integrative and preventive healthcare. Pharmacist-led initiatives can thus transform vegetable-based interventions from mere dietary advice to a structured adjunct in disease management, fostering better patient outcomes and long-term wellness.

**Keywords:** Pharmacist counselling, vegetable-based therapy, healing with greens, disease management, patient education, chronic diseases.

**DESIGN, DEVELOPMENT, STANDARDIZATION OF WOOD APPLE (LIMONIA ACIDISSIMA) PULP EXTRACT FOR QUALITY ASSURANCE**

Vinit Isankar, Dhanashri Tumme, Vanshita Bobde, Vaishanavi Navghare
School Of Pharmacy, G H Raisoni University,
Saikheda, Madhya Pradesh, India 480337
vinitisankar@gamil.com

The wood apple, or Limonia acidissima, is a fruit used for medical purposes that is known for its antibacterial, digestive, and antioxidant qualities. In order to guarantee safety, effectiveness, and reproducibility, standardization of herbal extracts is an essential component of quality assurance (QA). The chromatographic and spectral analysis of wood apple pulp extract in compliance with ICH guideline is the main focus of this work. Thin Layer Chromatography (TLC), and High-Performance Liquid Chromatography (HPLC) were used for chromatographic profiling. The presence of bioactive substances and their functional groups was verified by spectral characterisation using Fourier Transform Infrared Spectroscopy (FTIR), and UV-Visible Spectroscopy. The developed analytical techniques were verified for accuracy, precision, specificity, and robustness in accordance with ICH guideline. The results support the use of wood apple pulp extract in herbal formulations for antioxidant activity and regulatory compliance by providing a scientific foundation for quality control and standardization.

**Keywords:** Wood apple, UV-Vis, FTIR, HPLC

**MORINGA OLEIFERA LEAF EXTRACT: A NATURAL APPROCH TO GLYCEMIC CONTROL**

SHIVAM VILAS DANGE
shivamdange971@gmail.com

Diabetes Mellitus (DM) is a chronic medical condition in which the body refuses to produce sufficient amounts of insulin, a hormone of the pancreas that is responsible for maintaining blood glucose levels in the body. There are many herbs used for treating diabetes but studies shows that Moringa oleifera shows 40-60% more effectiveness than other herbs for diabetes. M. oleifera shows anti-hyperglycemic (antidiabetic) activity and the effect of reducing glycemia without causing any adverse effects. Nowadays, M. oleifera formulations are available in powder, capsules and tablet form only, we attempt to prepare a liquid dosage form of herb which would be more Bio-available thereby showing faster action and easy to administer compared to the existing powdered formulation. These project will successfully develop an oral liquid herbal formulation using M. oliefera leaf extract, demonstrating its potential as a natural management option for diabetes. The formulation of an oral liquid herbal product using M. oliefera leaf extract gives a promising potential for diabetes management. The development of a M. oliefera liquid oral represents a promising approach to numerous health benefits of this plant in a convenient and consumable form.

**Keywords**: Diabetes Mellitus; Moringa oleifera; leaf extracts; Anti-hyperglycemic activity; Antidiabetic activity

Insomnia, a neurological disorder, the most common sleep disorder in adults also known as sleeplessness. Although benzodiazepines and sedative-hypnotics are employed in current pharmaceutical therapies that relieve symptoms, but they cause negative side effects such as dependency and cognitive impairment. There is an urgent need to find sustainable, side-effect-free, and efficient substitutes. In this study, preclinical rat models are utilized to examine the potential of Sahadevi (Vernonia cinerea), a widely used medicinal plant, as a natural treatment for insomnia in Ayurveda. To study the effect of Sahadevi extract on insomnia, two varying doses (200 mg/kg and 400 mg/kg) were given. Anti-insomnialogic effects were studied in behavioral paradigms such as EPM, HBT, and OFT. To know neurochemical as well as oxidative stress regulation, biochemical biomarkers such as melatonin, serotonin, dopamine, norepinephrine, malondialdehyde (MDA), and catalase were examined. Behavioral assesments demonstrated dose dependent improvement by both doses, which significantly reduce augmentation of relaxation. Biochemical analysis detected higher concentrations of melatonin and serotonin and alteration in dopamine and norepinephrine levels, reflecting probable effects amenable to enhanced sleep. The neuroprotection of sahadevi was confirmed by enhanced catalase activity and decreased MDA content. Through the modulation of behavioural and neurochemical markers for sleep regulation, sahadevi had potent anti-insomnia activity. The green strategy is safer and environment friendly alternative to traditional sleep drugs and is thus worthy of further research by clinical trials.

**Keywords:** Sahadevi, alternative, insomnia, anxiety, neuroprotection

**PT-286**

**EXTRACTION, ISOLATION, AND CHARACTERIZATION OF RUTIN FROM AEGLE MARMELOS: A PHYTOCHEMICAL AND ANTIOXIDANT EVALUATION**

Meenal Sambhaji Patil , Madhuri U Shelar, Pooja Bagade
Department of Pharmaceutical Quality Assurance, Alard School of Pharmacy, Pune, Maharashtra, India – 411057
patilmeenal9325@gmail.com

This study investigates the extraction, isolation, and characterization of rutin—a potent flavonoid—from Aegle marmelos leaves, with a focus on optimizing yield and evaluating antioxidant potential. Using both Soxhlet and maceration techniques with varying solvent systems, ethanolic extraction via Soxhlet yielded the highest crude extract (5.48%) and rutin content (1.44%), outperforming hydroalcoholic and aqueous fractions.Rutin was identified through classical phytochemical tests (Shinoda, Zn-HCl reduction, and $AlCl_3$), and further confirmed via IR spectroscopy, revealing characteristic peaks for hydroxyl, carbonyl, and aromatic groups consistent with standard rutin. Antioxidant activity was assessed using the phosphomolybdenum assay, where the ethanolic Soxhlet extract demonstrated the highest activity (103.58 mg AA/g), compared to hydroalcoholic (72.68 mg AA/g) and macerated ethanolic extracts (67.32 mg AA/g).Quantitative analysis was performed using HPTLC, with a validated method showing linearity ($R^2 = 0.997$), precision (%RSD < 2%), robustness, and acceptable LOD (0.2 ng) and LOQ (0.61 ng). Recovery studies confirmed method accuracy with 97–99.8% recovery across extracts. This work highlights Aegle marmelos as a viable source of rutin and demonstrates a reproducible, scalable method for its extraction and quantification. The findings support its potential application in antioxidant-rich formulations and pave the way for further pharmacological exploration.

**Keywords:** Rutin, Aegle marmelos, Soxhlet extraction, antioxidant activity, HPTLC, IR spectroscopy, flavonoid isolation.

**PT-287**

**IN-SILICO EVALUATION OF PHYLLANTHUS NIRURI PHYTOCONSTITUENTS AGAINST KEY PROTEIN TARGETS IMPLICATED IN UROLITHIASIS**

Labbe Thaiba Banu, Ziyaul Haque, Pathan Tabreskhan
School of Pharmacy, Anjuman-I-Islam Kalsekar Technical Campus,
Navi Mumbai, Maharshtra, India 410206
1625thaibasvjc@gmail.com

The present study investigated the antiurolithiatic potential of Phyllanthus niruri through in-silico molecular docking and MM-GBSA free energy calculations against four key protein targets (1AZM, 4UBP, 5FBH, and 5YHL). A total of thirty phytoconstituents (PN1–PN30) were screened and compared with a standard reference ligand. The docking analysis revealed that several compounds, notably PN2, PN8, PN18, PN26, and PN28, exhibited highly favorable docking scores (ranging from –9.0 to –12.0) and binding free energies surpassing the reference

ISBN: 978-81-980623-8-3

molecule across multiple targets. Among these, PN2 (–11.469, –42.88 kcal/mol with 1AZM; –9.541, –77.66 kcal/mol with 4UBP; –9.264, –96.77 kcal/mol with 5YHL) and PN28 (–11.416, –34.12 kcal/mol with 1AZM; –12.388, –66.34 kcal/mol with 5YHL) demonstrated consistently strong binding affinity, highlighting their potential as lead antiurolithiatic candidates. The MM-GBSA results further supported the stability of these ligand–receptor complexes, with several molecules such as PN5, PN13, PN17, PN22, PN23, and PN30 also displaying superior binding energies compared to the standard. Overall, the findings suggest that Phyllanthus niruri harbors multiple bioactive constituents with significant protein-binding capacity, providing molecular-level evidence for its traditional use in urolithiasis management and supporting its potential as a source for novel therapeutic agents.

**Keywords:** Phyllanthus niruri, Urolithiasis, Molecular docking, MM-GBSA, Phytoconstituent

shankygcp@gmail.com

Extraction is an important part of extracting the bioactive components from herbs. Conventional and modern extraction methods have been widely used in many industries to achieve actual goals like, extracting bioactive components, separation of active bioactive components, selectivity of the analytical method, antibacterial, antioxidant & cytotoxicity activities and thus helps in identifying antioxidant, antimicrobial, and anticancer activities. Dried powdered leaves of Young Bamboo shoots, dried Ginger Zingiber officinale Roscoe, dried Plectranthus amboinicus leaves and dried Carica papaya leaves were extracted separately with various solvents like Ethanol (95%), Aqueous, Petroleum ether, Dichloromethane, Ethyl acetate, n-Butanol, Methanol, Acetone, Hydroalcoholic (50%) and chloroform by refluxing at 65-70°C for 3 h in a round bottom flask and filtered the liquid and the extraction process was repeated twice with a 1:3 ratio. The significant yield after extraction was found in the Hydroalcoholic (50%) extract for Young Bamboo shoots, Ginger Zingiber officinale Roscoe, Plectranthus amboinicus leaves and Carica papaya leaves when compared with other solvents. The results of phytochemical screening indicated the presence of alkaloids, flavonoids, steroids and tannins in ethanol, methanol, chloroform and hydroalcoholic (50%) extracts from Young Bamboo shoots, Ginger Zingiber officinale Roscoe, Plectranthus amboinicus leaves and Carica papaya leaves. This phytochemical screening helps in identifying phytoconstituents from Young bamboo shoots (Polyphenols and phytosterols), Ginger (6-gingerol, 6-shogaol, 6-paradol) and Plectranthus amboinicus (flavonoids, cinnamic derivatives, and terpenes). Anticancer and antibacterial activities will be carried out based on analytical results. The Hydroalcoholic (50%) extract was found to exhibit good yield than other solvents and showed presence of important phytoconstituents in Young Bamboo shoots, Ginger Zingiber officinale Roscoe, Plectranthus amboinicus leaves and Carica papaya leaves.

**Keywords:** Extraction, Young Bamboo shoots, Ginger Zingiber officinale Roscoe, Plectranthus amboinicus leaves, Carica papaya leaves, Hydroalcoholic(50%) antibacterial and anticancer.

## ANTI-UROLITHIATIC ACTIVITY OF BRYOPHYLLUM PINNATUM LAM. HYDROALCOHOLIC EXTRACT IN SODIUM OXALATE-INDUCED UROLITHIASIS IN RATS

R. B. Pandhare, V. K. Deshmukh
Mula Education Society's college of Pharmacy, Sonai, Tal- Newasa, Dist-Ahilyanagar Affiliated to Savitribai Phule Pune University, Pune.
ramdaspandhare@gmail.com

Despite advances in modern medicine, the development and growth of calculi continues to be a source of concern for mankind, as there is no effective treatment for kidney stones. In the present study we investigated antiurolithiatic activity of Bryophyllum pinnatum Lam against sodium oxalate (NaOx) induced urolithiasis in rats. In rats with renal calculi caused by sodium oxalate (NaOx, 70 mg/kg, i.p.); the antiurolithiatic action of Bryophyllum pinnatum hydroalcoholic extract (BPHE) was studied. BPHE was given every day orally at doses of 50, 100 and 200 mg/kg for 14 days to rats to examine activity against sodium oxalate (NaOx) mediated urolithiasis, with Cystone (500 mg/kg, p.o.) as a reference standard. The effect of the extract on urine oxalate, creatinine and phosphate retention and excretion in the kidney, as well as serum and biochemical analysis of kidney homogenate and histopathological examinations were studied. Oral administration of BPHE at doses of 50,100, and 200 mg/kg to rats with sodium oxalate-mediated renal calculi showed dose-dependent substantial ($P<0.05$) antiurolithiatic potential, with notable reversal of NaOx-induced ion excretion and urinary CaOx concentration. These findings justify the traditional use of Bryophyllum pinnatum hydroalcoholic extract (BPHE) in the treatment of renal calculi.

**Keywords:** Bryophyllum pinnatum Lam.; Cystone; Sodium oxalate; Urolithiasis.

## NANOTECHNOLOGY IN HERBAL COSMECEUTICALS: A SUSTAINABLE FUTURE FOR SKIN HEALTH

Sakshi V. Gurnule, Swati N. Lade, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India-441002
sakshigurnule14@gmail.com

Herbal cosmeceuticals have emerged as an important class of skin care agents due to their natural origin, safety profile, therapeutic efficacy, and wide cultural acceptance. They contain bioactive constituents such as polyphenols, flavonoids, alkaloids, and terpenoids that exhibit antioxidant, anti-inflammatory, antimicrobial, and photoprotective properties. Despite these benefits, their clinical application remains limited because of challenges like poor aqueous solubility, low stability against environmental factors, restricted penetration across the stratum corneum, and rapid degradation during storage. These properties reduce their bioavailability and effectiveness in conventional formulations. Potential ways to get around these restrictions are offered by nanotechnology. It is possible to optimize the delivery of bioactive by encapsulating herbal actives into nanoscale carriers, including liposomes, niosomes, nanoemulsions, SLN, nanostructured lipid carriers (NLC), nanogels, and phytosomes. These systems better penetrate the layers of the skin, improve solubility and stability, prevent degradation of sensitive phytoconstituents, and enable controlled or sustained release for extended activity. By using herbal extracts as stabilizing and reducing agents for the synthesis of nanoparticles, recent developments in green nanotechnology further advance this field and produce environmentally friendly and biocompatible goods. Aloe vera nanogels for skin hydration, green tea nanoparticle gels for anti-aging and UV protection, neem oil nanoemulsions for acne treatment, and turmeric-loaded liposomes for anti-inflammatory action are examples of practical uses. Combining nanotechnology and herbal cosmeceuticals unites state-of-the-art research and traditional knowledge. This creative method opens the door for safe, environmentally friendly, and next-generation skin care products in addition to improving efficacy and consumer appeal.

**Keywords:** Herbal Cosmeceuticals, Skin Care, Nano Carriers, Liposome, Green Nanotechnology.

**POTENTIAL OF SILVER NANOPARTICLES DERIVED FROM BANANA STEM (MUSA PARADISIACA LINN) FOR PURIFYING HEAVY METAL-CONTAMINATED WATER: A SUSTAINABLE AND COST-EFFECTIVE APPROACH**

Likhith B A, Moumita Dhara
Department of Pharmacology, Nitte college of pharmaceutical sciences, Yelahanka, Bengaluru -560064
likhithgowda153@gmail.com

Biogenic production of silver nanoparticles (AgNPs) offers a green alternative method to traditional chemical methods of fabricating nanomaterials. In this report, silver nanoparticles were produced using banana stem (Musa paradisiaca Linn) extract as both a reducing agent and a stabilizationon agent. The banana stem phytochemicals, such as flavonoids, glycosides, tannins, and polyphenols, facilitated the formation and stabilization of the nanoparticles. The synthesized banana stem silver nanoparticles (BS-AgNPs) were characterized by FTIR, SEM, EDX, and zeta potential techniques. The results showed BS-AgNPs were spherical nanostructures less than 200 nm in size with high colloidal stability. The functional utility of the BS-AgNPs was tested for water remediation in regard to heavy metal contamination. The nanoparticles showed excellent removal of toxic ions; especially $Pb^{2+}$ was removed through electrostatic attraction, surface complexation, and bioactive functional group interaction, which greatly lowered the concentration and provided good quality water. Banana stem extract was a renewable medium for synthesis and also gave the nanoparticles greater reaction activity. The resulting BS-AgNPs appeared more eco-compatible, less toxic, and cost-effective relative to chemically synthesized AgNPs. Therefore, this type of green nanotechnology presents a viable method for heavy metal contaminated water remediation, providing sustainable and affordable methods for the treatment of contaminated water.

**Keywords:** Biogenic synthesis, Silver nanoparticles (AgNPs), Banana stem extract, Heavy metal adsorption, Eco-friendly nanotechnology, Water purification.

**HERBAL INSIGHTS INTO NEUROPROTECTION: PHARMACOGNOSTIC CHARACTERIZATION AND MOLECULAR DOCKING OF THYMOL FOR ALZHEIMER'S THERAPY**

Misbah Shaikh, Rajat Sayyed
Department of pharmaceutics, MCES DRPAIU Allana College of Pharmacy, Azam Campus, Camp Pune, Maharashtra India 411001.
misbahshaikh1428@gmail.com

Alzheimer's disease (AD) is a progressive neurodegenerative disorder characterized by memory loss, cognitive decline, and reduced neuronal function. Currently available synthetic drugs provide only symptomatic relief and are often associated with adverse effects, highlighting the need for safer alternatives. Thymol, a monoterpene phenol derived from Thymus vulgaris (Lamiaceae), exhibits antioxidant, anti-inflammatory, and neuroprotective properties, making it a potential candidate in AD management. To ensure the quality and authenticity of the herbal raw material, a Pharmacognostic investigation of Thymus vulgaris was performed. This included macroscopic and microscopic identification, physicochemical evaluations, and preliminary phytochemical screening, which confirmed the presence of major bioactive such as thymol and carvacrol.To elucidate thymol's mechanism of action, molecular docking studies were carried out against key AD-related targets, including acetylcholinesterase (AChE), butyrylcholinesterase (BChE), and β-secretase (BACE1). Thymol showed favourable binding affinities with AChE (–6.4 kcal/mol) and BACE1 (–6.0 kcal/mol), indicating potential inhibition of cholinergic dysfunction and amyloid-beta aggregation. Additionally, docking with NF-κB pathway proteins suggested significant anti-inflammatory activity, reinforcing its neuroprotective role.The integration of Pharmacognostic profiling with computational docking provides a rational framework for developing novel herbal formulations. Among these, in situ nasal gels for nose-to-brain delivery of thymol present a promising approach to overcome the blood–brain barrier, enhance bioavailability, and ensure sustained neuroprotection with minimal side effects. This study demonstrates the synergy of pharmacognosy and molecular biology in establishing thymol's therapeutic potential against Alzheimer's disease.

**Keywords:** Thymol, Thymus vulgaris, Pharmacognostic identification, Molecular docking study

**INNOVATIVE HERBAL PATCHES OF CURCUMIN AND GLUTATHIONE: PHARMACOGNOSTIC PROFILING AND MOLECULAR DOCKING INSIGHTS FOR PSORIASIS THERAPY**

Imamjafar Lukade, Rajat Sayyed
Department of pharmaceutics, MCES DRPAIU Allana College of Pharmacy, Azam Campus, Camp Pune, Maharashtra India 411001.
jafarlukade786@gmail.com

Psoriasis is a chronic inflammatory skin disorder marked by keratinocyte hyperproliferation, oxidative stress, and immune dysregulation. Conventional therapies provide temporary relief but often cause adverse effects with long-term use, highlighting the need for safer plant-derived alternatives. This investigation explores the therapeutic potential of curcumin from Curcuma longa and glutathione, a natural tripeptide antioxidant, as dual-function agents for psoriasis management. Pharmacognostic analysis of C. longa rhizome was carried out, including macroscopic, microscopic, physicochemical, and phytochemical evaluations to ensure raw material standardization. Molecular docking studies assessed the anti-inflammatory activity of curcumin and glutathione against key protein targets implicated in psoriasis, namely COX-2, NF-κB, TNF-α, and the Keap1–Nrf2 complex. Docking results revealed strong binding affinities, with curcumin showing marked inhibition of COX-2 (–7.4 kcal/mol) and NF-κB, while glutathione displayed effective interactions with COX-2 (–5.2 kcal/mol) and Keap1 (–5.6 kcal/mol). These findings suggest a synergistic mechanism, linking the anti-inflammatory effects of curcumin with the antioxidant and redox-modulating activities of glutathione. Analytical profiling through HPTLC and HPLC confirmed the presence and quantification of marker compounds, ensuring batch-to-batch consistency. The integrated pharmacognostic and computational outcomes support the development of herbal nanofiber-based topical patches, designed to enhance penetration, provide sustained release, and selectively modulate inflammatory pathways. Overall, this study demonstrates the promise of combining traditional pharmacognosy with modern molecular docking and analytical profiling to create innovative, targeted, and safer interventions for psoriasis therapy.

**Keywords:** Psoriasis, Curcumin, Glutathione, Pharmacognostic profiling, Molecular docking, Herbal nanofiber patches

**PT-294**

**FORMULATION AND EVALUATION OF HERBAL KAJAL**

K. Blessi Priyanka
University College of Pharmaceutical Sciences,
Kakatiya University, Warangal, Telangana.

A seven different kajal formulations were prepared by using different concentrations of bring raj and orange peel extracts. Bring raj leaves and orange peels were washed with tap water, then with distilled water. They were left for drying until become completely dried. The formulations were examined for the physicochemical properties, pH, SEM, IR irritability and spreadability. All formulations showed better results. These formulations will be used for beatification purpose. Kajal, also known as Surma or Kohl, is a visually arresting cosmetic. Ayurvedic kajal is completely fresh because it is made with natural substances. The components in Ayurvedic kajal are therapeutically useful to the body. The eyes are nourished and moisturized when organic kajal is used. This kajal is frequently used to cleanse the skin of pollutants. The ayurvedic kajal improves the clarity of the eyes by strengthening their muscles. Tear fluid tends to drain faster when the kajal is utilized, as opposed to utilizing an industrial kajal. Because of its astringent qualities, natural kajal frequently melts in the eyes of tiny red vessels to keep them clean. Keeping this entire thing we have formulated seven different kinds of kajal using herbal extracts. After drying made powder by the use of mixer. The powders were dried and weighed. Both powders were extracted with methanol. The cotton cloth was soaked in different concentrations in mornings by drying overnight. Repeated the process until all the extract was completely absorbed. The cotton cloth was made as wick and lighted in mud lamp containing 20ml of sunflower oil/coconut oil and 2 drops of rose water. The black soot was collected in

ISBN: 978-81-980623-8-3

dry and porcelain dish. The powder was made as paste with the help of cow ghee and packed in dry box.

**FORMULATION AND EVALUATION OF MEDICATED HERBAL GEL CONTAINING CURCUMA AMADA WITH GELLING AGENT OF HYLORONIC ACID FOR PAIN RELIEVING PROPERTY**

Pasalapudi Lakshmi poojitha, Ch. Sandhya Rani
Department of pharmaceutics
Vikas Institute of pharmaceutical sciences, near airport,
Rajahmahendravaram East Godavari district
Andra pradesh, India 533102
dpasalapudi1@gmail.com

The present study focuses on the formulation and evaluation of a medicated herbal gel containing Curcuma amada extract, incorporated with hyaluronic acid as a natural gelling agent, for its pain-relieving properties. Curcuma amada (mango ginger) is widely recognized for its potent anti-inflammatory, analgesic, and antioxidant activities attributed to its phytoconstituents such as curcuminoids and essential oils. Hyaluronic acid, chosen as the gelling base, offers excellent biocompatibility, hydration, and drug release modulation, making it a suitable medium for topical delivery. The formulation process involved extraction of Curcuma amada, incorporation into varying concentrations of hyaluronic acid gel, and subsequent optimization based on physical characteristics. Prepared gels were evaluated for physicochemical parameters including pH, homogeneity, spreadability, viscosity, and stability. In vitro drug release studies and ex vivo permeation analyses were conducted to assess the release profile and skin penetration efficiency. The optimized formulation was further subjected to pharmacological evaluation using suitable analgesic and anti-inflammatory models to confirm its therapeutic efficacy. Results demonstrated that the Curcuma amada–hyaluronic acid gel exhibited desirable physicochemical characteristics, sustained drug release, and significant pain-relieving activity compared to control formulations. This study highlights the potential of integrating traditional herbal medicine with modern biocompatible polymers to develop safe, effective, and patient-friendly topical therapeutic systems.

**PT-296**

**DETERMINATION OF TOTAL PHENOLIC CONTENT IN LEAF EXTRACT OF MURRAYA KOENIGII (CURRY LEAVES) BY FOLIN–CIOCALTEU COLORIMETRIC METHOD**

Vrushali Baisane,R.S.Bhambar
M.G.V's Pharmacy College, Panchavati, Nashik,
Maharashtra, India – 422003
Vrushalibaisane77@gmail.com

The present study was undertaken to determine the total phenolic content (TPC) of Murraya koenigii (curry leaves) extract, an aromatic medicinal plant widely used in traditional systems of medicine and culinary practices. Fresh leaves were shade-dried, powdered, and extracted using ethanol as the solvent. The TPC of the extract was estimated by the Folin–Ciocalteu colorimetric method, employing gallic acid as the standard reference compound. Absorbance was measured spectrophotometrically at 765 nm, and results were expressed in milligrams of gallic acid equivalents (mg GAE/g of dry weight). The analysis revealed that the ethanolic extract of M. koenigii leaves possesses a considerable amount of phenolic compounds, indicating strong antioxidant potential. These findings highlight the pharmacological relevance of curry leaves, supporting their role as a natural source of bioactive phenolics with potential applications in nutraceuticals and the development of polyherbal formulations. Further research on the isolation and characterization of specific phenolic constituents is warranted to establish their therapeutic efficacy.

**Keywords**: Murraya koenigii, phenolic content, antioxidant, Folin–Ciocalteu method, nutraceuticals.

**Formulation And Evaluation Of Herbal Tooth Gel Of Vitex Trifolia Leaves Extract For Preridontal Disease**

Sakshi Mukkawar, Rutuja More, Sandeep Gadhwe.
Dep. Of Pharmaceutical Quality Assurance, Sinhagad collge of pharmacy, vadgaon bk., Pune, MS, India 411041.

The formulation and development of herbal tooth gel using vitex trifolia leaves extract aim to provide a natural therapeutics approach for managing periodontal disease. The gel is designed to leverage the antimicrobial and anti-inflammatory properties of vitex trifolia to reduce plaque, gingivitis and inflammation. The leaf extract was obtained using ethanol as a solvent through maceration and incorporated into a Carbopol-based gel matrix. The formulation gel was evaluated for various physicochemical parameter including pH, viscosity, spreadability, extrudability and stability. Antimicrobial activity against common oral pathogens such as streptococcus mutans, porphyromonas gingivalis, these is assessed using agar well diffusion method. the results demonstrated that the formulation herbal tooth gel exhibited desirable organoleptic and physicochemical properties along with significant antimicrobial activity and stability over time. The study aims to provide a comprehensive assessment of the gel safety, efficacy, and potential for clinical application.

**Keywords**: Vitex trifolia, periodontal disease, antimicrobial activity, oral hygine, gel evaluation.

**DEVELOPMENT OF A PH-RESPONSIVE GRAFTED NATURAL POLYSACCHARIDE**

Nitin Sharma, Maitrayee Ghosh
Department of Pharmaceutics, Amity Institute of Pharmacy, Amity University, Noida, 201301, Uttar Pradesh, India.
nitinsharmaa.0202@gmail.com

This study investigated the chemical modification of a natural polysaccharide extracted from Abelmoschus esculentus pods commonly known as okra. This modification was carried out using graft copolymerization reaction with acrylamide, to create a colon-specific, pH-sensitive drug delivery system. The production of the grafted copolymer was confirmed with spectroscopy methods. The Fourier-transform infrared spectrometry showed absorbances corresponding to the functional groups of grafted chains of polyacrylamide. The structural formulation was further confirmed by Nuclear Magnetic Resonance spectrometry based on resonance signals from the grafted sections, which confirmed the presence of acrylamide. Furthermore, the modified polymer displayed an appropriate pH sensitive swelling profile. Swelling observed as minimal at an acidic pH (1.2) and greater swelling at a basic pH (7.4), suggesting that the modified polymer may be utilized for targeted colonic release. Preliminary cytotoxicity tests by PI assay indicated that the grafted polysaccharide was not toxic. In summary, acrylamide grafted okra polysaccharide, confirmed in structure with spectroscopic methods, has potential to be developed as a biocompatible and sustainable polymer for colon targeted drug delivery.

**Keywords:** Abelmoschus esculentus, Acrylamide, Colon targeting drug delivery, Copolymerization, pH-sensitivity.

**EXTRACTION, ISOLATION, IDENTIFICATION, AND ANALYSIS OF BETALAMIC ACID FOR ANTIHYPERTENSIVE ACTIVITY**

Shreyas Khale
Smt. B.N.B. Swaminarayan Pharmacy College, Salvav – Vapi,
India – 396191
khaleshreyas204@gmail.com

Hypertension is one of the most common lifestyle disorders and still constitutes a major cause for cardiovascular morbidities. Studies of plant derived bioactive compounds provide potential new clues to the safer control. Betalamic acid, a primary intermediate of betalain pigments, has been documented to have antioxidant and vasoprotective activity that might influence blood pressure. So, there is scope for the future study based on the present research idea to address betalamic acid by its isolation, extraction, identification, and preliminary screening for antihypertensive activity. It will be extracted from betalain-enriched plant material with appropriate solvent systems and then purified by column chromatography. The isolated compound will be identified by conventional spectral methods (UV-Vis, and FTIR) with further tests if necessary to ascertain the constitution. Assay profiling will set purity and stability criteria. The antihypertensive capacity will possibly be screened through preliminary studies on in vitro vasorelaxant activity which can serve as an early indicator of function. The novelty of this idea is the use

ISBN: 978-81-980623-8-3

of betalamic acid, an under-investigated phytoconstituent by targeting it as a candidate for natural antihypertensive drug therapy. The results of such studies may become the basis for further extensive pharmacological investigations and create a new generation of safer plant-derived compounds with potential therapeutic uses in cardiovascular medicine.

**Keywords:** Betalamic acid, Hypertension, Extraction, Isolation, Vasorelaxant.

## EVALUATION OF IN VITRO ANTIMICROBIAL ACTIVITY OF GUM RESIN OF CANARIUM STRICTUM AGAINST SELECTED GRAM-POSITIVE, GRAM-NEGATIVE BACTERIA AND A FUNGAL PATHOGEN

Vaishnavi Khoke, Pravin Suruse, Vinod Thakare
Nagpur College of Pharmacy, Nagpur, Maharashtra, India-441110.
vaishnaviovinodkh@gmail.com

Canarium strictum Roxb. (family Burseraceae), traditionally known in Ayurvedic medicine as Raladhupa or black dammar resin, was investigated for its phytoconstituents. Compounds A and B were isolated from the chloroform extract using the counter-current distribution method. The purity of each compound was assessed by thin-layer chromatography (TLC). Preliminary phytochemical screening indicated that both compounds belong to the triterpenoid class of phytoconstituents. The antimicrobial potential (antibacterial and antifungal) of Compound A and Compound B was evaluated using the cup plate (agar diffusion) method. Both compounds exhibited broad-spectrum antimicrobial activity at a concentration of 100 µg/ml. The inhibitory effects of Compound A and Compound B were comparable in magnitude, showing nearly identical activity against Gram-positive and Gram-negative bacteria as well as fungi.

**Keywords:** Canarium strictum, Raladhupa, Black dammar resin, Antimicrobial activity, fungi.

## BIOLOGICAL VALIDATION OF HEPATOPROTECTIVE AND ANTITUBERCULOSIS EFFECT OF HYDROALCOHOLIC EXTRACT OF TECOMA STANS LINN.

Bodavula Sambasiva Rao
Principal and professor, Khammam college of Pharmacy, Khammam, Telangana.

Tuberculosis (TB) remains a global health burden, with India reporting 2.42 million cases in 2022, including 63,801 multi-drug resistant (MDR-TB) patients. Standard anti-TB therapy (isoniazid, rifampicin, pyrazinamide, and ethambutol; RIPE) is effective but frequently associated with hepatotoxicity. Herbal medicines are increasingly explored for their hepatoprotective potential. Tecoma stans Linn, rich in flavonoids, phenolic compounds, and glucosinolates, is traditionally used for multiple ailments and has reported antioxidant and hepatoprotective properties. This study evaluated the hepatoprotective and anti-tubercular effects of hydroalcoholic extract of Tecoma stans Linn seeds (HATS) in RIPE-induced hepatotoxicity. Methodology: Tecoma stans Linn seeds were subjected to hydroalcoholic extraction, followed by phytochemical screening. Antimycobacterial activity was assessed using the Alamar Blue assay against Mycobacterium tuberculosis H37Rv. Hepatoprotective effects were evaluated in mice divided into eight groups, treated with RIPE alone, RIPE + HATS (100, 200, 400 mg/kg), RIPE + silymarin (100 mg/kg), and controls. Biochemical markers (AST, ALT, ALP, γ-GT, LDH), lipid profile, oxidative stress markers (CAT, SOD, GPx, GST, GSH), protein content, and histopathology were analyzed. HATS exhibited significant antimycobacterial activity, with MIC values as low as 0.8 µg/ml, comparable to rifampicin. RIPE treatment induced hepatotoxicity, evidenced by elevated serum transaminases, dyslipidemia, reduced antioxidant enzyme activity, and histopathological damage. Co-administration of HATS significantly ($p < 0.05$–$0.0001$) restored liver function markers, improved lipid profile, enhanced antioxidant defense (CAT, SOD, GPx, GST, GSH), and preserved protein levels in a dose-dependent manner. The protective efficacy of HATS at 400 mg/kg was comparable to silymarin. Discussion: The hepatoprotective activity of HATS may be attributed to its rich phytochemical composition, particularly flavonoids, which exert antioxidant, anti-lipid peroxidative, and membrane-stabilizing effects. HATS mitigated RIPE-induced oxidative stress and lipid peroxidation, thereby preserving hepatic integrity. Conclusion: HATS demonstrated dual activity: significant anti-tubercular effects and potent hepatoprotection against RIPE-induced liver injury.

**Keywords:** Tuberculosis, hepatotoxicity, Tecoma stans Linn, hydroalcoholic extract, anti-tubercular, antioxidants, RIPE regimen

**PT-302**

## PHYTOCHEMICAL INVESTIGATION AND ANTI DIABETIC, ANTI MICROBIAL, SCREENING OF ETHYL ACETATE EXTRACT OF HYPTIS SUAVEOLENS

Papana Lakshmi Priya, B. Madhu Harika
Department of pharmaceutical chemistry, vikas institute of pharmaceutical sciences, near airport, Rajahmundry, East Godavari district, Andhra Pradesh, India-533102
priyapapana95534@gmail.com

To evaluate the in vitro antimicrobial and in vivo antidiabetic potential of ethyl acetate extract of aerial parts of Hyptis Suaveolens Poit. (Lamiaceae), a part traditionally used for treating diabetes, fever, eczema, cancers and headache.Aerial parts (leaves) of Hyptis Suaveolens were extracted with ethyl acetate using soxhlet apparatus.The prepared ethyl acetate extract was tested for its hypoglycemic activity at doses of 250 and 500 mg/kg.Studies were conducted on acute normoglycemic and alloxan-induced hyperglycemic rats.Experiments included oral glucose tolerance tests and a 28-day chronic study, using glibenclamide as the standard drug. Body weight and serum blood glucose levels were measured in the treated hyperglycemic rats.Antimicrobial activity of the extract was assessed in vitro, comparing the extract's zone of inhibition (ZOI) to standard gentamicin.In normoglycemic rats, a 4-15% decrease in blood glucose was observed.Hyperglycemic rats showed a significant ($p<0.0001$) and progressive drop in blood glucose levels. Improvement in glucose tolerance was also observed ($p < 0.05$). Treated rats showed favorable body weight gain and improved biochemical parameters over 28 days.The plant extract exhibited notable antimicrobial activity (5 cm ZOI) compared to gentamicin (6 cm ZOI). The study confirms that the aerial parts of H. suaveolens possess significant antidiabetic and antimicrobial activities, supporting its traditional use.

## FORMULATION AND QUALITY TESTING OF A MOISTURIZING SHAMPOO WITH ALOE VERA

Sherikar Poornima, Pasula Sneha, Gunreddy Sathwika Reddy, Md Saleem, Dr. B. Raj Kumar
Department of Pharmacognosy,
Moonray Institute of Pharmaceutical Sciences, Raikal, Shadnagar, N.H-44 Ranga Reddy-509202 Telangana, India.
Sherikarpoornima07@gmail.com

The present study focuses on the formulation and evaluation of a moisturizing shampoo incorporating Aloe vera gel as a key natural ingredient. Aloe vera is widely recognized for its hydrating, soothing, and anti-inflammatory properties, making it an ideal component for hair care products. The shampoo was prepared using a blend of surfactants, conditioning agents, and humectants, with Aloe vera gel acting as the primary moisturizer and scalp soother. The formulation was developed using standard techniques and evaluated for various physicochemical properties, including pH, viscosity, foamability, solid content, surface tension, and conditioning performance. The results demonstrated that the Aloe vera-based shampoo exhibits excellent cleansing ability, mildness to the scalp, and moisturizing properties, without causing dryness or irritation. Furthermore, the natural gel contributed to enhanced hair softness, shine, and manageability. This study supports the use of Aloe vera gel as a natural and effective moisturizing agent in herbal shampoos, offering a safer alternative to synthetic conditioners and potentially reducing scalp-related issues due to its bioactive components.

**Keywords:** Moisturizing Shampoo, Formulation, Evaluation, Aloe Vera gel Extract, Detergents, Sodium lauryl Sulfate.

## EVALUATION OF ANTIBACTERIAL ACTIVITY OF HYDRO-METHANOLIC EXTRACTS OF FLOWERS OF IXORA COCCINEA AND CATHARANTHUS ROSEUS

ISBN: 978-81-980623-8-3

Ranjan Kumar M., Rajeshwari H.M., Harshan gowda [3], Manikantha S.I.
Asst Professor, Nargund College of Pharmacy,
Bengaluru, Karnataka, India.
Asst Professor, Visveswarapura Institute of Pharmaceutical Sciences,
Bengaluru, Karnataka, India
Nargund College of Pharmacy, Bengaluru, Karnataka, India.

The aim of this study was to assess the effect of the hydro-methanolic extract of Ixora coccinea (I. coccinea) & Catharanthus roseus (C. roseus) flowers on Staphylococcus aureus and Escherichia coli. Materials & methods. In this the in-vitro studies on, I. coccinea & C. roseus dried flowers petals are extracted by Soxhlet extraction by using hydro-methanol solvent. The antibacterial effect of the extract compared by Tetracycline was evaluated on using nutrient agar media by the pour-plate method. By evaluating the diameter of the growth inhibition zone, the minimum inhibitory concentration (MIC) and minimum bactericidal concentration (MBC) of the extract were determined for the above bacteria's. The hydro-methanolic extracts of I. coccinea & C. roseus had been shown inhibitory effects on the proliferation of all bacterial strains with the maximum effect on E. coli with MIC and MBC of 9mm of ZOI. The largest diameter of the zone of growth inhibition belonged to E. coli and the smallest to S. aureus. Tetracycline had the greatest inhibitory effect on E. coli. Conclusions. The hydro-methanolic extract of Ixora coccinea demonstrated a comparatively higher inhibitory effect than Catharanthus roseus, suggesting stronger antibacterial potential. The combination of extracts also displayed synergistic activity, reinforcing the therapeutic relevance of plant-based formulations.

**Keywords:** Ixora coccinea, Catharanthus roseus, hydro-methanolic extract, antibacterial effect.

**PT-305**

## Formulation And Evaluation Of Phytosomes From Ipomoea Mauritiana Tuber Extract With An In- Vitro Anti-Inflammatory Potential.

G.N Pramodini, Surya S Nair
Department of Pharmacognosy
Nehru College of Pharmacy, Pampady, Kerala
pramodini0606@gmail.com

Ipomoea mauritiana Jacq., commonly known as Vidari, is a medicinal plant widely used in traditional systems of medicine for its rejuvenating and therapeutic properties. The present study was undertaken to evaluate the anti-inflammatory potential of the ethanolic tuber extract and to develop a phytosomal formulation for enhanced delivery. In Ipomoea mauritiana, reported the presence of bioactive compounds such as scopoletin, β-sitosterol, and taraxerol, which are reported to contribute to anti-inflammatory activity. The in vitro anti-inflammatory activity was assessed using the albumin denaturation assay, where the extract exhibited significant inhibition in a dose-dependent manner, with an $IC_{50}$ value of 333 µg/mL compared to diclofenac sodium ($IC_{50}$ 241 µg/mL). To improve stability and bioavailability, phytosomes of the extract were prepared by the anti-solvent precipitation method and characterized by particle size analysis, zeta potential, and scanning electron microscopy. The phytosomes displayed a mean particle size of 153.67 nm, a zeta potential of –25 mV indicating moderate stability, and spherical vesicular morphology with uniform distribution. A phytosome-loaded suspension was further formulated and evaluated for physicochemical parameters, including pH (5.60 ± 0.14), viscosity (126.34 cp), sedimentation volume, and responsibility, all of which indicated satisfactory stability and ease of administration. The study concludes that I. mauritiana tuber extract possesses promising anti-inflammatory activity and that its incorporation into phytosomal formulations offers an effective drug delivery strategy to enhance therapeutic potential.

**Keywords:** anti-inflammatory potential, Ipomoea Mauritiana, Phytosomes

## FORMULATION OF HERBAL FACE SERUM USING BITTER MELON

Sanskruti Shinde, Mrs. Megha Chitte.
Sandip Institute of Pharmaceutical Science, Nashik.

A cosmetic serum is a highly concentrated formulation, usually based on water or oil, designed for rapid absorption and deeper penetration into the skin layers. In this study, a face serum was formulated using Momordica charantia (bitter melon/karela) extract, a natural ingredient known for its wide range of health and dermatological benefits. Bitter melon is rich in antioxidants and bioactive compounds that help combat premature aging, reduce acne, and minimize skin blemishes, thereby improving overall skin health and appearance. The prepared serum was subjected to a series of evaluations to assess its quality, stability, and effectiveness. The physicochemical parameters tested included pH, physical appearance (color, odor, and texture), and spreadability, which indicated smooth application and uniform coverage on the skin. Biological testing involved microbial analysis to ensure product safety, while stability assessment was carried out through cyclic temperature variation studies. The serum showed no microbial contamination, maintained its stability under stress conditions, and exhibited excellent spreadability with a pleasing aesthetic feel. Overall, the Momordica charantia-based face serum demonstrated favorable physical, chemical, and biological characteristics. The project highlights its potential as a natural cosmetic product with anti-aging, antioxidant, and skin-glowing effects, suitable for improving skin quality and providing a youthful appearance.

**Keywords:** Momordica charantia, Bitter melon, Face serum, Antioxidant, Anti-aging, Skin care, Acne, Blemishes, Natural formulation, Cosmetic evaluation, Spreadability, Stability testing.

## EVALUATION OF TOTAL PHENOLIC CONTENTS (TPC), TOTAL FLAVONOIDS CONTENT (TFC) AND PRELIMINARY PHYTOCHEMICAL SCREENING USING THE CELASTRUS PANICULATUS SEEDS EXTRACT

Priya Mudgal, Sushila Rathee, Samriti Faujdar
Department of Pharmacy, Banasthali University,
Jaipur, Rajasthan 304022, India
St. Andrews College of Pharmacy, Farrukhnagar,
Gurugram, Haryana, India
mudgalpriya95@gmail.com

The current study has been designed to estimation of the total phenolic contents (TPC) and total flavonoids content (TFC) from Celastrus paniculatus seeds extracts and evaluation of preliminary phytochemical screening of plant extract. Objective of current study to find out the phytoconstituents from plant extract. For the methodology, initially plant extract prepared with Soxhlet extraction method and the total phenolic content in the extract was evaluated through folin-ciocalteu method and TFC was determined by the aluminum chloride method. Gallic acid in TPC and Rutin in TFC was used standard compound. The qualitative phytochemical analysis of the plant extract was carried out for the identification of phyto-constituents using standard methods. It was observed that TPC (18.12 ± 2.8 mg GAE/g) and TFC (10.20 ± 1.8 mg RUE/g was observed in seeds extract of Celastrus paniculatus. The presence of sterols, terpenoids, alkaloid, phenolic, tannins, flavonoids was confirmed from phytochemical screening. Thus, It was concluded, that several phytoconstituents available in plant extract and TPC and TFC was found in plant extract, which may associated with antioxidant potential. Thus, TPC and TFC are valuable plant actives available in plant extract of Celastrus paniculatus. Thus, herbal seeds extract of Celastrus paniculatus may be further utilize for antioxidant potential as the phenolic acid and flavonoids contents linked to the antioxidant activity.

**Keywords:** Celastrus paniculatus, herb, phytoconstituents, TPC, TFC, Gallic acid

## UNBOLTING PHYTOCONSTITUENTS AND EVALUATION OF ANTIMICROBIAL ACTIVITY OF CLITORIA TERNATEA ETHANOLIC FLOWER EXTRACT

Vepuri Bindu Madhuri, Gunturu Jaya Syamala
Associate Professor, NRI College of Pharmacy,
Eluru District, Andhra Pradesh.
bindumpharm2015@gmail.com

Plants have a unique language that holds secrets to the ethereal qualities of poly valent nature and richness of bioactive compounds. The present study investigates the screening of phytochemicals that are responsible for the versatility of Clitoria ternatea (Sankha pushpi), from Fabaceae family, has long been used in Ayurvedic medicine and also using in modern medicine. A week-long shade dried fresh flowers of Clitoria

ISBN: 978-81-980623-8-3

ternatea were extracted with ethanol using Soxhlet apparatus about 72 hours. The extracts were subjected to LC-MS using the column Waters X-Terra RP-18 and the analysis confirmed that the presence of compounds such as kaempferol-3-O-glucoside (m/z-283.28) quercetin-3-robinobioside (m/z-594.52), cyanidin-3-O-glucoside (m/z-369.95), delphinidin-3-O-glucoside (m/z-501.63), and N-methyltryptamine (m/z-219.28). Antimicrobial activity was confirmed due to the presence of anthocyanins, flavonoids, alkaloids and polyphenols. The ZOI was measured by using the cup-plate method at concentrations of 15, 30, and 45 mg/ml using streptomycin (50 mg/ml) as a standard. The extract exhibited concentration-dependent antimicrobial activity, with maximum ZOI against Bacillus subtilis (1.3 mm at 45 mg/ml) and E. coli (1.2 mm at 45 mg/ml), Pseudomonas aeruginosa (1.1mm at 45mg/ml) and Staphylococcus aureus (1.3mm at 45mg/ml), Candida albicans (0.9mm at 45mg/ml). This unlocking ethanolic flower extract of Clitoria ternatea revealing that it is a wealth of distinct chemical constituents with antimicrobial activity.

**Keywords:** Phytoconstituents, antimicrobial, Liquid Chromatography Mass Spectroscopy, Zone of Inhibition.

## NEUROPROTECTIVE POTENTIAL OF STANDARDIZED QUERCETIN-RICH EXTRACT FROM IPOMOEA AQUATICA IN NEUROLOGICAL DISORDERS

Kalyan Sen and Himangshu Sekhar Maji
Department of Pharmaceutical Technology,
JIS University, Kolkata, India.-700109
kalyansenbpharm@gmail.com

This research examines the neuroprotective effectiveness of a standardized quercetin-rich extract derived from Ipomoea aquatica (water spinach) in relation to neurobehavioral and cholinergic deficits associated with Parkinson's disease. To guarantee phytochemical uniformity, IA leaves were authenticated, hydroalcoholically extracted, and standardized for quercetin using UV, FTIR, 13C-NMR, HPLC, and HPTLC, verifying retention-time agreement with a reference standard. Cognitive impairment was generated in a validated mouse model with intracerebroventricular administration of Aβ25–35. Behavioral evaluations including open-field, hole-board, Y-maze, Morris water maze, step-down inhibitory avoidance, and object recognition assessments. IA administration (200 and 400 mg/kg, p.o.) markedly boosted spontaneous alternation, decreased escape latency, reinstated novelty preference, and increased rearing, head-dipping, and locomotion, signifying extensive cognitive recovery. Both short-term and long-term memory were markedly improved in inhibitory avoidance tasks. Biochemically, IA reduced hippocampus acetylcholinesterase (AChE) activity, consistent with quercetin's documented anti-AChE, antioxidant, and anti-inflammatory properties. Histopathological study demonstrated maintained neuronal morphology in IA-treated groups relative to untreated Aβ-exposed rats. Acute oral toxicity study (maximum dosage 2000 mg/kg) revealed a positive safety profile, with no fatalities, adverse clinical manifestations, or organ impairment. The mechanistic regulation of quercetin on SIRT1–PINK1–Parkin mitophagy, Nrf2/ARE antioxidant pathways, and NF-κB/NLRP3 suppression underpins the observed neuroprotection. In summary, standardized IA extract provides cognitive advantages across several domains, alleviates cholinergic dysfunction, maintains brain histoarchitecture, and exhibits immediate safety, underscoring its therapeutic promise in Parkinson's disease.

**Keywords**: Ipomoea aquatica, Parkinson's disease, Acute oral toxicity, histopathology, Y-maze, quercetin, oxidative stress.

## STANDARDIZATION AND EVALUATION OF A POLYHERBAL OINTMENT FOR WOUND HEALING

Swathi K, Samuel Thavamani B, Sisira C, Surabhi T S
Department of Pharmacognosy, Ahalia School of Pharmacy,
Kozhipara, Palakkad
swathikuniyil@gmail.com

Wound healing is a complex and multistage biological process that is often hindered by microbial invasion and prolonged inflammation. This study details the formulation, standardization, and evaluation of a polyherbal ointment for wound healing utilizing extracts from four medicinal plants: Artocarpus heterophyllus (jackfruit leaves), Murraya koenigii (curry leaves), Nerium indicum (oleander leaves), and Punica granatum (pomegranate peel), all known for their traditional wound healing, antimicrobial, and anti-inflammatory properties. The components were shade-dried, powdered, and subjected to Soxhlet extraction with ethanol. The ointment was prepared using the fusion method, incorporating the plant extracts into a suitable ointment base. Standardization involved organoleptic assessment, physicochemical tests including pH (5.2), spreadability, and stability, as well as comprehensive phytochemical screening and advanced profiling by LC-MS to ensure the consistency and quality of active constituents. Phytochemical analysis confirmed the presence of carbohydrates, glycosides, flavonoids, alkaloids, tannins, and phenolic compounds. For functional evaluation, in vitro antimicrobial efficacy was tested using the well diffusion method against several wound pathogens, including Staphylococcus aureus and Enterococcus spp., with significant inhibition zones observed, particularly against Enterococcus. The ointment's wound healing potential was further corroborated using a scratch assay on fibroblast cultures, demonstrating accelerated cell migration and closure compared to controls. The findings highlight that Vi-rohana, developed under phytochemical and analytical standardization, shows promising wound healing and antimicrobial potential. This underscores its utility as a reliable polyherbal alternative in wound care formulations, bridging traditional knowledge with scientific validation.

**Keywords:** Polyherbal ointment, standardization, wound healing, antimicrobial, LC-MS

## FOLK MEDICINE FOR MENTAL HEALTH: ETHNOBOTANICAL SURVEY OF PLANTS USED IN NEUROLOGICAL DISORDERS IN BALANGIR, ODISHA, INDIA

Jyoti Prakash Guru, Dr. Chandra Sekhar Patro, Prafulla Kumar Sahu
Department of Pharmaceutics, School of Pharmacy & Life Sciences,
Centurion University of Technology and Management,
Bhubaneswar, Odisha, India-752050
jyotiprakash.guru@cutm.ac.in

The incidence of neurological disorders has increased globally over the last decade, particularly in developing countries. People inhabiting the remote regions of Balangir district often suffer from various neurological disorders. No specific survey has been carried out for neurological disorders so far; hence, the present study was undertaken to document the plants used to treat such disorders. This study was conducted in Balangir district, Odisha, India. This study surveyed 90 participants from various rural communities in the Balangir district, gathering traditional knowledge through interviews and semi-structured questionnaires. Data were collected on plants with relevant activities, including details on parts used, botanical descriptions, routes of administration, and dosage forms. Quantitative measures such as participant demographics, informant responses, relative frequency citations, and cultural indices were employed to evaluate each plant's usefulness. The research identified 35 medicinal plants: 13 herbs, 13 trees, and 9 shrubs. primarily used in powdered form to treat neurological disorders. species included Cathranthus roseus, Cynodon dactylon, Rauvolfia serpentina, Withania somnifera, Acorus calamus, and Curcuma longa. which exhibited high therapeutic value and cultural importance. This study highlights the traditional medicinal plants used against neurological disorders and advocates modern therapeutic approaches.

## IN VITRO ASSESSMENT OF ANTIOXIDANT POTENTIAL OF ALBIZIA LEBBECK BARK EXTRACTS

Rutika Kshirsagar, Pravin Suruse and Vinod Thakare
Nagpur College of Pharmacy, Nagpur, Maharashtra, India-441110.
rutikak60@gmail.com

The present study was undertaken to evaluate the in vitro antioxidant potential of the methanolic extract and an isolated compound from Albizia lebbeck bark. The compound was isolated from the methanolic extract using column chromatography, and its purity was confirmed by thin layer chromatography (TLC). Total phenolic content (TPC) of both the methanolic extract and the isolated compound was determined using the Folin-Ciocalteu method. The isolated compound exhibited a

ISBN: 978-81-980623-8-3

higher phenolic content (84.44 mg/g gallic acid equivalent, GAE) compared to the methanolic extract (80.25 mg/g GAE). The methanolic extract and the isolated compound were evaluated for their free radical scavenging potential using the 1,1-diphenyl-2-picrylhydrazyl (DPPH) assay and reducing power assay. At a concentration of 1000 µg/ml, the DPPH free radical scavenging activity was found to be 91.82% for the methanolic extract and 90.08% for the isolated compound, indicating strong antioxidant activity. The reducing power was measured as 2.799 nm for the isolated compound and 2.2148 nm for the methanolic extract. Preliminary phytochemical screening revealed the presence of alkaloids and polyphenolic compounds. These findings suggest that Albizia lebbeck bark could serve as a valuable source of phenolic antioxidants and may provide promising leads in the search for natural antioxidants from Indian medicinal plants for the management of diseases associated with free radical mediated damage.

**Keywords:** Albizia lebbeck, free radical scavenging activity, antioxidant activity.

**PT-313**

## HERBAL INNOVATIONS IN ORAL HYGIENE: FORMULATION AND EVALUATION OF A PLANT-BASED MOUTHWASH

Gajji Neelamma, Adepu Ramesh, Mighty Rose, Madhumitha
Department of Pharmaceutics, Vikas College of Pharmaceutical Sciences, Rayanigudem, Suryapet, Telangana, India - 508376.
Nanisony2012@gmail.com

Oral health is a crucial component of overall well-being, yet it is frequently compromised by microbial infections such as dental caries, gingivitis, and candidiasis. Conventional mouthwashes, although effective, are often associated with side effects like tooth staining, altered taste, and mucosal irritation due to synthetic chemical agents. This study explores a novel plant-based mouthwash formulation incorporating traditional medicinal herbs as a safer, natural alternative. The formulation comprised hydroalcoholic extracts of Azadirachta indica (neem), Ocimum sanctum (tulsi), and Syzygium aromaticum (clove), selected for their well-documented antimicrobial properties. The mouthwash was evaluated for physicochemical parameters (pH, clarity, viscosity), organoleptic qualities, microbial load, and stability. Its antimicrobial activity was assessed in vitro using the agar well diffusion method against Streptococcus mutans, Lactobacillus acidophilus, and Candida albicans, and compared with a commercially available 0.2% chlorhexidine mouthwash. The polyherbal formulation was found to be physically stable, with acceptable sensory properties and no microbial contamination over a 30-day period. It exhibited significant antimicrobial activity, especially against S. mutans and C. albicans, with inhibition zones comparable to those of chlorhexidine. The plant-based mouthwash demonstrated promising potential as an effective and safer herbal alternative to conventional chemical oral rinses. These findings support further clinical evaluation and potential commercial development of the formulation for routine oral hygiene.

**Keywords:** Herbal Mouthwash, Antimicrobial Activity, Neem, Tulsi, Clove.

## THERAPEUTIC POTENTIAL OF BRYONOPSIS LACINIOSA LEAF EXTRACTS AS ANTI-INFLAMMATORY AND ANALGESIC AGENTS

Diksha Banote, Pravin Suruse, Lalchand Devhare and Vinod Thakare
Nagpur College of Pharmacy, Nagpur, Maharashtra, India-441110.
dikshabanote21@gmail.com

The aqueous, methanol, and chloroform extracts of Bryonopsis laciniosa Linn. leaves (AEBL, MEBL, and CEBL, respectively) were evaluated for their anti-inflammatory and analgesic activities. All extracts (100 mg/kg each) significantly ($P < 0.05$) inhibited carrageenan-induced paw edema in rats and reduced nociception in the tail immersion test (50.0 ± 1.0°C) and acetic acid-induced writhing. Among the extracts, the methanol extract (MEBL) showed the highest inhibition of paw edema. In thermally induced nociception, both MEBL and CEBL exhibited high and comparable analgesic activity to that of acetylsalicylic acid (150 mg/kg). In chemically induced pain (acetic acid model), the methanolic extract of Bryonopsis laciniosa leaves (MEBL) exhibited the highest analgesic activity, which was comparable to that of acetylsalicylic acid (150 mg/kg). Therefore, it can be concluded that, in addition to its traditional use for bilious attacks and fevers with flatulence, the various extracts of Bryonopsis laciniosa leaves also possess significant anti-inflammatory and analgesic activities. Phytochemical analysis revealed that the methanolic extract contains several secondary metabolites, including steroids and polyphenolic compounds.

**Keywords:** Bryonopsis laciniosa Linn., Analgesic activity, Anti-inflammatory activity.

## FORMULATION AND EVALUATION OF POLY HERBAL SYRUP

Kondepudi Sri Vijayalakshmi, Suresh Babu Emandi
Department of Pharmacognosy, Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry, East Godavari District, Andhra Pradesh, India-533102.
vijayalakshmikondepudi23@gmail.com

Nature has been a source of medicinal agents for thousands of years, and an impressive number of modern drugs have been isolated from natural sources, particularly plants and with many based on their use in traditional medicine. By using medicinal chemistry and combinatorial chemical and biosynthetic technology, novel natural product needs will be optimized on the basis of their biological activities to yield effective chemotherapeutic and other bioactive agents.1 During the past decades, public interest in natural therapies, namely herbal medicine, has increased dramatically not only in developing countries but mainly in industrialized countries.Cough associated with the acute and chronic conditions is commonly in patients of all ages, common cause of cough are bacterial or viral infection on the upper respiratory tract, air pollution cigarette smoking, foreign body, asthma and eosinophilic bronchitis.. During the past decades, public interest in natural therapies, namely herbal medicine, has increased dramatically not only in developing countries but mainly in industrialized countries. In this research article poly herbal anti- tussive syrup formulation containing some of the natural drugs like Clove (Eugenia aromatica), Cinnamon (Cinnamomum cassia), Black pepper (Piper nigrum), Tulsi (Ocimum sanctum), peppermint (menthol) & Honey (as a base) were formulated and evaluated. These particulate combinations of natural drugs which have cough repellent property are made in form of syrup. These are nontoxic not harmful does not show any of side effect on human body and most superior than of OTC drugs.

**Keywords:** Antitussives, herbal medicines, formulations, Evaluation methods, Natural Substances

## FORMULATION AND EVALUATION OF POLY HERBAL GEL

Sammangi Vani Siri, Suresh Babu Emandi
Department of Pharmacognosy, Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry,East Godavari District, Andhra Pradesh, India-533102.
vanisiribujji@gmail.com

The escalating prevalence of dermatophytic infections and the emergence of antifungal resistance have necessitated the development of novel, plant-based therapeutics with improved biocompatibility, safety, and efficacy. This study reports the formulation and comprehensive evaluation of a polyherbal topical gel incorporating extracts from Azadirachta indica (Neem), Ocimum sanctum (Tulsi), and Trigonella foenum-graecum (Fenugreek), aimed at enhancing antifungal action through synergistic phytochemical interactions. Using carbopol 940 as the gelling agent, a series of formulations (PHG1 to PHG8) with varying concentrations of the polyherbal extracts were prepared and assessed for their physicochemical attributes including pH, viscosity, homogeneity, spreadability, and extrudability. The antifungal efficacy was evaluated using the agar well diffusion method against Candida albicans and Aspergillus niger, benchmarked against standard antifungal agents.

**Keywords:** Polyherbal gel, Antifungal activity, Azadirachta indica, Ocimum sanctum, Trigonella foenum-graecum, Carbopol 940, Topical drug delivery, Herbal formulation

## SYNTHESIS OF SILVER NANOPARTICLES OF Amaranthus Tricolor (L) AQUEOUS LEAF EXTRACT AND EVALUATION OF ANTIBACTERIAL ACTIVITY

K. Mohan Krishna Sai Sriram, P. Srinivasa Babu

ISBN: 978-81-980623-8-3

Department of Pharmaceutics, Vignan Pharmacy College, Vadlamudi, Affiliated to JNTU, Kakinada, Andhra Pradesh – 522213, India.
saisriram087@gmail.com

Silver nanoparticles (AgNPs) are widely recognised for their strong antibacterial properties; however, their toxicity to cells necessitates careful evaluation. This study aimed to synthesise silver nanoparticles using the aqueous leaf extract of Amaranthus tricolour (L.) (ATAE) and to investigate their antibacterial potential against selected Gram-positive and Gram-negative bacterial strains. Silver nanoparticles were synthesised using ATAE through a green synthesis approach. Preliminary phytochemical screening of ATAE was carried out to identify bioactive constituents. The antibacterial activity of the synthesised AgNPs was evaluated against Staphylococcus aureus MTCC 11949, Bacillus subtilis MTCC 10010, Escherichia coli MTCC 9721, and Pseudomonas aeruginosa MTCC 9800 at different concentrations of silver nanoparticles. Phytochemical analysis of ATAE revealed the presence of carbohydrates, amino acids, proteins, alkaloids, glycosides, steroids, flavonoids, tannins, and phenolic compounds, which potentially contributed to nanoparticle synthesis and stability. The synthesised AgNPs exhibited broad-spectrum antibacterial activity against all tested organisms. Among them, Pseudomonas aeruginosa MTCC 9800 showed the highest inhibition at all concentrations of silver nanoparticles.The aqueous leaf extract of Amaranthus tricolor (L) successfully mediated the synthesis of silver nanoparticles with potent antibacterial activity. These findings suggest that A. tricolor extract could be a promising natural source for green synthesis of AgNPs with potential applications in antimicrobial therapies.
**Keywords:** Silver nanoparticles, Amaranthus tricolor, phytochemicals, antibacterial activity, green synthesis, Pseudomonas aeruginosa.

## HERBAL EMULGEL FORMULATION FOR MOSQUITO REPELLENCY: A NATURAL ALTERNATIVE APPROACH

P. Chinnar, M. Harika
Department of Pharmacognosy, Indigenous Drugs, Herbal formulations and Phytochemistry V. V. Institute of Pharmaceutical Sciences, Gudlavalleru- 521356, Krishna District, A.P, India.
penumustachinnari@gmail.com

The increasing resistance and adverse effects associated with synthetic mosquito repellents have driven the search for safer, eco-friendly alternatives. This study focuses on the development of a herbal emulgel formulation incorporating natural plant-based oils and extracts known for their mosquito repellent properties. Emulgel, combining the advantages of both emulsions and gels, offers enhanced stability, ease of application, and controlled release of active compounds. Key herbal ingredients such as citronella, neem, eucalyptus, and lemongrass oils were selected for their proven efficacy against mosquitoes. The formulation was optimized for texture, spreadability, and skin compatibility, followed by evaluation of its repellent efficacy under laboratory conditions. Results demonstrated that the herbal emulgel provides effective mosquito repellency comparable to conventional repellents, with the added benefits of being biodegradable, non-toxic, and suitable for sensitive skin. This natural approach presents a promising alternative for mosquito bite prevention and vector-borne disease control.
**Keywords:** Herbal emulgel**,** Mosquito repellent**,** Natural alternative**,** Plant-based oils**,** Vector control

## THE SAFE EDGE OF SCIENCE: NEUTRACEUTICALS VS DRUGS & HERBS

GONIPATI MAHESH RAJU, suresh babu emandi
Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry, East Godavari District, Andhra Pradesh, India-533102.
gloryson143@gmail.com

The contemporary healthcare landscape is witnessing a transformative shift, where therapeutic innovation meets the demand for safety and sustainability. While synthetic drugs have been pivotal in combating acute and chronic diseases, their widespread use is frequently shadowed by adverse effects, systemic toxicity, and long-term complications. Herbal remedies, rooted in traditional medicine, offer a natural and biocompatible alternative but often suffer from issues like variability in active compounds, lack of standardization, and unpredictable pharmacokinetics. Emerging as a bridge between nutrition and therapeutics, nutraceuticals represent a novel paradigm that harmonizes efficacy with safety. Derived from dietary sources, nutraceuticals provide bioactive compounds capable of modulating metabolic, immunological, and cellular pathways simultaneously. Unlike conventional drugs targeting isolated mechanisms, nutraceuticals offer a holistic and preventive approach, minimizing adverse effects while enhancing overall wellness. Their compatibility with human physiology positions them as a superior adjunct or alternative to synthetic and herbal interventions. Recent advances in phytochemistry, biotechnology, and nanodelivery systems have further refined the precision, bioavailability, and therapeutic potency of nutraceuticals. Clinical studies now demonstrate their effectiveness in managing chronic diseases, neuroprotection, cardiovascular health, and metabolic regulation. Beyond therapeutic potential, nutraceuticals align with eco-conscious and patient-centric healthcare trends, emphasizing preventive care and long-term safety over symptom suppression alone. Thus, nutraceuticals embody the “safe edge of science”, integrating the ancient wisdom of natural compounds with modern research rigor. They transcend the limitations of both synthetic medications and herbal therapies, redefining the paradigm of contemporary healthcare. By prioritizing safety, holistic efficacy, and innovation, nutraceuticals are not only a promising alternative but also a forward-thinking strategy in preventive and therapeutic medicine.
**Keywords:** Nutraceuticals, synthetic drugs, herbal medicines, safety, innovation, preventive healthcare, holistic therapy

Professor & Head, College of Pharmaceutical Sciences, Govt. T D Medical College, Alappuzha, Kerala
(DEAN: Kerala University of Health Sciences, Thrissur, Kerala).
shadiyamoiduck@gmail.com

The present study focuses on the phytochemical screening and GC-MS characterization and molecular docking of bioactive components present in various extracts of aerial parts of Pachystachys coccinia Aubl (Family-Acanthaceae). Powdered drug was charged into soxhlet apparatus and extraction was conducted using solvents of increasing polarity, namely petroleum ether, chloroform, ethyl acetate, ethanol, and water. Phytochemical screening of various extracts was performed to identify the presence of various secondary metabolites such as alkaloids, glycosides, phenolics, flavonoids, carbohydrates, proteins, triterpenoids, phytosterols and tannins. Both qualitative and quantitative phytochemical screening shows that chloroform extracts having plenty of secondary metabolites. The chemical composition of the extract was analyzed using Gas Chromatography-Mass Spectrometry (GC-MS) revealing the presence of thirteen bioactive compounds with 2,4-Di-tert-butylphenol, Cetene, Tetradecane, Heptadecenal, Dodecane, Hexadecane, Octadecane, Tetradecene, Behenic alcohol, Stigmasterol, Phytol, Heneicosanol. Molecular docking result indicated that 2,4-Di-tert-butylphenol bind effectively to the active site residues of Aspulvinone dimethylallyl transferase inhibitor (PDBID-7dz9) & Ubiquinol-cytochrome-c reductase inhibitor (PDBID-1p84) with docking score of -6.472kcal/mol, -5.558kcal/mol respectively. The presence of these bioactive constituents in the plant extract may authenticate the scientific evidences for various pharmacological activities and therapeutic potentiality of the plant.

rajasreejkrishnan@gmail.com

Cucumis melo Linn (muskmelon), belonging to the family Cucurbitaceae, is a widely cultivated plant with significant nutritional and medicinal value. Traditionally, various parts of the plant have been used for their nephroprotective, anti-inflammatory, antioxidant, diuretic, antimicrobial, and antihyperlipidemic properties. The present study focused on the preparation of methanolic extract of C. melo (MECM) fruit and its phytochemical profiling using Gas Chromatography (GC). Preliminary phytochemical screening confirmed the presence of several bioactive compounds, including flavonoids, phenolic compounds, alkaloids, and triterpenoids. The GC analysis of the methanolic extract of Cucumis melo (MECM) revealed a wide range of bioactive phytoconstituents, including fatty acids, sterols, phenolic compounds, terpenoids, and cucurbitacins. Notably, several compounds were identified as precursors for the biosynthesis of essential vitamins, particularly vitamins E (tocopherols) and K1 (phylloquinone). Vitamin E serves as a potent lipid-soluble antioxidant that protects cell membranes from oxidative damage, while vitamin K1 plays a vital role in blood clotting, bone metabolism, and cardiovascular health. The presence of these compounds suggests that C. melo may have significant nutraceutical potential and could serve as a natural dietary source of essential micronutrients. Additionally, the detection of phenolic compounds, flavonoids, terpenoids, and cucurbitacins supports the plant's traditional use in Ayurveda and Unani medicine. These compounds are associated with strong antioxidant, anti-inflammatory, and cytoprotective properties, which may help in managing oxidative stress-related disorders such as diabetes, cardiovascular diseases, and cancer. The study highlights C. melo as a promising source of pharmacologically active compounds for developing herbal drugs.

**Keywords:** Cucumis melo Linn, Gas Chromatography (GC), phytochemicals, antioxidant, herbal medicine, bioactive compounds.

## NATURE'S WHISPER VS. CHEMISTRY'S NOISE: WHY HERBS HEALS SAFER

Jalli Srihitha, G.Sumalatha
Department of Pharmaceutical Sciences, Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry, East Godavari District, Andhra Pradesh, India-5331002
jallisrihitha@gmail.com

In the evolving landscape of healthcare, patient safety and therapeutic efficacy remain paramount concerns. Conventional synthetic medications have undoubtedly transformed modern medicine with their targeted pharmacological actions and rapid symptom relief. However, their widespread use is often accompanied by a spectrum of adverse effects, ranging from mild intolerance and allergic reactions to serious systemic toxicity. Moreover, the long-term implications of synthetic drugs, including organ stress and drug interactions, continue to challenge clinicians and patients alike. In contrast, herbal medicines, rooted in centuries of traditional practice, offer a safer and more harmonious approach to healing. Derived from natural plant sources, these remedies contain a rich array of bioactive compounds that work in synergy to restore physiological balance. Unlike synthetic drugs that typically target a single biochemical pathway, herbs exert multifaceted effects on metabolic, immunological, and cellular functions, thereby reducing the risk of unintended side effects. Their biocompatibility and gradual mode of action make them particularly suitable for long-term health management, preventive care, and chronic disease support. Recent scientific investigations have validated many traditional claims about herbal efficacy, revealing their potent antioxidant, anti-inflammatory, and immunomodulatory properties. Standardization techniques, phytochemical profiling, and quality control measures have further enhanced their reliability, bridging the gap between ancient wisdom and modern evidence-based medicine. Herbs exemplify a preventive and holistic paradigm, emphasizing wellness rather than mere symptom suppression. Ultimately, the safety profile, therapeutic versatility, and natural origin of herbal medicines position them as a viable and preferable alternative to synthetic drugs. They embody what can be described as "Nature's Whisper", offering subtle yet effective healing without the harsh consequences often associated with chemical interventions. This underscores the importance of integrating herbal therapies into modern healthcare frameworks, promoting a balanced, patient-centered approach that prioritizes safety, efficacy, and sustainability.

**Keywords:** Herbal medicines, synthetic drugs, safety, holistic healing, therapeutic efficacy, natural remedies.

**PT-323**

## ANTITUBERCULAR POTENTIAL OF EXTRACTS FROM GLYCYRRHIZA GLABRA, OPLIMINOUS BURMANII, PANDANUS AMARYLLIFOLIUS, CLINACANTHUS NUTANS, AND AERVA LANATA: PHYTOCHEMICAL CHARACTERIZATION AND BIOLOGICAL EVALUATION

Surendra jugguru
Associate Professor, Pharmaceutical Chemistry, Division, Jagan's Institute of Pharmaceutical Sciences, Nellore, Andhra Pradesh, India.
jsvcp@gmail.com

Tuberculosis (TB), caused by Mycobacterium tuberculosis, remains a major global health challenge, necessitating the search for new, effective therapeutic candidates. This study examines extracts from five medicinal plants: Glycyrrhiza glabra (liquorice), Opliminous burmanii, Pandanus amaryllifolius (Ramba), Clinacanthus nutans, and Aerva lanata (Mountain Knotgrass) to evaluate their antitubercular potential. Phytochemical constituents of the extracts were characterized using NMR, IR, and mass spectrometry to identify major bioactive components. The extracts were tested in vitro against M. tuberculosis H37Rv using a resazurin microtiter assay. Several extracts showed significant inhibitory activity, with minimum inhibitory concentrations (MICs) approaching those of standard first-line anti-TB drugs. Molecular docking studies further supported these findings, revealing favorable binding interactions of key phytochemicals with essential mycobacterial targets. Notably, extract combinations, particularly those of P. amaryllifolius and C. nutans, demonstrated synergistic effects consistent with their known antioxidant and antimicrobial activities. The results suggest that plant extracts, either alone or in combination, possess promising antimycobacterial properties and warrant further investigation through in vivo efficacy and pharmacokinetic studies for potential development as complementary anti-TB therapies.

**Keywords:** Glycyrrhiza glabra; Opliminous burmanii; Pandanus amaryllifolius; Clinacanthus nutans; Aerva lanata; tuberculosis; Mycobacterium tuberculosis; plant extracts; antimycobacterial activity; phytochemical characterization; natural product synergy; molecular docking

## THERAPEUTIC POTENTIAL AND PHARMACEUTICAL DEVELOPMENT OF MULTITARGETED POLYPHENOLIC COMPOUND ETHYL GALLATE

Nicky Gupta, Roshni Sharma, Mohammad Adnan Raza, Anjila Firdous, Ajazuddin
Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh,INDIA-490023
nicky2203g@gmail.com

Ethyl gallate, a derivative of gallic acid, having significant characteristics including anti-inflammatory, antioxidant & antiviral, positioning it as potential candidate for therapeutic applications across several different illnesses, such as inflammatory condition, cancer, and viral illnesses like influenza, herpes simplex. Preclinical studies have shown that it has the capacity to modulate inflammation and oxidative stress, both of them plays significant roles in a variety of pathological diseases. The versatility of ethyl gallate in addressing a lot of disease pathways demonstrates its promise in integrated therapeutic methods. However, despite promising in vitro and animal model results, its clinical use remains unknown. The lack of human clinical studies leaves a significant vacuum in our findings, particularly of its safety, efficacy, and comprehensive pharmacological mechanisms. Future study is required to close this gap and establish the therapeutic value of ethyl gallate.

**Keywords:** Ethyl gallate, Anti-inflammatory, Cancer, Antiviral, Integrated therapeutic methods

The current invention is concerned with a Personalized Herbal Care Platform which fuses conventional herbal preparations with contemporary digital technologies such as Artificial Intelligence (AI), Internet of Things (IoT), and an Interactive Sensory Simulator to offer long-term and personalized personal care solutions. The system uses AI-based profiling to examine several parameters like skin type, hair condition, lifestyle, and environmental factors. It then uses this profiling to create semi-personalized herbal formulas for skin, hair, and wellness. These formulations are created from locally available medicinal herbs, thus providing purity, safety, and batch-to-batch consistency, as well as facilitating fair-trade and farmer-friendly sourcing models. A unique feature of the invention is the Interactive Sensory Simulator, functionally connected to the AI database. The simulator allows users to sample product effectiveness and sensory properties before they buy. In particular, it offers: (i) visual simulation of anticipated improvements by means of AR-based time-lapse projections, (ii) tactile simulation of texture of the formulation via haptic feedback, and (iii) fragrance simulation by means of AI-based aroma visualization. This convergence enables consumers to make informed choices and builds trust by offering a scientific, multi-modal representation of product performance. The invention also includes mechanisms for sustainability in the form of biodegradable, zero-waste packaging that is refillable and reusable. IoT-based monitoring facilitates tracking of product use, expiration, and waste minimization through a circular distribution system. Through a combination of plant-based intelligence and state-of-the-art personalization technologies, this innovation overcomes generic formulation limitations, unsustainable packaging, and dependence on synthetics, to create a future-proof model for customized herbal wellness solutions.

**Keywords:** Herbal Care Platform, AI-based Profiling, Interactive Sensory Simulator, IoT-enabled Monitoring and Sustainable Packaging.

**ADVANCES IN NUTRACEUTICAL-BASED STRATEGIES FOR THE MANAGEMENT OF DIABETES MELLITUS**

Rutuja Yellarwar, Monali R. Dakhole, Krishna R. Gupta, Milind J.Umekar
Department of Pharmaceutical Chemistry, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur, Maharashtra, India 441002
Yellarwar6@gmail.com

In recent years, the use of nutraceuticals, nutritional supplements and natural remedies has increased significantly worldwide in healthcare. Diabetes mellitus, particularly type 2 diabetes, remains a major global health concern, affecting over 500 million individuals worldwide. A chronic metabolic disease, diabetes mellitus is characterised by ongoing hyperglycemia and developing consequences that impact several organ systems. Bioactive substances obtained from food, known as nutraceuticals, have shown great promise in the treatment of diabetes because of their diverse range of therapeutic applications. Omega-3 fatty acids, polyphenols, flavonoids, alkaloids, and micronutrients all exhibit antidiabetic properties through a variety of pathways, such as enhancing insulin sensitivity, maintaining pancreatic β-cell function, reducing oxidative stress, altering lipid metabolism, and regulating gut microbiota. It has also been demonstrated that a number of nutraceuticals can lower the risk of problems related to diabetes, including cardiovascular dysfunction, retinopathy, nephropathy and neuropathy. Recent developments in formulation science, like synergistic nutraceutical combinations and nanoencapsulation, have improved bioavailability and clinical efficacy even more. Clinical and preclinical research is gradually confirming their function as supplements to traditional treatment, providing more sustainable, affordable, and safe options for long-term care. Standardisation, regulatory clarity, and extensive clinical validation are still major obstacles, nevertheless. The present state of nutraceutical-based diabetic mellitus therapies is reviewed, incorporating molecular insights, treatment outcomes, and future views. There is great potential for nutraceuticals to advance patient-centered, holistic diabetic care by bridging the gap between medication and nutrition.

**Keywords:** Nutraceuticals, Diabetes mellitus, polyphenols, cardiovascular disease, kidney damage.

**PHYTOCHEMICAL SCREENING AND IN VITRO ASSESSMENT OF CARDIO-PROTECTIVE POTENTIAL OF BUNCHOSIA ARGENTEA FRUIT EXTRACT USING H9C2 CARDIAC CELL LINE**

Aysha. M. A, Sneha. V. K, Aswathy. M. V, Sengottuvel. T
Department of Pharmacology, Prime College of Pharmacy, Palakkad, Kerala
ayshama737@gmail.com

To investigate the phytochemical composition, antioxidant potential, and cardioprotective effects of Bunchosia argentea fruit extract using the H9c2 cardiomyocyte cell line. The extract was prepared using hydroalcoholic maceration and characterized by qualitative and quantitative analyses, including HPTLC and GC–MS. Antioxidant activity was assessed using the DPPH radical scavenging assay. Cytoprotective effects were evaluated in vitro in H9c2 cells subjected to oxidative stress, with cell viability determined by the MTT assay. The extract, rich in flavonoid fractions such as quercetin, phenols, and other bioactives, exhibited strong antioxidant activity and dose-dependent cytoprotection. Treatment significantly improved cell viability under oxidative stress and confirmed the cardioprotective potential of the extract. Bunchosia argentea fruit extract demonstrates promising antioxidant and cardioprotective effects in vitro, supporting its potential as a natural therapeutic candidate for the prevention of oxidative stress–induced cardiac injury.

**Keywords:** Bunchosia argentea, cardioprotection, hydroalcoholic extract, antioxidant, isoproterenol, flavonoids.

Department Of Pharmaceutical Chemistry, Vignan Institute Of Pharmaceutical Technology, Duvvada, Visakhapatnam, India, 530049.
vasudha4mpharm@gmail.com

Delek air tree is a traditional medicinal plant valued for its diverse ethno pharmacological uses, particularly in the treatment of metabolic and inflammatory disorders. In the present study, the methanol extract of the whole plant was subjected to gas chromatography–mass spectrometry (GC–MS) analysis, which revealed the presence of 17 major known phyto constituents. Subsequent chromatographic fractionation of the extract led to the isolation of six compounds.To the best of our knowledge, this is the first report of these compounds from Delek air tree.Beyond chemical profiling, the methanol extract was evaluated for its antidiabetic and antiobesity potential through in vitro enzyme inhibition assays. The extract demonstrated significant inhibitory activity against α-amylase and α-glucosidase, enzymes crucial in carbohydrate metabolism, thereby indicating its potential to regulate postprandial hyperglycemia. Furthermore, notable inhibition of pancreatic lipase was observed, suggesting promising antiobesity activity by limiting dietary fat absorption. These results not only validate the traditional claims of Delek air tree but also provide a pharmacological basis for its application in managing metabolic disorders such as diabetes and obesity. Overall, this study contributes to the phytochemical characterization of Delek air tree and highlights its therapeutic potential as a source of bioactive compounds with dual antidiabetic and antiobesity properties. Future investigations focusing on bioassay-guided isolation and mechanistic studies are warranted to further explore its medicinal value.

**Keywords:** Delek Air Tree, GC-MS Analysis, Antiobesity, Antidiabetic

The present investigation aimed to formulate and evaluate a polyherbal cosmetic face serum utilizing extracts of Nelumbo nucifera and Vitis vinifera L., selected for their antioxidant potency and skin-brightening efficacy. The extracts were incorporated into a serum base with to obtain a stable formulation. Preliminary phytochemical screening confirmed the presence of bioactive constituents including fatty acids, vitamins, phytosterols, polyphenols, flavonoids, tannins, alkaloids, and essential minerals. These phytoconstituents are recognized for their role in mitigating oxidative stress and enhancing skin radiance. The study further emphasized the determination of antioxidant activity and brightening potential of the plant extracts. The formulated serum exhibited promising results, suggesting that the synergistic effects of Nelumbo nucifera and Vitis vinifera L. can be harnessed in the development of effective antioxidant-rich, skin-brightening cosmetic formulations. The findings highlight the potential application of this polyherbal serum in promoting skin health and beauty through natural plant-based actives.

**Keywords:** Nelumbo nucifera, Vitis vinifera L, Anti- oxidant, Face serum.

**FROM OCEANS TO FIELDS: MARINE MACROALGAE APPLICATIONS AND ABIOTIC STRESS-INDUCED ANTHOCYANIN SYNTHESIS IN LETTUCE**

Shaileyee Das, Surashree Samanta and Tourin Rahaman
Department of Pharmacognosy, Bharat Technology,
Howrah, West Bengal, India – 711316
drshaileyeedas@gmail.com

Marine macroalgae such as Ulva clathrata are increasingly recognized as sustainable bio-stimulants that can enhance plant growth, physiology, and nutritional quality, while abiotic stresses such as salinity, acidity, drought, waterlogging, and pesticide exposure strongly influence secondary metabolite production like anthocyanins in lettuce (Lactuca sativa). In this study, seaweed extracts were prepared and applied as foliar sprays and soil drenches in both soil-based and hydroponic systems, while Red Rosso lettuce seedlings were subjected to graded abiotic stress treatments under controlled conditions. Growth parameters including shoot and root length, leaf number, biomass, and physiological markers (chlorophyll, protein, phenolics, flavonoids, and antioxidant activity) were measured alongside spectrophotometric quantification of anthocyanin content. Results revealed that macroalgae treatments significantly enhanced germination, vegetative vigor, biomass accumulation, and biochemical composition in both cultivation systems, with hydroponics showing slightly superior responses. Conversely, abiotic stresses induced variable but often elevated anthocyanin accumulation, particularly under moderate salinity, acidity, and drought, highlighting their role in oxidative stress mitigation. The integration of seaweed-based bio-inputs with insights into stress-induced secondary metabolite synthesis demonstrates a dual approach for improving lettuce productivity and nutritional value, offering a sustainable strategy for modern agriculture.

**Keywords:** Marine macroalgae, Biostimulant, Abiotic stress, Anthocyanin accumulation, Plant Tissue Culture

**PT-331**

**FORMULATION AND EVALUATION OF HERBAL TOOTH-FOAMING TABLETS AS AN ECO-FRIENDLY ALTERNATIVE**

Kavitha Vasudevan, Aleena Mary Rose, Anu Raphel, Sherin P Joshy

Oral hygiene is integral to overall health, and there is increasing interest in natural, eco-friendly alternatives to conventional toothpaste. Traditional toothpaste tubes, composed of polymers and metal coatings, pose serious environmental challenges due to poor recyclability and prolonged degradation times, often exceeding 500 years. This study aimed to formulate and evaluate herbal tooth-foaming tablets as a sustainable substitute for toothpaste, addressing both oral health and environmental concerns. Three batches of herbal tooth-foaming tablets were prepared using readily available herbal ingredients with recognized medicinal properties in dentistry. The formulations were assessed for physicochemical characteristics, stability, effectiveness in plaque removal, and overall sensory attributes. Variants with different ingredient compositions were compared to ensure suitability across consumer preferences Herbal tooth-foaming tablets demonstrated several advantages over conventional toothpaste. They were lightweight, compact, spill-proof, and packaged in minimal or plastic-free materials, thereby reducing environmental burden. The tablets showed strong efficacy in plaque reduction, elimination of bad breath, and imparted a refreshing sensation, contributing to improved oral cleanliness. Among the formulations tested, F3 was identified as optimal due to its superior physicochemical properties and overall performance. Herbal tooth-foaming tablets represent a promising eco-friendly alternative to toothpaste. By combining oral health benefits with environmental sustainability, they offer a viable solution to reduce plastic waste while meeting consumer demand for natural, holistic oral care. Further clinical validation could establish their role as a revolutionary oral hygiene product.

**Keywords:** Herbal Tooth foaming Tablets, oral hygiene, Eco friendly, Pre and post compression evaluation.

**ASSESSMENT OF GENETIC SIMILARITY AMONG MULBERRY ACCESSION BY A RAPD MARKER.**

Nandini. K
Dept of pharmaceutical biotechnology
Nargund college of pharmacy, Bangalore
Karnataka, India-560085
Nandinidivakar84@gmail.com

Mulberry (Morus spp.), the pivotal crop for sericulture, faces major challenges in genetic improvement due to its outbreeding nature and high heterozygosity. Root traits are critical for drought resilience and productive cultivation, especially under rain-fed conditions. This study addresses the need for efficient screening and genetic mapping by employing RAPD markers for analysing the genetic diversity and inheritance of root traits in mulberry. A contrasting parental set – Dudhi White (high root type) and UP (poor root type) – was selected from field and germplasm screening. A mapping population (F1 hybrids) of 200 progeny was developed and analysed. Genomic DNA was isolated and quantified, followed by PCR amplification using selected RAPD primers (e.g., OPAC-17). Detailed procedures for DNA extraction, amplification cycles, and marker scoring are described, ensuring reproducibility. Chi-square analysis was utilized to test segregation ratios and identify polymorphic markers. Comparative morphological profiling indicated distinct variability in root and leaf traits between parental lines. RAPD profiling of 200 progeny revealed clear polymorphism, confirming segregation of markers for mapping root traits. Six polymorphic RAPD markers amplified among the progeny with OPAC-17, ranging from 600 to 2300 bp, were evaluated for their segregation pattern. Four markers showed non-significant deviation from the expected 1:1 ratio, while the remaining markers deviated significantly. DNA profiles generated (refer to Figures 2–4) demonstrate robust marker segregation and polymorphism. RAPD and ISSR markers proved simple, reliable, and cost-effective for mapping in this perennial crop, in contrast to more laborious and expensive RFLP techniques. The integration of RAPD marker analysis in mulberry germplasm enables the identification of genetically diverse root traits, facilitating marker-assisted breeding for drought resilience. The developed marker profiles and mapping strategies provide a framework for future genetic improvement, aiming to enhance root architecture and stress tolerance in mulberry.

**Keywords:** Mulberry, Morus spp., root traits, RAPD markers, genetic mapping, marker-assisted selection, drought resilience, sericulture

Cardiovascular diseases involving deep vein thrombosis, stroke, hypertension, and heart attacks are the leading causes of morbidity and mortality worldwide. Synthetic drugs used to treat these disorders often

ISBN: 978-81-980623-8-3

cause serious adverse effects. The discovery of natural products for treating these diseases can reduce side effects. Inhibiting platelet aggregation prevents thrombus formation, which is the most common mechanism to assess the potential efficacy of anti-thrombotic agents. Therefore, the present study aimed to evaluate the in vitro anti-thrombotic activity of the hydroalcoholic extract of Chrysanthemum indicum flowers. This study assessed the anti-thrombotic activity of the extract using clotting time and CaCl2-induced clotting time assays. The inhibitory activity of the Chrysanthemum indicum flower extract was comparable to that of the standard drug. The percentage inhibition was attributed to the presence of flavonoids, phenols, and carotenoids. The IC50 values of the extract, determined by clotting time and CaCl2-induced assays, were 41.96 and 49.75 µg/ml, respectively, while the IC50 of the standard was 24.36 µg/ml.

**Keywords:** In vitro, Chrysanthemum indicum flower, anti-thrombotic activity, clottingtime.

## ALLIUM CEPA EXTRACT: A NOVEL TREATMENT FOR ALOPECIA AREATA

N.Reshma, v.v.s.s.s.naga durga, N.v.v.s.s.lakshmi
Vikas institute of Pharmaceutical Sciences, Near Air Port, Rajahmundry, East Godavary District, Andhra Pradesh, India-533102.
neelamhymasrilakshmi@gmail.com

Alopecia areata is an autoimmune disorder characterized by non-scarring hair loss, often leading to psychological distress in affected individuals. Current treatment options, including corticosteroids and immunotherapies, have variable efficacy and potential side effects. This study explores the therapeutic potential of Allium cepa (onion) extract as a novel, natural treatment for alopecia areata. Allium cepa is rich in sulfur compounds, flavonoids, and antioxidants, known for their anti-inflammatory, A randomized, double-blind, placebo-controlled clinical trial was conducted involving patients diagnosed with mild to moderate alopecia areata. Participants were divided into two groups: one received topical Allium cepa extract, while the other was treated with a placebo solution, both applied twice daily over an 8-week period. Efficacy was assessed through clinical evaluation, digital photography, and patient self-reports.Results showed that the Allium cepa-treated group exhibited significantly greater hair regrowth compared to the placebo group, with improvements observed as early as four weeks into treatment. Additionally, patients reported enhanced scalp condition and minimal adverse reactions, mainly limited to mild irritation in a few cases.The findings suggest that Allium cepa extract can serve as an effective and well-tolerated alternative therapy for alopecia areata. Its natural composition and favorable safety profile make it a promising candidate for broader clinical application. Further studies with larger sample sizes and longer follow-up periods are recommended to validate these results and establish standardized treatment protocols.

**Keywords:** Alopecia areata, Allium cepa, natural treatment, randomized controlled trial, alternative therapy, hair regrowth, topical application, anti-inflammatory, antioxidants, sulfur compounds.

## EVALUATION OF IN-VITRO ANTI-INFLAMMATORY AND ANTIOXIDANT ACTIVITIES OF ETHANOLIC EXTRACT OF HIBISCUS CANNABINUS ROOTS

Harsha M1, Supriya Mana1, Agilandeswari Devarajan2
1Department of Pharmacology, MVM College of Pharmacy, yelahanka, Bengaluru - 560064
2Department of Pharmaceutics, MVM College of Pharmacy, yelahanka, Bengaluru – 560064
harsham7975@gmail.com

Hibiscus cannabinus L., known as kenaf, has been used in traditional medicine for a long time to treat inflammatory and oxidative stress-related conditions. This study introduces a unique examination of the in vitro anti-inflammatory and antioxidant properties of its root ethanolic extract through protein denaturation and free-radical scavenging assays. The extract was prepared using optimized maceration and then tested for denaturation of bovine serum albumin (BSA) and 1,1-diphenyl-2-picrylhydrazyl (DPPH) at five different concentrations (50–500 µg/mL). In the BSA assay, the extract stopped proteins from denaturing in a way that depended on the concentration. At 500 µg/mL, the extract stopped proteins from denaturing by 78.6%, which was better than aspirin's 65.4% at the same concentration. Spectrophotometric analysis revealed an IC50 of 212.3 µg/mL for anti-inflammatory activity, indicating enhanced efficacy relative to the standard. The DPPH assay showed strong free-radical scavenging, with a maximum inhibition of 91.2% at 500 µg/mL and an IC50 of 84.7 µg/mL, which is very close to the IC50 of ascorbic acid (72.5 µg/mL). Using high-performance liquid chromatography to do phytochemical profiling, we found high levels of quercetin, kaempferol, and chlorogenic acid, which were strongly linked to the bioactivities we saw. Fourier transform infrared spectroscopy indicated hydrogen bonding and conjugated systems typical of polyphenolic structures. Multivariate analysis validated substantial positive correlations between flavonoid content and bioactivity metrics ($r > 0.89$, $p < 0.01$). The extract's dual-action bioactivity and low cytotoxicity in RAW 264.7 macrophages show that it could be a safe, plant-based treatment for inflammatory and oxidative stress disorders. These results provide a foundation for in vivo validation and the development of formulations of kenaf root–derived phytopharmaceuticals aimed at chronic inflammation and associated disorders.

**Keywords:** Hibiscus cannabinus, Kenaf, Anti-inflammatory, Antioxidant, Bovine serum albumin (BSA) assay, DPPH assay, Oxidative stress

## EVALUATION OF ANTIGOUT POTENTIAL ON TRIGONELLAFOENUM-GRAECUM MUCILAGE

Sneha.V. K, T Sengottuvel, N L Gowrishankar
Department of Pharmacology, Prime College of Pharmacy, Palakkad
snehasea02@gmail.com

Gout is a type of arthritis caused by the buildup of uric acid crystals in the joints, leading to inflammation, pain, and swelling. Trigeonellafoenum- graecum is a plant that commonly used both as an herb and a spice which belongs to Fabaceae family. They have slight bitter taste and strong aroma. The seeds are small golden-brown seeds, hard, angular in shape. The mucilage has a viscous, gel like texture and become more thicker and more gelatinous when they are soaked in water. They are used for digestive health, weight management, blood sugar control etc. Here we use the mucilage of Trigonellafoenum-graecum for the Pharmacological and Phytochemical analysis. The phytoconstituents present in mucilage is alkaloids, fiber, protein but rich in flavonoids, polyphenols, triterpenoids. The Trigonellafoenum-graecum mucilage having antigout property. The assay of xanthine oxidase reductase inhibitors has been conducted and all the above. Further studies reveal the therapeutic value of Trigonellafoenum-graecum mucilage in future.

**Keywords:** Trigonellafoenum-graecum, Phytochemical screening, Physicochemical, Antigout

## EVALUATION OF ANTIDIABETIC AND ANTIOXIDANT ACTIVITIES OF METHANOLIC EXTRACT OF MARSILEA MINUTA L.

Anusha R1, Supriya Mana1, Agilandeswari Devarajan2
1Department of Pharmacology, MVM College of Pharmacy, yelahanka, Bengaluru - 560064
2Department of Pharmaceutics, MVM College of Pharmacy, yelahanka, Bengaluru – 560064
anugowda724@gmail.com

Marsilea minuta L. (Marsileaceae), a semi-aquatic fern found in tropical and subtropical areas of India, has great potential as a dual-action phytomedicine for treating diabetes and oxidative stress. This study is the first to fully test the methanolic extract from the whole M. minuta plant for its combined antidiabetic and antioxidant effects using new in vitro bioassay methods. The methanolic extract showed very strong α-amylase inhibitory activity, with IC50 values that were similar to those of standard acarbose. This means that it was able to stop a carbohydrate-metabolizing enzyme from working, which is important for controlling blood sugar after eating. Advanced spectrophotometric analysis demonstrated substantial antioxidant capacity via the DPPH radical scavenging assay, with the extract exhibiting enhanced free radical neutralization potential across concentration gradients (0.2-1.0 mg/mL) when compared to the ascorbic acid standard. The dose-response relationship showed a linear connection between the concentration of

ISBN: 978-81-980623-8-3

the extract and its biological activity. At the best concentrations, the extract inhibited α-amylase by 89.4% and scavenged DPPH by 92.1%, which was better than synthetic antioxidants. Phytochemical profiling indicates the existence of bioactive compounds such as flavonoids, phenolic acids, and terpenoids that contribute to the identified dual therapeutic effects. The methanolic extraction protocol, optimized for maximum recovery of bioactive compounds, signifies an innovative method for exploiting the medicinal potential of M. minuta. This important study shows that M. minuta is a promising natural treatment for diabetes that also protects against oxidative stress, which is a big step up from synthetic drugs that only target one thing. The findings scientifically substantiate traditional applications and facilitate the development of standardized phytopharmaceutical formulations aimed at metabolic disorders associated with oxidative stress.

**Keywords:** Marsilea minuta, Antidiabetic, Antioxidant, α-amylase inhibition, DPPH assay, Phytotherapy, Metabolic disorders

## PREPARATION AND EVALUATION OF HERBAL CREAM FOR DIAPER RASHES

Harshita Nehru, Agilandeswari Devarajan, Vijayanandhan V
Department of Pharmaceutical Sciences, MVM College of Pharmacy, Bengaluru, Karnataka, India-560064
harshitanehru1@gmail.com

Diaper rash is a common and uncomfortable skin condition often found in infants and toddlers, representing about 10–20% of all skin-related complaints seen by paediatricians. This rash develops when the skin covered by the diaper remains exposed to moisture, friction, and irritating substances for a long time, which weakens the outermost layer of skin and makes it easier for harmful agents to enter, resulting in redness and soreness. This study aimed to develop a natural cream using hazelnut and wheat germ oils, selected for their well-known skin-nourishing and protective qualities. Once these oils and necessary ingredients were obtained, multiple batches of cream were formulated and examined for properties such as pH balance, texture, ease of application and uniformity without separation. The creams maintained a mild pH near 6, spread easily over the skin, and showed optimal thickness that changed appropriately with applied pressure, ensuring user-friendly application and protection. Stability tests conducted over three months under warm, humid environments confirmed no alterations in the cream's appearance or texture. Additionally, antimicrobial testing against bacteria and fungi commonly associated with diaper rash—including Pseudomonas aeruginosa, Candida albicans, Staphylococcus aureus, and Escherichia coli—demonstrated the cream's ability to inhibit these microorganisms. These findings suggest that the cream formulated with hazelnut and wheat germ oils offers a safe and effective solution to soothe, protect, and heal diaper rash by hydrating the skin, reinforcing its natural barrier, reducing inflammation, and combating infection, all in a single, convenient product.

**Keywords:** Diaper rash, Herbal cream, Antimicrobial Activity, Stability, Healing oils

## IN VITRO ANTHELMINTIC ACTIVITY OF AERIAL PARTS AND FLOWERS OF MELASTOMA MALABATHRICUM

Jeenu Joseph, Santhosh M Mathews
Pushpagiri College of Pharmacy, Perumthuruthy, Thiruvalla, Kerala-689107
jeenukuruvilla@gmail.com

Melastoma malabathricum is a traditionally important plant which has proven therapeutic activities such as ant diabetic, antiulcer, wound healing, anti-inflammatory, antimicrobial, antiviral and gastro protective properties. Current study focused to investigate the in vitro anthelmintic activity of ethanolic and aqueous extracts of aerial parts and flowers of Melastoma malabathricum on Indian earth worms (Pheretima posthuma). The earth worms were classified into 6 groups with 6 worms in each group. The anthelmintic activity of ethanolic and aqueous extracts of both aerial parts and flowers of Melastoma malabathricum at two concentrations such as 25mg/ml and 50mg/ml was investigated by assessing the time of paralysis and time of death of the earth worms. Standard used is piperazine citrate and 2% gum acacia as the standard. All the four extracts (MMAE, MMAA, MMFE, MMFA) depicted significant anthelmintic activity ($p<0.001$) in a dose dependent manner and the activity was comparable to that of the standard drug piperazine citrate. The anthelmintic activity of ethanolic and aqueous extracts of aerial parts and flowers of Melastoma malabathricum is demonstrated for the first time.

**Keywords:** Anthelmintic, Melastoma malabathricum, Piperazine citrate, Indian earth worms

## ANTIMICROBIAL ACTIVITY OF CLITORIA TERNATEA (L.) EXTRACTS

Kale Priti Rohidas, Amol Navnath Khedkar
Saikrupa Institute of Pharmacy, Ghargaon, Shrigonda, Ahilyanagar, Maharashtra, India 413728
pritikale1032@gmail.com

The antimicrobial activity of methanolic extracts from different parts of Clitoria ternatea L. (leaves, stems, flowers, seeds, and roots) was evaluated against a panel of pathogenic microorganisms. Antimicrobial efficacy was assessed using agar well diffusion and broth microdilution methods against 12 bacterial strains (Escherichia coli, Pseudomonas aeruginosa, Klebsiella pneumoniae, Staphylococcus aureus, Bacillus subtilis, Salmonella typhi, Proteus mirabilis, Enterobacter aerogenes, and others), two yeasts (Candida albicans, Saccharomyces cerevisiae), and three filamentous fungi (Aspergillus niger, Aspergillus flavus, Penicillium chrysogenum). The leaf and root extracts demonstrated the highest antimicrobial activity ($p < 0.05$), with minimum inhibitory concentrations (MICs) ranging from 0.3 to 100.0 mg/mL. These extracts also exhibited corresponding bactericidal (MBC) and fungicidal (MFC) activity, confirming their potential for broad-spectrum microbial inhibition. Phytochemical screening revealed the presence of flavonoids, tannins, alkaloids, saponins, cardiac glycosides, steroids, terpenoids, and volatile oils, while anthraquinones and phlobatannins were absent. The antimicrobial effects are likely attributable to the synergistic action of these phytochemicals, particularly flavonoids and alkaloids, known for their ability to disrupt microbial membranes and inhibit key enzymatic pathways. The results highlight Clitoria ternatea, especially its leaves and roots, as promising sources of bioactive compounds with significant antimicrobial potential. These findings support its ethnomedicinal use and justify further research focused on compound isolation, mechanism of action, and in vivo validation for potential applications in pharmaceutical and food preservation industries.

**Keywords:** Clitoria ternatea, antimicrobial, Phytochemical screening

**PT-341**

## PRELIMINARY PHARMACOGNOSTICAL PHYTOCHEMICAL AND PHARMACOLOGICAL SCREENING OF THE BARK OF CASSIA FISTULA L.

Merlin A John and Santhan Nehru Narkilli
Department of Pharmacognosy, Nehru College of Pharmacy, Thrissur, Kerala, India-680588
merlin01john@gmail.com

Cassia fistula L. (Fabaceae) is commonly known as golden shower tree. It is highly demanded in herbal medicine due to its extensive medical, pharmacological, ethnomedicinal and conventional properties and uses such as antioxidant, antimicrobial, antifungal, antidiabetic and anti-inflammatory activity. The prime objective of the study is to assess the phytochemical characterization of Cassia fistula L. bark for their biological properties. The study evaluates the preliminary phytochemical analysis, invitro antioxidant activity and invitro anti-inflammatory activities. The antioxidant activity was studied by using DPPH free radical scavenging assay method and the anti- inflammatory activity was performed by inhibition of protein denaturation assay. The above studies summaries that the ethanolic extract of Cassia fistula L. barks contains amino acids and have antioxidant and anti- inflammatory properties.

**Keywords:** Antioxidant, Anti-inflammatory, Cassia fistula L.

## ELUCIDATING THE THERAPEUTIC EFFICACY OF A POLYHERBAL EXTRACT FOR HYPOGLYCEMIC ACTIVITY

Jyoti Dinkar Shewale and Rekha Gour
Research scholar, Oriental University Indore, M.P.
jbkhedekar@gmail.com

The increasing prevalence of diabetes mellitus, together with the limited access of many patients to conventional anti-diabetic drugs and the side

ISBN: 978-81-980623-8-3

effects resulting from their use, are the reason for the ever-increasing need for new agents. The most important strategies used in the therapy of this disease is to reduce the postprandial blood glucose level by inhibiting the carbohydrate-degrading enzymes α-amylase and α-glucosidase. The aim of this study was to assess the hypoglycemic effects of Gymnema Sylvestre and Momordica Charantia. The physiochemical evaluation of powder drug, Soxhlet extraction and phytochemical evaluation of plant extract was carried out. The Anti-oxidant activity of plant extracts at different concentration was evaluated. For Momordi cacharantia, the DPPH radical scavenging percentage increases from 20% at 0.1 mg/mL to 40% at 1 mg/mL, while the ABTS radical scavenging percentage increases from 30% to 50% over the same concentrations. Similarly, the total antioxidant capacity rises from 15 mg AAE/g to 20 mg AAE/g. Gymnema sylvestre exhibits a similar trend, with increasing antioxidant activity with higher concentrations, reaching 45% DPPH scavenging, 55% ABTS scavenging, and 25 mg AAE/g total antioxidant capacity at 1 mg/ml. The in-vivo antidiabetic activity of the test compounds was evaluated by assessing the blood glucose levels in streptozotocin (STZ)-induced diabetic rats over a period of 28 days. Statistical analysis using one-way ANOVA followed by Duncan's multiple range test revealed no significant differences in blood glucose levels among the groups on Day 0-28.

**Keywords:** Diabetes mellitus, Soxhlet extraction, ABTS, DPPH, Streptozotocin.

## NETWORK PHARMACOLOGY ELUCIDATION OF AMHERSTIA NOBILIS LEAF AGAINST RHEUMATOID ARTHRITIS: MULTI-TARGET AND PATHWAY INSIGHTS

Jasna T J, Yogendra nayak, D. Vijaykumar
Nehru College of Pharmacy, Thrissur, Kerala.
Part time-PhD scholar, MCOPS
Associate Professor, Manipal College of Pharmaceutical Sciences, Karnataka

Rheumatoid arthritis (RA) is a disabling autoimmune disorder that is characterized by persistent inflammation of the synovium and progressive joint erosion. The aim of the research was to determine the therapeutic potential of Amherstia nobilis leaf considering a network pharmacology metabolite, target and signaling pathway against RA.Active constituents of Amherstia nobilis were determined by literature survey and instrumental analysis with 34 compounds obtained. A prediction of targets identified 937 related genes, which was compared to RA-related genes (6,574) in GeneCards database. There were 326 overlapping genes that were found as therapeutic targets. STRING was used to analyze them in terms of protein–protein interaction (PPI), and Cytoscape in terms of hub gene recognition. Gene ontology (GO) and KEGG enrichment were performed in ShinyGO database to conduct functional annotation. PPI analysis revealed that AKT1, TNF, SRC, and EGFR are important hub genes. GO enrichment was found to be involved in oxidative stress control, immune dysregulation, synovial proliferation and chronic inflammatory reactions. Cellular component analysis focused on the membrane-related immune signaling and vesicle-mediated cytokine release, whereas molecular functions focused on the immune signaling, cytokine secretion, and cell adhesion. KEGG pathway analysis showed that it is enriched in VEGF, AGEreceptor-AGE, PI3K-Akt, HIF-1, and TRP channels signaling pathways, which are major signaling pathways in RA pathogenesis. As evidenced in this research, Amherstia nobilis leaf presents a multi-target and multi-pathway mode of action of possible anti-inflammatory effects. The results offer mechanistic information as to why A. nobilis can be used as a potential solution to RA management, and why additional experiments are warranted.

## UNRAVELLING THE ANTHELMINTIC EFFECT OF PSIDIUM GUAJAVA ON PHERETIMA POSTHUMA

Akshaya Rajan. P and Sreenadh P. K
Department of Pharmacognosy, Nehru College of Pharmacy, Thrissur, Kerala, India-680588
akshayarajnp@gmail.com

Psidium guajava commonly known as guava was widely known for its antispasmodic and antimicrobial, diabetes, rheumatism, ulcers, malaria, cough and bacterial infection. Traditionally the plant has been widely used for gastrointestinal infection such as diarrhea, dysentery, stomach aches and indigestion and also used for prophylaxis and treatment of virus infection and fungal infections. Anthelmintic activity of Psidium using different extract was also reported. Here in the present study Pheretima posthuma model has been selected as it has a close resemblance with human intestinal roundworm, anatomically and physiologically. The plants and earthworm were collected and authenticated. The fresh leaves and fresh ripen fruit of Psidium guajava were dried, powdered and subjected for soxhelt extraction of leaves and maceration for fruit using ethanol as solvent. Different concentration of crude extract, leaves extract and fruit extract were evaluated for preliminary phytochemical test and anthelmintic activity (Pheretima posthuma). All extract showed significant anthelmintic activity. Among the extracts crude fruit extract (5mg) shows maximum activity. The results suggest that Pheretima posthuma may be beneficial in the treatment of parasitic infections.

**Keywords:** Psidium guajava, Anthelmintic, Pheretima posthuma, Soxhelt extraction, Maceration.

## THE CREATION AND ASSESSMENT OF A MOISTURIZING BODY BALM STICK ENRICHED WITH GREEN TEA

Baishnavi sanjay sake

To give the skin deep hydration, nourishment, and protection, a moisturizing body balm stick has been created. Utilizing a combination of organic components. Green tea extract, rosemary extract, arrowroot powder, stearic acid, beeswax, Shea butter, turmeric, and jasmine oil are important ingredients in the balm that each have their own special advantages for the skin. Strong antioxidants and anti-inflammatory qualities found in green tea extract aid in shielding the skin from environmental aggressors and free radical damage. Rosemary extract promotes skin health by having antibacterial and revitalizing properties. While stearic acid maintains stability and consistency, arrowroot powder enhances the texture of the balm, facilitating smooth application and skin absorption. By creating a protective layer, avoiding skin drying, and acting as a barrier against the elements, beeswax is essential for retaining moisture in the skin. Shea Butter provides deep hydration and enhances skin elasticity, making it perfect for individuals with dry or sensitive skin. Turmeric, recognized for its anti-inflammatory and healing effects, helps diminish redness and irritation, while Jasmine Oil offers soothing, calming benefits along with a lovely scent. The blend of these ingredients is formulated to deliver both immediate and lasting skin advantages. The balm is intended to enhance skin texture, replenish moisture, and shield against environmental damage. With this formulation, the product aims to deliver a natural, effective, and convenient approach to skin care that promotes overall skin health and hydration.

**Keywords:** Antioxidant, Hydration, Moisturizer, green tea, body balm stick.

## PHYTOCHEMICAL FRACTIONATION, QUANTITATIVE ESTIMATION AND IN-VITRO ANTIOXIDANT EVALUATION OF SALAMALIA MALABRICA LINN. STEM BARK

Narayan R Miskin, Pulak Majumder,
Pradeepa B Channakkalavara, Shaista omer
Department of Pharmacognosy, Sri Adichunchanagiri College of Pharmacy, Adichunchanagiri University, Mandya, Karnataka- 48. India.
Department of Pharmacology, T.M.A.E. Society's MMJG College of Pharmacy, Haveri, 581110 Karnataka, India.
nrm_rhm@rediffmail.com

The present study was undertaken to fractionate the stem bark of Salamalia malabrica Linn. into alkaloid-rich (AF), flavonoid-rich (FF), and tannin-rich (TF) fractions, followed by quantitative estimation of key phytoconstituents and in-vitro antioxidant evaluation. The coarsely powdered bark was initially treated with an aqueous acidic solution and extracted with ethyl acetate (3 × 200 mL) to eliminate neutral constituents. The remaining aqueous layer was alkalinized to pH 9 using 30% ammonium hydroxide and subsequently extracted with chloroform (3 × 300 mL). The combined chloroform extracts were concentrated under reduced pressure to yield alkaloid-rich fraction (AF). For flavonoid

ISBN: 978-81-980623-8-3

extraction, the dried alcoholic extract of the bark was dissolved in alcohol and partitioned with ethyl acetate in a separating funnel. The ethyl acetate layer was concentrated on a hot water bath to obtain the flavonoid-rich fraction (FF). The tannin-rich fraction (TF) was obtained by defatting the coarsely powdered bark with petroleum ether, followed by cold maceration with an acetone: water mixture (70:30). The solvent was removed to yield TF. All three fractions were subjected to preliminary phytochemical screening, followed by quantitative estimation of total alkaloids using gravimetric method, total flavonoids using the aluminium chloride colorimetric method, and total tannins using the Folin-Ciocalteu method. The antioxidant potential of each fraction was evaluated using DPPH radical scavenging assay, Ferric Reducing Antioxidant Power (FRAP) assay, and hydroxyl radical scavenging assay. Among the tested fractions, FF and TF exhibited significant antioxidant activity, indicating the presence of potent bioactive compounds with free radical scavenging potential.

**Keywords:** Salamalia malabrica, Alkaloids, Flavonoids, Tannins, Antioxidant activity.

## PHYTOCHEMICAL SCREENING & EVALUATION OF ANTIDEPRESSANT ACTIVITY OF ETHANOLIC EXTRACT OF FLOWER OF ZEPHYRANTHES CITRINA

Sonam Chaturvedi, Namrata Kushwaha, Seemu Singh,
Sunil Kumar Dwivedi
Sri Aurobindo Institute of Pharmacy, Indore (M.P.) 453555
sonam.chaturvedi@saip.ac.in

Depression is a common neuropsychiatric disorder characterized by persistent sadness, reduced motivation, and disturbances in sleep and appetite. Although synthetic antidepressants are clinically available, their therapeutic use is often restricted by side effects, delayed onset of action, and poor patient compliance. These drawbacks have shifted research interest towards herbal alternatives that may offer safer and more effective interventions.The present study aimed to evaluate the antidepressant-like activity of the ethanolic flower extract of Zephyranthes citrina (EEZC) in Swiss albino mice using standard behavioral models.Phytochemical analysis of EEZC revealed flavonoids, alkaloids, saponins, tannins, glycosides, and triterpenes. Mice were randomly allocated into four groups (n = 6): control (propylene glycol), standard (fluoxetine 20 mg/kg), and test groups treated with EEZC at 100 mg/kg and 200 mg/kg. Antidepressant activity was evaluated on Day 1 and Day 14 using the Forced Swim Test (FST) and Tail Suspension Test (TST), with immobility time recorded as the primary parameter.EEZC administration produced a significant, dose-dependent reduction in immobility duration in both models compared with control. The effect was more pronounced after 14 days, with the higher dose (200 mg/kg) showing comparable efficacy to fluoxetine.The findings suggest that EEZC possesses notable antidepressant potential in animal models, possibly due to bioactive constituents such as flavonoids and saponins. Further studies involving compound isolation and mechanistic evaluation are needed to validate its therapeutic relevance.

**Keywords:** Zephyranthes citrina, antidepressant activity, ethanolic extract, Forced Swim Test, Tail Suspension Test, fluoxetine

## EVALUATION OF PHYTOCHEMICAL CONTENT AND INVITRO CYTOTOXIC ACTIVITY OF VARIOUS ORNAMENTAL PLANT FLOWER EXTRACTS AGAINST MCF-7 CELL LINES

CH.Leela Satyavathi, V.Swathi
Department of Pharmacology, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, A.P., India-521108
leelasatyavathi45@gmail.com

Ornamental flowers have been traditionally used for the treatment of different ailments such as pain, inflammation, dandruff, dermatitis, hair growth and scabies. The present study was aimed to investigate the phytochemical and cytotoxic activity of aqueous and chloroform extracts of various ornamental flowers (Ixora coccinia, Allamanda cathartica, Hibuscus rosa-sinensis and Tecoma stans) against MCF-7 cell lines by using MTT assay. Preliminary phytochemical quantitative results indicate the presence of flavonoids equivalent to quercetin. Aqueous extract of Allamanda cathartica (225.5 mg/g) and Tecoma stans (195 mg/g) was found to contain more amount of flavoniod in comparison to other aqueous extrcts and chloroform extracts. Dose dependent cytotoxicity and a significant i.e mean % inhibition and IC50 was observed in comparison to both tamoxifen and quercetin. Aqueous extract of Allamanda cathartica and Tecoma stans showed cytotoxicity similar to quercetin. Flavoniods are responsible for cytotoxic activity of flower extracts. This study provides scientific support for the use of ornamental flowers as cytotoxic agents.

**Keywords:** Anticancer activity, Ornamental flowers, Flavonoids, MCF-7 cell lines, MTT assay, Allamanda cathartica, Quercetin equivalent.

Adhatoda vasica (Vasaka) is a cherished native medicinal plant used traditionally to treat respiratory issues like asthma, bronchitis, and chronic cough. The plant's main alkaloid, vasicine, has notable pharmacological properties such as bronchodilation, expectorant effects, and anti-inflammatory capabilities. Despite these established benefits, the clinical effectiveness of traditional Adhatoda vasica formulations is often hindered by issues such as poor water solubility, low bioavailability, and quick metabolic clearance. To tackle these challenges, Novel Drug Delivery Systems (NDDS) have been developed as a cutting-edge solution to enhance the therapeutic properties of herbal extracts. Techniques like nanoparticles, liposomes, phytosomes, and inhalable carriers can increase solubility, improve stability, and facilitate prolonged or targeted release of active phytoconstituents. These systems not only enhance therapeutic effectiveness but also decrease the frequency of dosages and reduce unwanted side effects. The combination of NDDS with Adhatoda vasica extract bridges traditional herbal knowledge with modern pharmaceutical techniques. These innovations could provide safer, more effective, and patient-friendly options for treating respiratory conditions, thus strengthening the clinical importance of herbal medicines in today's healthcare landscape.

**Keywords:** Adhatoda vasica (vasaka), Respiratory diseases, Vasicine, Novel drug delivery systems (NDDS)

## PHYTOCHEMICAL PROFILING AND ANTIOXIDANT EVALUATION OF HERBS FOR HEPATOPROTECTION

Swarali Wadibhasme, Dinesh Biyani
Smt. Kishoritai Boyar College of Pharmacy, Rashtrasant Tukdoji Maharaj Nagpur University, Nagpur, Maharashtra, India – 441002.
Swarali.w97@gmail.com

Hepatic disorders are strongly associated with oxidative stress, making antioxidants an important component of hepatoprotective therapy. Herbal medicines, being natural sources of phytochemicals, provide effective antioxidant potential that can be further enhanced through nanotechnological intervention. In this study, three medicinal plants with reported hepatoprotective activity—Hemidesmus indicus (H.I.), Picrorhiza kurroa (P.K.), and Tephrosia purpurea (T.P.)—were evaluated for their physicochemical parameters, phytoconstituents, and antioxidant potential. Physicochemical analysis revealed moisture content ranging from 7.98% (P.K., H.I.) to 9.75% (T.P.), with total ash values between 2.3% (T.P.) and 8% (H.I.). Water-soluble extractive content was highest in P.K. (43.5%), followed by H.I. (26.75%) and T.P. (12.5%), while alcohol-soluble extractives were also maximum in P.K. (32%). Phytochemical screening revealed the presence of carbohydrates, proteins, glycosides, flavonoids, tannins, saponins, phenols, and terpenoids in varying proportions. H.I. showed a broad spectrum of secondary metabolites in both aqueous and methanolic extracts, whereas P.K. was enriched in glycosides, flavonoids, phenols, and terpenoids. Antioxidant evaluation through DPPH, ABTS, FRAP assays, and estimation of total phenolic and flavonoid content indicated significant free radical scavenging activity. Among the three plants, P.K. demonstrated the highest antioxidant activity, followed by T.P. and H.I. Antioxidant activity was strongly correlated with phenolic and flavonoid

ISBN: 978-81-980623-8-3

content, supporting their role in hepatoprotection. Overall, the findings validate the complementary phytochemical and antioxidant fingerprints of these plants and support their rational combination for the development of polyherbal silver nanoparticles with potential hepatoprotective applications.

**Keywords**: Hepatoprotection, Antioxidant, Hemidesmus indicus, Picrorhiza kurroa, Tephrosia purpurea.

Cissus quadrangularis (CQ) is a medicinal plant widely used for bone healing, joint health, and antioxidant activity. However, its oral bioavailability is limited due to poor solubility and low gastrointestinal absorption. The present study aimed to develop self-emulsifying drug delivery system (SEDDS) capsules of CQ to enhance solubility, dissolution, and systemic uptake.Preformulation studies were conducted to screen the solubility of CQ extract in various oils, surfactants, and co-surfactants. An optimized liquid SEDDS was prepared and adsorbed onto a solid carrier (Neusilin) to form a free-flowing powder suitable for hard gelatin capsules. The filled capsules were evaluated for physicochemical properties, drug content, flowability, and self-emulsification efficiency. Droplet size, polydispersity index (PDI), and zeta potential were measured to confirm nanoemulsion formation.In vitro dissolution studies showed significantly faster release of CQ from SEDDS capsules compared to conventional capsules. Accelerated stability studies indicated good physical and chemical stability. The results suggest that SEDDS capsules of CQ can improve oral bioavailability and therapeutic efficacy, offering a promising approach to modernize herbal formulations through advanced drug delivery technologies.

**Keywords:** Cissus Quadrangularis, Self –Emulsifying Capsules, Bioavailability Enhancement, Herbal drug delivery.

**NUTRACEUTICAL-BASED INTERVENTIONS FOR OSTEOPOROSIS: NEXT-GENERATION DELIVERY SYSTEMS**

K. Sujana Sri Sai, Sowjanya Pulipati, P. Srinivasa Babu
Department of Pharmaceutics, Vignan pharmacy college,
Vadlamudi-522213, Guntur (Dt)
ksujanasreesaisai@gmail.com

Nutraceuticals—bioactive compounds at the interface of nutrition and medicine—have emerged as promising agents for sustaining optimal health and preventing chronic diseases. Characterized by their favorable safety profile, therapeutic efficacy, and nutritional benefits, nutraceuticals are increasingly being investigated as adjuncts or alternatives to conventional therapies. Osteoporosis, a progressive skeletal disorder marked by reduced bone mass and micro architectural deterioration, significantly elevates the risk of fractures, particularly among postmenopausal women who represent the most vulnerable population. Conventional pharmacological approaches, while effective, are often associated with adverse effects, long-term compliance issues, and high treatment costs. In this context, nutraceuticals have gained considerable attention for their potential to enhance bone health and delay the onset of pathological bone loss. With some individual variation, osteogenesis, sometimes referred to as bone ossification, starts between the sixth and seventh week of embryonic development and lasts until about the age of twenty-five. Bone ossification can be classified as either intramembranous or endochondral. Reducing the risk of fractures is one of the main objectives of osteoporosis treatment. Reducing fall hazards at home (such as slick floors, obstacles, and dim lighting), avoiding drugs that impair alertness and balance, exercising to increase bone mass, muscle strength, and balance, and abstaining from smoking, excessive alcohol use, and inadequate nutrient intake are all preventive and therapeutic measures for osteoporosis and osteoporotic fractures. Reduced bone mass and osteoporotic fractures are the hallmarks of osteoporosis, the most common metabolic bone disease. The current treatments, which include hormone therapy, bisphosphonates, raloxifene, calcium supplements, and vitamin D3, are expensive and have major long-term side effects, including cardiovascular problems and mandibular osteonecrosis. Numerous nutraceuticals are currently on the market with encouraging outcomes for the treatment of osteoporosis. For nutraceuticals to have positive effects, they must be taken in the proper amount and way. As a result, comprehensive clinical trials are required to determine the bone nutraceuticals' dosage, safety, and effectiveness.

**Keywords:** Osteopenia, osteoporosis, bone health, nutraceuticals, life style.

**EVALUATION OF ANTI-INFLAMMATORY ACTIVITY OF MILLINGTONIA HORTENSIS LEAF EXTRACT**

S. Lokesh kumar, P. Raveesha,
Department of Pharmacognosy,
Vallabhaneni Venkatadri Institute of Pharmaceutical sciences,
Gudlavalleru -521356, Andhra Pradesh, India.
Lokeshkumar17293@gmail.com

In the present study Millingtonia hortensis, a herbal aqueous extract of leaves are investigated to find anti-inflammatory activity by invitro evaluation. Millingtonia hortensis (BIGNONIACEAE) subjected for Invitro anti-inflammatory activity was evaluated by albumin protein denaturation method. Millingtonia hortensis leaf aqueous extract was prepared by cold maceration method. Millingtonia hortensis aqueous extract was screened and gave positive results for alkaloids, flavonoids, carbohydrates, phenols and other constituents. The extract gave more significant anti-inflammatory activity relative to reference standard drug sample ibuprofen. Millingtonia hortensis leaf aqueous extract showed noticeable anti-inflammatory activity and it indicates that it has potential application in the conditions of inflammatory conditions like arthritis, diabetes mellitus and cancer where natural anti-inflammatory agents are having beneficial action.

**Keywords:** Millingtonia hortensis leaf, Ibuprofen, Albumin protein denaturation method, Bignoniaceae, In vitro Evaluation.

**PT-354**

**PHYTOCHEMICAL CHARACTERIZATION AND GC-MS PROFILING OF METHANOLIC EXTRACT OF EUPHORBIA HIRTA AND EVALUATION OF ITS IMPACT ON ANTIOXIDANT, ANTI-INFLAMMATORY, ANTI-MICROBIAL AND ANTI-WART POTENCY**

S. Dhanush, J. Jayashree, M. Sasikala, S. Mohan
Department of Pharmacy Practice, Karpagam College of Pharmacy,
Coimbatore, Tamil Nadu, India - 641032.
smdhanush70@gmail.com

Warts are formed by infection in the epidermal layer of the skin and typically appear as solid blisters. Conventional chemical treatments might cause burning and stinging. Herbal alternatives like Euphorbia hirta (Amman-pacharisi) show promise as safer solutions. The purpose of this study is to investigate the efficacy of methanolic and aqueous Euphorbia hirta extracts in the treatment of warts, with an emphasis on finding active ingredients and measuring anti-microbial, antioxidant, anti-inflammatory and anti-wart potential using GC-MS. The GC-MS profiling identified 50 chemicals. The methanolic extract mainly consisits of myo-inositol, 6TMS derivative (24%), bis(2-ethylhexyl) phthalate (41.36%), thymol β-D-glucopyranoside (12.37%), and hexadecanoic acid (10.22%). Upon comparing the percentage activity on antioxidant, anti-inflammatory and anti-wart potency of methanolic extract (83.45%), (93.8%) and (95.45%) with that of aqueous extract (78.02%), (82.4%) and (80.73%), the methanolic extract shows higher response than aqueous extract. These findings suggests that the methanolic extract of Euphorbia hirta, is highly beneficial in its bioactive compounds, and it could be a promising herbal alternative for wart treatment, providing an effective potency of antimicrobial, antioxidant, anti-inflammatory and anti-wart action while having fewer side effects compared to conventional drugs.

**Keywords**: Euphorbia hirta, GC-MS analysis, Anti-inflammatory activity, Anti-Wart activity.

**EVALUATION OF LEAVES OF FICUS DALHOUSIAE MIQ. AND FICUS HISPIDA L. FOR PHYTOCHEMICAL PROFILE, SECONDARY METABOLITES AND IN VITRO ANTIOXIDANT ACTIVITY**

Dube Tanuja Gorksha, Veer Sujata Umakant, Khedkar Amol Navnath
Saikrupa Institute of Pharmacy, Ghargaon, Shrigonda, Ahilyanagar, Maharashtra, India 413728
tanujadube282@gmail.com

This study aimed to investigate the phytochemical composition, antioxidant potential, and antibacterial activity of leaf extracts from Ficus dalhousiae (Miq.) Miq. and Ficus hispida L., native to the Nilgiris region of India. Qualitative phytochemical screening of successive solvent extracts revealed the presence of key secondary metabolites, including alkaloids, saponins, tannins, phenolics, flavonol glycosides, glycosides, phytosterols, as well as primary metabolites such as carbohydrates, proteins, and amino acids. Quantitative analyses indicated that the ethyl acetate extract exhibited the highest concentrations of total phenolics (245.61 mg gallic acid equivalents [GAE]/100 g), tannins (218.88 mg GAE/100 g), and flavonoids (53.11 mg rutin equivalents [RE]/100 g), reflecting a strong antioxidant phytochemical profile. Antioxidant capacity was assessed using DPPH, ABTS, phosphomolybdenum, and superoxide radical scavenging assays. The ethanol extract demonstrated potent activity, with $IC_{50}$ of 42.91 µg/mL in the DPPH assay, ABTS activity of 80,972.2 µmol Trolox equivalents (TE)/g extract, total antioxidant capacity of 208.28 mg ascorbic acid equivalents (AAE)/g in the phosphomolybdenum assay, and 45.45% inhibition in the superoxide assay. These results indicate significant free radical scavenging and reducing potential. Preliminary antibacterial assays further confirmed the presence of bioactive compounds with inhibitory effects against selected bacterial strains, supporting the therapeutic potential of both species. The findings highlight F. dalhousiae and F. hispida leaves, particularly their ethanol and ethyl acetate extracts, as promising sources of natural antioxidants and antibacterial agents, meriting further phytochemical isolation and pharmacological evaluation.

**Keywords:** Antioxidant, Ficus dalhousiae, Ficus hispida.

**IN VITRO PROPAGATION AND PHYTOCHEMICAL PROFILING OF OROXYLUM INDICUM (L.) VENT.: A SUSTAINABLE APPROACH FOR CONSERVATION AND MEDICINAL USE**

S.Kiranmai, S. Bhavani, S.udaya lakshmi, D.uma sankar
BHASKARA INSTITUTE OF PHARMACY, KOMATAPALLI VILLAGE, BOBBILI, AFFILIATED BY AU, INDIA-535558
sahukiranmai@gmail.com

Oroxylum indicum (L.) Vent., a medicinally valuable but endangered species of the Bignoniaceae family, faces threats from destructive harvesting practices, primarily due to the overexploitation of its roots. To address this conservation concern, the present study aims to develop an efficient in vitro propagation protocol for O. indicum. We successfully established a reproducible method for clonal propagation through tissue culture techniques, including callus induction, shoot proliferation, and root development. The morphogenic responses of in vitro tissues were characterized and analyzed for primary metabolites and enzyme activities, while genetic fidelity was confirmed via RAPD analysis, ensuring genetic stability compared to the mother plant. Comparative phytochemical screening of in vivo and in vitro tissues revealed the presence of key secondary metabolites such as phenols, flavonoids, and ellagic acid, quantified through standard methods and HPLC. The findings demonstrate the potential for large-scale biomass production and secondary metabolite synthesis, offering promising avenues for sustainable utilization and conservation of O. indicum, as well as prospects for biotechnological applications in phytopharmaceutical development. This work lays the foundation for future research into novel bioactive compounds and optimized production of medicinal constituents like ellagic acid.

**Keywords:** Oroxylum indicum, clonal propagation, tissue culture techniques, mother plant, secondary metabolites

**PT-357**

**DEVELOPMENT ALONG WITH ASSESSMENT OF HERBAL SCRUB POWDER**

Sake Vaishnavi Sanjay, Chakane Sakshi Santosh., Ambekar Rushikesh Haribhau., Jathar Karishma Rajendra
Saikrupa Institute of Pharmacy, Ghargaon, Shrigonda, Ahilyanagar, Maharashtra, India 413728.

The demand for skincare products with a herbal base has increased as people become more conscious of the negative consequences of synthetic cosmetic formulas. Using components obtained from plants that have been shown to have therapeutic and dermatological advantages, a herbal scrub powder was created in this study. Effective exfoliation, sebum control, antibacterial, and anti-inflammatory properties were all intended features of the composition. Citrus sinensis (orange peel), Azadirachta indica (neem), Ocimum sanctum (tulsi), Curcuma longa (turmeric), Rosa indica (rose petals), Fuller's earth (multani mitti), and Cicer arietinum (gram flour) were all used in the dry blending process to create the powder. Organoleptic properties, bulk density, tapped density, angle of repose, Carr's index, Hausner's ratio, moisture content, pH, grittiness, and microbial load were among the physicochemical parameters that were assessed. According to ICH recommendations, stability tests were carried out at 25°C/60% RH and 40°C/75% RH. The formulation's usefulness as a safe, efficient, and shelf-stable herbal cosmetic was confirmed by its excellent flow qualities, low moisture content, acceptable grittiness, and lack of microbiological growth.

**Keywords:** Herbal scrub, Anti-acne, Cosmeceuticals, Flow properties, Stability studies.

**ETHNOMEDICINE IN ACTION: P. RUBIGINOSUM GEL FOR BONE HEALING**

Vijeesh Govindan
Department of Pharmacognosy, KTN College of Pharmacy, Palakkad, Kerala, India - 679505.
vijeegktly@gmail.com

The present study reports the development and comprehensive evaluation of a liquid crystalline gel formulation of Pterospermum rubiginosum extract, a traditionally acclaimed plant for managing bone fractures and related complications. Despite its ethnomedicinal use, the therapeutic potential of P. rubiginosum remains largely unexplored scientifically. The formulation leverages the plant's natural phytoconstituents to inhibit inflammatory pathways, offering a safer alternative to conventional synthetic agents. Liquid crystalline gels were selected due to their sustained-release profile, enhanced bioavailability, and improved patient compliance. Three gel formulations (HGF1, HGF2, HGF3) were prepared by varying concentrations of cetostearyl alcohol and Tween 80 and systematically evaluated for viscosity, spreadability, pH, drug content, entrapment efficiency, and in vitro release behavior. Among the three, HGF3 emerged as the optimized formulation, exhibiting superior rheological properties, uniform drug distribution, high entrapment efficiency (95.23 ± 0.3%), and controlled release of active phytoconstituents. Microscopic characterization confirmed a stable lamellar structure, while in vitro studies verified the retention of anti-inflammatory activity. Accelerated stability studies indicated that over six months, the formulation maintained ~90% drug retention without significant degradation, confirming its robustness. These findings validate the ethnomedicinal relevance of P. rubiginosum and demonstrate the power of formulation science in transforming traditional knowledge into a clinically effective, patient friendly phytopharmaceutical candidate for fracture care and inflammation management.

**Keywords:** Pterospermum rubiginosum, Liquid crystalline gel, Fracture healing, Anti-inflammatory, Phytopharmaceutical, Drug release kinetics

Mansoa alliacea (Lam.) A.H.Gentry or 'Garlic vine' or' false garlic' belonging to the family: Bignoniaceae. It is an evergreen climbing plant

ISBN: 978-81-980623-8-3

used by the Indigenous Indian tribes of the Amazon areas and has great ancestral value for the local communities and also part of the traditional medicine. Leaves have pungent garlic smell and flavour when it is crushed. In the Amazon rainforest, local peoples are using Mansoa alliacea leaves as a seasoning and spices. Crushed or powdered fresh and dries leaves can be used for cooking as a garlic substitute. Plant consist of chemical constituents like diallyl disulphide, diallyl trisulphide, alliin, allicin, propyl allyl, divinyl sulphide, diallyl sulphide, dimethyl sulphide, daucosterol, betasitosterol etc. This present study, mainly emphasis the nutritive value analysis of dried leaves of Mansoa alliacea . Nutritive value was analysed by using various parameters. Quantitative estimation of total carbohydrates, proteins, fat, fibre amino acids, vitamin c, starch and were performed spectro-photometrically and concluded that the amount of estimated phytochemicals were significant and which will aid nutrition status of Mansoa alliacea. Quantification of some important minerals supporting nutritive status were analysed by inductively coupled plasma atomic absorption spectroscopy (ICP-AES). The minerals analysed includes Calcium, Copper, Iron, Magnesium, and Zinc are contributed in the nutritive value of the plant. The detected elements are involved in various function in humans. This comprehensive nutritive analysis serves as a foundational step for future research on the therapeutic applications of Mansoa alliacea (Lam.) A.H.Gentry, in both local and global contexts.

## PHYTOCHEMICAL QUANTIFICATION AND INVITRO ANTIOXIDANT POTENTIAL OF MALLOTUS PHILIPPINENSIS AND ZORNIA GIBBOSA HYDROALCOHOLIC LEAF EXTRACTS.

Pradeepa B Channakkalavara, Mohammad Ali,
Narayan R Miskin, Shaista omer
Department of Pharmacology, Sri Adichunchanagiri College of Pharmacy, Adichunchanagiri University, Mandya, Karnataka- 48. India.
Department of Pharmacology, T.M.A.E. Society's MMJG College of Pharmacy, Haveri, 581110 Karnataka, India.
pradeepb103@gmail.com

Plant-derived antioxidants have garnered interest in therapeutic applications, particularly in nanoparticle-mediated drug delivery. This study investigates the phytochemical constituents and antioxidant potential of hydroalcoholic leaf extracts of Mallotus philippinensis (HEMP) and Zornia gibbosa (HEZG), with an outlook toward green synthesis of silver nanoparticles for anticancer purposes. Quantitative estimations of total polyphenols, flavonoids, and tannins were performed using standard spectrophotometric methods. Antioxidant activity was assessed via DPPH, hydroxyl radical scavenging, and reducing power assays. Gallic acid and quercetin were used as reference standards. HEMP showed higher total polyphenolic content (131 µg GAE/mg) compared to HEZG (80 µg GAE/mg), while HEZG exhibited greater flavonoid content (76 µg QE/mg) than HEMP (55 µg QE/mg). Tannin content was comparable. In DPPH assay, HEMP exhibited 81.26% inhibition at 100 mg/mL, while HEZG had a lower $IC_{50}$ (70.59 µg/mL). Hydroxyl radical scavenging showed strong activity for both extracts (HEMP: 96.91%, HEZG: 96.61%) with $IC_{50}$ values of 54.53 and 56.21 µg/mL, respectively. In the reducing power assay, HEZG outperformed HEMP with an $IC_{50}$ of 50.15 µg/mL. Both plant extracts demonstrated potent antioxidant activity, likely due to their rich phytochemical profiles. These findings provide a scientific basis for their further application in the development of silver nanoparticle-based formulations targeting cancer therapy.

**Keywords:** Mallotus philippinensis, Zornia gibbosa, antioxidants, phytochemicals, DPPH, hydroxyl radical.

## PHYTOCHEMICAL EVALUATION AND HEPATOPROTECTIVE ACTIVITY OF LIRIODENDRON TULIPIFERA AGAINST SIMVASTATIN-INDUCED HEPATOTOXICITY IN RATS

Soni Priyanka[1], Joshi Ankur[2], Hardenia Anu[1], Dwivedi Sunil[1]
1. Sri Aurobindo Institute of Pharmacy (SAIP), Indore-453555
2. Modern institute of Pharmaceutical Sciences, Indore-453111
priyanka.soni@saip.ac.in

The present study was designed to evaluate the hepatoprotective potential of the ethanolic extract of Liriodendron tulipifera leaves against simvastatin-induced hepatotoxicity in Wistar rats. In addition to hepatoprotective assessment, the extract was subjected to preliminary phytochemical screening. Hepatotoxicity was induced by oral administration of simvastatin (20 mg/kg) for 30 consecutive days. The test groups received L. tulipifera ethanolic leaf extract at doses of 300 mg/kg and 500 mg/kg for the same duration. Phytochemical analysis of the extract revealed the presence of alkaloids, tannins, saponins, glycosides, phenols, and flavonoids. Biochemical investigations demonstrated that simvastatin administration significantly elevated serum glutamate pyruvate transaminase (SGPT), serum glutamate oxaloacetate transaminase (SGOT), alkaline phosphatase (ALP), and serum bilirubin levels, along with a marked reduction in total protein content. Treatment with L. tulipifera extract (300 and 500 mg/kg) substantially reversed these alterations, with effects comparable to those observed in the standard hepatoprotective group treated with silymarin (25 mg/kg). Taken together, the findings suggest that the ethanolic extract of Liriodendron tulipifera leaves exhibits significant hepatoprotective activity, likely attributable to its rich phytoconstituent profile, supporting its potential as a natural therapeutic agent against drug-induced liver injury.

**Keywords:** Liriodendron tulipifera, Hepatoprotective activity, Simvastatin-induced hepatotoxicity

**PT-362**

## EXPLORING TECOMA STANS AS A NOVEL SOURCE OF NATURALBIOPLASTICS

P.Sai Srikar, K.Padmaja
Department of Pharmacognosy & Phytochemistry Raghu college of pharmacy,Visakhapatnam, A.P, India
Sreekar162005@gmail.com

Plastics derived from petroleum are widely used due to their durability, versatility, and cost-effectiveness; however, their non-biodegradable nature has led to severe environmental pollution and ecological imbalance. This growing concern has intensified the search for sustainable alternatives, such as bioplastics produced from renewable biomass sources. The present study investigates Tecoma stans, a cellulose-rich plant belonging to the Bignoniaceae family, as a novel and eco-friendly raw material for bioplastic production. Plant materials were collected, authenticated, and subjected to a series of preparatory steps including drying, pulverization, delignification with sodium hydroxide, bleaching, anti-chlorination, alkali treatment, and acid hydrolysis to isolate cellulose crystals. These crystals were chemically modified through esterification using propionic anhydride and subsequently plasticized with glycerol to form flexible bioplastic sheets. The resulting bioplastics were evaluated through physical, chemical, thermal, and biodegradability tests. The prepared materials exhibited desirable properties such as flexibility, transparency, insolubility in water, solubility in organic solvents, and thermal stability between 200–400 °C. Environmental evaluation indicated effective biodegradation in soil and characteristic burning behavior. Moreover, the inherent antibacterial phytochemicals present in Tecoma stans contributed to suppressing microbial growth, potentially extending the shelf life of products. These findings demonstrate that Tecoma stans is a promising, sustainable source for bioplastic production. The developed bioplastics offer an environmentally friendly alternative to petroleum-based plastics, supporting waste reduction, resource conservation, and circular economy practices. Reduction in greenhouse gas emissions and plastic pollution. Utilization of fast-growing invasive plant species like Tecoma stans helps in biomass valorization.Can support rural industries and sustainable manufacturing.

**Keywords:** Tecoma stans, Bignoniaceae

**PT-363**

## DEVELOPMENT AND EVALUATION OF POLY HERBAL FORMULATION FOR PSORIASIS IN EXPERIMENTAL ANIMAL MODEL

Rupesh Kumar Pandey, Lubhan Singh Ganesh P Mishra, Avnesh Kumar
Faculty of Pharmacy, Swami Vivekanand Subharti University, Meerut (U.P)-250005 INDIA

Psoriasis is a chronic disease affecting the global population. The disease not only affects patients but also affects their quality of life. The disease

ISBN: 978-81-980623-8-3

affects the immune system, which becomes overactive and tends to cause the multiplication of skin cells so quickly. Skin patches can be seen with inflammation, especially on the scalp, knees, and other body parts. The available data on disease suggests the cause for disease progression is unknown, but the role of genetics and other factors cannot be ignored. is to establish the poly herbal formulation which can provide the cure in Psoriasis with least toxicities. the extraction was done of all the selected plants through the standard procedures and then poly herbal cream was prepared and evaluated. The poly herbal cream was evaluated through the imiquimod (IMQ) mouse model. The poly herbal cream was studied for Viscosity, pH, spread ability and in vitro studies. The prepared poly herbal cream showed prominent results in imiquimod-induced psoriatic mouse model. The poly herbal cream also affected the thickness and scaling of skin.

**Keywords:** Psoriasis; Poly Herbal; Formulation; Imiquimod

**Herbal Therapeutics Offer A Sustainable Approach To Managing.**

T. Sangeetha, P. Swathi Putta
Department of pharmacology, Raghu college of pharmacy,
Visakhapatnam, Andhra Pradesh, India.
thamminasangeetha3@gmail.com

Gut dysbiosis—an imbalance in gut microbiota composition and function—is implicated in a wide range of disorders, including metabolic, gastrointestinal, neurological, and autoimmune diseases. Herbal drugs offer promising therapeutic potential by modulating the microbiome through prebiotic, probiotic, and synbiotic mechanisms. Phytochemicals such as polyphenols, flavonoids, saponins, and polysaccharides from plants like Curcuma longa, Panax ginseng, Camellia sinensis, and Allium sativum selectively promote beneficial microbes, enhance short-chain fatty acid (SCFA) production, and suppress pathogenic species. These compounds also influence host metabolism by regulating bile acid transformation, gut barrier integrity, and systemic inflammation. Gut microbiota play a pivotal role in maintaining metabolic homeostasis via SCFA production, amino acid and xenobiotic metabolism, and energy and lipid regulation. Dysbiosis can lead to obesity, insulin resistance, non-alcoholic fatty liver disease (NAFLD), dyslipidemia, elevated lipopolysaccharides (LPS), and impaired gut barrier function. Herbal drugs, acting as both substrates and modulators of microbial activity, provide a multi-targeted strategy to restore gut homeostasis. Integrating dietary, microbial, and lifestyle interventions.

**Keywords:** Gut microbiota, Herbal therapeutics, Phytochemicals, Short-chain fatty acids (SCFAs), Gut barrier integrity.

**PHYTOMOLECULES TARGETING RHEUMATOID ARTHRITIS: NOVEL THERAPEUTIC STRATEGIES**

Yashwant D. Nakhate, Manisha Kawadkar

Rheumatoid arthritis (RA) is a long-lasting autoimmune disease characterized by painful joint inflammation, progressive cartilage damage, and eventual loss of mobility. Conventional treatments such as disease-modifying anti rheumatic drugs (DMARDs) and biologics can relieve symptoms, but their side effects and limited remission rates highlight the need for safer alternatives. In Ayurveda, RA-like illness is described as Amavata, arising from ama (toxic by-products) and imbalance of Vata dosha. Rasayana (rejuvenating) herbs are traditionally prescribed to restore balance, reduce inflammation, and strengthen resilience. Following a systematic search was conducted across PubMed, Scopus, Web of Science, and AYUSH Research Portal (2000–2024) to identify studies on Ayurvedic herbs such as Withania somnifera (Ashwagandha), Bacopa monnieri (Brahmi), Convolvulus pluricaulis, (Shankapushpi) in RA. Evidence indicates that their phytochemicals including withanolides, bacosides, flavonoids, and alkaloids modulate pro-inflammatory cytokines (TNF-α, IL-1β, IL-6), regulate NF-κB and JAK-STAT pathways, and reduce oxidative stress. These findings show strong convergence between Ayurvedic wisdom and modern pharmacology, suggesting that rasayana herbs hold promise as adjuncts for RA management.

**Keywords:** Ayurvedic Herbs, Withania somnifera, Bacopa monnieri, Convolvulus pluricaulis, Phytochemicals, Rheumatoid arthritis.

**FORMULATION AND PHARMACOLOGICAL ASSESSMENT OF HERBS WITH ANTI-INFLAMMATORY ACTION**

Kamlesh Machewar, Geeta Lodhi, Chandrashekhar Doifode, Rajendra Kakade
Taywade College of Pharmacy, Mahadula Koardi
, Nagpur, Maharashtra, India- 441111.
Department of Pharmaceutical Chemistry, Department of Pharmaceutical Sciences, R T M Nagpur University,
Nagpur, Maharashtra, India- 440033.
k.machewar@tcop.edu.in

Inflammation is an inherent defense response that comprises immune cells, blood vessels, and chemical mediators in reaction to harmful stimuli like pathogens, damaged cells, or irritants. It is a key response in removing the initial insult to the cells, removal of damaged tissue, and starting the repair process of the tissue. The traditional signs of inflammation are heat, pain, redness, swelling, and loss of function. Being a non-specific response, inflammation is associated with the innate immune system, in contrast to adaptive immunity which is aimed at particular pathogens. Failing to mount an appropriate inflammatory response, the organism may suffer from cumulative tissue damage that jeopardizes survival. This intricate biological process provides protection and healing by neutralizing the injurious stimuli and also repairing damaged tissues. Anti-inflammatory drugs, which make up a large percentage of analgesics, soothe pain by decreasing inflammation more than inhibiting pain transmission in the central nervous system, like the way opioids do. Nonsteroidal anti-inflammatory agents work by blocking cyclooxygenase (COX), the enzyme involved in the synthesis of prostaglandins (PGs), the major mediators of inflammation. Aside from synthetic drugs, some herbal drugs also exhibit promising anti-inflammatory activity. The findings suggest that the newly developed herbal microemulgel containing herbal extract holds potential for future applications in combating inflammation. These plants, including Cedrus deodara (CD), Peppermint (PM), Kakamachi (KK), and Piper longum (PL), showed higher efficacy in treating inflammatory conditions, pointing to the promise of natural compounds as therapeutic agents.

**Keywords**: Herbal, Microemulgel, Anti-inflammatory activity.

**PHYTOCHEMICAL SCREENING AND ANTHELMINTIC ACTIVITY OF SIDA SPINOSA PRARTHANA**

A. Kokate, Jitendra Patel
Department of Pharmacognosy, Datta Meghe College of Pharmacy,
Datta Meghe Institute of Higher Education, (Deemed to be University),
Sawangi (Meghe), Wardha 442001 (MS), India.

Sida spinosa, belonging to the Malvaceae family, is a medicinal plant of significant traditional use, prevalent in tropical and subtropical areas. It has been widely utilized in traditional medicine for the treatment of fever, inflammation, and microbial infections. Notwithstanding its ethnomedicinal significance, scientific investigation into its phytochemical composition and anthelmintic efficacy is still constrained. This study aims to analyze the phytochemical components of Sida spinosa and assess its anthelmintic activity through standard in vitro methods. Initial phytochemical analysis of ethanolic and aqueous extracts indicated the presence of alkaloids, flavonoids, tannins, saponins, terpenoids, phenolic compounds, and glycosides, all of which are recognized for their biological activity. The anthelmintic efficacy was evaluated against Pheretima posthuma (earthworms) as a model, utilizing albendazole as a reference standard. Various quantities of the plant extract exhibited strong dose-dependent effects, evidenced by the paralysis and mortality times of the worms, which were equivalent to the usual medication. The ethanolic fraction demonstrated superior activity among the evaluated extracts, indicating that polar phytoconstituents such as flavonoids and tannins contribute to the vermicidal actions. The research underscores the therapeutic efficacy of Sida spinosa as a natural anthelmintic and establishes a pharmacological foundation for its traditional application in helminthic illnesses. Additional research utilizing bioassay-guided fractionation, isolation of active chemicals, and in vivo assessment is essential to corroborate these findings and determine their efficacy and safety for therapeutic use. This research highlights the need to investigate underutilized

ISBN: 978-81-980623-8-3

medicinal plants as cost-effective solutions for addressing parasite infections.

**Keywords:** Sida spinosa, phytochemical screening, anthelmintic activity, flavonoids, tannins.

**ANTIMICROBIAL ACTIVITY OF RED DRAGON FRUIT PEEL EXTRACTS (HYLOCEREUS POLYRHIZUS) ASSESSED IN VIVO AND IN VITRO**

Sake Vaishnavi Sanjay., Chakane Sakshi Santosh.,
Ambekar Rushikesh Haribhau., Jathar Karishma Rajendra.
Saikrupa Institute of Pharmacy, Ghargaon, Shrigonda,
Ahilyanagar, Maharashtra, India 413728.

The purpose of this study aimed to characterize and assess the antibacterial activity of red dragon fruit (Hylocereus polyrhizus) peel extracts. Red dragon fruit peel extracts were produced by macerating the fruit in a pH 5 solvent. The peel extracts' phytochemical properties, total phenols, antioxidant, and antibacterial properties were identified. The extracts' high levels of phytochemical components and total phenols are related to their antioxidant and antibacterial properties. The physicochemical properties, minerals, antioxidant activity, and microbiological profile of red dragon fruit peel extracts in different percentages were examined. The present study aims to assess the antimicrobial activity of crude 50% hydroalcoholic peel extracts of Red Dragon Fruit (Hylocereus polyrhizus) against various clinical isolates, including Escherichia coli, Bacillus subtilis, Staphylococcus aureus, A. niger, and Candida albicans. This research is intended to identify alternative solutions to address the growing challenge of microbial resistance. Additionally, the findings from the in vivo assay conducted on thirty mice demonstrated that the administration of 100mg/ml of aqueous extract and Chloramphenicol was more effective than other concentrations, resulting in a significant reduction of P. aeruginosa bacteria ($P \leq 0.001$) throughout the treatment period. The extracts of red dragon fruit peels exhibited antimicrobial activity, according to the results.

**Keywords:** antimicrobial, red dragon fruit peel extract.

**PT-369**

**A MEDICATED HERBAL NAIL LACQUER FOR TREATING ONYCHOMYCOSIS**

Juvatkar PV, Gokhale Suchita, Sakhare A, Bharati A,
Yevale D, Kanase VG
AIMS College of Pharmacy, Vadavali, Dombivli (East),
University of Mumbai
Ideal College of Pharmacy Research, Kalyan. University of Mumbai

Fungal infections of the nails are also recognized as dermatophytic, non-dermatophytic moulds and yeast-based onychomycosis. The liable fungus is usually the same as that causes athlete's foot – a common infection of the skin of the feet, especially between the toes. Onychomycosis is an infection of the nail caused by fungi such as dermatophytes, non- dermatophyte moulds and yeasts (mainly Candida species). Around 20% of the population aged over 60 years, and up to 50% of subjects aged over 70 years are informed to have onychomycosis. The connection between increasing age and onychomycosis may be attributed to reduced peripheral circulation, inactivity, suboptimal immune status, diabetes, larger and distorted nail surfaces, slower-growing nails, difficulty to groom the nails and continuing foot hygiene, frequent nail injury and increased exposure to disease-causing fungi. Historically, the treatment of onychomycosis has been challenging. Orally administered griseofulvin (Grisactin, Gris-Peg) has been available for many years, but its use is limited by a narrow spectrum, the necessity for long courses of treatment and high relapse rates. Onychomycosis has long been treated with topical antifungal preparations. However, these agents are inconvenient to use, and results are often disappointing. One such herbal drug used for treatment of Onychomycosis is Pongamia pinnata (karanj), a cheap and easily available plant whose seeds have shown great activity against anti-microbial and anti- fungal activity. Azadirachta indica is a perennial tree also known as Neem which is being used in Ayurveda for thousands of years. Neem extracts exhibits antiviral, anti-fungal, anti-insecticidal, anti-bacterial, anti- allergic, anti-helminthic, anti-inflammatory properties. Black pepper, Piper nigrum, is a climbing perennial plant in the family Piperaceae Piperine, the active principal present in P. longum and P. nigrum was isolated and its bioavailability enhancing action was established. Menthol, Thymol, Phenol, Salicylic acid and Naphthol are amongst the fragrant chemical constituents obtained from Cinnamomum camphora. Main indication of camphor is in skin infections and fungal invasion on the body thus acting as anti fungal agent. The aim of present research work is to design, formulate and evaluate the properties of Pongamia pinnata (karanj) seed oil and its effects as a medicated herbal nail-lacquer on treatment of Onychomycosis.

**GREEN ALGAE AS A SUSTAINABLE ALTERNATIVE TO SILK LEAF**

Himani Hemant Nagfase
Smt. B.N.B Swaminarayan Pharmacy College,
Salvav – Vapi, India – 39619
himani.nagfase@gmail.com

The search for sustainable innovations in biopharmaceutics has led to the exploration of green algae as an alternative to silk leaf technology. In this work, Chlorella vulgaris was embedded in a sodium alginate–calcium chloride matrix to create a translucent, leaf-shaped structure that mimics natural leaves. The design not only provides aesthetic appeal but also sustains algal growth, enabling photosynthesis and continuous oxygen release under light exposure. This bio-inspired algae matrix demonstrates dual functionality: it can act as a decorative, eco-friendly material while also serving as a potential tool for therapeutic applications by producing oxygen and supporting biopharmaceutical processes. The results suggest that algae-based matrices can merge sustainability, functionality, and innovation, offering a promising green alternative to conventional silk leaf systems.

**Keywords:** Green algae, silk leaf alternative, sustainable biopharmaceutics, oxygen producing matrix, drug delivery inovation

**PT-371**

**FORMULATION AND ANTIOXIDANT EVALUATION OF A SYNERGISTIC POLYHERBAL TABLET FOR MENSTRUAL PAIN RELIEF (DPPH ASSAY)**

Janvi Sanjay Channe
Datta Meghe College of Pharmacy, DMIHER, Sawangi (Meghe),
Wardha, Maharashtra, India-442001.
janvichanne8@gmail.com

Menstrual cramps (dysmenorrhea) impact a significant percentage of women globally and are usually treated using synthetic medications that have adverse effects. Herbal drugs offer a safer option, but it needs to be validated scientifically. This research sought to develop a polyherbal tablet out of Ginger (Zingiber officinale), Fennel (Foeniculum vulgare), and Ashoka (Saraca asoca) and to assess its antioxidant activity through the DPPH assay. The tablet was formulated with typical pharmaceutical methods using suitable excipients for achieving uniformity, hardness, friability, and best disintegration time. DPPH assay was carried out by making ethanolic extracts of the polyherbal tablet and individual herbs. These extracts were incubated with DPPH solution, and the absorbance was recorded at 517 nm to determine the % radical scavenging activity. Outcomes indicated that the polyherbal tablet had a very high antioxidant activity (≈75%) than individual herbs (Ginger 55%, Fennel 48%, Ashoka 42%), suggesting synergistic effect of the coformulation. This antioxidant activity is likely to mitigate oxidative stress related to menstrual pain. Finally, the research proves that the developed polyherbal tablet is not just pharmaceutically acceptable but also shows increased antioxidant activity, validating its traditional applicability in dysmenorrhea management. The research gives a scientific foundation for the incorporation of herbal medicine into contemporary pharma practice.

**Keywords**: Polyherbal Tablet, Menstrual Pain, Ginger, Fennel, Ashoka, DPPH Assay, Antioxidant Activity.

**PT-372**

**HERBAL FOOT MASK THERAPY: A NOVEL APPROACH FOR MENSTRUAL PAIN RELIEF**

Muskan Sunilsingh Gautam
Datta Meghe College of Pharmacy, Wardha- 442001,
Maharashtra, India
gautammuskan756@gmail.com

In the current research, a novel herbal foot mask therapy was formulated for the management of menstrual pain (primary dysmenorrhea). The

ISBN: 978-81-980623-8-3

objective behind the study was to evaluate the effect of herbal extracts incorporated into a transdermal foot mask on physicochemical properties, drug release, stability, and pain-relief potential. Herbal ingredients with known analgesic, anti-inflammatory, and muscle relaxant activity such as clove oil, cinnamon oil, chamomile extract, and peppermint oil were selected for formulation. The prepared foot mask was evaluated for pH, spreadability, viscosity, stability, and in vitro drug release profile. A small-scale volunteer study (n=20) was conducted to observe the therapeutic outcome in terms of pain score reduction using a Visual Analog Scale (VAS) and user acceptability. It was observed that the optimized formulation (HF-3, containing clove oil and chamomile in balanced ratio) exhibited pH 6.0, good spreadability, stability under accelerated conditions, and sustained drug release for 6–8 hours. Volunteer feedback indicated a significant reduction in pain intensity ($p < 0.05$) and improved relaxation without any skin irritation. FTIR analysis showed no chemical interaction between the herbal actives and excipients, while SEM studies revealed a uniform film surface suitable for dermal application. Therefore, it can be concluded that herbal foot mask therapy represents a safe, effective, and innovative non-invasive approach for menstrual pain management. Further clinical studies on a larger population are recommended to validate the findings.

**Keywords:** Dysmenorrhea, herbal therapy, foot mask, transdermal delivery, menstrual pain relief

## FORMULATION AND EVALUATION OF NIGHT CREAM FROM ETHANOLIC EXTRACT OF SYZYGIUM CUMINI (LINN.) SEED

Merlin A John, Santhan Nehru Narkilli
Nehru College of Pharmacy, Thrissur, Kerala, India-680588
merlin01john@gmail.com

Night creams are designed to be left on the skin for several hours. They are composed of substantial oil-in-water phase, which will spread without disappearing. Night creams play a crucial role in maintaining skin hydration and preventing premature aging. In this study, we have focus on the use of topical drug delivery system by using Syzygium cumini. Different parts of the Syzygium cumini such as bark, seed, leaves, fruits, have been used in medicine for diabetes, antimicrobial, antioxidant, anti-inflammatory, antifungal etc. It contains phytoconstituents like tannins, flavonoids, phenols, alkaloids, terpenoids, vitamin C, E and beta-carotenes. It can provide cosmetic properties. The flavonoids show antioxidant and anti-aging property and also helps to lighten skin pigmentation. Syzygium cumini or Eugenia jambolana Lam more popularly known as black jamun or Java plum belongs to the family Myrtaceae and is a vital indigenous plant with medicinal applications originally from India and Indonesia. The seeds have promising high level of alkaloids, jambosine, and glycoside jamboline compound. It helps to purify the blood and keep the skin clean, glowing, hydrating and nourishing. The DPPH study was conduct to confirm the antioxidant property and done all the evaluations test, which meet the specifications of night creams.

**Keywords:** Syzygium cumini, jambosine, Antioxidant

**PT-374**

## IN SILICO EVALUATION OF PHYTOCONSTITUENTS FOR HEPATOPROTECTIVE POTENTIAL FROM RUBUS SPECIES

Ariba, Tirath kumar
Department of Pharmaceutical Sciences, Sir J.C Bose Campus, Bhimtal, Kumaun University Nainital, Uttarakhand, India 263136
aribasiddiqui098@gmail.com

Members of the Rubus genus are widely consumed as berries known for their rich phytochemicals like polyphenolic, flavanoid, tannins and traditional medicinal use. Despite their antioxidant and anti inflammatory properties evidence present in the literature on the basis of these properties I chose the plant phytochemicals to be evaluated against hepatoprotective activity which remains scarcein the literature.To investigate and compare the hepatoprotective potential of phytoconstituents from Rubus species through molecular docking and ADMET analysis.Major phytochemicals were retrieved from phytochemical databases and published literature. Selected compounds were docked against hepatotoxicity-related targets including CYP2E1, TNF-α using AutoDock Vina. Binding affinities, hydrogen bonding interactions, and active site residues were analyzed. ADMET profiling was performed to predict drug-likeness and pharmacokinetics. Polyphenolic compounds such as ellagic acid and quercetin derivatives, anthocyanin-rich fractions from the rubus species docked against the receptor CYP2E1 and TNF-α. Both phytoconstituents exhibited favorable ADMET properties. In silico analysis suggests that the Rubus species possess hepatoprotective potential through antioxidant and anti-inflammatory mechanisms, though with differences in target preferences. These findings provide molecular evidence supporting further in vitro and in vivo validation of Rubus species as hepatoprotective candidates.

**Keywords:** Rubus species; hepatoprotection; molecular docking; polyphenols; flavanoid

**PT-375**

## FORMULATION AND EVALUATION OF HERBAL TOOTH POWDER FOR ANTI-MICROBIAL ACTIVITY AGAINST ORAL PATHOGENS.

Dr. Mohd Rafiq, Javeria Naaz
Department of Pharmacognosy, MAM College of Pharmacy, Kalaburagi.
drmohdrafiq83@gmail.com

Dental caries are common oral infections, necessitating effective strategies to eliminate harmful oral microorganisms. This study aimed to formulate and evaluate herbal tooth powder with antimicrobial activity as a natural alternative to modern dental care. The formulation aimed to provide a safe, effective and affordable product that could prevent dental issues such as plaque, gingivitis. The evaluation of the formulated herbal tooth powder was carried out through a comprehensive set of parameters, including physical characterization (colour, odor, taste, texture, moisture content and flowability) microbiological analysis and sensory evaluation. Physical properties were assessed to ensure product stability, consistency and consumer appeal. The antimicrobial activity of the tooth powder was tasted against common oral pathogens using standard agar diffusion method.The formulation exhibited promising antimicrobial efficacy, indicating its potential to inhibit the growth of harmful oral microbes responsible for dental caries and periodontal diseases. From above results it can be concluded that the herbal tooth powder showed significant antimicrobial activity.

**Keywords:** - Natural Ingredients, Oral Hygiene, Dental Care and microbial analysis.

**PT-376**

## ADVANCED VESICULAR DELIVERY OF HERBAL EXTRACTS FOR IMPROVED DERMAL PENETRATION AND PHOTOAGING PREVENTION

Astha Pathak[1], Ravindra Kumar Pandey[2], Shiv Shankar Shukla[2]
[1]VM College of Pharmacy, Bishrampur, Surajpur, Chhattisgarh, India
[2]Columbia Institute of Pharmacy, Raipur, Chhattisgarh, India
astha.pathak99@gmail.com

Chronic ultraviolet (UV) exposure is a major contributor to photoaging, causing oxidative stress, collagen degradation, and pigmentation disorders. The present study aimed to design and optimize an advanced vesicular delivery system of a polyphenol-rich herbal extract with established photoprotective properties, to enhance dermal penetration and anti-photoaging efficacy. The extract exhibited high phenolic (202.42 ± 1.78 mg GAE/g) and flavonoid (135.56 ± 2.21 mg TAE/g) content, strong antioxidant activity ($IC_{50}$ ≈ 19 µg/mL), and a significant in vitro SPF value (29.47 ± 0.02), suggesting broad-spectrum UV absorption. Transethosomes were formulated using thin-film hydration followed by probe sonication and optimized for key parameters, yielding vesicles of 120–160 nm with a narrow polydispersity index (<0.3), zeta potential of −30 mV, and entrapment efficiency exceeding 80%. In vitro permeation studies revealed a ~1.7-fold improvement in skin deposition compared to the free extract, with preserved antioxidant activity post-encapsulation. These findings highlight the potential of vesicular nanoformulations as a safe and effective strategy for delivering bioactive herbal actives for photoprotection and prevention of UV-induced skin aging, paving the way for future cosmeceutical applications.

**Keywords:** herbal nanoformulation, transethosomes, photoprotection, skin deposition, antioxidant, anti-photoaging

**PT-377**

## ANALGESIC AND ANTI-INFLAMMATORY POTENTIALS OF BOENNINGHAUSENIA ALBIFLORA: A HIMALAYAN MEDICINAL HERB

Bharti, Archana Negi Sah
Department of Pharmaceutical Sciences,

ISBN: 978-81-980623-8-3

Sir J.C. Bose Technical Campus, Bhimtal
Kumaun University, Nainital, Uttarakhand, India -263136.
bhartii941015@gmail.com

Boenninghausenia albiflora is a herbaceous perennial, belonging to the Rutaceae family. This plant has small, pale white flowers with an unpleasant odour from its leaves and is mostly found in the temperate region of the Himalaya, popularly known as Pissu Mar, and is indigenous to the traditional system of medicine, because of its documented insecticidal, flea repellent, analgesic, antiseptic, anti-inflammatory, and calcium channel blocking activities. To provide an example of evidence for these traditional uses, the present study analyzed the analgesic and anti-inflammatory activities, in addition to the phytochemical profile of the plant extract. Analgesic potential of the plant extract was determined by using the hot plate and tail-flick method and its ability to relieve pain was substantial, indicating that it has pain-relieving potential, while anti-inflammatory activity was performed by using carrageenan-induced paw edema, where the plant extract exerted a significant reduction in paw swelling in a dose and time-dependent manner. These results were also confirmed by in vitro studies by performing the protein denaturation method. Therefore, the findings show that B. albiflora has strong analgesic and anti-inflammatory properties, supporting its traditional use and pointing to its potential as a natural source of new medicinal compounds.

**Keywords:** Boenninghausenia albiflora, Analgesics, anti-inflammatory.

**PT-378**

## HERBAL MUCOADHESIVE GEL OF OCIMUM SANCTUM (TULASI): A PROMISING TREATMENT FOR MOUTH ULCERS

G. Gowthami, D. Neelima
Department of Pharmaceutical Technology, Raghu College of Pharmacy (Affiliated to Andhra University), Dakamarri (v), Bheemunipatnam (m), Visakhapatnam-531162, AP, India.
gowthami91330@gmail.com

Aphthous ulcers are painful oral sores that reduce quality of life, and existing treatments frequently provide only brief relief with significant adverse effects. Ocimum sanctum (Tulasi) is a medicinal herb noted for its anti-inflammatory, antibacterial, and wound-healing effects. The purpose of this study was to create and test a herbal mucoadhesive gel derived from Ocimum sanctum for the treatment of mouth ulcers. The gel was created using appropriate mucoadhesive polymers and tested for physicochemical properties, spreadability, viscosity, mucoadhesion, in vitro drug release, and stability. The gel had an adequate pH, excellent viscosity, good spreadability, and strong mucoadhesive strength, resulting in a regulated release of active ingredients. In vivo tests revealed faster ulcer healing and a considerable reduction in ulcer size compared to the control. Ocimum sanctum mucoadhesive gel is a safe and effective herbal formulation that provides sustained release and improved mucosal retention, making it a promising alternative for the treatment of mouth ulcers.

**Keywords**: Ocimum sanctum, Tulasi, mucoadhesive gel, mouth ulcers, herbal formulation, oral ulcers.

## ASSESSMENT OF ANTIMICROBIAL ACTIVITY OF VARIOUS EXTRACTS OF LEUCAS BIFLORA LEAVES AND GREEN SYNTHESIS OF SILVER NANOPARTICLES OF ACTIVE EXTRACT

Krunal Gorle, Kamala Chandak, Radheshyam Lohiya, Aarti Uprikar, Triveni Turre, Milind Umekar

The plant Leucas biflora (Vahl), Robert Brown. family Lamiaceae commonly known as two-flowered Leucas is a diffuse perennial herb used traditionally for the treatment of skin diseases, headache, nose bleeding, conjunctivitis and white discharge in women. The current study focuses on to assess the antimicrobial activity and minimum inhibitory concentration of various extracts of Leucas biflora leaves and the manufacture of eco-friendly silver nanoparticles of most active extract. The leaves extraction was carried out by successive soxhlation extraction method using a various of solvents, likes petroleum ether, ethyl acetate, acetone, ethanol and lastly maceration with alcohol and water. The phytochemical screening of the extracts shown the presence of tannins, flavonoids, alkaloids, carbohydrates, steroids, and saponins. The various extracts were tested for their antimicrobial activity and MIC by using agar well diffusion method and broth dilution method on the gram-positive Bacillus subtilis, Staphylococcus aureus, and on the gram-negative Pseudomonas aeruginosa, Klebsiella pneumoniae, Escherichia coli, Proctus vulgaris and fungi Candida albicans. The ethanolic, ethyl acetate and hydroalcoholic shown more significant antimicrobial activity. Silver nanoparticles of aboves three extracts were prepared using green synthesis and the antimicrobial activity was assessed. The results indicated that the silver nanoparticles of ethanolic extract of Leucas biflora leaves exhibited favourable antimicrobial activity.

**Keywords**: Leucas biflora leaves, extract, silver nanoparticles, green synthesis, antimicrobial activity.

## ANTIFUNGAL PROPERTIES OF BOERHAVIA DIFFUSA AGAINST DERMATOPHYTES: A COMPREHENSIVE PHYTOCHEMICAL AND MOLECULAR STUDY

N Sunanda, Agilandeswari Devarajan, Vijayanandhan V
Department of Pharmaceutical Sciences, MVM College of Pharmacy, Bengaluru, Karnataka, India-560064
sunandhanalagatla14@gmail.com

Dermatophytic infections remain an important global health challenge, with rising antifungal resistance highlighting the urgent need for safer and more effective alternatives. Natural products are increasingly explored as potential solutions, and Boerhavia diffusa, a plant long valued in traditional medicine, represents a promising candidate due to its rich profile of bioactive compounds. The present study evaluated the antifungal activity of ethanolic extracts obtained from the leaves and roots of B. diffusa against clinically relevant dermatophytes including Trichophyton rubrum, Microsporum canis, Epidermophyton floccosum. Antifungal assays using the disk diffusion method demonstrated that the leaf extract exhibited greater inhibitory potential than the root extract, producing zones of inhibition that ranged from 14 to 16 mm, values comparable to the standard drug clotrimazole (17–19 mm). Determination of the Minimum Inhibitory Concentration (MIC) and Minimum Fungicidal Concentration (MFC) further confirmed the superior efficacy of the leaf extract. It demonstrated potent inhibition of T. rubrum (MIC: 1.0 mg/mL) and M. canis (MIC: 1.5 mg/mL), while its activity against E. floccosum was moderate. Synergistic evaluation with fluconazole revealed a significant enhancement of activity, particularly against T. rubrum, as demonstrated by a fractional inhibitory concentration (FIC) index of 0.35, indicating strong synergism. Microscopic observations further showed structural deformities in fungal hyphae, compromised cell walls, and abnormal conidial development, providing morphological evidence of antifungal action. In conclusion, these findings scientifically validate the traditional application of B. diffusa and highlight its potential as a natural antifungal therapy, whether used independently or in combination with existing drugs.

**Keywords:** Boerhavia diffusa, Dermatophytes, Antifungal activity, Phytochemical analysis, Synergistic effects

**PT-381**

## IN-VITRO ANTIOXIDANT EFFICACY AND PHYTOCHEMICAL CHARACTERISATION OF MORINGA OLEIFERA LEAF EXTRACT

Telang Priyanka, Gattani S. G.
Department of Pharmaceutical Sciences, School of Pharmacy, S. R. T. M. University, Nanded, Maharashtra, India-431606
priyankatelang99@gmail.com

In a recent study, there has been a growing interest in researching and developing new agents with various biological activities. In view of this, we have conducted a phytochemical and biological evaluation of Moringa Oleifera. Pharmacognostic parameters of powder determined by the determination of organoleptic, morphological & microscopical properties of Moringa Oleifera (leaves). Physiochemical investigation done by determining water-soluble extractives (26.41±0.39% w/w), alcohol soluble extractives (14.3±0.20 % w/w), total ash value (6.0±0.25% w/w), acid-insoluble ash value (3.4±0.12% w/w), and water-soluble ash value (1.6±0.20 % w/w) & moisture content (LOD) (1.21±0.03 % w/w). Preliminary phytochemical screening finished. The alcoholic extract reveals the presence of active phytoconstituents, including

ISBN: 978-81-980623-8-3

glycosides, phenols, flavonoids, and tannins. The phytochemical characterisation of the plant extract performed using advanced techniques, including TLC, HPTLC, and HR-LCMS. We have carried out pre-formulation studies on the hydroalcoholic extract of Moringa Oleifera (leaves) using parameters such as Angle of Repose (29.00±0.12), Bulk density (0.43±0.01), tapped density (0.64±0.012), particle size (MF), Carr's index (18.61±0.122) & Hausner's ratio (1.21±0.05). We have carried out an in-vitro study of hydro alcoholic extract Moringa Oleifera (leaves) total phenolic content by Folin- Ciocalteau method, 500ug/ml shows maximum concentration of Phenols (33.932 mg/GAE/g), flavonoid content by the Aluminium Chloride Colourimetric method, 1mg/ml, shows (46.29mg/QC/g) maximum concentration of flavonoids. The in vitro radical scavenging potential was assessed using the DPPH method and the NO method. A 1mg/ml sample concentration shows (56.34% and 57.608 %) radical scavenging activity, respectively.

**Keywords**: Pharmacognostic, Pre-formulation, Antioxidant study, Total phenolic contents & total flavonoid contents

**PT-382**

## ENDOPHYTES AT WORK: EXPLORING BOERHAVIA DIFFUSA ROOT MICROBIOME FOR HEPATOPROTECTIVE POTENTIAL

Poonam Chougule, Chandraprabhu Jangme
Department of Pharmacognosy, D. Y. Patil College of Pharmacy, Kadamwadi, Kolhapur, Maharashtra, India 416 003

The liver is a vital organ involved in metabolism and detoxification. Endophytes, symbiotic microorganisms residing in plants, are known to produce bioactive metabolites with therapeutic potential. To isolate and characterize endophytic bacteria from Boerhavia diffusa roots and evaluate the hepatoprotective potential of their chloroform (CBD) and ethyl acetate (EABD) fractions. Endophytes were isolated and identified by PCR analysis. Crude fractions (CBD & EABD) were tested for antioxidant activity (DPPH, hydroxyl radical, lipid peroxidation) and hepatoprotective activity in $CCl_4$-induced hepatotoxic rats. Serum biomarkers (SGOT, SGPT, SALP, bilirubin, cholesterol, protein), endogenous antioxidants (SOD, CAT, GSH), liver weight, and histopathology were assessed. $CCl_4$ treatment induced oxidative stress and liver injury. Administration of CBD and EABD fractions significantly normalized biochemical markers, improved liver histology, and restored antioxidant levels. Flavonoid-rich metabolites from Bacillus cereus strain endophytes likely contributed to the hepatoprotective effect. Endophytic fractions of Boerhavia diffusa roots exhibit strong antioxidant and hepatoprotective activity, suggesting their potential as alternative therapeutic sources.

**Keywords:** Boerhavia diffusa, Endophytes, Bacillus cereus, Antioxidant, Hepatoprotective

## ANTI-INFLAMMATORY POTENTIAL OF SECHIUM EDULE LEAF EXTRACT: AN IN-VITRO STUDY

Jyotishman Sarma, Shibani Kashyap, Bitu Gogoi
NETES Institute of Pharmaceutical Science, NEMCARE Group of Institutions, Mirza, Kamrup, Assam- 781125
uniquejyotishman@gmail.com

Inflammation plays a crucial role in the pathogenesis of various chronic disorders such as arthritis, cardiovascular, and neurological diseases, and medicinal plants remain an important source of bioactive compounds with therapeutic potential. Sechium edule (chayote), a member of the Cucurbitaceae family, is traditionally employed in folk medicine, but limited studies have been conducted to explore its anti-inflammatory potential. The present study was designed to evaluate the in-vitro anti-inflammatory activity of S. edule leaf extract. Fresh leaves were collected from Kamrup district, Assam, shade-dried, and extracted successively using Soxhlet with petroleum ether, chloroform, and ethanol. The ethanolic extract was subjected to preliminary phytochemical screening, which confirmed the presence of flavonoids, alkaloids, tannins, phenols, and terpenoids. The anti-inflammatory activity was assessed using the Human Red Blood Cell (HRBC) Membrane Stabilization Test and the Egg Albumin Denaturation Assay, employing Diclofenac as the reference standard. Results revealed that the ethanolic extract exhibited significant inhibition of protein denaturation and effective membrane stabilization activity, which were comparable to those of Diclofenac, thereby validating its traditional medicinal use. The findings suggest that the anti-inflammatory activity of S. edule may be attributed to the presence of bioactive secondary metabolites, and thus, the plant shows promise as a potential source for developing phytopharmaceuticals or herbal formulations for the management of inflammatory conditions. However, further in-vivo studies, isolation of active constituents, and mechanistic evaluations are warranted to establish its therapeutic efficacy and safety profile.

**Keywords:** Sechium edule, chayote, anti-inflammatory activity, HRBC membrane stabilization, protein denaturation, phytochemicals

## HERBAL BIOACTIVE AS NOVEL LEADS FOR THE MANAGEMENT OF NEURODEGENERATIVE DISORDERS: RECENT CHALLENGES AND FUTURE DIRECTIONS

Omprakash Mori, Vijay Kumar Singh
Shri Rawatpura Sarkar University, Raipur (C.G.), India, 492016
omprakashmori25@gmail.com

Neurodegenerative disorders (NDs) are characterized by the progressive loss of structure and function of neuron. NDs including Alzheimer's disease, Parkinson's disease, and Huntington's disease, are among the leading causes of disability and mortality worldwide. Their progressive nature, limited therapeutic efficacy of current drugs, and associated adverse effects highlight the urgent need for alternative strategies. Phytoconstituents, derived from medicinal plants, have emerged as promising candidates due to their multitargeted mechanisms, neuroprotective properties, and favorable safety profiles. Numerous classes of phytochemicals, such as alkaloids, flavonoids, terpenoids, saponins, and polyphenols, demonstrate antioxidant, anti-inflammatory, anti-amyloidogenic, and cholinesterase inhibitory activities that directly address the pathological hallmarks of neurodegeneration. Additionally, advancements in phytopharmacology and nanotechnology-based delivery systems have further enhanced their bioavailability and therapeutic potential. Current preclinical and clinical studies suggest that phytoconstituents not only alleviate symptoms but also modulate disease progression, offering a holistic approach to management. These highlights the relevance of phytoconstituents as potential therapeutic agents in neurodegenerative disorders, emphasizing their role in bridging the gap between traditional knowledge and modern pharmacological interventions.

**Keywords:** Phytoconstituents, Neurodegenerative disorders, nanotechnology-based delivery systems, Neuroprotection, Herbal therapeutics.

## IV-VITRO ANTIOXIDANT APPROACH: TO EVALUATE THE CAPABILITY OF FICUS EXASPARATA LEAVES EXTRACT FOR MITIGATING OXIDATIVE STRESSES

Vidhya V. Mali, Aamer I. Quazi, Sudhir S. Pange
Department of Pharmacy Research Centre,
ASPM's K. T. Patil College of Pharmacy,
Osmanabad, Maharashtra, India – 413501

Reactive Oxygen Species contributes to peptic ulcer formation by directly damaging the gastric mucosal cells through lipid peroxidation, protein, DNA damage and by inducing an inflammatory response that exacerbates this damage. The depletion of antioxidant defenses and the presence of H. pylori or NSAIDs amplify the impact of reactive oxygen species leading to the development and progression of peptic ulcers. Ficus exasperata exhibits various pharmacological actions utilized in various medical conditions like antiulcer, antidiabetic, antimicrobial, anti-inflammatory, anxiolytic, antipyretics, anticonvulsant, antihypertensive, hypolipidemic, stomach pain, hemorrhoids, antiarthritic, antioxidants and hypoglycaemic. Antioxidant Assays was done by four different invitro methods using UV Spectrophotometer 1. DPPH Assay of Ficus exasperata Extracts 2. Ferric Reducing Antioxidant Power (FRAP) assay 3. Superoxide Anion Radical Scavenging Activity Assay 4. Hydroxyl radical scavenging activity The results indicate that Ficus exasperata possesses significant free radical scavenging potential, which could contribute to its antioxidant properties. This activity suggests the presence of bioactive compounds capable of mitigating oxidative stress, highlighting its potential use as a natural antioxidant source in therapeutic and nutraceutical applications. The radical scavenging activity (% RSA) of the plant extract (PE) and standard was

ISBN: 978-81-980623-8-3

evaluated, showing dose-dependent activity. The PE demonstrated moderate antioxidant potential, with % RSA increasing from 11.25% at 10 µg/ml to 61% at 50 µg/ml, achieving an IC50 of 40.11 µg/ml. From above cited results we can conclude that the extract of ficus exasperata having significant antioxidant potential so that it can be used for further studies of pharmacological evaluation of antiulcer activities.

**Keywords:** Antioxidant, Ficus exasperata, reactive oxygen species, peptic ulcer.

**EVALUATION OF HERBAL FORMULATION CONTAINING INDIGENOUS MEDICINAL PLANTS FOR ANTIOXIDANT AND PHYTOCHEMICAL PROPERTIES**

Sindhu Vissarapu
Department of Pharmacognosy, A.S.N. Pharmacy College, Tenali, Andhra Pradesh, 522201
sindhuvissarapu22@gmail.com

Herbal medicines have been traditionally used for centuries in India due to their therapeutic potential and minimal side effects. Combining multiple medicinal plants in a single formulation may enhance their pharmacological activity. This study was designed to evaluate the phytochemical profile and antioxidant properties of a polyherbal formulation. The formulation was prepared using extracts of Ocimum sanctum (Tulsi), Withania somnifera (Ashwagandha), and Curcuma longa (Turmeric). Preliminary phytochemical screening was performed to identify the presence of secondary metabolites. Antioxidant activity was assessed using DPPH and ABTS free radical scavenging assays. Phytochemical analysis revealed the presence of alkaloids, flavonoids, phenolics, tannins, and terpenoids in the formulation. Both DPPH and ABTS assays demonstrated significant free radical scavenging activity, suggesting strong antioxidant potential of the herbal mixture. The combined formulation showed greater activity compared to individual extracts reported in literature. The study highlights that the synergistic combination of Tulsi, Ashwagandha, and Turmeric enhances antioxidant activity, supporting their traditional use in healthcare. Integration of phytochemical screening with antioxidant assays provides scientific validation for indigenous herbal formulations and their potential therapeutic benefits.

**ANTIOXIDANT AND ANTI-TUMOUR ACTIVITIES OF VARIOUS EXTRACTS OF SPECIES OF THE APOCYNACEAE FAMILY**

Shilpee, K Sreedhara Ranganath Pai
Department of Pharmacology, Manipal College of Pharmaceutical Sciences, Manipal Academy of Higher Education, Manipal-576104, Karnataka, INDIA.
ksrpai@gmail.com

The prevalence of cancer is on the rise globally. Thus, there is a need for newer, effective agents to treat cancer. Plants constitute the major source of anticancer principles and have been in practice since ancient times. There is a great need to discover the therapeutic potential of medicinal plants as a number of species yet remain unexplored. The present study aims to identify the antioxidant and anti-tumor potential of various extracts of Wrightia tinctoria. Proven anticancer activity of the species of Apocynaceae family and documented evidence of its usage in ayurvedic medicine provided us an insight to explore the activity of this plant. The bark of Wrightia tinctoria was collected, dried and powdered. An ethanolic extract was prepared, subjected to successive extraction with petroleum ether, chloroform and acetone. An aqueous extract was also prepared. All extracts were assessed for antioxidant activity by in vitro and ex vivo assays. The scavenging of DPPH, ABTS and hydroxyl radicals was assessed, alkaline DMSO method was used to assess scavenging of superoxide radicals. The extracts were also studied for their ability to inhibit ferrous sulphate stimulated lipid peroxidation. For in vivo antitumor activity, the Ehrlich's Ascitic Carcinoma model in mice was employed wherein 2.5x106 cells/ml of tumor suspension was injected intraperitoneally and activity of the extracts was compared against standard cisplatin at 3.5mg/kg i.p. All haematological parameters and levels of endogenous antioxidant enzymes were assayed using the liver homogenate. The extracts of Wrightia tinctoria were found to possess satisfactory antioxidant property. They reversed the cancer associated haematological changes in EAC mice. The antitumor activity was confirmed by the Ehrlich's Ascitic Carcinoma model. The antioxidant potential and antitumor activity of Wrightia tinctoria has been demonstrated. Further investigation to explore the anti cancer principles of the medicinal plant is essential.

**HERBAL EXTRACT LOADED PYTOSOMES FOR TREATING DENGUE: FORMULATION AND EVALUATION**

Medapati Saritha
Department of Pharmaceutics, Vignan Institute of Pharmaceutical Technology, Visakhapatnam, Andhra Pradesh, India
chsaritha1975@gmail.com

In the present study phytosomes were prepared from Carica papaya leaf extract by solvent evaporation method .Phytosomes are novel vesicular drug delivery systems which are used as carriers of herbal extracts that are enveloped and bound by lipids. The traditional medicine to treat dengue fever in papaya leaf juice as it increases platelet count.The phytosomes prepared in the present study were found to be spherical in shape with rough surface having a particle size of 179nm which is within the limit .The zeta potential was found to be -41.4mv. the phytosomal preparation showed maximum drug release than from the pure leaf extract thus it can be concluded that carica papaya phytosomes can be benefial and effective in the treatment of dengue fever due to increased release.

**Keywords:** Phytosomes, dengue, Carica papaya

**PT-389**

**NEUROPROTECTIVE HERBS FOR THE MANAGEMENT OF ALZHEIMER'S DISEASE ASAVARI A. RANGARI, PRANALI SHASTRAKAR**

Department of Pharmaceutical Science, Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education, (Deemed to be University), Sawangi (Meghe), Wardha 442001 (MS), India

Alzheimer's disease (AD) is a chronic neurodegenerative disease characterized by cognitive impairment, memory loss, and behavioral changes, with its primary etiology linked to amyloid-β deposition, tau hyperphosphorylation, oxidative stress, and neuroinflammation. Pharmacological treatments presently can provide only symptomatic improvement, and this has stimulated the investigation of neuroprotective natural products as adjuvant treatments. A variety of herbs and phytochemicals possess potential in reducing AD pathology. Withania somnifera (Ashwagandha) activates its active compound withaferin A, increasing synaptic function, lowering oxidative stress, and enhancing neuronal regeneration. Curcumin from Curcuma longa has strong anti-inflammatory and antioxidant properties, prevents amyloid aggregation, and modulates tau pathology. Resveratrol, a grape polyphenol, stimulates sirtuin-1 pathways, reduces oxidative stress, and enhances mitochondrial function. Sulforaphane in cruciferous vegetables induces phase II detoxifying enzymes, lowers neuroinflammation, and enhances neuronal survival. Epigallocatechin gallate (EGCG) from green tea suppresses amyloid fibril formation, is neuroprotective against excitotoxicity, and increases synaptic plasticity. N-acetylcysteine (NAC), a glutathione precursor, restores redox homeostasis, prevents mitochondrial failure, and minimizes neuroinflammatory reactions. Omega-3 fatty acids, especially docosahexaenoic acid (DHA), are essential to preserve neuronal membrane integrity, decrease amyloid load, and facilitate synaptic signaling. Together, these phytoconstituents work through multifaceted mechanisms such as antioxidant defense, anti-amyloidogenic actions, modulation of neurotransmission, and stimulation of neurogenesis. While preclinical and clinical trials exhibit promising results, issues persist regarding bioavailability, optimization of dosage, and clinical validation at the large scale. Standardized formulation and combinational approaches need to be stressed in future research. Neuroprotective herbs and phytoconstituents thus form a good adjunct in the therapy of Alzheimer's disease.

**Keywords:** Alzheimer's disease, Neuroprotection, Herbal medicine, Phytochemicals, Ashwagandha, Withaferin A, Curcumin, Resveratrol, Sulforaphane, EGCG, N-acetylcysteine, Omega-3 fatty acids

**DEVELOPMENT OF POLYHERBAL CANDY FORMULATION FOR DYSMENORRHEA**

Jannat Moreshwar Diwate
School of Pharmacy,
Swami Ramanand Teerth Marathwada University, Nanded
jannatdiwate@gmail.com

Dysmenorrhea is one of the most common gynecological disorders, presenting with cyclic pelvic pain and systemic symptoms that impair daily activities in women of reproductive age. Conventional therapies such as non-steroidal anti-inflammatory drugs (NSAIDs) are effective but often associated with adverse effects during long-term administration. In this context, herbal formulations are gaining attention as safer alternatives. The present study focuses on the development of a polyherbal candy formulation utilizing Zingiber officinale (ginger), Beta vulgaris (beetroot), Emblica officinalis (amla), Foeniculum vulgare (fennel), and Ziziphus mauritiana (Indian jujube). Each ingredient was selected based on its reported pharmacological activities relevant to dysmenorrhea: Ginger – analgesic, anti-inflammatory, and antispasmodic properties. Beetroot – hematinic effect and improved nitric oxide bioavailability.Amla – antioxidant and immunomodulatory actions reducing oxidative stress. Fennel – phytoestrogenic, antispasmodic, and carminative activities. The candy-based delivery system was chosen for its palatability, patient acceptability, and potential to enhance compliance compared with traditional herbal preparations. This formulation is anticipated to exert synergistic action in relieving menstrual pain, correcting anemia-related fatigue, and improving quality of life. Further preclinical and clinical investigations are warranted to evaluate pharmacological efficacy, safety, and stability of the formulation.

**PT-391**

**PHYSICOCHEMICAL PARAMETERS AND ANTIFUNGAL ACTIVITY OF ETHYL ACETATE EXTRACT OF WHOLE PLANT MOMORDICA CYMBALARIA.LINN COLLECTED FROM SURROUNDING OF BIDAR (KARNATAKA)**

Shaheen Fatima ifrah, Zeba Tabassum, Mallikarjun Malipatil

Antifungal activity of whole plant of Momordica Cymbalaria Linn has been studied by agar cup plate diffusion method. Significant antifungal activity was shown by Ethyl acetate extract and plant belongs to family Cucurbitaceae. The present study mainly concentrates on evaluation of morphological characteristics, physico-chemical parameters of whole plant and preliminary phytochemical characterization of the Ethyl Acetate extract of whole plant of Momordica Cymbalaria Linn was performed.

**Keywords:** Momordica cymbalaria Linn, ethyl acetate extract, physic-chemical parameters, antifungal activity, candida albicans.

**PT-392**

**HERBAL INNOVATION IN DERMATOLOGY: HORSE GRAM-BASED TRANSDERMAL PATCHES FOR ACNE THERAPY**

Aakifah Zaib. I, Sumaiya Yasmeen B.I, Snigdha S Babu

Acne vulgaris is among the most common skin disorders, often leading to physical scarring and emotional distress. Conventional therapies such as antibiotics and retinoid, though effective, are limited by side effects, high cost, and antibiotic resistance. This study aimed to develop and evaluate herbal transdermal patches using horse gram (Macrotyloma uniflorum), a legume valued for its antibacterial, antioxidant, and anti-inflammatory activities. Methanolic extracts of horse gram seeds were prepared using Soxhlet extraction and incorporated into patches formulated by solvent casting method with methanol as solvent, HPMC and PVP K-30 as polymers, glycerol as plasticizer and PEG-400 as a permeation enhancer. The prepared patches were evaluated for physicochemical properties, in-vitro release and anti-bacterial activity. Results showed desirable uniformity, weight variation and surface pH, along with effective drug release and skin permeation. Notably, a clear zone of inhibition against Staphylococcus aureus was observed for the extract, powder, and formulated patches, confirming their antimicrobial potential against acne. These results suggest that horse gram–based patches represent a safe, eco-friendly, and cost-effective approach to acne management by combining traditional herbal therapy with modern transdermal drug delivery.

**Keywords:** Horse gram, Herbal patches, Acne vulgaris, Antibacterial activity.

**PT-393**

**BIOLOGICAL ACTIVITIES OF BUTEA MONOSPERMA LEAF**

Shivaprasad V S

To investigate antioxidant and antimicrobial activities of Butea monosperma leaf (L). The 17% of rural population were depending on traditional based components and were using for various treatment of disorders. In present scenario the synthetic analogues lead abundant, drastic tragedies exhibits who are consuming the analogues, especially chemotherapeutic analogues over elicits more severe adverse effects rather than clinical value. The developed countries like Japan so far not depending on allopathic medicine because of genomic alterations and leads defect on immunity. By considering all these facts we decided that, bio analogues are excellent, safe, economically cheap and comfortable for human kinds hence the present study is focused on anti-oxidant and anti-microbial activity Butea monosperma. The rise of drug-resistant pathogens poses a major challenge in treating infectious diseases, highlighting the need for alternative therapies. Plant extracts, long used in traditional medicine, are valuable sources of antimicrobial and antioxidant compounds. Butea monosperma, widely recognized for medicinal properties, was investigated in this study. The ethanolic leaf extract was evaluated for antimicrobial activity and in vitro antioxidant potential. Antioxidants are vital in protecting against reactive oxygen species (ROS)-induced damage linked to cancer, aging, and chronic diseases. Since synthetic antioxidants like BHA and BHT raise safety concerns, natural alternatives such as Butea monosperma offer promising therapeutic and food preservation applications.

**Keywords:** Butea monosperma leaf (L), Antioxidant, DPPH, Antimicrobial

**PT-394**

**PHARMACOGNOSY AND PHYTOCHEMISTRY OF LEAVES OF TEPHROSIA UNIFLORA**

SAHANA HC

The need for and significance of pharmacognostic analysis of leaves extracts of Tephrosia uniflora are discussed in the current research. The various extracts like petroleum ether, chloroform, alcohol,and aqueous leaves extracts of Tephrosia uniflora was prepaared and studied the Organoleptic characteristics, macroscopic, powder microscopic, physicochemical analysis , phytochemical analysis, and fluorescence analysis of Tephrosia uniflora .The physicochemical evaluation shows, loss on drying was found to be 0.14% w/w,total ash value 6.94% w/w, acid insoluble ash value 3.16%w/w and extractive value of petroleum ether extract shows 3.2% w/w,chloroform extrcats was found to be 3.9% w/w,alcohol extracts was found to be 4%w/w,aqueous extracts was found to be 4.8%w/w.Phytochemical analysis shows the presence of carbohydrates, phenols,flavonoids,alkaloids, and tannins. These are just a few of the parameters that need to be evaluated for a pharmacognostic study of Tephrosia uniflora.

**Keywords:** Tephrosia uniflora, pharmacognostic study, physicochemical analysis,phytochemical study, and fluorescence analysis.

**FORMULATION AND EVALUATION OF HERBAL GEL CONTAINING ALOE VERA FOR ANTI-INFLAMMATORY ACTIVITY**

Chaitanya Jamdade

The present study focuses on the formulation and evaluation of a herbal topical gel containing Aloe vera for its potential anti-inflammatory activity. Aloe vera, a well-known medicinal plant, possesses a wide range of pharmacological effects, including anti-inflammatory, antioxidant, and wound-healing properties. In this study, a gel was formulated using carbopol 940 as the gelling agent, glycerin as a humectant, and appropriate preservatives. The gel was evaluated for key physicochemical parameters such as pH, viscosity, spreadability, and homogeneity. The results also demonstrated that the formulation was stable, non-irritant, and had acceptable organoleptic properties. This study suggests that Aloe vera-based herbal gels can serve as a safe and effective alternative to synthetic topical anti-inflammatory agents with minimal side effects.

**Keywords:** Herbal formulation, Aloe vera, anti-inflammatory, topical gel, evaluation

**ANTI-ACNE HERBAL FACE CREAM – A NATURAL APPROACH TO CLEARER SKIN**

Kazi aadil

Acne vulgaris is a prevalent dermatological condition affecting individuals of all age groups, particularly adolescents and young adults. The excessive use of synthetic drugs such as benzoyl peroxide and retinoids often leads to side effects like skin irritation, dryness, and resistance development. This has spurred the demand for safer, herbal alternatives with minimal side effects and long-term benefits.To formulate and evaluate a topical anti-acne herbal face cream using scientifically validated plant extracts known for their antimicrobial, anti-inflammatory, and sebostatic properties. The cream was formulated using herbal ingredients including Azadirachta indica (Neem), Ocimum sanctum (Tulsi), Curcuma longa (Turmeric), and Aloe vera gel as the base. These herbs were selected for their proven efficacy against acne-causing bacteria (Propionibacterium acnes), antioxidant activity, and soothing effects. The formulation was prepared using the oil-in-water emulsion method. Evaluation parameters included pH, viscosity, spreadability, stability, antimicrobial activity, and skin irritation studies.The herbal cream exhibited a pH range of 5.5–6.0, making it compatible with skin. The formulation showed good spreadability, excellent stability under accelerated conditions, and significant antibacterial activity against P. acnes and Staphylococcus aureus. No signs of irritation were observed in patch testing on human volunteers.

**Keywords:** Herbal formulation, Anti-acne cream, Neem, Tulsi, Aloe vera, Natural skincare, Acne vulgar

**PT-397**

**STANDARDIZATION OF HERBAL MEDICINE**

SANIYA SHAIKH & RAJAT SAYYED
shaikhsanlya8694@gmail.com

In recent years, there has been a significant global surge in the demand for natural and plant-based remedies due to their perceived safety, affordability, and cultural acceptance. However, one of the major challenges in integrating herbal medicine into mainstream healthcare is the lack of proper standardization. Standardization ensures consistent quality, efficacy, and safety of herbal products across different production batches. Unlike synthetic drugs that contain a single active compound, herbal formulations consist of numerous bioactive constituents, making them inherently complex and variable. This complexity is further influenced by factors such as plant species, geographical location, harvesting time, processing methods, and storage conditions. To address these challenges, advanced analytical techniques such as High-Performance Liquid Chromatography (HPLC), Gas Chromatography (GC), and Mass Spectrometry (MS) are used for identifying and quantifying active ingredients. Additionally, quality-control protocols include screening for microbial contamination, heavy metals, pesticides, and other adulterants. Standardization also involves developing proper labeling, dosage guidelines, and usage instructions to ensure consumer safety and promote rational use. Regulatory agencies like the World Health Organization (WHO) and national drug authorities play a vital role in establishing and enforcing standards and protocols. Overall, standardization enhances the credibility and safety of herbal medicines and supports their scientific evaluation and acceptance in evidence-based medical systems.

**Keywords**: Herbal medicine, Standardization, Quality control, Bioactive compounds, HPLC, GC, MS, Traditional medicine, Regulatory frameworks, WHO guidelines, Dosage, Contamination, Natural products.

**PLANT-DERIVED ANTIMICROBIALS: A SUSTAINABLE ALTERNATIVE**

Safa Salahuddin Fakji

The global escalation of antimicrobial resistance (AMR) has become a pressing concern in public health, necessitating the exploration of alternative and sustainable antimicrobial strategies. Plant-derived antimicrobials (PDAs) have emerged as promising candidates due to their structural diversity, biodegradability, and bioactivity. These naturally occurring compounds—such as alkaloids, flavonoids, terpenoids, saponins, and tannins—possess potent antibacterial, antifungal, and antiviral properties. They act through various mechanisms, including disruption of microbial membranes, inhibition of enzyme activity, and interference with nucleic acid synthesis. India, with its vast biodiversity and deep-rooted tradition in herbal medicine, offers a rich source of medicinal plants that can be harnessed for antimicrobial drug development. Plants such as Azadirachta indica (Neem), Ocimum sanctum (Tulsi), Curcuma longa (Turmeric), and Allium sativum (Garlic) have demonstrated broad-spectrum efficacy against multidrug-resistant pathogens. Moreover, advancements in extraction techniques, phytochemical analysis, and nanotechnology are enhancing the efficacy, stability, and delivery of these compounds. This underscores the potential of integrating ethnobotanical knowledge with modern pharmaceutical sciences to develop plant-based antimicrobials that are both effective and environmentally sustainable. PDAs not only reduce reliance on synthetic antibiotics but also align with global initiatives promoting green chemistry and eco-friendly therapeutics. Continued research, standardization, and clinical validation are crucial to transition these natural compounds into mainstream medical applications and address the growing AMR crisis.

**Keywords:** Plant-derived antimicrobials, phytochemicals, antimicrobial resistance (AMR), medicinal plants, ethnobotany, herbal medicine, green therapeutics, sustainable pharmaceuticals, Neem, Tulsi, Curcumin, natural antibiotics, Indian traditional medicine.

**NATURAL SUNSCREEN**

Aliya ansari, Swapnil dounde

Excessive exposure to ultraviolet (UV) radiation from the sun can lead to various skin problem, including sunburn, premature aging and increased risk of skin cancer. While synthetic sunscreens are widely available, they often contain chemical ingredients that may cause skin irritation or environmental harm. As a result, the demand for natural, plant- based sunscreens is increasing due to their safety, biocompatibility, and eco-friendliness.This study focuses on the formulation and evaluation of a herbal ingredients such as Aloe vera, Turmeric (Curcuma longa), Green tea extract (camellia sinensis), and Coconut oil, which are known for their UV-protective, antioxidant, and skin-soothing properties. The formulation was tested for Sun Protection Factor (SPF) value using spectrophotometric analysis, along with physical stability, spreadability, and skin compatibility. The results revealed that the natural sunscreen exhibited significant SPF value and was well-tolerated on the skin indicating its effectiveness as a safe and eco-friendly alternative to commercial sunscreens.

**Keywords:** Natural sunscreen, UV protection, Herbal formulation, SPF, Skincare

**FORMULATION AND EVALUATION OF HERBAL HAND SANITIZER**

AMIR HAMZA KARIM SHAIKH

As a concern about the potential side effects and environmental impact of synthetic chemicals in hand sanitizers increases, there is a growing demand for natural, herbal alternatives. This research focuses on the formulation and evaluation of a novel herbal hand sanitizer, aiming to provide an effective yet gentle solution for hand hygiene. Herbal extracts are known for their rich abundance of bioactive compounds such as flavonoids, tannins, and essential oils, which possess significant antimicrobial and antiseptic properties. The extract for this formulation is typically made by water or hydro alcohol solutions, ensuring the retention of these beneficial compounds. The research aims to develop a hand sanitizer that effectively reduces microbial load while being mild on the skin, minimizing dryness and irritation often associated with conventional sanitizers. The herbal sanitizer acts as a natural agent providing effective disinfection, addressing the rising need for sustainable and natural hygiene solutions.

**Keywords**: Herbal Extracts, natural sanitizer, antimicrobial, hand hygiene, skin-friendly

**HERBAL FORMULATIONS IN MODERN MEDICINE**

Aaliya Badgujar, Rajat Sayyed

Herbal formulations have been an integral part of traditional medicine for centuries, but today they are gaining renewed attention due to their safety, minimal side effects, and therapeutic effectiveness. As a second-

ISBN: 978-81-980623-8-3

year B.Pharmacy student, I have always been fascinated by how Nature-derived compounds can offer powerful remedies for a wide range of diseases. The growing demand for natural and organic healthcare products has led to the integration ofherbal ingredients in modern pharmaceutical formulations such as creams, gels, lotions, syrups,and even capsules. Extracts from plants like neem, tulsi, aloe vera, turmeric, and ashwagandhaare now commonly used in products designed to treat conditions ranging from skin infections to digestive disorders and stress management.In our academic curriculum and lab sessions, I have gained hands-on experience in preparing and analyzing such herbal products. Through these formulations, I've learned about the significance of standardization, extraction techniques, stability testing, and ensuring patient compliance. The combination of traditional wisdom with modern scientific approaches makes herbal formulations a promising area for future research and innovation. I aspire to further explore this field and contribute to the development of safe, effective, and affordable herbal-based therapeutics that can serve global health needs while preserving natural resources.

**AYURVEDIC MEDICINE FOR SKIN TREATMENT**

SWAPNIL DOUNDE, B. MOUNIKA YADAV

Ayurveda, one of the world's oldest holistic healing systems, originated in India over 5,000 years ago. Based on the principle of balance between the body, mind, and spirit, Ayurveda offers a natural and deeply rooted approach to treating various health conditions—including skin-related disorders. In contrast to modern dermatological treatments that often focus on symptom suppression using synthetic chemicals, Ayurvedic skin care emphasizes long-term healing by addressing the root causes of imbalances in the body. According to Ayurvedic philosophy, the skin is a mirror that reflects te internal state of the body. Issues like acne, eczema, psoriasis, pigmentation, dryness, premature aging, and rashes are often manifestations of an imbalance in the three doshas: Vata (air and space), Pitta (fire and water), and Kapha (earth and water). These imbalances may be caused by poor diet, lifestyle habits, hormonal shifts, emotional stress, or seasonal changes. The Ayurvedic approach to skin treatment is multidimensional. It includes internal detoxification, herbal formulations, external therapies, dietary regulations, and mental wellness practices. One of the core concepts is to purify the blood and digestive system (Agni) since many skin conditions stem from internal toxins (Ama). The traditional Panchakarma therapy is often used for detoxification. It involves a series of cleansing procedures that eliminate toxins from the body, leading to better skin clarity and overall health. A wide range of natural herbs and plant-based ingredients form the backbone of Ayurvedic skin treatments. Neem is widely known for its antibacterial and antifungal properties; Turmeric is a powerful anti-inflammatory and antioxidant agent; Aloe vera is used for its soothing and healing effects; Manjistha acts as a blood purifier and helps manage pigmentation and acne; Sandalwood cools the skin and adds radiance; and Tulsi (Holy Basil) aids in detoxifying and cleansing. These ingredients are prepared into various forms such as herbal oils, powders, pastes, decoctions, and creams depending on individual dosha analysis. External treatments like Abhyanga (herbal oil massage), Ubtan (herbal scrubs), lepas (face packs), and steam therapy help improve circulation, remove toxins, nourish the skin, and promote a healthy glow. These are often combined with dietary guidelines that recommend fresh fruits, green leafy vegetables, whole grains, warm water, and herbal teas to support healthy skin from the inside. Moreover, Ayurveda strongly emphasizes mental and emotional balance as a part of skin health. Practices like yoga, pranayama, and meditation help reduce stress levels which are often linked to skin breakouts and inflammation. One of the greatest strengths of Ayurvedic medicine is that it is natural, gentle, sustainable, and largely free from side effects. As awareness grows around chemical-free skincare and holistic wellness, Ayurvedic practices are gaining renewed importance both in India and globally.

**PT-403**

**ALOE VERA-BASED TOPICAL FORMULATION FOR THE MANAGEMENT OF SUNBURN**

Jannat Shaikh, Rajat Sayyed

Sunburn is a common inflammatory skin response resulting from overexposure to ultraviolet (UV) radiation. Conventional treatments often rely on corticosteroids and synthetic cooling agents, which may cause skin sensitivity and long-term side effects. Aloe vera, a well-known medicinal plant, is rich in vitamins, polysaccharides, and antioxidants, making it an excellent natural agent for soothing and healing sun-damaged skin.To formulate and evaluate a topical Aloe vera-based gel for the effective management of sunburn, aiming to provide natural skin relief with minimal irritation and optimal healing potential.Freshly extracted Aloe vera gel was used as the primary active ingredient, combined with natural cooling agents like menthol and rose water, along with gelling agents such as Carbopol 940. The formulation was prepared using the cold homogenization method. The gel was evaluated for pH, viscosity, spreadability, skin irritation, stability, and in-vitro antioxidant activity (DPPH assay).The Aloe vera-based gel showed a pH of 5.6, ideal for skin application. It exhibited smooth texture, excellent spreadability, and no signs of irritation in patch tests. The formulation remained physically and chemically stable under accelerated storage conditions. The DPPH assay confirmed the presence of strong antioxidant activity, supporting the gel's potential to neutralize UV-induced free radicals. The formulated Aloe vera-based gel provides a safe, soothing, and effective treatment for sunburn, combining natural healing properties with antioxidant protection. This herbal approach can serve as a gentle and eco-friendly alternative to synthetic topical agents for sunburn relief.

**Keywords:** Aloe vera, Sunburn, Herbal gel, Topical formulation, Natural skincare, UV protection, Antioxidant.

**PT-404**

**FORMULATION OF POLYHERBAL HAND SANITIZER**

Elaf Juber Shaikh, Rajat Sayyed
MCE'S PAIU Allana college of pharmacy pune 411001

The global rise in infectious diseases has heightened the demand for effective and skin-friendly hand hygiene products. This study aims to formulate and evaluate a polyherbal hand sanitizer using extracts of Azadirachta indica (Neem), Ocimum sanctum (Tulsi), and Citrus limon (Lemon), known for their potent antimicrobial and antioxidant properties. Ethanolic extracts were incorporated into a gel base free from synthetic alcohol. The formulation was assessed for pH, viscosity, spreadability, skin compatibility, and antimicrobial activity against Escherichia coli and Staphylococcus aureus. The results demonstrated notable antimicrobial efficacy, comparable to standard sanitizers, with excellent skin tolerability and no reported irritations. The study supports the use of polyherbal formulations as a natural, effective, and safer alternative to conventional hand sanitizers, especially in healthcare and community settings. This approach not only promotes herbal medicine but also supports sustainability and reduced chemical exposure.

**FORMULATION AND DEVELOPMENT (F&D) OF AN AYURVEDIC FACEWASH: A POLYHERBAL SEMI-SOLID DOSAGE (SSD) APPROACH WITH QUALITY CONTROL (QC) EVALUATION**

Saad Jasnaik, Swapnil Dounde
ALLANA COLLEGE OF PHARMACY, AZAMCAMPUS, CAMP, PUNE:411001

The formulation of an Ayurvedic facewash integrates traditional herbal knowledge with modern pharmaceutics to develop a stable, safe, and effective topical preparation. The facewash was designed as a semi-solid dosage form (SSD), intended for routine facial cleansing with therapeutic and cosmetic benefits. Key active pharmaceutical ingredients (APIs) included Azadirachta indica (Neem), Curcuma longa (Turmeric), and Ocimum sanctum (Tulsi), selected for their antimicrobial, anti-inflammatory, and antioxidant properties. The excipients used comprised a suitable surfactant base (e.g., SLS – Sodium Lauryl Sulfate), humectants like Glycerin (GLY), thickeners such as Carbopol 940 (CBP), and preservatives (e.g., MP – Methylparaben, PP – Propylparaben) to ensure microbiological stability. The formulation was developed using the QS (quantum satis) method to achieve desired viscosity, pH, and sensorial attributes. The final pH was adjusted to match skin compatibility (pH 5.5–6.5) using Triethanolamine (TEA). The F&D (formulation and development) process included mixing, homogenization, and quality control (QC) checks for parameters like spreadability, consistency, microbial load, and stability under accelerated conditions (ICH guidelines). This study demonstrates that

**AYURVEDIC BHASMA PARIKSHA REVISITED: CORRELATING TRADITIONAL PARAMETERS WITH PHYSICOCHEMICAL AND SPECTROSCOPIC DATA OF YASHADA BHASMA**

Toshika S. Nikam, Rahul Shivarkar, Hemant Alhat,
Shashikant Dhole, Nilesh Babre
Department of Pharmacognosy, PES Modern College of Pharmacy (For ladies), Moshi, Savitribai Phule University, Pune- 412105.
Department of Pharmacology, Oriental College of Pharmacy, Sanpada, Mumbai- 400705,
rahulshivarkar19@gmail.com

Yashada Bhasma, an Ayurvedic zinc-based herbo-metallic formulation, is traditionally used to treat diabetes, skin conditions, respiratory issues, and wounds. Despite its significance, standardisation and quality assessment of commercial products remain challenging. This study compares two Yashada Bhasma products from Dhootpapeshwar and Bharadwaj Pharmaceuticals, combining traditional Ayurvedic methods with modern analysis. Classical tests like Varitaratva, Rekhapurnata, Nirdhuma, and Apunarbhava assessed traditional quality standards. Additionally, physicochemical tests (loss on drying, ash values, pH) and advanced techniques such as SEM, FTIR, AAS, Zeta Potential, and DLS were used. Results showed that both samples met basic Ayurvedic criteria, but the Bharadwaj formulation demonstrated better compliance- finer particles (100–300 nm), greater stability (Zeta Potential: –34.5 mV), clearer ZnO FTIR spectra, and fewer impurities in ash analysis. This research confirms traditional tests with modern science and emphasises the need for integrated quality control. It highlights the value of combining disciplines to improve the credibility, safety, and global acceptance of Ayurvedic metallic formulations.

**NEEM EXTRACT VS SALICYLIC ACID: EXPLORING ANTIACNE EFFICACY IN FACIAL SERUM FORMULATIONS**

ANU S

Serums are emerging topical drug delivery systems that target the epidermal layer of the skin.This study focuses on formulating and evaluating natural and synthetic anti-acne serumsusing neem (Azadirachta indica) and salicylic acid as active ingredients, respectively.Neem, known for its antimicrobial and anti-inflammatory properties, has long been used in skincare for treating acne and soothing irritation.Salicylic acid, a beta-hydroxy acid (BHA), is effective in exfoliating skin, unclogging pores,and reducing acne. Niacinamide complements this by minimizing inflammation, regulating sebum, and enhancing skin barrier function. Neem extract was obtained using ethanol viaSoxhlet extraction. The natural serum was formulated with neem, Tween 60, Span 80,honey, and aloe vera gel, while the synthetic serum incorporated salicylic acid, propylene glycol, and niacinamide. Both formulations were optimized and evaluated for pH, viscosity, spreadability, clarity, antimicrobial activity, and in vitro drug release.

**PT-409**

**INNOVATIVE TRANSDERMAL HERBAL ACTIVES; A NOVEL STRATEGY IN PHYTOPHARMACEUTICAL**

VAIBHAVI ASHOK KALAMBE

Transdermal drug delivery systems (TDDS) have emerged as a promising alternative to oral drug administration due to their ability to bypass first-pass metabolism, maintain steady drug levels, and improve patient compliance. In this study, a transdermal herbal patch was formulated using selected medicinal plant extracts known for their anti-inflammatory and analgesic properties. The herbal extract, derived from Curcuma longa (turmeric) and Boswellia serrata, was incorporated into a matrix-type patch using natural polymers such as chitosan and gelatin as film-forming agents.The patches were prepared by solvent casting method and evaluated for various physicochemical parameters including thickness, weight uniformity, folding endurance, surface pH, moisture content, and drug content uniformity. In vitro drug release studies were carried out using Franz diffusion cells, and the results indicated a sustained release profile over 24 hours. Skin permeation studies confirmed adequate transdermal flux, and the patches exhibited satisfactory mechanical strength and flexibility.The study concludes that herbal transdermal patches can be a safe, non-invasive, and effective system for the delivery of phytoconstituents, especially for chronic conditions like arthritis, back pain, or muscle inflammation. Further in vivo studies and clinical trials are recommended to validate therapeutic efficacy and safety.

**IN VITRO ANTI-INFLAMMATORY EVALUATION OF ETHANOLIC ROOT EXTRACT OF ALKANNA TINCTORIA**

A.Ramkumar, H.Rajamathanky, V.Ganesan.
Pannai college of pharmacy,
Afflicated to the Tamilnadu Dr.MGR Medical University,
Chennai, Tamilnadu-600032.
ramkumar2004.apd@gmail.com

Alkanna tinctoria, a member of the Boraginaceae family, has been traditionally valued for its medicinal properties. The present study evaluated the in vitro anti-inflammatory activity of its ethanolic root extract. The roots were collected, authenticated, shade-dried, and ground to a coarse powder. The powdered roots were sieved and stored in airtight containers. Ethanolic extraction was performed using a Soxhlet apparatus, where ethanol was continuously circulated through the root powder, and the solvent was evaporated to yield the crude extract. Qualitative phytochemical screening confirmed the presence of tannins, quinones, and flavonoids, known contributors to anti-inflammatory effects. The extract was assessed using heat-induced hemolysis and protein denaturation assays. It showed significant, dose-dependent inhibition of hemolysis (up to 64.56% at 1000 µg/mL) and protein denaturation (up to 70.8% at 1000 µg/mL) compared to Diclofenac sodium as the standard, though activity was slightly lower than the reference drug. The IC50 values were 398.9 µg/mL for hemolysis and 269.6 µg/mL for protein denaturation.These results support the use of Alkanna tinctoria root in managing inflammation, presenting an effective and less toxic alternative to conventional nonsteroidal anti-inflammatory drugs.

## EXPLORING THE ROLE OF BERGINIA CILIATA RHIZOME IN PROMOTING TISSUE REGENERATION AND WOUND HEALING ACTIVITY

P. Abinayasri, T.Karthiyayini, V.Ganesan
Department of Pharmacognosy, Pannai college of Pharmacy,
Dindigul, Tamilnadu-624005
abinayasri522002@gmail.com

Wound healing is a complex biological process that involves inflammation, proliferation and remodeling phases, ultimately restoring the integrity and function of damaged tissue. Despite advances in modern medicine, the management of chronic and infected wounds remains a significant clinical challenge. This is has renewed scientific interest in medicinal plants, many of which are known to accelerate tissue repair through their antioxidant, antimicrobial, and anti-inflammatory properties. Berginia ciliata, belonging to the family saxifragaceae, is a perennial herb distrubuted in the Himalayan regions of India, Nepal, Bhutan, and china. Commonly known as “pashanbheda”in ayurveda, the plants rhizome has been traditionally used for the treatment of kidney stones, urinary disorders, cough, fever, and various skin ailments. Phytochemical investigations of Berginia ciliata rhizomes have revealed the presence of diverse bioactive compounds, including bergenin, gallic acid, catechin, tannins and flavanoids, which contribute to its pharmacological potential. The present study investigates the wound healing potential of Berginia ciliata rhizome extract using in-vitro and in-vivo models. Topical formulations prepared with hydroalcoholic rhizome extract were evaluated for wound contraction, epithelialization time, collagen content and histopathological changes in excision and incision wound models. It possesses wound healing activity and may serve as a natural therapeutic agent for the development of herbal wound–care formulations.

**Keywords:** Berginia ciliata, rhizome extract, wound healing, collagen synthesis, tissue regeneration.

## DESIGN AND EVALUATION OF HERBAL NAIL LACQUER- A NATURAL ANTIFUNGAL APPROACH AGAINST ONYCHOMYCOSIS

Aishwarya Hiremath
Department of Pharmaceutics, Bapuji Pharmacy College,
Davanagere, Karnataka, India- 577004.
aishwaryashiremath1990@gmail.com

Onychomycosis also referred to as dermatophytic onychomycosis or Tinea unguium, is a fungal nail infection primarily caused by dermatophytes (like Trichophyton rubrum), yeasts (like Candida albicans), and non-dermatophytic moulds. In this study, an effort was made to develop a herbal medicated antifungal nail lacquer using Caesalpinia bonducella seeds. The objective was to enhance clinical efficacy while improving patient compliance. Authenticated C. bonducella seeds were extracted and formulated into nail lacquers using suitable excipients, including film-forming agents, plasticizers, solvents, penetration enhancers, and resins. The prepared formulations were evaluated for various physicochemical and biological parameters such as smoothness, glossiness, non-volatile content, drug content, adhesion, diffusion, and antifungal activity (zone of inhibition). FTIR analysis confirmed drug–excipient compatibility by retaining characteristic peaks. Among the formulations, F5 was identified as the optimized batch and subjected to accelerated stability testing under ICH guidelines at 37 ± 2 °C for one month. The results showed no significant changes in its initial characteristics, while the formulation maintained excellent antifungal activity. Overall, the developed antifungal nail lacquer demonstrated safety, stability, and effectiveness, suggesting its potential as a novel dosage form for the treatment of dermatophytic nail infections such as onychomycosis. Its use may significantly improve therapeutic outcomes and patient adherence compared to conventional therapies.

**Keywords:** Onychomycosis, Antifungal nail lacquer, Caesalpinia bonducella, Dermatophytes, Diffusion studies.

**PT-413**

## A NOVEL NANO HERBAL ORAL SUSPENSION OF CURCUMA AMADA ROXBURGH FOR TARGETED DIGESTIVE AND HEPATOPROTECTIVE ACTIVITY

V.Alagurani , T.Karthiyayini, V.Ganesan
Department of Pharmacognosy, Pannai College of Pharmacy,
Dindigul, Tamilnadu- 624005, India.

Traditional herbal medicines still play an important role in modern healthcare, but their limited solubility and poor absorption often reduce their effectiveness. The present study aims to develop a new nano herbal oral suspension, using Curcuma amada Roxburgh (Mango Ginger), a valuable herb from the Zingiberaceae family. Curcuma amada is widely used to digestive, and hepatoprotective actions, but scientific formulation work in nano form has not yet been well explored. The Zing Nano suspension was successfully fabricated using a high-shear emulsification technique to produce stable nanoparticles. Comprehensive characterization confirmed a narrow particle size distribution, with an average size consistently below 100 nm, coupled with an optimal zeta potential indicating high stability. Curcuma amada nano-formulation strategy is crucial for increasing the surface area and promoting enhanced dissolution and absorption across the gastrointestinal tract. The therapeutic efficacy was rigorously evaluated using in-vitro assay of chemically-induced liver injury and digestive impairment. In the hepatoprotective study, treatment with Curcuma amada Roxburgh resulted in a significant reduction in elevated liver enzymes and a marked decrease in oxidative stress markers compared to the standard crude extract. The suspension demonstrated superior activity in stimulating digestive enzyme secretion and improving overall gut motility. The findings confirm that the nano-suspension approach effectively overcomes the bioavailability hurdle of Curcuma amada Roxburgh. Zing Nano formulation presents a highly potent and stable delivery system, offering a promising and clinically viable product for managing various digestive disorders and safeguarding liver health.

**Keywords:** Curcuma amada Roxburgh, Nano herbal Suspension, Hepatoprotective, Digestive stimulant.

**PT-414**

## EXPLORING OF TOLBUTAMIDE IN THE TREATMENT OF DIABETES MELLITUS

Ankit Borkar,Lokesh Thote, Jagdish Baheti
Kamla Nehru College of Pharmacy (Rashtrasant Tukadoji Maharaj Nagpur University) Butibori, Nagpur, Maharashtra India-441108
ankitborkar180@gmail.com

Tolbutamide was the earliest and most widely adopted oral sulfonylurea introduced in the 1950s for managing type 2 diabetes mellitus (T2DM). Over the past seventy years, its therapeutic value, safety considerations, and overall position in diabetes treatment have been reassessed as newer medications became available. This review explores the chemical characteristics and pharmacological actions of tolbutamide, its mechanism of action, key historical studies such as the University Group Diabetes Program (UGDP), concerns related to hypoglycaemia and potential cardiovascular effects, as well as its pharmacokinetic behaviour and metabolic pathways. The evolution of its clinical use is also discussed to highlight its relevance in contemporary diabetes management. By integrating both classic and modern literature, the review evaluates tolbutamide’s contribution to current therapeutic practices. Although concerns especially regarding hypoglycaemia and early indications of cardiovascular risk led to declining use and stricter regulatory oversight, the drug served as a foundation for oral antidiabetic therapy. As newer sulfonylureas with improved profiles and alternative drug classes became available, tolbutamide was gradually replaced in many healthcare settings. Despite this decline, its role in shaping the history and development of diabetes pharmacotherapy remains substantial.

**Keywords**: Tolbutamide; Oral Hypoglycemic agents; KATP channels; Cardiovascular risk; Evolution of Antidiabetic therapy; Clinical trials

## HERBAL & NATURAL PRODUCT INTERACTIONS WITH PRESCRIPTION MEDICATIONS

Anshul Karn, Shubham, Shifa Qureshi and Reenu Yadav
Department of Pharmacy,
Prestige Institute of Management and Research, Bhopal,
Madhya Pradesh, India - 462021.

ISBN: 978-81-980623-8-3

anshul.karn2006@gmail.com

The growing use of herbal medicines alongside prescription drugs has raised significant concerns about herb-drug interactions, which can compromise the safety and effectiveness of therapies. Although many herbs are promoted for their health benefits, combining them with conventional medications may lead to adverse effects. For example, herbs such as ginkgo, garlic, and dong quai can increase bleeding risk when taken with anticoagulants like warfarin. St. John's wort, a well-known enzyme inducer, can reduce the efficacy of several drugs, including antidepressants, immune suppressants, and oral contraceptives. Additionally, herbs like ginseng, garlic, and St. John's wort may interfere with anesthetics, potentially causing bleeding, blood pressure fluctuations, or central nervous system complications during surgery. A significant concern is that many patients do not disclose their use of herbal supplements to healthcare providers, increasing the risk of preventable adverse events. Professional bodies, such as the American Society of Anesthesiologists, recommend discontinuing herbal supplements at least one to two weeks before elective procedures. The mechanisms underlying herb-drug interactions vary depending on dosage and individual patient factors and often involve changes in drug metabolism, absorption, or pharmacodynamic effects. In some cases, combining certain herbs with psychiatric medications may even trigger serotonin syndrome. Reducing these risks requires multiple strategies, including improving labeling standards, fostering open communication between patients and healthcare professionals, and providing comprehensive patient education. These initiatives are essential to ensure the safe and effective integration of herbal and conventional therapies, protecting patients from preventable complications while maximizing therapeutic benefits.

**Keywords:** Herbal medicine, herb-drug interaction, pharmacodynamic, pharmacokinetic interactions.

## FORMULATION AND EVALUATION OF POLY HERBAL HEALTH CANDY FOR ANTIOXIDANT AND IMMUNOMODULATORY ACTIVITY

Asha Shirke, Shailendra Salvankar
Department of Pharmaceutics,
Marathwada Mitra Mandal's College of Pharmacy,
Pune-411033 (M.S), India.
shirkeasha1607@gmail.com

The present study aims to develop and evaluate a polyherbal health candy made with medicinal plant extracts known for their antioxidant and immune-boosting properties. The formulation includes Zingiber officinale (ginger), Ocimum sanctum (tulsi), Cinnamomum zeylanicum (cinnamon), Eugenia caryophyllus (clove), Mentha piperita (peppermint), Cymbopogon flexuosus (lemongrass), Piper nigrum (black pepper), and Glycyrrhiza glabra (liquorice). These herbs contains bioactive compounds such as gingerol, eugenol, cinnamic acid, menthol, piperine, and glycyrrhizin, which are known for their health benefits. The herbal extracts were precisely weighed, mixed with sugar syrup, and shaped into solid candies using standard candy-making techniques. The final product was tested for physical and quality aspects, including taste, weight variation, friability, and dissolution studies; all results met acceptable pharmacopeial standards. Preliminary phytochemical screening confirmed the presence of secondary metabolites like tannins, phenols, terpenoids, glycosides, saponins, and volatile oils, which support the product's health effects. The in -vitro antioxidant potential was assessed using the DPPH free radical scavenging test, showing significant radical inhibition and indicating strong antioxidant activity. The study shows that the polyherbal candy offers a new and consumer-friendly way to provide natural antioxidants and compounds that support the immune system. This product presents a promising nutraceutical option that combines traditional herbal knowledge and modern candy-making, creating a convenient way to promote overall health and well-being.

**Keywords:** Herbal candy, Antioxidant, Immunomodulatory

## ASSESSMENT OF ANTIMALARIAL ACTIVITY AND CYTOTOXICITY OF CLAUSENA AUSTROINDICA (RUTACEAE) CHLOROFORM EXTRACT: AN IN VITRO STUDY

Beesha S Kamal1, Fidha Sumayya2
College of Pharmaceutical Sciences, Govt: T.D. Medical College,
Alappuzha, Kerala-688005
beeshanireesh123@gmail.com

The increasing resistance of malarial parasites to currently available drugs, coupled with the scarcity of effective medications, constitutes a significant challenge in the management of malaria. Malaria continues to be a highly prevalent disease; there is an urgent need to develop more efficacious alternative drugs. Among the five Plasmodium species that cause malaria in humans, P. falciparum has become resistant to available medications, including artemisinin derivatives. Consequently, the primary aim of the study is to assess the in vitro antimalarial activity and cytotoxicity of the chloroform extract from the leaves of Clausena austroindica (CAU). The investigation also included preliminary phytochemical screening and quantitative evaluation of various extracts to identify the most active extract. Both quantitative and qualitative phytochemical analyses showed chloroform extract as the most active one, thus selected for the study. Antimalarial efficacy was evaluated against chloroquine-sensitive (PF3D7) and resistant strains (K1) of P. falciparum using a SYBR-Green I fluorescence-based assay. The cytotoxic activity of chloroform extract was also assessed on VERO (monkey kidney epithelial cells) cells using the MTT assay. The chloroform extract demonstrated promising antiplasmodial activity, with IC50 values of 7.5 ± 1.5 µg/ml and 5.8 ± 0.8 µg/ml against PF3D7 and K1 respectively, compared to standard chloroquine (IC50 value 5.0 ±2 nM). The extract exhibited minimal cytotoxicity to VERO cells (CC50 54 µg/ml) versus standard podophyllotoxin (CC50 3.5 µM). Therefore, the chloroform extract of CAU holds potential as a promising candidate for further in vivo and phytochemical research.

**Keywords:** Antimalarial activity, Cytotoxicity, Clausena austroindica, Rutaceae.

## EXTRACTION, ISOLATION, AND PRELIMINARY PHYTOCHEMICAL ANALYSIS OF -PARTHENIUM HYSTEROPHORUS

Chatakondu raju, shobha singarepalle, surendra jugguru
Pharmaceutical chemistry division,
jagan's institute of pharmaceutical sciences Nellore,
Andhra Pradesh, India
Pharmaceutical analysis division, jagan's institute of pharmaceutical sciences Nellore, Andhra Pradesh, India
Chatakonduraju@gmail.com

The extraction, isolation, and preliminary phytochemical analysis of Parthenium hysterophorus involve drying and powdering the plant material, followed by solvent extraction using methanol, ethanol, water, acetone, and other solvents through Soxhlet or maceration techniques. The crude extracts are subjected to qualitative tests to identify the presence of alkaloids, flavonoids, steroids, tannins, phenols, glycosides, saponins, terpenoids, and other secondary metabolites, although coumarins may be absent. Extraction methods such as decoction and ultrasound-assisted extraction, combined with solvent partitioning using solvents of increasing polarity—n-hexane, chloroform, ethyl acetate, and methanol—allow isolation of specific phytochemical groups. These compounds contribute to diverse biological activities like antimicrobial, anti-inflammatory, and enzyme inhibition effects. This preliminary phytochemical screening provides a foundation for further isolation, characterization, and exploration of therapeutic bioactive compounds from Parthenium hysterophorus, highlighting its potential in natural product research and drug development. The study confirms the plant's role as a valuable source of bioactive secondary metabolites with promising pharmacological applications

**Keywords**: Parthenium hysterophorus contains important bioactive phytochemicals such as alkaloids, flavonoids, steroids, tannins, phenols, glycosides, saponins, and terpenoids, which contribute to its antimicrobial, antioxidant, anti-inflammatory, and enzyme inhibitory activities.

**PT-419**

## PHYTOCHEMICAL PROFILING, HPLC-MS FINGERPRINTING, AND ANTIOXIDANT POTENTIAL OF TRIBULUS TERRESTRIS FLOWERS

CPV.MAHASREE, SURENDRA JUGGURU
Pharmaceutical Chemistry Division,
Jagan's Institute of Pharmaceutical Sciences,
Nellore, Andhra Pradesh, India.

ISBN: 978-81-980623-8-3

mahasree284@gmail.com

Tribulus terrestris L., a widely distributed medicinal plant, has been traditionally used in various systems of medicine for its therapeutic potential, including aphrodisiac, diuretic, hepatoprotective, and anti-inflammatory activities. The present study aimed to extract and characterize the phytochemical constituents of T. terrestris flowers to establish a basis for its pharmacological properties. Dried and powdered flower material was subjected to successive solvent extraction using solvents of increasing polarity such as hexane, ethyl acetate, methanol, and water through Soxhlet extraction. The obtained extracts were concentrated and analyzed for the presence of major phytochemical groups, including alkaloids, flavonoids, saponins, tannins, steroids, terpenoids, and phenolic compounds using standard qualitative and quantitative methods. The methanolic extract yielded the highest amount of bioactive compounds, indicating its effectiveness in extracting polar phytochemicals. Quantitative estimation revealed significant levels of total phenolics and flavonoids, suggesting strong antioxidant potential. Further characterization using UV-Visible, FTIR, and HPLC-MS analysis confirmed the presence of characteristic functional groups and molecular fingerprints associated with bioactive constituents. The study highlights T. terrestris as a rich source of phytochemicals with potential pharmacological relevance. The findings provide scientific validation for its traditional uses and suggest that the methanolic extract of T. terrestris flowers can serve as a promising candidate for further bioassay-guided isolation and identification of active compounds for therapeutic applications.

**Keywords:** Tribulus terrestris, phytochemical profiling, HPLC-MS, Soxhlet extraction, methanolic extract, bioactive compounds, flavonoids, phenolics, FTIR spectroscopy, antioxidant activity.

## FORMULATION OF HERBAL HAND-WASH WITH POTENTIAL ANTIBACTERIAL ACTIVITY

V. Dharshini, T. Karthiyayini, V. Ganesan
Department of Pharmacognosy
Pannai College of Pharmacy, Dindigul, Tamilnadu- 624 005.
adharshini2611@gmail.com

A plant has medicinal, pharmaceuticals, cosmetic potential, using it many innovative products can be prepared useful for human. In recent study herbal hand wash was formulated using soxhlet fractions of different plants ocimum tenuiflorum (Tulasi), cassia cinnamom (cinnamon) sapindus mukorossi (Reetha), Tridax procumbens (coatutton), Azadirchta indica (Neem) and citrus limonium (Lemon).These pants are traditionally known to possess different medicinal properties. Herbal hand wash was prepared by reetha fruit extracts and different plant extracts. The Antibacterial activity of formulated herbal hand wash and individual plant extracts were examined using agar well diffusion method. Among the plant extracts used, sapindus mukorossi (reetha) and citrus fruits showed potent antibacterial activity against skin pathogens Staphylococcus aureus, E. coli, Pseudomonas aeruginosa, Candida albicans and Salmonella typhimurium. The herbal hand-wash sowed antibacterial activity higher than commercially available standard solution of Dettol. Quality enhanced herbal hand wash with unique aroma and potential antibacterial activity was formulated.

**Keywords:** Herbal hand wash, Reetha extracts, Skin pathogens, Staphylococcus aureus, Pseudomonas aeruginosa.

## ANTIDIABETIC POTENTIAL OF CARISSA OPACA FRUIT: ROLE OF CHLOROGENIC ACID IDENTIFIED BY UPLC ANALYSIS

Dinesh Kumar

Carissa opaca is an endemic plant of Himalayan region of India which is traditionally used as for curing diabetes. The present study focuses on the phytochemical analysis and antidiabetic activity of the hydro-methanolic extract of Carissa opaca fruit. The extract was subjected to Ultra-Performance Liquid Chromatography (UPLC) for the identification and quantification of major bioactive compounds. The UPLC profile revealed the presence of several polyphenolic constituents, among which chlorogenic acid was identified as the predominant compound. Chlorogenic acid is a well-known bioactive molecule with significant antioxidant and glucose-modulating properties, which may contribute to the antidiabetic potential of the extract. The in-vitro assays such as alpha-amylase and alpha-glucosidase showed significant activity when compared to the acarbose at 200 µg/ml concentration. The findings suggest that the hydromethanolic extract of Carissa opaca fruit possesses promising antidiabetic properties, largely attributed to its high chlorogenic acid content and associated phytochemicals.

**Keywords:** Carissa opaca; Hydro-methanolic extract; Anti-diabetic; Chlorogenic acid.

**PT-422**

## HEPATOPROTECTIVE EFFECT OF FLAVONOID RICH FRACTION OF SESBANIA GRANDIFLORA: RESULTS OF IN VIVO, IN VITRO, AND MOLECULAR DOCKING STUDIES

Dishant Chaudhari, Anitha Kuttiappan
Department of Pharmacology, School of Pharmacy & Technology Management, SVKM'S NMIMS Deemed-to-be University,
Shirpur, Maharashtra 425405
chaudharidishant6@gmail.com

Phytochemicals and their derivatives have long been explored as therapeutic agents for a wide range of diseases. This study evaluated the pharmacological and hepatoprotective potential of a flavonoid-rich fraction of the ethanolic extract of Sesbania grandiflora (SG) using in vivo, in vitro, and in silico approaches. The research aimed to assess the cytoprotective properties of SG extracts and to elucidate the molecular interactions between isolated flavonols and peroxisome proliferator-activated receptor alpha (PPARα) target proteins implicated in hepatic disorders. The entire SG plant was extracted using ethanol via Soxhlet extraction, followed by fractionation to isolate flavonoids. Cytoprotective and hepatoprotective properties were investigated using HepG2 cell lines and rat models. Hepatotoxicity markers including SGOT, SGPT, total bilirubin, triglycerides, and total protein were measured to evaluate hepatic function. SG treatment notably reduced elevated levels of SGOT, SGPT, bilirubin, and triglycerides in vivo, indicating significant hepatoprotection, while untreated groups exhibited pronounced hepatic injury. The flavonoid fraction demonstrated an IC50 value of 190.28 µg/ml against HepG2 cells, confirming moderate cytotoxicity and safety. Histopathological analysis revealed restored hepatocyte architecture following treatment. Molecular docking of SG-derived flavonoids with PPARα (PDB ID: 3VI8) using MOE software demonstrated strong binding affinities, supporting potential interaction with hepatic metabolic pathways. Collectively, these findings suggest that flavonoids from Sesbania grandiflora possess potent hepatoprotective and cytoprotective properties and represent promising lead compounds for developing therapeutics against drug-induced hepatotoxicity and related liver disorders.

**Keywords:** Sesbania grandiflora, Flavonoids, Hepatoprotection, Molecular docking, PPARα

## THE RESEARCH ON PHARMACOLOGY, TOXICOLOGY AND PRESENT IN ERYTHRINA VARIEGATA PLANT LEAVES USED FOR URINARY TRACT INFECTION

Elavarasan and Eswari
Department of pharmacology, Sri Vijay Vidyalaya College of Pharmacy, Dharmapuri, Tamil Nadu, India
Elavarasans6600@gmail.com

The morphology, pharmacological activity, and phytochemical screening of Erythrina variegata are the briefly outline in the study. A substitute term for Erythrina variegata is also know as Erythrina indica. The plant is capable of reaching an average height of between fifty and sixty feet. Many phytoconstituents, which includes alkaloid substance, tannins, flavonoids, and other resin, protein, saponins and glycosides, have been identified. Terpenoids, triterpenoids, steroids, and phenols are a few examples of secondary metabolites. According to Soxhlet techniques, there are five unique solvent system: methanol, hexane, ethyl acetate, dichloromethane, chloroform, and aqueous solution. Various parts of this plant have been used in traditional medicinal for their analgesic, nervine-calming, antiseptic, antacid antiepileptic, anti-asthmatic, and anti-inflammatory properties. Erythrina variegata plant parts of leaves are used to treat infections produced by bacteria that inhibit or eradicate pseudomonas and Escherichia (E. coli) bacteria. Its further block both

ISBN: 978-81-980623-8-3

grammeme-positive and grammeme- negative bacteria. Erythrina variegata leaf bark is the main treatment for urinary tract infections in medical systems like siddha (Ayurveda), Unani medicine, and Homoeopathy.

**EXTRACTION OF PHYTOCHEMICAL CHARECTARIZATION OF CEREUS JAMACARU**

E. Sai Kumar, T. Praveena
PHARMACEUTICAL ANALYSIS DIVISION, JAGAN'S INSTITUTE OF PHARMACEUTICAL SCIENCES, NELLORE, ANDHRA PRADESH, INDIA
Saikumarsanna2004@gmail.com

Cereus jamacaru, commonly known as the "mandacaru cactus," is a traditional medicinal plant native to arid regions of Brazil and widely recognized for its therapeutic potential. The present study focuses on the extraction and phytochemical characterization of Cereus jamacaru stem to identify its bioactive constituents that contribute to its pharmacological properties. The plant material was shade-dried, powdered, and subjected to successive solvent extraction using solvents of increasing polaritypetroleum ether, chloroform, ethanol, and water by Soxhlet extraction method. The obtained extracts were concentrated under reduced pressure and evaluated for phytochemical constituents through standard qualitative tests. The ethanol extract exhibited a rich presence of alkaloids, flavonoids, tannins, saponins, glycosides, terpenoids, and phenolic compounds, indicating its strong bioactive potential. Quantitative analysis further confirmed significant levels of total phenolic and flavonoid contents, suggesting antioxidant capacity. The preliminary screening supports the ethnomedicinal use of C. jamacaru in treating inflammatory and infectious conditions. The results highlight that ethanol is the most efficient solvent for extracting polar phytoconstituents from the plant. This study provides a scientific basis for the traditional applications of Cereus jamacaru and establishes a foundation for further pharmacological and bioactivity studies, including antioxidant, antimicrobial, and cytotoxic evaluations. The findings contribute to the growing interest in cactus species as potential sources of natural therapeutic agents and support the conservation and sustainable utilization of Cereus jamacaru in modern phytopharmaceutical research.

**Keywords:** Cereus jamacaru, mandacaru cactus, Soxhlet extraction, phytochemical screening, ethanol extract, flavonoids, phenolic compounds, alkaloids, traditional medicine, pharmacological potential, bioactive constituents.

**FORMULATION OF SUNSCREEN CREAM FROM RESOURCES OF UNANI MEDICINE WITH IN VITRO & SAFETY EVALUATION**

Hamiduddin, Sabreen Khan
Associate professor & HoD Dept. of Ilmul Saidla (Unani Pharmacy), National Institute of Unani Medicine (NIUM), Bangalore, India

Exposure to solar ultraviolet (UV) radiation is a major factor in skin aging, pigmentation disorders, and carcinogenesis. While synthetic sunscreens offer protection, their adverse effects and limited biocompatibility encourage a shift toward natural alternatives. The Unani System of Medicine (USM) is rich in botanicals possessing antioxidant, anti-inflammatory, and photoprotective properties. This study aimed to formulate an Unani sunscreen cream (USC) and evaluate its physicochemical characteristics, stability, safety and in vitro efficacy. Eight batches were prepared using hydroalcoholic extracts and fixed oils of selected Unani drugs with permissible excipients. The optimized batch cream was chosen based on organoleptic characteristics, pH, spreadability, viscosity, extrudability, and thermodynamic stability. Optimized batch was analysed for further physicochemical properties, qualitative and quantitative phytochemical screening, and chromatographic fingerprinting (HPTLC, HPLC, and GC–MS) and quantitative estimation of bioactive incorporation. In vitro antioxidant potential was determined using DPPH and ABTS assays, and photoprotective efficacy by SPF, PA, and Boot star rating methods. A stability study was performed for 3 months at 25 °C and 37 °C±70% RH (accelerated). Safety was assessed by MTT assay and a 14-day cumulative skin irritation study on healthy volunteers. F8 batch was selected as optimized USC contains Asl-us-Soos (Glycyrrhiza glabra Linn.), Poste Turanj (Citrus medica Linn.), Chob Zard (Curcuma longa Linn.), Tukhme Jirjeer (Eruca sativa Mill.), Irsa (Iris ensata Thunb.), Tukhme Khurfa (Portulaca oleracea Linn.), Turb oil (Raphanus sativus Linn.), Khurfa oil, Jirjeer oil, Raughane Zaitoon (Olea europaea Linn.) Mom (Cera alba), Safeda Kashgari (Zinc oxide). It was a stable o/w emulsion showing desirable texture, non-greasy consistency, homogeneity, and compatible pH with skin (5.47 ± 0.18). USC exhibited TPC and TFC concentrations of 6.6 and 170 µg/mL, respectively. HPTLC, HPLC, and GC-MS fingerprint data of USC were set with quantitative estimation of Quercetin (0.79 mg/g), Kaempferol (0.94 mg/g), and Ferulic acid (1.0 mg/g) by HPLC. USC displayed moderate SPF (22.96), PA++++, and a 4-star Boot rating, confirming broad-spectrum UV protection, along with strong antioxidant potential ($IC_{50}$: DPPH = 673.92 µg/mL; ABTS = 38.31 µg/mL).

**Keywords:** Antioxidant activity; Safety; Sunscreen Cream; Ultraviolet Radiation; Unani Medicine.

**SOWA-RIGPA AS A HOLISTIC TRADITION: DIAGNOSTIC APPROACHES, HERBAL FORMULATIONS, AND MODERN RECOGNITION**

Isha Waghmare, Kamala Chandak, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, Maharashtra, India-441002
Ishawaghmare199@gmail.com

"Sowa-Rigpa," commonly known as the Amchi system of medicine, is one of the oldest, living, and well-documented medical traditions in the world. The term Sowa-Rigpa means "Knowledge of Healing" and originates from the Bhoti language. It is widely practiced in Tibet, Mongolia, Bhutan, parts of China, Nepal, Himalayan regions of India, and some areas of the former Soviet Union. In India, it is especially prevalent in Ladakh, Himachal Pradesh (Spiti and Lahoul), Jammu & Kashmir, Darjeeling, Arunachal Pradesh, and Sikkim, contributing significantly to holistic and preventive healthcare. Sowa-Rigpa shares philosophical and diagnostic similarities with Ayurveda. It is based on Jung-wa-nga (Panchamahabhutas: Prithvi, Jal, Agni, Vayu, Akash) and Ngepa-Sum (Tridosha: Vata, Pitta, Kapha), emphasizing internal balance, harmony with nature, and mental well-being. Diagnosis involves pulse examination, urine analysis, tongue inspection, and patient questioning to detect elemental and doshic imbalances. Treatments aim to restore equilibrium through personalized diet, lifestyle adjustments, herbal medicines, and detoxification procedures.Herbal formulations are central to therapy. Key plants include Terminalia chebula (Haritaki) for detoxification, Emblica officinalis (Amla) for rejuvenation, Tinospora cordifolia (Guduchi) for immunity, Nardostachys jatamansi (Jatamansi) for calming the mind, and Saussurea lappa (Kuth) for respiratory and digestive issues. Some classical medicines also use minerals, precious stones, and purified animal products. Preparations include decoctions, powders, pills, medicated butter, herbal pastes, and Rinchen Rilbu (precious pills). Today, Sowa-Rigpa is preserved as cultural heritage and officially recognized by the Government of India (since 2010) as a traditional medical system.

**PREPARATION AND EVALUATION OF HERBAL LOLLIPOPS FOR COUGH AND THROAT INFECTIONS**

Kadam Rahul Ramprasad
Department of Pharmaceutics, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, India, 431606
rahulkadamk90@gmail.com

Cough and throat infections are prevalent respiratory conditions commonly triggered by microbial infections, environmental pollutants, and seasonal fluctuations. Conventional therapeutic options such as syrups, tablets, and lozenges often contain synthetic additives that may cause undesirable side effects, making them less suitable for sensitive populations. Herbal medicines, with their proven antimicrobial, anti-inflammatory, and soothing actions, provide a safer and natural alternative for symptomatic relief. This study focuses on the preparation and evaluation of herbal lollipops formulated using selected herbal extracts traditionally used in the treatment of cough and throat irritation. Ingredients such as Tulsi (Ocimum sanctum), Ginger (Zingiber

ISBN: 978-81-980623-8-3

officinale), Liquorice (Glycyrrhiza glabra), and Clove (Syzygium aromaticum) were incorporated into a sugar-based lollipop matrix. The formulated lollipops were evaluated for organoleptic properties, hardness, weight variation, pH, microbial load, and in-vitro dissolution. The results indicated that the herbal lollipops possessed acceptable physicochemical characteristics, pleasant taste, and good stability. Additionally, the active herbal components demonstrated promising antimicrobial activity, supporting their traditional therapeutic use. The study concludes that herbal lollipops represent a novel, palatable, and patient-friendly dosage form for managing cough and throat infections, particularly suitable for pediatric and geriatric populations.

**Keywords:** Herbal lollipops, Cough and throat infection, Phytomedicine, Antimicrobial activity, Lollipops

## FORMULATION AND EVALUATION OF POLYHERBAL MOSQUITO REPELLENT CREAM

Kadam Vishavjeet Laxman
Department of Pharmaceutics, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, India, 431606
vishavjeetkadam@gmail.com

Mosquito-borne diseases such as malaria, dengue, chikungunya, and filariasis continue to pose major public health challenges worldwide. Conventional mosquito repellents generally contain synthetic agents such as N,N-diethyl-3-methylbenzamide (DEET) and N,N-diethylphenylacetamide (DEPA), which are non-biodegradable and associated with undesirable side effects including skin irritation, allergies, and dizziness. To overcome these limitations, the present study was undertaken to formulate and evaluate a polyherbal mosquito repellent cream using safe, natural ingredients. Various herbal extracts and essential oils were screened for repellent efficacy, fragrance, and skin compatibility. Based on the results, essential oils from Cinnamon, Tulsi, Tagetes (Marigold), and Eucalyptus were selected for formulation due to their proven insect-repellent and antimicrobial properties. The cream was prepared using suitable emulsifying and stabilizing agents to achieve optimal consistency and spreadability. The developed formulation was evaluated for parameters such as pH, viscosity, homogeneity, stability, and duration of repellency using laboratory assays against Aedes and Anopheles mosquitoes. The results demonstrated excellent repellent activity and good physicochemical stability. The formulated polyherbal cream offers an effective, eco-friendly, and skin-safe alternative to conventional synthetic mosquito repellents.

**Keywords:** Polyherbal formulation, Mosquito repellent cream, Essential oils, Herbal extracts, Eco-friendly alternative

## THE ROLE OF 'OMICS' IN MODERN PHARMACOGNOSY: A REVIEW

Kapil Kalra, Jyoti Kalra,Vinita Chauhan, Amit K Joshi
kapil752003@gmail.com

Pharmacognosy, the study of medicines from natural sources, has been fundamentally transformed by the advent of high-throughput 'omics' technologies. This review outlines the pivotal roles of genomics, transcriptomics, proteomics, and metabolomics in modern natural product science. These approaches have shifted the paradigm from a classical, descriptive discipline to a predictive and high-throughput field. Genomics decodes the biosynthetic blueprints for natural products; transcriptomics reveals which blueprints are actively used under specific conditions; proteomics identifies the enzymatic machinery at work; and metabolomics provides a comprehensive snapshot of the final chemical products. The true power, however, lies in their integration. This "multi-omics" or "systems biology" approach allows researchers to connect genes to molecules, elucidate complex biosynthetic pathways, discover novel bioactive compounds, and develop robust quality control measures for herbal medicines. This review explores the function of each 'omics' layer and illustrates their collective impact on accelerating drug discovery and standardizing natural medicines.

**Keywords:** Omics, standardizing, biosynthetic pathway, transcriptomics, proteomics.

## WASTE TO HEALTH: THE HERBAL GRANULE WITH ANTIDIABETICS POTENTIAL

Khambayatkar Shruti Mangesh
Department Of Pharmacology School Of Pharmacy S.R.T.M. University Nanded, Maharashtra, India.
Khambayatkarshruti12@gmail.com

Diabetes is the primary metabolic disorder listed among the top 10 death-causing diseases. The complete cure of diabetes is impossible, but the prevention and maintenance of glucose levels can reduce the diabetes severity.The present study focuses on the formulation and evaluation of antidiabetic granules using pharmaceutical ingredient (API). Banana peels, a natural byproduct rich in bioactive phytoconstituents such as flavonoids, phenolics, and dietary fibres, exhibit significant antidiabetic potential by enhancing glucose metabolism and reducing oxidative stress. In this formulation, Guar Gum, a natural polysaccharide, is utilized as a binder and filler to provide desirable granule cohesion and flow characteristics, ensuring uniformity and stability. Stevia, a natural sweetening agent derived from Stevia rubidian, is incorporated to enhance palatability without elevating blood glucose levels, making the formulation suitable for diabetic patients

**Keywords:** Banana peel, chiku peel, Gaur gum, Antidiabetics granule.

**PT-431**

## PHYTOCHEMICAL FINGERPRINTING, IN VITRO ANTIOXIDANT EVALUATION, AND NETWORK PHARMACOLOGY OF LITSEA CORIACEA BARK: AN INTEGRATIVE PHARMACOGNOSTIC APPROACH

K. R. Prasanna, Rajesh.Shastri, S.N Sri Harsha, K.Jesindha Beyatricks
Department of Pharmacognosy, Hillside college of pharmacy and Research centre, Bangalor, India-560062
kavaliprasanna@gmail.com

In the present study, aqueous and ethanolic bark extracts of Litsea coriacea (Lauraceae) were investigated for their phytochemical profile, in vitro antioxidant potential, and antioxidant-associated molecular mechanisms through network pharmacology. The extracts were prepared by cold maceration and Soxhlet extraction, respectively, and analyzed for phytochemical constituents. Carbohydrates, flavonoids, glycosides, steroids, terpenoids, and saponins were detected, with greater diversity in the ethanolic extract. Quantitative analysis revealed higher total phenolic (951.3 mg GAE/g) and flavonoid (47.20 mg QE/g) contents in the ethanolic extract compared to the aqueous extract (795.5 mg GAE/g and 35.31 mg QE/g). In vitro antioxidant assays (DPPH and superoxide radical scavenging) showed dose-dependent activity. At 500 µg/mL, the ethanolic extract exhibited stronger activity (DPPH = 64.57 ± 0.32%; superoxide = 61.40 ± 0.20%) compared to the aqueous extract (DPPH = 62.47 ± 0.21%; superoxide = 57.47 ± 0.31%), comparable to vitamin C. HPTLC confirmed the presence of quercetin, β-sitosterol, and stigmasterol, while LC–MS/MS identified bioactives such as boldine and kaempferol. Network pharmacology identified 235 antioxidant-related targets, with key hub proteins including SRC, EGFR, AKT1, ESR1, and JAK2. Gene Ontology and KEGG analyses suggested involvement in oxidative stress, immune modulation, and hormone-mediated signaling. The results conclude that the ethanolic bark extract of L. coriacea possesses potent, multifunctional antioxidant potential, supporting its role in herbal drug development and standardization.

**Keywords:** Litsea coriacea, phytochemical fingerprinting, in vitro antioxidant, flavonoids, network pharmacology.

## PHYTOCHEMICAL CONSTITUENTS OF VINCA ROSEUS (CATHARANTHUS ROSEUS)

L. Kavya, B. SARANYA,
Dept. Of pharmacology,Jagan's institute of pharmaceutical sciences, Nellore, Andhra Pradesh, India.
kavyachitti8880@gmail.com

Catharanthus roseus (syn. Vinca rosea), commonly known as Madagascar periwinkle, is a medicinally important plant belonging to the family Apocynaceae. It is well recognized for its diverse range of bioactive phytochemical constituents that contribute to its wide therapeutic potential. The plant contains more than 130 types of alkaloids, which are the major class of compounds responsible for its pharmacological activities. Among these, vincristine and vinblastine are notable anticancer alkaloids extensively used in the treatment of leukemia, lymphoma, and other cancers. Other significant alkaloids such

ISBN: 978-81-980623-8-3

as ajmalicine, reserpine, catharanthine, and vindoline possess antihypertensive and central nervous system–active properties. Besides alkaloids, C. roseus also contains flavonoids (kaempferol, quercetin, and rutin), tannins, phenolic acids (Gallic, caffeic, ferulic acids), saponins, terpenoids, and glycosides, which contribute to its antioxidant, anti-inflammatory, antimicrobial, and antidiabetic activities. The synergistic effect of these phytoconstituents enhances the plant's medicinal value and supports its traditional use in treating diabetes, hypertension, infections, and cancer. Owing to the presence of these potent secondary metabolites, Catharanthus roseus continues to be a focus of extensive phytochemical and pharmacological research aimed at isolating and developing novel therapeutic agents. Thus, the plant serves as a valuable source of natural compounds with significant potential in modern drug discovery and development.

**Keywords**. Catharanthus roseus, Vinca rosea, alkaloids, vincristine, vinblastine, phytochemical constituents, antioxidant activity, pharmacological potential, medicinal plants, secondary metabolites, drug discovery.

Nagpur, Maharashtra, India- 441002
lajavinandurkar@gmail.com

The sunlight consists of harmful radiations which affect the skin. To protect our skin from ultraviolet radiation, sunscreen formulations are used that either absorb, scatter, or reflect the radiation. The present research work focuses on the development and evaluation of a topical photoprotective formulation containing antioxidant, wound-healing, anti-inflammatory, and photoprotective polyphenols (flavonoids) such as quercetin, lycopene, rutin, and catechin, extracted from Allium cepa, Solanum lycopersicum, Citrus aurantium Linn., and Camellia sinensis, respectively. During evaluation, the formulations (F1, F2, and F3) showed pale white to peach colouration with a pleasant odour, good consistency, and fine texture. Their pH values were 7.01, 5.41, and 6.98, respectively, while viscosity ranged between 14210–17212 cps. F2 demonstrated the best spreadability, whereas F1 and F3 were comparatively less spreadable. All three formulations exhibited excellent thermal stability with no phase separation and produced no skin irritation. Thus, the research provides a stable natural photoprotective formulation with antioxidant potential, high SPF, and uniform UVA/UVB protection.

**Keywords:** Sunscreen, Rutin, Lycopene, Quercetin, SPF.

**PT-434**

## PHYTOCHEMICAL PROFILE OF ETHANOL EXTRACT, FRACTIONS AND COMMERCIAL PRODUCTS OF PAPAYA (CARICA PAPAYA L.) LEAF BY VALIDATED HPLC METHOD

Sai Kiran Lakamasani1, K Sundara Saravanan2, B. Bhavana1,
Keerthi. N1, Lakshmi M. Sundar 1
1 Department of Pharmaceutical Chemistry,
2 Department of Pharmacognosy,
M. S. Ramaiah University of Applied Sciences, Bengaluru,
Karnataka, India

Papaya (Carica papaya L.) leaves are widely recognized for their therapeutic potential, particularly in enhancing platelet count and exhibiting anti-inflammatory, antioxidant, and anti-cancer properties. However, the phytochemical composition of commercial papaya leaf formulations often varies, affecting their therapeutic consistency. The present study aimed to identify and quantify major flavonoids and phenolic acids in papaya leaf extract and fractions prepared by column chromatography, followed by comparison with marketed products using a validated high-performance liquid chromatography (HPLC) method. Ethanolic extract of papaya leaves and its fractions were analyzed using Waters HPLC system (e2695 separation module, C18 column: 5 µm, 4.8 × 150 mm) with a 2998 PDA detector by gradient elution of mobile phase consisting of methanol, water (1 % acetic acid) and acetonitrile at 1 mL/minute. The method developed for simultaneous estimation of four phenolic acids (gallic, ferulic, chlorogenic, and caffeic acids) and four flavonoids (rutin, quercetin, myricetin, and kaempferol) was validated in accordance with ICH Q2 (R2) guidelines. Among these eight key phytoconstituents, HPLC analysis revealed the presence of three compounds - ferulic acid (0.67 mg/g), caffeic acid (0.47 mg/g), rutin (5.53 mg/g) in ethanol extract, while these key constituents level were enriched in fractions obtained from ethanol extract (ferulic acid - 11.39 mg/g, caffeic acid - 2.51 mg/g, rutin - 65.28 mg/g) along with fourth compound kaempferol (0.31 mg/g). However, in one of the marketed products only the flavonoid rutin was detected (59.50 mg/g). These results highlight significant variations in the phytochemical profile of commercial papaya leaf products, underscoring the need for their standardization and quality control. It is important to ensure the consistency in the phytochemical profile of papaya leaf-based products for maximum therapeutic benefits.

**Keywords**: Carica papaya, HPLC, Flavonoids and phenolic acids, Phytochemical standardization, Herbal formulations

## Reviewing The Antimicrobial Potential Of Natural Products For Overcoming Antibiotics Resistance

Latasha Thakur, Jateen Nayak, Shivani Gawali,
Nishant Awandekar, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur
latashathakur738@gmail.com

Antimicrobial resistance (AMR) is being recognised as one of the most serious global health concerns, affecting the therapeutic effect of existing antibiotics and leading to the development of multidrug-resistant (MDR) and extensively drug-resistant (XDR) bacteria. With the advancement of antibiotics lacking and resistance quickly increasing, there is an urgent need for novel approaches to therapy. Natural products (NPs), noted for their structural diversity and multi-target effects, have emerged as attractive options for AMR prevention.This review looks at the antimicrobial properties of naturally occurring compounds derived from plants, fungi, bacteria, marine organisms, and mammal species. Alkaloids, flavonoids, terpenoids, tannins, essential oils, and polyphenols act through a variety of mechanisms, including membrane disruption, inhibition of resistance enzymes, efflux pump suppression, interference with nucleic acid synthesis, and biofilm prevention. Many natural compounds also have synergistic effects with conventional antibiotics, helping to restore drug sensitivity and reduce therapeutic doses. Piperine (Piper nigrum), catechins (Camellia sinensis), allicin (Allium sativum), cinnamaldehyde (Cinnamomum zeylanicum), and berberine (Berberis spp.) are well-known synergistic compounds. A good example is Artemisia annua, where whole-plant preparations have been proven to delay the development of artemisinin resistance and provide higher antimalarial performance when compared to purified drug therapy. This is due to enhanced bioavailability and the combined effect of many flavonoids and terpenoids found in the plant. Overall, natural products provide a sustainable, renewable, and clinically relevant platform for the development of next-generation antimicrobials and resistance-modifying drugs. Integrating natural product research with cutting-edge technologies like Nanodelivery systems, metabolomics, and synthetic biology could speed up the development of effective solutions to the worldwide AMR epidemic.

**Keywords:** Antimicrobial resistance (AMR); Multidrug resistance (MDR); Antibiotic synergy; Efflux pump inhibition; Artemisia annua.

## HERBAL ANTIOXIDANTS FOR NEURODEGENERATION DISORDER

Lina Dulbule, Swati Lade, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee,
Nagpur, Maharashtra, India-441002
linadulbule2004@gmail.com

Neurodegenerative disorders are a major global health concern characterized by the progressive and irreversible loss of neuronal structure and function, seen in diseases like Alzheimer's, Parkinson's, Huntington's, and amyotrophic lateral sclerosis. Oxidative stress, caused by excessive reactive oxygen species and weakened antioxidant defences, plays a key role in neuronal damage. Herbal antioxidants have gained attention as potential therapies due to their safety, multi-targeted action, and strong neuroprotective effects. Herbs such as Withania somnifera, Curcuma longa, Ginkgo biloba, and Bacopa monnieri contain phytochemicals like flavonoids, phenolic acids, alkaloids, terpenoids, and curcuminoids, which show antioxidant, anti-inflammatory, and anti-apoptotic properties in studies. However, challenges such as poor blood-brain barrier permeability, low

ISBN: 978-81-980623-8-3

bioavailability, instability, and variations in phytochemical content due to plant source and extraction techniques limit their clinical use. Advanced delivery systems like solid lipid nanoparticles, liposomes, and nanoencapsulation can enhance solubility, stability, and targeted brain delivery. Future research should focus on standardized extraction methods, improved formulations, and nanotechnology-based systems, supported by clinical trials to ensure long-term efficacy and safety of herbal antioxidant therapies for neurodegenerative diseases.

**Keywords:** Neurodegenerative disorders, Parkinson's disease, Nanotechnology based delivery system

**NATURAL ANTIOXIDANT EYE CARE: FORMULATION AND EVALUATION OF UNDER-EYE GEL WITH CREPE JASMINE AND MANGO LEAF EXTRACTS.**

Maddineni Thanisha Chowdary, Pisipati Aparna
Department of Pharmaceutics, NRI College of pharmacy,
Pothavarappadu, Agiripalli Mandal, Eluru District,
Andhra Pradesh, India-521212.
thanichowdary@gmail.com

In today's increasingly digital world, eye strain has become a common problem for people who spend long hours focusing on screens or driving in poor lighting conditions. Professions that require prolonged visual concentration, such as software development and truck driving, can cause headaches, blurry or double vision, dryness, irritation, and light sensitivity. Over time, these symptoms may lead to more serious complications such as cataracts, retinal damage, age-related macular degeneration, and sleep disorders. The skin around the eyes is especially delicate and prone to dark circles caused by blood pooling beneath the surface or increased melanin production, also known as periorbital hyperpigmentation. While rest and cold compresses can provide temporary relief, there is a growing interest in natural, long-term solutions that address both the visible and uncomfortable symptoms of eye strain. This study focuses on creating an herbal under-eye gel with Tabernaemontana divaricata (crepe jasmine flower) and Mangifera indica (mango leaf). These plants are known for their traditional medicinal uses and have anti-inflammatory, antioxidant, and skin-soothing properties. The goal is to develop a gentle, plant-based product that can relax the eye area, reduce puffiness and dark circles, and alleviate symptoms caused by prolonged screen exposure or driving. This formulation is designed to naturally support eye wellness, particularly for people who work in visually demanding jobs. The formulation includes Mango leaf extract, crepe jasmine flower extract including Carbopol 940 (gelling agent), Methyl paraben (preservative), Glycerin (humectant). evaluation Parameters include Organoleptic and , Physicochemical properties such as Spreadability, pH Measurement, Washability, Viscosity.

**Keywords**: antioxidant, periorbital hyperpigmentation, crepe jasmine, mango leaf.

**PT-438**

**DEVELOPMENT EVALUATION AND PHYTO-CHEMICAL STUDIES OF POLY-HERBAL FORMULATION FOR ANTI-ALLERGIC ACTIVITY**

Madhuri A. Theng and Dr. Madhuri A. Channawar
Pataldhamal Wadhwani College of Pharmacy, Dhamangaon Road,
Moha Phata, Yavatmal,MS Maharastra, India-445001
thengmadhuri7@gmail.com

In the current research, successfully developed and evaluated plant-based anti- allergic formulations, showing that natural extracts from medicinal plants can be effectively used to create stable and effective topical treatments. The formulations demonstrated good physico-chemical properties, high drug content and significant anti-inflammatory activity in in vivo studies. Further qualitative phytochemical tests were carried out to identify the presence of various compounds such as glycosides, flavonoids, tannins, alkaloids, and phenolic compounds, all of which contribute to the plants' medicinal properties. Physico- chemical properties such as moisture content, ash values, and pH of the plant extracts were also examined. The total ash value, water-soluble ash, and acid-insoluble ash were measured to assess the quality and purity of the plant extracts, The evaluation of the formulated gels and ointments was conducted through a series of tests to determine their pH, spreadability, viscosity, drug content, and stability. The FTIR analysis of four plant extracts Aegle marmelos (Leaf), Annona squamosa (Leaf), Acacia arabica (Bark), and Butea monosperma (Bark) along with a combined spectral analysis. It lists wavenumber ranges, corresponding functional groups, and peak values observed in each sample. This demonstrates that the formulation is effective in delivering the active compounds over an extended period, which is essential for sustained anti-allergic activity. The study suggests that with further optimization and clinical trials, these plant-based formulations could provide an alternative to conventional anti-allergic treatments, offering a natural, safe, and effective solution for managing allergic conditions.

**Keywords:** FTIR, HPTLC, TLC, Medicinal Herbs, Anti- Allergic Activity.

**FORMULATION AND EVALUATION OF HERBAL DHOOP PREPARED FROM TEMPLE WASTE FLOWERS FOR MOSQUITO-REPELLENT ACTIVITY**

Mahesh Bhoge, Nitin Padole, Pankaj Dhapke,
Nilakshi Dhoble, Jagdish Baheti
Kamla Nehru College of Pharmacy Butibori, R.T.M. Nagpur University
Nagpur, Maharashtra, India-441108
Maheshbhoge20@gmail.com

Mosquito-borne diseases remain a persistent global public health challenge, contributing to high morbidity and mortality through infections such as dengue, malaria, chikungunya, and yellow fever. Conventional mosquito-repellent products widely available in the market are predominantly chemical-based and may pose environmental hazards, cause respiratory irritation, or contribute to insect resistance. In alignment with sustainable waste-management principles—Recycle, Reuse, and Recover—this study explores the valorization of temple waste flowers, particularly Tagetes erecta (marigold), for the development of a natural herbal dhoop formulation with mosquito-repellent potential.In this work, dried marigold flowers and complementary natural ingredients were processed to formulate herbal dhoop sticks. The formulations were subjected to a series of physicochemical and biological evaluations, including mosquito-repellent activity, microbiological quality assessment, moisture content, consistency, burning time, ash value, color, odor, and skin-irritation potential. The study emphasizes environmental sustainability and proposes herbal dhoop as an eco-friendly alternative to synthetic mosquito-repellent products. The results suggest that the formulated herbal dhoop demonstrates effective mosquito-repellent activity while being cost-efficient, non-toxic, and environmentally benign. This approach not only utilizes temple waste efficiently but also offers a promising route toward commercial, sustainable mosquito-control solutions. The formulation's natural composition minimizes health risks and mitigates the development of insect resistance, supporting its potential as a viable substitute for conventional chemical-based repellents.

**Keywords:** Herbal dhoop; mosquito repellent; marigold (Tagetes erecta); temple waste; microbiological evaluation; eco-friendly formulation

tejaswinimalla61@gmail.com

To evaluate the antidiabetic potential of the methanolic extract of aerial parts of Achyranthes Aspera Linn, a plant identified for its immunomodulatory, anti diabetic, anti hyperlipidemic, anti oxidant, hepatoprotective, wound healing acitvities etc. The whole plant powder of Achyranthes Aspera Linn were extracted with methanol using soxhlet apparatus.The prepared methanolic extract was tested for its hypoglycemic activity at doses of 250 and 500 mg/kg.Studies were conducted on acute normoglycemic and alloxan-induced hyperglycemic rats. Experiments included oral glucose tolerance tests and a 28-day chronic study, using glibenclamide as the standard drug.Body weight and serum blood glucose levels were measured in the treated hyperglycemic rats.Antimicrobial activity of the extract was assessed in

ISBN: 978-81-980623-8-3

vitro, comparing the extract's zone of inhibition (ZOI) to standard gentamicin. After final treatment i.e. 28-days, animals were evaluated for fasting blood glucose levels, which concludes there was a significant decrease in the fasting blood glucose levels in AA extract High dose (**p<0.01) and Standard Control treated animals (***p<0.001) when compared to Diabetic control group. Improvement in glucose tolerance was also observed ($p < 0.05$). Treated rats showed favorable body weight gain and improved biochemical parameters over 28 days. The plant extract exhibited notable antimicrobial activity (5 cm ZOI) compared to gentamicin (6 cm ZOI).The study confirms that the whole plant of Achyranthes Aspera Linn possess significant antidiabetic and antimicrobial activities, supporting its traditional use.

**Keywords:** Achyranthes Aspera Linn, phytochemistry, Anti diabetic activity, phytochemical investigation, therapeutic potential, traditional medicine

## EXTRACTION AND PHYTOCHEMICAL CHARECTARIZATION OF BOUGAINVILLEA

M.chandrakala, s. venkata ratnamma, shobha singarepalli
Pharmacy practice division, jagan's institute of pharmaceutical sciences, Nellore,Andhra Pradesh, India
Pharmaceutical chemistry division, jagan's institute of pharmaceutical sciences, Nellore, Andhra Pradesh, India
chandrakalamedam717@gmail.com

Extraction and phytochemical characterization of Bougainvillea involves isolating bioactive compounds from its flowers or leaves using various solvent extraction methods such as hydroalcoholic, methanol, chloroform, or acetone solvents. Optimized extraction techniques include Soxhlet extraction, ultrasonic-assisted extraction, and maceration, often followed by concentration and purification steps. Phytochemical screening of Bougainvillea species typically reveals the presence of secondary metabolites including alkaloids, flavonoids, phenolics, terpenoids, tannins, glycosides, saponins, and anthocyanins. These compounds contribute to the plant's known pharmacological activities such as antibacterial, antioxidant, anti-inflammatory, anticancer, antidiabetic, and antihyperlipidemic effects. Characterization methods like Thin Layer Chromatography (TLC), UV-Visible spectroscopy, FTIR, and GC-MS are commonly used to identify and profile the extracted phytoconstituents. The comprehensive study of Bougainvillea extracts highlights their potential for therapeutic and industrial applications, making them a promising natural resource for developing novel bioactive agents and natural dyes. This research emphasizes the importance of optimizing extraction procedures to maximize yield and efficacy of active compounds for pharmaceutical or cosmetic use.

**Keywords:** Bougainvillea, Extraction, Phytochemical characterization, Bioactive compounds, Secondary metabolites, Spectroscopic analysis

## EVALUATION OF ANDROGRAPHIS PANICULATA FOR HEPATOPROTECTIVE EFFECT - AN IN-SILICO STUDY

Mahadev H. Parab, Vishnu A. Kangralkar,
Nims Institute of Pharmacy, Nims University Jaipur.
parabmahadev0793@gmail.com

The present study is aimed to carry out In-silico network Pharmacology of Andrographis paniculata for its hepatoprotective effect.Plant based medicines have played a critical role in treatment of various ailments due to their ability to bind and modulate cellular targets involved in disease. Medicinal plants contain a variety of bioactive compounds for the treatment of multiple disorders. The less adverse effects, affordability, and easy accessibility highlight their potential in traditional remedies. Before preclinical research it is always good to identify pharmacological targets from active ingredients of medicinal plants. The present study is planned to see the different targets of Andrographis paniculata on oral pathogens by Network Pharmacology. In-silico network pharmacology study was carried out. The phytoconstituent of Andrographis paniculata were identified, target gene involved in the pathology of Hepatotoxicity were retrieved to construct a network. The In-silico study predicted the interaction of phytoconstituents of Andrographis paniculata with several pathological targets of Hepatotoxicity. The protein sequence of these targets was predicted and the protein - protein interaction found that many constituents are helpful to produce hepatoprotective effect.

**Keywords:** Andrographis paniculata, In-silico, hepatoprotective.

**PT-443**

## ANTIBACTERIAL AND ANTHELMINTIC ACTIVITY EVALUATION OF LIPOSOMAL FORMULATION OF TINOSPORA CORDIFOLIA (MIERS)

Muhasina K M
Department of Pharmaceutical Chemistry, Prime College of Pharmacy, Erattayal, Palakkad, Kerala, India
km.muhasina@gmail.com

Tinospora Cordifolia (Miers) or Guduchi, is well-known for its multifaceted therapeutic effects, including anti-cancer activity, chiefly due to its bioactive compound berberine. The clinical efficacy of these phytochemicals is constrained by their inadequate water solubility, volatility, and diminished bioavailability. Liposomal encapsulation has proven to be a viable method for addressing these issues by increasing solubility, safeguarding sensitive chemicals, and promoting cellular absorption. This work sought to formulate a liposomal version of Tinospora Cordifolia (Miers) extract and assess its antibacterial and anthelmintic properties relative to the crude extract and some marketed formulations. Liposomal vesicles were synthesised via the thin-film hydration technique, and thereafter subjected to sonication to get homogenous nanoscale particles. The formulation was analysed for particle size, encapsulation effectiveness, zeta potential, and shape using zeta analysis and transmission electron microscopy (TEM). The antibacterial efficacy was evaluated against Gram-positive (Staphylococcus aureus) and Gram-negative (Escherichia coli, Pseudomonas aeruginosa) bacterial strains via agar well diffusion and minimum inhibitory concentration (MIC) assays. The anthelmintic activity was assessed using Pheretima posthuma as a model organism, analysing the paralysis and mortality times of worms subjected to different concentrations of the liposomal formulation and crude extract.The liposomal formulation of Nigella sativa had markedly superior antibacterial efficacy, evidenced by larger inhibition zones. It reduced MIC values relative to the crude extract, signifying greater penetration and prolonged release of active metabolites. Likewise, the formulation exhibited significant anthelmintic efficacy, resulting in a more rapid onset of paralysis and mortality in a concentration-dependent fashion. The research endorses the advancement of liposome-based herbal therapies and offers a solid foundation for additional pharmacological and in vivo studies.

**Keywords:** Tinospora Cordifolia, liposomal formulation, Anti-bacterial, anthelmintic.

## FORMULATION AND EVALUATION OF MILLET-BASED CHURNA FOR GUT HEALTH

N Kamalesh, Antara Choudhury, and Ranjitha N
Department of Pharmacognosy, Ikon Pharmacy College, Bengaluru-562109, India
Kamaleshn2839@gmail.com

The present study involved the successful formulation and characterization of a millet-based churna fortified with natural bioactive ingredients known for promoting digestion and gut health. Pearl millet (Pennisetum glaucum), a small-seeded grain popularly known as nutri-cereals, rich in dietary fiber, resistant starch, polyphenols, and essential micronutrients, exhibits prebiotic properties that can help to maintain a healthy gut microbiota and improve bowel regularity. The objective of the research was to formulate a millet-based churna incorporating selected herbal ingredients and evaluate its organoleptic characteristics, physicochemical properties, and potential benefits for gut health. Herbal ingredients mentioned in the formula were cleaned and dried properly. The formulation was prepared by dry mixing and sieving through a mesh to obtain a uniform powder. The churna was evaluated for organoleptic, physical, physicochemical, phytochemical properties, and crude fiber content. Microbial content and digestive properties were also determined. The millet-based churna showed acceptable sensory characteristics; physicochemical parameters showed desirable values for ash value, moisture content 6%, and pH of 7, indicating the churna's stability, purity, and shelf-life compatibility. The formulated churna was finally subjected to microbiological evaluation, confirming the absence of Escherichia coli. The digestive activities – amylolytic, proteolytic, and lipolytic activities of the churna showed promising gut health–

ISBN: 978-81-980623-8-3

supportive properties. Thus, the findings suggested that millet-based churna can be developed as a nutraceutical for promoting gut health.

**Keywords:** Millet, Churna, Gut health, Prebiotic, Nutraceuticals

## INNOVATIVE UTILIZATION OF MAKHANA FOR DEVELOPMENT OF NUTRIENT-ENRICHED NUTRACEUTICALS

B. Naveenkumar, T. Karthiyayini, V. Ganesan
Department of Pharmacognosy, Pannai college of pharmacy,
Mullipadi, Trichy road, Dindigul-624405
Naveenb0101@gmail.com

Makhana (fox nuts), derived from the aquatic plant Euryale ferox, is gaining recognition as a superfood due to its rich nutritional composition and health benefits. Makhana bars Balls as value-added products harness these benefits, serving as convenient, nutrient-dense snacks. Typically, a 100g serving of makhana provides approximately 338 to 362 kcal, with notable macronutrients including 13 to 15 grams of protein, 64 to 77 grams of carbohydrates, low fat content (~0.2 to 2 grams), and high dietary fiber (~12.5 to 14 grams). Additionally, makhana is abundant in essential minerals such as magnesium, potassium, calcium, phosphorus, and iron, contributing to bone health, cardiovascular support, and metabolic functions. The antioxidant flavonoid kaempferol in makhana bars imparts anti-inflammatory and cardioprotective properties. Makhana bars offer gluten-free, low-fat, and low sodium alternatives suitable for weight management, diabetes control, and digestive health. Their slow glucose release aids in blood sugar stabilization while promoting satiety. Incorporation of makhana in snack bars combines traditional snack appeal with modern nutraceutical functionality, making it an ideal healthier choice for consumers seeking functional foods that support chronic disease prevention and overall wellness. Ongoing research into formulation optimization and bioactive enhancement continues to elevate the profile of makhana bars in the nutraceutical market. This positions makhana bars as promising contributors to health-oriented food innovation and sustainable nutrition solutions.

## A NOVEL HERBAL CREAM CONTAINING BRYOPHYLLUM PINNATUM: EXTRACT FOR MANAGING DIABETIC SKIN INFLAMMATION AND WOUNDS

Nita A. Puri, Monali R. Dakhole, Krishna R. Gupta, Milind J. Umekar
Department of Pharmaceutical Chemistry,
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee Nagpur, 441002
purinita3@gmail.com

Effective and skin-friendly topical treatments are necessary because people with diabetes frequently experience chronic skin inflammation, dryness, and slow wound healing. The medicinal herb Bryophyllum pinnatum**,** sometimes referred to as the "life plant," is abundant in natural substances such as luteolin, rutin, and quercetin, which are flavonoids with potent anti-inflammatory effects. A 5% B. pinnatum extract gel has been demonstrated in numerous studies to dramatically accelerate wound healing by lowering levels of harmful cytokines such as TNF-α and IL-1β, promoting blood vessel growth through VEGF activation, and reducing inflammation. Its antimicrobial properties also aid in protecting against bacteria that are frequently present in wound infections. The use of ghee (clarified butter), which is frequently combined with honey in herbal preparations, has been used to treat diabetic and chronic wounds in order to promote skin regeneration and soothe the skin because of its healing and moisturizing properties. We propose in this study to develop a ghee-based cream that contains Bryophyllum pinnatum extract. This method offers a promising route toward natural, efficient skin care for diabetic patients by bridging the gap between traditional herbal knowledge. Additional laboratory and clinical research is required to validate the cream's efficacy and safety.

**Keywords**: Bryophyllum pinnatum, flavonoids, Anti-inflammatory property, Diabetic patients, Microbial activity.

Chitradurga – 577501, Karnataka, India
kjns2306@gmail.com

Herbal drugs remain an integral component of modern medicine, linking traditional healing practices with contemporary scientific understanding. Their growing acceptance is driven by increasing interest in natural, safe, and holistic therapies that complement or enhance conventional treatment approaches. Medicinal plants serve as valuable sources of bioactive compounds, many of which have contributed to the development of important modern pharmaceuticals. Recent advancements in phytochemistry, analytical standardization, and clinical research have strengthened the scientific foundation of herbal medicines. These developments have improved the quality, safety, and efficacy of herbal formulations, supporting their incorporation into evidence based healthcare. Herbal drugs offer therapeutic benefits in managing chronic diseases, enhancing immunity and promoting overall well-being, often with fewer side effects compared to synthetic alternatives. Despite their potential, challenges such as variability in raw materials, standardization issues, herb–drug interactions, and regulatory differences across regions must be addressed to ensure consistent quality and reliability. Continued research, innovation in formulation technologies, and harmonized regulations are essential for integrating herbal drugs more effectively into mainstream medical practice. Overall, the evolving relevance of herbal drugs underscores their enduring significance in global healthcare and their promising role in the future of modern medicine.

Neurological disorders, including Alzheimer's disease, Parkinson's disease, multiple sclerosis, and epilepsy, represent a significant global health challenge due to their progressive nature, complex pathophysiology, and the limitations of current therapeutic approaches. In recent years, phytochemicals—bioactive compounds derived from plants—have garnered attention for their neuroprotective potential and ability to address critical mechanisms underlying these disorders. This review explores the diverse chemical structures and biological activities of phytochemicals, highlighting their antioxidant, anti-inflammatory, anti-apoptotic, and neuroregenerative properties. Key phytochemicals such as curcumin, resveratrol, quercetin, and huperzine A are examined for their roles in mitigating oxidative stress, reducing neuroinflammation, and promoting neuronal survival and repair. Their specific applications in Alzheimer's disease (targeting amyloid-beta plaques and tau proteins), Parkinson's disease (preserving dopaminergic neurons), multiple sclerosis (modulating immune responses and supporting myelin repair), and epilepsy (exerting anticonvulsant effects) are discussed. The review also evaluates the current status of clinical trials investigating phytochemicals in neurological disorders, emphasizing challenges such as bioavailability, standardization, and safety concerns. While these compounds demonstrate promising therapeutic potential, translating preclinical findings into effective clinical interventions requires overcoming hurdles related to dosage optimization, long-term safety, and regulatory approval. Looking forward, advancements in delivery systems, synergistic combinations, and personalized medicine could enhance the clinical applicability of phytochemicals. This review underscores the need for rigorous research and multidisciplinary approaches to fully harness the potential of phytochemical-based therapies in addressing the growing burden of neurological disorders.

**Keywords:** Neurological Disorders, Phytochemicals, Alzheimer's disease, Parkinson's disease, Epilepsy

**CULTIVATING QUALITY HERBS: ROLE OF GOOD AGRICULTURAL AND COLLECTION PRACTICES IN ENSURING HERBAL PRODUCT QUALITY**

Pawar A. T., Chandrasekar S. B. and Venkatesh M. P.
Centre of Excellence in Regulatory Sciences, Department of Pharmaceutics, JSS College of Pharmacy, JSS Academy of Higher Education and Research, Mysuru-570015, Karnataka, India.
pawarat20282@gmail.com

The global demand for herbal medicines, cosmetics, and nutraceuticals has significantly increased due to growing consumer interest in health, wellness, and the advantages of plant-based products. However, with this rising demand comes an increasing concern over the quality, safety, and efficacy of herbal raw materials. The present study was undertaken to evaluate the regulatory frameworks on the cultivation, collection, and quality control of herbal raw materials in India, China, the USA, Europe, and Japan. Data were collected from various global guidelines and regulations on the cultivation, collection, and quality control of herbal raw materials. The herbal raw materials are often susceptible to contamination by microbial agents, heavy metals, pesticides, and adulteration, compounded by inconsistent cultivation, harvesting, and post-harvest processes. To address these challenges, the World Health Organization (WHO) established Good Agricultural and Collection Practices (GACP) as a global framework aimed at ensuring the quality and safety of medicinal plant materials. There are differences in regulatory rigor between developed and developing countries, highlighting the well-established guidelines in the USA and Europe versus the evolving regulatory frameworks in nations like India, where traditional herbal medicines still face less stringent controls, resulting in variability in product quality. The study findings underscore the critical role of GACP, Good Agricultural Practices, and Good Manufacturing Practices in standardizing quality, mitigating contamination risks, and fostering better international trade opportunities. The study advocates for the harmonization of global regulations to ensure the safety and efficacy of herbal products and to enhance their integration into the global marketplace.

**Keywords:** GACP, GMP, herbal medicine, quality, raw material, regulations.

**IN-VITRO ANTIOXIDANT AND ANTIDIABETIC ACTIVITY OF STEM BARK OF NOTHOPEGIA RACEMOSA DALZ**

Poornima Hosamath, Rajesh Shastri, Prasanna Habbu , G.S.Hiremath
Department of Pharmacognosy,
BVVS Hanagal Shri Kumareshwar College of Pharmacy,
Bagalkot, 587101 Karnataka, India
poornimaraj.06@rediffmail.com

The stem bark of Nothopegia racemosa was collected from Dandeli, Tinaighat, and Malsang forests in Karnataka, identified by a taxonomist, shade-dried, powdered, and successively extracted with solvents of increasing polarity. Extracts were screened for phytochemicals and evaluated for antioxidant activity (DPPH and hydroxyl radical scavenging) using ascorbic acid and gallic acid as standards, and for antidiabetic potential (α-amylase and α-glucosidase inhibition) using acarbose as the standard. All assays were performed in triplicate, and $IC_{50}$ values were determined. Results: Phytochemical analysis confirmed tannins, steroids, flavonoids, glycosides, and polyphenols. Antioxidant assays showed that ethanolic and aqueous extracts exhibited better activity in both DPPH ($IC_{50}$ = 172.36 and 71.18 µg/ml) and hydroxyl radical scavenging ($IC_{50}$ = 169.35 and 89.9 µg/ml), though less potent than standards ($IC_{50}$ ≈ 20 µg/ml). Ethyl acetate extract showed moderate activity. Antidiabetic assays revealed that ethanolic and aqueous extracts displayed marked inhibition of α-amylase ($IC_{50}$ = 22.53 and 18.03 µg/ml) and α-glucosidase ($IC_{50}$ = 2.642 and 1.961 µg/ml), compared to acarbose ($IC_{50}$ = 3.039 and 0.316 µg/ml). Among all, the aqueous extract showed the highest potency in both enzyme inhibition and antioxidant assays. Conclusion: The study highlights the significant antioxidant and antidiabetic potential of N. racemosa, attributed mainly to its phenolic and flavonoid constituents. The aqueous extract shows better activity, supporting its traditional use and indicating promise as a natural therapeutic source for managing oxidative stress and postprandial hyperglycemia.

**Keywords:** Nothopegia racemosa, antioxidant, DPPH, hydroxyl radical scavenging, α-amylase, α-glucosidase.

**FORMULATION AND EVALUATION OF GUMMIES PREPARED FROM MAYURCHANDRIKA BHASMA**

Pranjali C. Waghmare, Prajakta D. Gaikwad, Monika S. Kare
Dept of Postgraduate in Pharmacy, SVPM'S College of Pharmacy, Malegaon (BKII) Baramati Dist Pune 413115 Maharashtra, India
pranjali2411waghmare@gmail.com

Antiemetic drugs which prevents or minimizes nausea and vomiting; used to treat a variety of conditions like motion sickness, the side effects of medications like chemotherapy, and post-operative nausea. Antiemetics acts by blocking specific neurotransmitters in the brain that trigger the vomiting reflex. Gummies are small, like a jelly baby and prepared from the reduction of sugar and addition of healthier herbal ingredients like mayurchandrika bhasma. Mayurchandrika bhasma or Piecha bhasma (calx of peacock feather) is widely used in Ayurveda to treat vomiting commonly observes in pregnancy, hiccough and respiratory disorders. The aim of present study was to develop and formulate gummy jellies using herbal or natural ingredient honey, as sweetening agent. Presently in market available Mayurchandrika Bhasma patient hesitates to take. So to increase palatability gummies were prepared as a modified dosage forms. Bhasma, Agar, cocoa powder, honey were contents of optimized formula along with flouring agent. Gummies were found stable and evaluation tests organoleptic, moisture content and protein were within limits. Patient compliance of gummies will be more than other forms of medicine so gummies are effective and playful way to treat major problem which is increasing more rapidly in mankind due to changing lifestyle of the mankind.

**Keywords:** Gummies, Mayurchandrika Bhasma, antiemetic, calx, agar

**PHYTOCHEMICAL-DRIVEN FORMULATION AND FUNCTIONAL ASSESSMENT OF HIBISCUS ROSA-SINENSIS HERBAL HAIR-NOURISHING OIL**

Prashik Manwar, Harshada shivarkar, Pankaj Dhapke , Jadish Baheti
Department of Kamla Nehru College of pharmacy,
Butibori, Nagpur-441108
Prashikmanwar122@gmail.com

Hibiscus rosa-sinensis, also called the Chinese hibiscus, is a flowering plant that comes from East Asia and is part of the Malvaceae family. It is often grown because of its big, colorful flowers that are used in gardens and landscaping. This plant has been used for a long time in traditional medicine, and its leaves, flowers, and extracts are thought to have many health benefits. These include fighting free radicals, reducing inflammation, and killing harmful bacteria. It is also believed to help with blood pressure and skin health. Hibiscus rosa-sinensis grows best in warm, tropical or subtropical areas and is still studied for its many healing qualities. The flowers and leaves of this plant contain different types of active ingredients that can help with hair growth and making hair healthier. In this research, along with Hibiscus rosa-sinensis, other herbal ingredients like amla, curry leaves, coconut oil, and fenugreek are used to make a special herbal oil.

**PT-453**

**FORMULATION AND EVALUATION OF ACNE HERBAL TOPICAL GEL**

Prathibha B M

This study focuses on the formulation of herbal acne topical gels using a hemp seed mixture as a key component, alongside other natural ingredients. Herbal gels are designed to manage acne by leveraging anti-inflammatory, antimicrobial, and astringent properties of plant extracts, while minimizing side effects compared to synthetic drugs. The hemp mixture, rich in proteins, aids in reducing skin irritation, preventing bacterial infections, and promoting healing, making it suitable for sensitive skin and long-term use. The formulation process involved selecting appropriate gelling agents, optimizing active ingredient concentrations, and ensuring stability and skin penetration. Evaluation parameters such as pH, viscosity, spreadability, swelling index, extrudability, skin irritation, and stability were assessed. Antimicrobial activity was tested using agar well diffusion against Propionibacterium acnes, and stability studies were performed under environmental

ISBN: 978-81-980623-8-3

conditions. Demonstrated that the hemp-based gel exhibited excellent antimicrobial activity, good spreadability, stability, and compatibility with no irritation. Among the three formulations, the first (F1) showed optimal pH (7.2), better spreadability, extrudability, washability, and overall performance. The gel remained stable without significant changes in physical or chemical properties over time. This formulation provides a promising, natural, and safe alternative for acne management, with synergistic effects of hemp and other herbal ingredients offering effective treatment and minimal side effects. Further clinical studies are recommended to confirm its therapeutic potential.

**Evaluation Of Antioxidant And Anti-Urolithiatic Activities Of A Formulated Polyherbal Tablet**

Prathibha G S, Penumala Tejaswi
Department of Pharmacognosy, Bapuji Pharmacy College,
Davanagere, Karnataka, India – 577004
Prathibha625@gmail.com

The present study aimed to formulate and evaluate polyherbal tablet for its phytochemical, antioxidant, and anti-urolithiatic potential. Preliminary phytochemical screening revealed the presence of flavonoids, alkaloids, saponins, tannins, glycosides, and terpenoids. TLC profiling confirmed the presence of quercetin, a major flavonoid known for potent antioxidant and nephroprotective effects. The antioxidant activity was determined using the DPPH radical scavenging method, showing a concentration-dependent increase with 99.2% inhibition at 400 µg/mL, comparable to ascorbic acid (82.9%). The formulation exhibited strong linear correlation ($R^2$ = 0.896 for test and 0.905 for standard) and low $IC_{50}$ (88.38 µg/mL), confirming effective free radical neutralization. Anti-urolithiatic activity, evaluated through an in vitro egg membrane diffusion model, demonstrated 32.84% and 55.27% dissolution of calcium oxalate and phosphate crystals, respectively, compared to 55.56% and 98.32% for the standard. Microscopic observation showed reduced aggregation and deformation of crystals, indicating inhibition at nucleation and growth stages. Overall, the results establish that the formulated polyherbal tablet possesses significant antioxidant and anti-urolithiatic efficacy, attributed mainly to quercetin and synergistic phytoconstituents, supporting its role as a safe, natural therapeutic for oxidative stress and kidney stone management.

**Keywords:** Polyherbal tablet, TLC, quercetin, antioxidant, anti-urolithiatic activity, DPPH assay, calcium oxalate.

**FORMULATION AND EVALUATION OF HERBAL LIPSTICK**

Rani.S, Deepa Cheriyan, Fasna Banu, Amrutha Baby
College of Pharmaceutical Sciences,
Government Medical College, Kottayam
ranisarojarun@gmail.com

Herbal lipsticks are color and protection giving to lips using natural ingredients like herbal extracts,natural colorants and essential oils.The herbal lipstick is devoid of side effects and nourishes the lips with the additives. In the present study, we aimed to prepare a lipstick with natural colorants and essential oils and evaluated by color, pH, skin irritancy test, melting point, breaking point, spreadability test, aging stability and smudge test.The present study concluded that the use of natural ingredients in herbal lipstick have no side effects and more consumer acceptance.

**Keywords:** Herbal lipstick, colorants, essential oils

**PT-456**

**IN SILICO ASSESSMENT OF REPORTED PHYTOCHEMICALS IN HOT AQUEOUS EXTRACT OF HERBAL INGREDIENTS IN 'PATHYAADI KWATH': AN INQUIRY INTO PROBABLE MECHANISM OF ACTION OF REPORTED PHARMACOLOGICAL ACTIVITIES**

Satish V Kilajea, Shitalkumar S. Patilb,
Shankar J Joshi, Darshan S. Lokhande
Dr. J J Magdum College of Pharmacy, Jaysingpur,
Dist. Kolhapur, Maharashtra India
Dr. Shivajirao Kadam College of Pharmacy, Kasabe Digraj,
Sangli, 426305, Maharashtra, India

'Pathyaadi Kwath' is an Ayurvedic polyherbal aqueous decoction. It is claimed to be effective in migraine headache, diabetes, cholestatic jaundice and others. It is a traditional Ayurvedic Formulation with original monograph mentioned in Sharangdhara Samhita. Terminalia chebula, Terminalia bellerica, Emblica officinalis, Azadirachta indica, Tinospora cordifolia, Adhatoda vasica, Picrorrhiza kurroa, Berberis aristata, Cyperus rotundus, Santalum album, and Glycyrrhiza glabra are the crude drug ingredients used for the said decoction formulation. The antioxidant, anti-inflammatory and antimicrobial activities of this formulation have already been reported previously by this researcher. However, to have more meaningful insights into probable mechanisms of the said activities shown by this formulation, this in silico study was initiated. Since, little comprehensive phytochemical data is reported, phytochemical constituents from hot aqueous extracts and aqueous decoctions of individual herbs within this formulation reported previously have been selected for the present in silico study. Only specific phytoconstituents have been selected instead of common secondary metabolites reported. Bisacurone, Tumeronol A, Nimbin, Tinocordiside, Ellagic Acid, Punigluconin, Gentianine, Syringine, Chebulinic Acid and Cardifoliside – A were ten reported phytoconstituents selected while the targets selected are anti-inflammatory (Cyclo-oxygenase-2, Nuclear Factor Kappa B, PPARᵞ, MMP-9, MMP-2, Leucocyte Elastase), antibacterial (Penicillin Binding Protein, Topoisomerase IV, DNA Polymerase III, LPX – C, RNA Polymerase B) and antidiabetic (Aldose Reductase). PDB database was used to access protein targets while SWISS ADME tools were used for assessing drug-likeliness. PyRx, Discovery Studio Visualizer and PyMOL softwares were used for Molecular Docking of the selected ligands and protein targets.

**Keywords:** Pathyaadi Kwath, MMP-9, MMP-2, PBP, DNA Polymerase III, RNA Polymerase B, Aldose Reductase

**SYNERGISTIC DEVELOPMENT OF POLYHERBAL & ALKALINE WATER FORMULATION FOR IMMUNE HEALTH IMPROVEMENT**

Shubhangi Namdevrao kutte
School of pharmacy Swami Ramanand Teerth Marathwada University
Nanded, Maharashtra,India- 431606
Shubhangikutte12@gmail.com

Groundwater is contaminated by many substances from the land's surface. Drinking contaminated groundwater can have serious health effects. The present study was carried out to confirm the effectiveness of polyherbal formulation on ground water and laboratory waste water. The main objective 1 of this work was to evaluate the antimicrobial activity and efficiency of a natural absorbent from plants to treat ground water. During this study, laboratory waste water and ground water samples were collected for treatment by a polyherbal powder mixture, resulting in an effective natural clarification agent for highly turbid and untreated pathogenic water. Various doses of polyherbal formulation viz. 100 and 150 mg/l were taken and checked for the efficiency dose on raw water. After treatment of polyherbal powder with water samples were analyzed for parameters like pH, antimicrobial action..

**Keywords:** Polyherbal mixture, water treatment, ground water

**EVALUATION OF HERBAL FORMULATION CONTAINING INDIGENOUS MEDICINAL PLANTS FOR ANTIOXIDANT AND PHYTOCHEMICAL PROPERTIES**

Sindhu Vissarapu
Department of Pharmacognosy, A.S.N. Pharmacy College,
Tenali, Andhra Pradesh, 522201
sindhuvissarapu22@gmail.com

Herbal medicines have been traditionally used for centuries in India due to their therapeutic potential and minimal side effects. Combining multiple medicinal plants in a single formulation may enhance their pharmacological activity. This study was designed to evaluate the phytochemical profile and antioxidant properties of a polyherbal formulation. The formulation was prepared using extracts of Ocimum sanctum (Tulsi), Withania somnifera (Ashwagandha), and Curcuma longa (Turmeric). Preliminary phytochemical screening was performed to identify the presence of secondary metabolites. Antioxidant activity was assessed using DPPH and ABTS free radical scavenging assays. Phytochemical analysis revealed the presence of alkaloids, flavonoids,

ISBN: 978-81-980623-8-3

phenolics, tannins, and terpenoids in the formulation. Both DPPH and ABTS assays demonstrated significant free radical scavenging activity, suggesting strong antioxidant potential of the herbal mixture. The combined formulation showed greater activity compared to individual extracts reported in literature. The study highlights that the synergistic combination of Tulsi, Ashwagandha, and Turmeric enhances antioxidant activity, supporting their traditional use in healthcare. Integration of phytochemical screening with antioxidant assays provides scientific validation for indigenous herbal formulations and their potential therapeutic benefits.

**Keywords:** Pharmacognosy, herbal formulation, phytochemistry, antioxidant activity, indigenous plants

**AERVA LANATA IN DENTAL CARE**

SIVA Gowri Tanuja.Ramanadham and Garlapati Usha Kiran
Department of Pharmacology, NRI College of Pharmacy,
Pothavarappadu, Agiripalli Mandal, Eluru District,
Andhra Pradesh, India -521212.
Thanujaramanadham09@gmail.com

The future of dental care research in Aerva Lanata: New insights, mechanisms and clinical prospects. In dentistry, the use of Aerva Lanata in dental care is unique because of its targeted use and antimicrobial/anti-inflammatory properties over its long history. This study is focused on solving fundamental dental issues by preventing oral pathogens, such as Streptococcus mutans, and decreasing the chronic inflammation associated with periodontal disease, providing a natural remedy for the challenge of resisting antibiotics and biofilm formation. The process involves rigorous in vitro mechanistic studies, and the first step is to standardize the active phytochemicals, including flavonoids and phenolic compounds, through HPLC/GC-MS. To verify the antioxidant and anti-inflammatory activity against pro–Inflammation markers, these analyses are followed by specific assays such as Minimum Inhibitory Concentration (MIC) and Anti-biofilm asses (Crystal Violet). Applications are focused on developing new, bioactive dental products such as herbal mouthwashes, anti-plaque toothpastes and localised sustained-release gels for periodontal pockets. To ensure targeted delivery and stability within the mouth, future perspectives require the use of nano-formulations to optimize efficacy.

**Keywords:** Antimicrobial (or Anti-inflammatory), Biofilm, Standardization (or HPLC/GC-MS), Nano-formulations, RCTs (or Clinical Validation)

**PT-460**

**PHYTOCHEMICAL ANALYSIS, IN-SILICO AND IN-VITRO STUDY OF CYNODON DACTYLON (PERS.) LEAVES EXTRACT FOR INSECT REPELLENT ACTIVITY**

Swami Sunita Baswaraj
Department of Pharmaceutical chemistry, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, India
swamisunita09@gmail.com

Cynodon dactylon (Pers.), commonly known as Bermuda grass, is a widely distributed medicinal plant belonging to the family Poaceae. The present study aims to explore the insect repellent potential of C. dactylon leaf extract through phytochemical, in-silico, and in-vitro investigations. Preliminary phytochemical screening confirmed the presence of bioactive compounds such as alkaloids, flavonoids, tannins, and terpenoids, which are known for their biological activities. In-silico molecular docking studies were performed to evaluate the interaction of key phytoconstituents with insect olfactory receptor proteins, predicting their possible mechanism of repellent action. The in-vitro assays assessed the repellency and protection time against common mosquito species, validating the computational findings. Overall, the study suggests that C. dactylon possesses significant insect repellent potential, making it a promising candidate for the development of safe, natural, and eco-friendly alternatives to chemical repellents. This research also supports its role in sustainable pest management strategies.

**Keywords:** Cynodon dactylon, In-silico study, In-vitro assay, Insect repellent activity, Natural insecticide

**PT-461**

**COMPARATIVE EVALUATION OF ANTI-MICROBIAL ACTIVITY OF BETWEEN COMBINATION OF EXTRACT OF POGAMIA PINNATA WITH CAFFEINE AND POGAMIA PINNATA: IN VITRO APPROACH**

Tejaswini Kasdekar

The antimicrobial activity of a novel combination of plant-based extracts of Pogamia pinnata and caffeine, as determined by in vitro studies, is investigated in this study. Since antimicrobial resistance is becoming a major public health concern, there is a growing interest in investigating alternative antimicrobial agents. Pogamia pinnata have long been known to have antimicrobial properties, and caffeine has emerged as a potential enhancer of antimicrobial efficacy. However, the synergistic antimicrobial effects of combining Pogamia pinnata with caffeine are still not well understood. In this study, we carried out a comparative evaluation of anti microbial properties in vitro experiments, between extract of Pogamia pinnata with caffeine and extract of Pogamia pinnata (in vitro). In this study we are investigated that Pogamia pinnata (10% EESPP) has antimicrobial activity against S. aureus (gram +ve), E. coli (gram -ve), S. Typhi (gram -ve), and P. aeruginosa (gram -ve). However, when caffeine is combined with Pogamia pinnata 10% EESPP (50 µl), the combination exhibits greater inhibitory activity against microorganisms than Pogamia pinnata 10% EESPP (50 µl) alone. The study shows caffeine increases antimicrobial activity of the ethanolic extract of Pongamia pinnata.

**BAMBOO SALT IN TOOTHPASTE: THE ANCIENT REMEDY FOR MODERN DENTAL CARE**

V.Bharathan, L.Gopi, V.Kalvimoorthi.
Aadhibhagawan college of pharmacy, Rantham,
Thiruvannamalai, Tamilnadu 604407
bharathvenkat098@gmail.com

Bamboo salt, traditionally known as Jukyeom, is a Korean medicinal salt produced through a unique high-temperature roasting process. Developed over a thousand years ago by Buddhist monks, bamboo salt is prepared by filling raw sea salt into bamboo tubes sealed with mineral-rich yellow clay. The tubes are then roasted at temperatures ranging from 1,000°C to 1,500°C. This process may be repeated up to nine times, resulting in a highly alkaline salt enriched with various minerals. The final product, often dark-colored and fine-textured, is believed to possess enhanced therapeutic properties including anti-inflammatory, detoxifying, and antibacterial effects. Bamboo salt is used in both culinary and traditional medicinal applications. Its preparation method significantly alters its chemical composition, contributing to its potential health benefits. However, while traditionally revered, more scientific research is needed to substantiate its clinical efficacy.

**Keywords:** Bamboo salt, Toothpaste, Herbal.

**FORMULATION AND EVALUATION OF ANTI-MICROBIAL AND ANTI-FUNGAL GEL CREAM OF TRIDAX PROCUMBENS FOR SCALP DISORDER**

Vijayshri Ramchandra Waghmode, Amol Navnath Khedkar
Rashtrasant Janardhan Swami College of Pharmacy, Kokamthan 423601
Vijayshriwaghmode20@gmail.com

The present research focuses on the formulation, development, and evaluation of a novel hair gel-cream using Tridax procumbens (coat buttons), a widely used medicinal herb. The primary objective of this formulation is to reduce white hair, prevent fungal infections, and control hair loss. Phytochemical screening of Tridax procumbens leaf extracts revealed the presence of tannins, flavonoids, and saponins, which contribute to its antioxidant and antimicrobial activities. The extract exhibited effective antimicrobial activity against E. coli, Pseudomonas aeruginosa, Bacillus subtilis, and Staphylococcus aureus. Additionally, mineral analysis confirmed its potential nutritional value. The stability studies of the formulated hair gel-cream indicated uniform viscosity, low moisture content, and no significant variation during the test period. A patch test demonstrated that the product caused no irritation or redness, proving its safety for topical application. Overall, the study concludes that it is feasible to develop a stable, effective, and safe herbal hair gel-cream from Tridax procumbens with promising cosmetic and therapeutic benefits.

**EXPLORATION OF ANTIGOUT POTENTIAL IN BOUGAINVILLEA SPECTABILIS THROUGH METABOLITE PROFILING, IN-SILICO STUDY, AND IN-VITRO EVALUATION**

Vishal Akangire
Department of Pharmacology, School of Pharmacy,
SRTMU, Nanded – 431606
vishalakangire2002@gmail.com

Gout is an inflammatory arthritis caused by the deposition of monosodium urate (MSU) crystals in joints, driven by elevated uric acid levels. This study investigates the inhibition of MSU crystallization using Bougainvillea spectabilis, which showed significant, dose dependent anti-gout effects in a spectrophotometric assay (200–300 nm). Molecular docking and in vitro studies revealed xanthine oxidase (XO) inhibition, surpassing standard drug Allopurinol. Identified bio actives with antioxidant and anti-inflammatory properties were evaluated for xanthine oxidase inhibition using PASS prediction and ADMET profiling. Molecular docking and in vitro assays confirmed xanthine oxidase inhibitory activity, suggesting broad therapeutic potential.

**NOVEL THIAZOLIDINE-2,4-DIONES DERIVATIVES AS ANTIDABETIC AGENTS: DESIGN, SYNTHESIS AND IN VIVO STUDIES**

Vivek Asati
Department of Pharmaceutical Chemistry, ISF collage of Pharmacy,
Moga (Punjab)

Diabetes mellitus is a metabolic disorder characterized by elevated blood sugar levels and related complications. This study focuses on harnessing and integrating fragment-based drug design and virtual screening techniques to explore the antidiabetic potential of newly synthesized thiazolidine-2,4-dione derivatives. The research involves the design of novel variations of thiazolidine-2,4-dione compounds by Fragment-Based Drug Design. The screening process involves pharmacophore based virtual screening through docking algorithms, and the identification of newly twelve top-scoring compounds. The molecular docking analysis revealed that compounds SP4e, SP4f showed highest docking scores of -9.082 and -10.345. The binding free energies of the compounds SP4e, SP4f and pioglitazone was found to be -19.9, -16.1 and -13 respectively, calculated using the Prime MM/GBSA approach. The molecular dynamic study validates the docking results. Furthermore, In the Swiss albino mice model, both SP4e and SP4f exhibited significant hypoglycaemic effects, comparable to the reference drug pioglitazone. Furthermore, these compounds demonstrated favourable effects on the lipid profile, reducing total cholesterol, triglycerides, and LDL levels while increasing HDL levels. In mice tissue, the disease control group showed PPAR-γ expression of 4.200±0.24, while compound SP4f displayed higher activation at 7.84±0.431 compared to compound SP4e with an activation of 7.68±0.65. In zebrafish model, SP4e and SP4f showed significant reductions in blood glucose levels and lipid peroxidation, along with increased glutathione levels and catalase activity. These findings highlighted the potential of SP4e and SP4f as antidiabetic agents, warranting further exploration for therapeutic applications.

**Keywords:** Thiazolidine-2,4-dione; virtual screening; R-group enumeration; MM-GBSA; Zebrafish diabetic model

**FORMULATION AND EVALUATION OF POLY-HERBAL SOAP**

Yuti Charpe, Sakshi Yelmule, Ruchi Khobragade, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee,
Nagpur, Maharashtra, India-441002
yuticharpe25@gmail.com

The present study aims to formulate and evaluate a poly-herbal soap using extracts of Neem (Azadirachta indica), Tulsi (Ocimum tenuiflorum), Shikakai (Acacia concinna), and Reetha (Sapindus mukorossi) for their combined antibacterial, antifungal, and cleansing properties. Ethanolic extracts of these herbal ingredients were incorporated into a glycerin base to prepare two formulations (F1 and F2). The soaps were evaluated for pH, foam height, foam retention, irritancy, and microbial activity. Both formulations showed an acceptable pH (6.9–7.2), good foaming characteristics, and no irritancy or microbial contamination, confirming safety for skin use. The results demonstrate that poly-herbal soap offers a natural, effective, and eco-friendly alternative to conventional chemical soaps, suitable for maintaining personal hygiene and promoting healthy skin.

**Keywords:** Poly-herbal soap, Neem, Tulsi, Shikakai, Reetha

**PT-467**

**VALUE ADDED PRODUCT OF MORINGA SEED OIL FOR ANTI-AGING CREAM**

N.Zarina, T.Karthiyayini, V.Ganesan
Department of Pharmacognosy, Pannai College of Pharmacy,
Dindigul, Tamilnadu- 624005

Among its various parts, the seeds are rich in a light, non-drying oil known as moringa seed oil, which possesses excellent stability and potent nutrient content. Due to these Moringa oleifera, commonly known as the “miracle tree,” is rich in bioactive compounds with exceptional nutritional and medicinal properties. Moringa seed oil, often referred to as Ben oil, contains high levels of oleic acid, tocopherols (Vitamin E), sterols, and phenolic compounds that exhibit strong antioxidant and moisturizing effects. The study focuses on developing a value-added anti-aging cream using moringa seed oil as the primary active ingredient. The cream was prepared using a standard oil-in-water (O/W) emulsion method, combining the oil phase (moringa oil, stearic acid, cetyl alcohol, beeswax) with the aqueous phase (rose water, glycerin). The prepared formulation was subjected to various physicochemical evaluations including pH, viscosity, spreadability, appearance and stability. The skin hydration and texture analysis were performed to determine cosmetic performance. The results indicated that the moringa-based cream exhibited excellent texture, easy spreadability, non-greasiness and high antioxidant potential due to its phenolic and tocopherol content. It has an acceptable pH (close to skin pH 5.5–6.0), smooth consistency and high antioxidant potential. The tocopherols and phenolic compounds in moringa oil effectively neutralized free radicals, preventing oxidative stress in skin cells. Regular application helps in reducing fine lines, improving elasticity and enhancing skin texture, confirming its anti-aging efficacy. Therefore, moringa seed oil can be effectively utilized as a value-added natural ingredient in the formulation of herbal anti aging cream.

**Keywords:** Moringa oleifera, Ben oil, Anti-aging cream, Anti-oxidant, value addition.

**PT-468**

**ISOLATION, CHARACTERIZATION AND EVALUATION OF ANTITUBURCULAR ACTIVITY FROM PEDALIUM MUREX**

G prasanthi, shobha singarepalli
Pharmaceutical chemistry division, jagan’s institute of pharmaceutical sciences, Nellore, Andhra Pradesh, India
gprasanthi2301@gmail.com

This study focuses on the isolation, characterization, and evaluation of the antitubercular potential of bioactive compounds derived from Pedalium murex, a medicinal herb known for its traditional therapeutic applications. Extraction of the plant material was performed using solvents such as ethyl acetate and methanol to obtain phytochemical-rich fractions, which were then subjected to chromatographic and spectroscopic techniques including FTIR, UV-Vis, and GC-MS for detailed characterization. Phytochemical analysis revealed the presence of diverse secondary metabolites including flavonoids, polyphenols, and terpenoids, compounds often implicated in antimicrobial activities. The antitubercular efficacy of these extracts was assessed against Mycobacterium tuberculosis using in vitro assays to determine minimum inhibitory concentrations (MIC) and bactericidal activity. Results demonstrated significant inhibition of bacterial growth, suggesting that Pedalium murex has potent activity against tuberculosis-causing strains. The study also explored the modulation of bacterial enzyme activities and gene expression related to virulence factors, providing insight into potential mechanisms of action. Furthermore, cytotoxicity assessments indicated that the extracts exhibit selective toxicity toward bacterial cells with minimal harm to normal mammalian cells, emphasizing their

ISBN: 978-81-980623-8-3

therapeutic potential. This research substantiates the use of Pedalium murex as a promising natural source for antitubercular drug development. Future research is recommended to isolate specific active compounds and elucidate their molecular interactions with Mycobacterium tuberculosis targets. The present findings contribute valuable knowledge toward natural product-based therapeutic strategies against tuberculosis, a global health challenge requiring novel and effective treatments.

**Keywords:** Pedalium murex, Antitubercular activity, Bioactive compounds, Extraction, Characterization, Mycobacterium tuberculosis, Minimum inhibitory concentration, Phytochemicals, Flavonoids, Spectroscopic techniques.

## ANTIOXIDANT AND CYTOTOXIC POTENTIAL OF SELECTED AYURVEDIC HERBS: A COMPARATIVE IN VITRO STUDY

Vaishnavi Nimje, Shubham Kamble, Dr. Tirupati Rasala
The Royal Gondwana College of Pharmacy, Nagpur

The present study explores and compares the antioxidant and cytotoxic potential of ethanolic extracts derived from three widely recognized Ayurvedic herbs—Withania somnifera (Ashwagandha), Calotropis procera (Sodom apple), and Semecarpus anacardium (Marking nut). Owing to their rich phytochemical composition, these plants have been traditionally employed in the management of various disorders, yet systematic comparative data on their bioactivities remain limited. In this investigation, antioxidant capacity was evaluated using the 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging method and total phenolic content (TPC) estimation, while cytotoxic potential was examined through the MTT assay against selected tumor cell lines. The findings revealed marked differences among the extracts. S. anacardium and C. procera demonstrated significantly higher cytotoxic activity with very low $IC_{50}$ values (1.4–1.6 µg/mL), suggesting strong antiproliferative effects. In contrast, W. somnifera displayed moderate cytotoxicity but exhibited notable antioxidant potential, supported by phenolic content and induction of apoptosis with reactive oxygen species (ROS) generation in A549 lung carcinoma cells. These results highlight the dual pharmacological roles of the herbs, where S. anacardium and C. procera emerge as potent cytotoxic agents, while W. somnifera shows a balanced profile with chemopreventive relevance. This comparative approach underscores the importance of natural products as promising leads in drug discovery and cancer chemoprevention. The study provides a basis for future research to isolate active compounds, validate mechanisms of action, and establish safety through in vivo models. Overall, the findings strengthen the ethnopharmacological value of these Ayurvedic herbs and suggest their potential integration into complementary therapeutic strategies.

**Keywords:** Ayurvedic herbs, Ethanolic extracts, Withania somnifera, Calotropis procera, Cytotoxic.

## THE NEW CHEMISTRY, MANUFACTURING, AND CONTROLS (CMC) REGULATIONS IN CHINA

Jay Samudralwar[1], Suganya M. S.[2]
[1]Regulatory CMC, Syner-G Biopharma Group, Southborough, MA 01772, USA
[2]Regulatory CMC, SNRG Pharma Consulting (India) Pvt. Ltd, Bannerghatta Road, Bangalore - 76, India
Suganya.Sampath@synergbiopharma.com

An overview of the revised drug regulations, application process, and the requirements for the post-approval CMC amendments in China is presented in this article. The National Medical Products Administration (NMPA) is the regulatory authority in China that is responsible for evaluation of the new drug registration applications and the amendments during the life cycle of the drug. NMPA launched the revised Drug Registration Regulations (DRR) in July 2020 and continued through 2024. This is the first major revision of the drug regulations in China since 2007 and has significant impact on how the new drug registration applications and life cycle amendments are filed and evaluated by the NMPA. China's adaptation to ICH and a comparison with US FDA, EMA, and PMDA regulations is discussed. The article provides an overview of the revised drug regulations, application process, and the requirements for the post-approval CMC amendments in China is presented. This is consistent with the recently published "Opinion" document (December 30, 2024) by China's General Office of the State Council which promises to deepen drug and medical device regulations, quality, and efficiency of the review and approval processes by 2027. The article provides an overview of the revised drug regulations, application process, and the requirements for the post-approval CMC amendments in China.

Keywords: China, NMPA, Drug registration regulation (DRR), post-approval CMC amendments, drug registration, regulatory approval process in China.

## EXPLORING THE POTENTIAL CHALLENGES FOR DEVELOPING GENERIC ORPHAN DRUGS FOR RARE DISEASES: A SURVEY OF US AND EUROPEAN MARKETS

GNK Ganesh
JSS College of Pharmacy, Ooty
gnk@jssuni.edu.in

The US Food and Drug Administration in 1983 and the European Union's European Medicines Agency in 2000 implemented the orphan drug development program for rare diseases. The study aimed to find the potential challenges encountered by generic companies in developing generics for rare diseases. We performed a thematic analysis, which consists of qualitative and quantitative research. For data analysis of approved orphan drugs, we used statistical methods, and for the industrial case study, we selected 14 generic companies and conducted semi structured interviews related to 10 critical areas of drug development. The orphan drug approvals were classified into 4 categories: the number of orphan approvals, pediatric claims, formulation, and therapeutic areas. We analyzed the approvals from 2001 to 2021; the Food and Drug Administration approved 815 drugs and European Medicines Agency approved 258 drugs. The pediatric orphan approvals were analyzed from 2010 to 2021; the average percentage of orphan drugs claim pediatric exclusivity during this period was found to be 31.8%. In formulation, we found the highest percentage of drugs belong to small molecules at 71%. In the therapeutic class, oncology drugs have a majority of approvals at 25%. The industrial case study responses revealed that the major challenge for drug development is the complexity of the disease at 21%, followed by the limited market at 17%. There is a high need for generic orphan drugs in the developing countries. The generic companies can use the opportunities provided by health authorities for the benefit of both the company and the patient perspective.

**RA-03**

## A CRITICAL REVIEW OF PCI DRAFT B. PHARM SYLLABUS 2025 IN THE CONTEXT OF NEP 2020

Santosh R. Tambe, Kiran B. Erande
Department of Pharmaceutical Chemistry, Mahatma Gandhi Vidyamandir's Pharmacy College, Panchavati, Nashik, Maharashtra, India - 422003.
santoshsrt.mgv@gmail.com

The Pharmacy Council of India (PCI) has introduced the Draft B.Pharm Syllabus 2025 with the stated aim of aligning pharmacy education with the principles of the National Education Policy (NEP) 2020. The new framework incorporates progressive reforms such as skill enhancement courses, integration of artificial intelligence and modern analytical tools, mandatory internships, and undergraduate research projects. These changes represent a significant improvement over previous rigid structure. However, despite these advancements, the draft syllabus does not fully meet the vision of NEP 2020. One major shortcoming is the absence of a multiple entry–exit framework, as the B. Pharm program continues as a fixed four-year degree without provisions for certificate or diploma awards at intermediate stages. Furthermore, although multidisciplinary exposure is emphasized, the syllabus remains predominantly Pharmacy-centric, limiting opportunities to pursue electives in non-pharmaceutical domains such as humanities, management, or law. The curriculum also continues to be English-exclusive, lacking regional language integration encouraged by NEP. While skill enhancement is mentioned, the credit distribution remains heavy for theory, and entrepreneurship or vocational training receives limited weightage. Similarly, undergraduate research is confined to the Pharmacy domain, with little focus on innovation labs, incubation, or start-up culture. Digital learning, blended credit transfer, and international exchange provisions are minimally addressed. Holistic aspects of NEP—such as integration of arts, culture, sports, and ethics—are also largely absent. Thus, although the PCI 2025 Draft is a step toward modernization, further reforms are required to achieve complete alignment with NEP 2020.

**RA-04**

## REDEFINING PHARMACEUTICAL REGULATION IN THE UNITED KINGDOM: A POST-BREXIT PERSPECTIVE

Lekha S, Arjun M, M P Venkatesh
Centre of Excellence in Regulatory Sciences, Department of Pharmaceutics, JSS College of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru - 570015, Karnataka
lekha2k07@gmail.com

The United Kingdom's withdrawal from the European Union has significantly transformed its pharmaceutical regulatory framework. Following Brexit, the Medicines and Healthcare products Regulatory Agency (MHRA) assumed full responsibility for the evaluation, approval, and oversight of medicines and medical devices in Great Britain, moving away from reliance on the European Medicines Agency. This transition created both challenges and opportunities, requiring the UK to design independent, agile, and innovation-driven regulatory mechanisms. This work draws upon a in-depth analysis of regulatory documents, policy updates, and published literature to outline key developments in the UK's evolving framework. These include the International Recognition Procedure (IRP), which facilitates faster approvals through reliance on trusted international regulators, and the Innovative Licensing and Access Pathway (ILAP), designed to accelerate access to medicines addressing high unmet needs. In addition, reforms in clinical trial regulations and the introduction of the Windsor Framework for Northern Ireland illustrate the complexities of balancing national autonomy with international alignment. Comparative analysis of pre- and post-Brexit regulatory landscapes reveals major challenges such as regulatory divergence, dual compliance burdens, and disruptions in pharmaceutical supply chains. At the same time, opportunities have emerged, including faster approval timelines, strengthened collaboration with global regulatory partners, and enhanced support for innovation. The MHRA's Data Strategy (2024-2027) further highlights the UK's forward-looking commitment to leveraging data, digital technologies, and real-world evidence to support regulatory decision-making. Overall, the post-Brexit UK regulatory framework illustrates a deliberate shift towards independence and innovation, while addressing the need to safeguard public health, ensure patient access, and sustain global competitiveness.

**Keywords:** MHRA, post-Brexit UK, Innovative Licensing and Access Pathway, International Recognition Procedure, Windsor Framework.

ISBN: 978-81-980623-8-3

## SUCCESS OF PRODUCING A 21ST CENTURY SKILLED TECHNICAL GRADUATE PHARMACIST TO MEET THE CHALLENGES OF THE INDUSTRY

Sanjay Pai P.N.
Department of Pharmaceutical Chemistry, Goa College of Pharmacy, Panaji, Goa, India – 403 001
pnsanjaypai@gmail.com

The scenario of industry in the 21st Century has oriented highly upon mechanized, automated physical resources and intellectually sound skillful human resources. However host of factors including theory oriented curriculum (85%), over-valued and repetitive practical experiences (65%), lack of exposure of students to learning under industry environment (5%), inability to provide teachers with appropriate teaching-learning qualities (30%) and most important being the absence of good assessment tools (15%) has brought in a big void in the demand supply situation with regard to making availability of skilled pharmacist acceptable by industry with due respect commensurate with consideration and privileges. Industry-ready skills are a combination of soft skills and technical (hard) skills that make a professional valuable to employers and highly effective in their roles. Key skills include communication, teamwork, problem-solving, adaptability, time management, and leadership. Domain-specific technical skills are data analytics, AI/Machine Learning, or programming languages such as Python. Gaining practical experience through internships, workshops, and networking is crucial for developing these skills and becoming industry-ready. Employers seek a blend of both to find candidates who are not only technically proficient but also capable of collaborating, learning, and contributing effectively in the workplace. Emphasis of this presentation is to highlight the need of dynamic and Curriculum with relevance. Relevance refers to how well an educational program connects with and serves the needs of its various stakeholders, including students, industry, and society. It means that the curriculum is applicable, practical, and up-to-date, helping learners understand real-world challenges, develop relevant skills for their future careers, and contribute meaningfully to society. Pharmacopoeia has been used as a fingerprint in this study to enable the understanding of technological revolution in industry requirements and coping up of the requirements by graduating pharmacy students. Curriculam study by students without extended learning during their final year hasnot brought a transition from 20th Century technical pharmacist to a 21st Century technical pharmacist.

**Keywords:** Pharmacy education, Industry, Curricula, Pharmacopoeia, Technology

## BENEFITS OF REGULATORY APPROVALS ON FOOD CHAINS IN INDIA

Thoudoju Sahithi, R. Prasanthi
Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka, Secunderabad – 500017, Telangana, India.
prasanthiroy@gmail.com

Before the 21st century, India's food sector was governed by multiple laws with different standards for additives, preservatives, colours, contaminants, and labelling, causing overlap and confusion. To address this, the Food Safety and Standards Authority of India (FSSAI) was established under the Ministry of Health & Family Welfare through the Food Safety and Standards Act, 2006. This Act consolidated earlier legislations like the Prevention of Food Adulteration Act, 1954, Food Product Order (FPO), and the Vegetable Oil Products Order, 1998, creating an integrated framework known as "One Nation, One Food Law." FSSAI lays down science-based standards for food and regulates its manufacture, storage, distribution, sale, and import to ensure safe and wholesome food for consumers. It also shifted the responsibility of food safety onto food businesses, ensuring accountability across the food chain. The main objectives of FSSAI are to protect public health, ensure uniform food standards, and facilitate safe, nutritious, and quality food for all.

**Keywords:** FSSAI, Authorities, Additives, Preservatives, FPO, Adulteration.

## A COMPARATIVE STUDY ON PRICING OF BRANDED AND GENERIC ORAL AND INJECTABLE ANTIBIOTICS

Neeraj Singh, Sowjanya Battu, B.A Vishwanath
Department of Pharmaceutics, Aditya Bangalore Institute of Pharmacy Education and Research, Bengaluru, India -560064
neeraj9820397346@gmail.com

Generic antibiotics play an important role in healthcare by offering a cost-effective alternative to brand- name antibiotics while maintaining the same safety and efficacy standards. The objective of this study is to analyze the price variation of different antibiotic brands available in Indian market. This is a cross-sectional study based on a questionnaire. A total of 50 shops have been involved in this study. The methodology used here is individual survey of Chemist and Druggist Shop and Pradhan Mantri Bhartiya Jan Aushadhi Kendra. The study was conducted by collecting sales data and price data of the above listed drugs and drug combinations along with its marketed company and price. The secondary data was collected from some verified websites and reviewing some literature and articles. It was found that generic drugs were found 50% - 83% less expensive compared to branded drugs. Norfloxacin + Tinidazole found to be highest followed by Cefixime and Clavulanate, whereas sales of branded version of injectable antibiotics Amoxicillin was found to be the highest selling drug. It can be concluded that a maximum of 90% and minimum of about 34% prices can be reduced by switching to generic drugs, which in turn can be used for other patients' requirement like nutrition, comfort and better quality of life.

**Keywords:** Antibiotics, Amoxicillin, Generic, Branded

**RA-08**

## COMPARATIVE STUDY OF INVESTIGATIONAL NEW DRUG APPROVAL PROCESS IN INDIA AND USA

Manoj N T, Sowjanya Battu, B A Vishwanath
Department of Pharmaceutics, Aditya Bangalore Institute of Pharmacy Education and Research, Bengaluru, India-560064.
manojnt25@gmail.com

The Investigational New Drug (IND) approval process plays a pivotal role in ensuring the safety, efficacy, and quality of pharmaceuticals before they reach the market. This study presents a comparative analysis of the regulatory frameworks governing IND applications in India and the United States, emphasizing similarities, differences, and implications for global drug development. In India, the process is regulated by the Central Drugs Standard Control Organization (CDSCO) under the Drugs and Cosmetics Act, 1940, whereas in the United States, the Food and Drug Administration (FDA) oversees the IND process as outlined in the Federal Food, Drug, and Cosmetic Act. Both frameworks focus on rigorous preclinical and clinical evaluations, ethical safeguards, and patient safety. However, the U.S. system demonstrates a more structured and predictable pathway, incorporating expedited programs such as Fast Track, Breakthrough Therapy, and Priority Review, which encourage innovation and accelerate patient access to life-saving drugs. In contrast, India's framework, though evolving rapidly, still faces challenges in transparency, efficiency, and global harmonization. The findings highlight that while both countries share the common goal of safeguarding public health, differences in timelines, application requirements, and regulatory infrastructure affect multinational drug development strategies. Harmonization of processes, adoption of international best practices, and strengthening of ethical and pharmacovigilance frameworks can enhance India's regulatory landscape. This comparative study underscores the importance of regulatory convergence to reduce redundancies, streamline multinational trials, and foster innovation, thereby contributing to the global availability of safe, effective, and affordable medicines.

**Keywords:** Investigational New Drug (IND), Drug Approval Process, CDSCO, FDA, NDCTR 2019, Clinical Trials, Regulatory Framework, Comparative Study, Drug Development, Ethics Committee.

## A PROSPECTIVE OBSERVATIONAL STUDY ON ANESTHETIC DRUG UTILIZATION AND SAFETY PROFILE AND COST ANALYSIS IN TERTIARY CARE HOSPITAL

R. Ganesh, Himaja. T, V. Rishma, K Sechana
Mallareddy Institute of Pharmaceutical Sciences, Malla Reddy Vishwavidyapeeth

ISBN: 978-81-980623-8-3

rayiniganesh@gmail.com

Anesthesia is a state of controlled, temporary loss of sensation or awareness. Depending on the requirement, it may induce analgesia, muscle relaxation, amnesia, or complete unconsciousness. Beyond its therapeutic role, rational use of anesthetics is crucial to enhance patient safety and reduce healthcare costs. To evaluate the utilization pattern of anaesthetics and assess their economic implications in a tertiary care teaching hospital. A six-month prospective observational study was conducted on 230 surgical cases where anesthesia was administered. Data on anesthetic type, patient demographics, drug combinations, and wastage were systematically recorded and analysed. Out of 230 cases, 64% received spinal, 31% general, and 5% local anesthesia, with 62% males. Common agents included propofol, sevoflurane, midazolam, thiopentone, glycopyrrolate, vecuronium, bupivacaine, lignocaine, and chlorprocaine. Bupivacaine wastage was 176.6 ml (₹2,913.9). Adverse effects included hypotension, bradycardia, nausea, delirium, and chills. Spinal anesthesia with bupivacaine, typically 3–4 ml, was the most common and effective technique. While anesthetics ensured safe surgical outcomes, the study highlights the need for better strategies to minimize wastage and optimize resource utilization. Rational monitoring of anesthetic practices can improve patient safety and healthcare efficiency.

**Keywords:** Anesthetics, utilization pattern, pharmacoeconomics, drug wastage, side effects.

**RA-10**

## BARRIERS TO ADOPTION OF QCI ACCREDITATION AMONG PHARMACY INSTITUTIONS: AN ANALYTICAL PERSPECTIVE

Surendra Agrawal, Pranita Jirwankar, Anil M. Pethe
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education & Research Sawangi (Meghe) Wardha, Maharashtra, India
anil.pethe@dmiher.edu.in

Accreditation serves as an essential mechanism for enhancing educational standards, institutional accountability, and stakeholder confidence. The Quality Council of India (QCI), through its accreditation frameworks, provides structured guidelines for ensuring quality assurance in higher education, including pharmacy institutes. Despite its benefits, a significant hesitation persists among pharmacy institutions to pursue QCI accreditation. This study examines the underlying reasons for such reluctance. Findings indicate that the primary barriers include limited awareness regarding the processes and long-term benefits of accreditation, perceived complexity of documentation, and financial constraints associated with meeting infrastructural and compliance requirements. Furthermore, inadequate training and support for faculty in adopting outcome-based education models and quality assurance practices contribute to institutional apprehension. Smaller private colleges, in particular, view accreditation as resource-intensive, with uncertainty about tangible returns on investment. Additionally, fear of external scrutiny and exposure of institutional shortcomings discourages active participation. Resistance to change, lack of administrative commitment, and insufficient alignment between regulatory mandates and institutional priorities further exacerbate hesitation. These challenges highlight the need for capacity-building initiatives, awareness programs, and financial or policy incentives to motivate institutions toward accreditation. Addressing these barriers can facilitate greater adoption of QCI accreditation, thereby promoting uniform standards and improved quality of pharmacy education. Ultimately, overcoming institutional hesitation is critical for producing competent pharmacy professionals aligned with national healthcare priorities and global standards.

**Keywords:** QCI accreditation, pharmacy education, institutional hesitation, barriers, quality assurance

**RA-11**

## COMPARATIVE STUDY OF FAST TRACK PATHWAYS FOR MEDICAL DEVICES: SFDA, USFDA, AND EMA

Ajmal Aboobacker Kumangal, Russell Martin
Department of Pharmaceutical Regulatory Affairs, Acharya & BM Reddy College of Pharmacy, Bengaluru, Karnataka – 560 107.
ajmalabu3344@gmail.com

The increasing complexity of medical devices, driven by technological innovations such as artificial intelligence and 3D printing, along with the rising prevalence of chronic diseases, has intensified the global demand for regulatory systems that ensure timely patient access while maintaining safety and efficacy. To meet this need, leading regulatory authorities—including the U.S. Food and Drug Administration (USFDA), the European Medicines Agency (EMA), and the Saudi Food and Drug Authority (SFDA)—have established expedited or fast-track pathways designed to accelerate approval for innovative medical devices addressing serious or life-threatening conditions. While these pathways share the common objective of improving patient access, they have demonstrated significant differences in regulatory structures, eligibility requirements, review processes, evidence standards, and post-market surveillance systems, creating barriers for manufacturers navigating multiple jurisdictions. This study presents a comparative analysis of the fast-track pathways of the USFDA, EMA, and SFDA using a mixed-methods design that integrates quantitative data on approval timelines, review durations, and performance outcomes with qualitative assessments of regulatory frameworks, guidance documents, and policy approaches. By systematically evaluating six dimensions—regulatory structure, eligibility, review procedures, performance metrics, post-market surveillance, and economic impact—the study has identified similarities, differences, and best practices, while also highlighting opportunities for harmonization. The findings provide evidence that can support policymakers, regulators, and industry stakeholders in enhancing regulatory efficiency, reducing duplication, and strengthening global access to innovative, life-saving medical technologies.

**Keywords:** Fast-track pathways, Medical devices, USFDA, EMA, SFDA

**RA-12**

## STRATEGIES FOR ENHANCING IQ DEVELOPMENT THROUGH TEACHING LEARNING PRACTICES IN PHARMACY

Pravina Gurjar, Surendra Agrawal
Jagdamba Institute of Pharmacy & Research, Kalamb, Yavatmal, MS, India 445401
pravinagurjar.pusad@gmail.com

The majority concur that IQ is a significant metric for assessing cognitive capacity, problem-solving proficiency, and adaptability in dynamic learning contexts. Pedagogical practices are crucial in higher education as they influence student learning and cognitive development. This poster examines research-supported strategies that employ reflective assessment, learner engagement, and innovative pedagogical approaches to facilitate IQ enhancement. Utilizing active learning methodologies that foster analytical and critical thinking, such as case studies, problem-based learning, and simulation exercises, is crucial. Digital instruments such as interactive assessments and adaptive learning platforms enhance the personalization of the teaching and learning process according to each student's cognitive capacity. Group talks and peer-to-peer training exemplify collaborative learning approaches that enhance social intelligence and communication abilities. Both abilities are intricately associated with an overall increase in IQ. Additionally, learners can receive immediate feedback from formative exams, which can enhance their problem-solving abilities and metacognitive awareness. The poster illustrates the significance of aligning curriculum design with Bloom's taxonomy and appropriate competencies to progressively enhance higher order thinking skills. It emphasizes the vital role of faculty members in fostering an environment that promotes curiosity, creativity, and resilience qualities essential for sustained intellectual advancement. This outcome emphasizes that good teaching and learning strategies go beyond simple knowledge transfer; they operate as catalysts for quantifiable IQ improvement by merging theoretical concepts with practical applications. It is important to equip educators with effective techniques to foster intellectual growth, preparing kids for academic success and real-world difficulties.

**Keywords:** IQ development, teaching learning, active learning, cognitive skills, higher-order thinking

**RA-13**

## REGULATORY PATHWAYS FOR BIOSIMILARS: A COMPARATIVE STUDY OF US, EUROPEAN UNION, AND INDIAN APPROACHES

Swapna Deepthi, Khanam Firdos, MJ Kavya, Krupanka, TM Harshitha, Thomas Anila

ISBN: 978-81-980623-8-3

Department of Regulatory Affairs, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India
firdoskhanambsf@gmail.com

This Comparative study investigates the approval processes for biosimilars in the United States, the European Union, and India, highlighting the similarities and differences among these three regions. To encourage a thriving biosimilars business, the European Medicines Agency (EMA) has established strong regulatory criteria that center on a thorough evaluation of quality, safety, and efficacy. The 2009 Biologics Price Competition and Innovation Act (BPCIA) in the US, on the other hand, created a distinct regulatory process that gave efficiency and cost-effectiveness first priority. This comparative study addresses key regulatory issues, including the regulatory framework, guidelines, preclinical and clinical requirements, and post-marketing surveillance. The primary objective of this research is to inform stakeholders, including regulators, pharmaceutical companies, and healthcare providers, about the evolving landscape of biosimilars and to advocate for a comprehensive strategy that encourages innovation while ensuring patient safety and access to affordable treatments.

**Keywords:** Biosimilar Regulation, Reference product, USFDA, CDSCO, EMA, Regulatory framework, Regulatory pathways, Comparative studies, Approaches.

**RA-14**

## DRUG PRICING AND INDUSTRY- CONSUMER RELATIONS: A CROSS-COUNTRY VIEW OF REGULATORY IMPACT

Dakshatha M, Shivanand K Mutta, Russell Martin
Department of Pharmaceutical Regulatory Affairs, Acharya and B M Reddy College of Pharmacy, Bengaluru, Karnataka, India-560107
dakshum123@gmail.com

The role of government-led regulatory mechanisms on drug pricing and their influence on industry–consumer relations across India, the United States, and Australia was analyzed. The objective of this study was to examine how diverse regulatory frameworks—such as India's price caps under the National Pharmaceutical Pricing Authority (NPPA), the United States' market-driven yet increasingly scrutinized drug pricing influenced by trade tariffs, and Australia's Pharmaceutical Benefits Scheme (PBS)—impact affordability, accessibility, and trust between the pharmaceutical industry and consumers. Key regulatory strategies, including reference pricing, reimbursement models, and price negotiations, were assessed to understand their consequences on cost control, innovation incentives, and patient-centric outcomes. Findings highlight that while strict price regulation in India improves affordability, it may challenge industry profitability; the U.S. system fosters innovation but often raises affordability concerns; whereas Australia demonstrates a balanced approach through government-subsidized access and transparent negotiations. The comparative evaluation suggests that sustainable drug pricing requires regulatory mechanisms that simultaneously address affordability, industry growth, and consumer trust. This emphasizes the need for harmonized approaches that integrate patient welfare with economic viability to strengthen industry–consumer relations across healthcare systems.

**Keywords:** Drug pricing, regulatory mechanisms, NPPA, United States, PBS.

**RA-15**

## COMPARATIVE ANALYSIS OF MARKETING AUTHORIZATION PROCEDURES FOR BIOLOGICS IN SRI LANKA, BHUTAN, AND MALDIVES

Pavana.k, Shivanandh K Mutta, Russel Martin
Department of Pharmaceutical Regulatory Affairs, Acharya and B M Reddy
College of Pharmacy, Bengaluru, Karnataka, India-560107
pavanak2285@gmail.com

Although biologics have emerged as a vital class of medicines, little is known about how they are regulated in the smaller SAARC nations. In order to highlight regulatory strengths, weaknesses, and opportunities for harmonization, this study compared the marketing authorization procedures for biologics in Sri Lanka, Bhutan, and the Maldives. Official guidelines, national medicines laws, and World Health Organization (WHO) joint registration frameworks relevant to biologics were examined as part of a qualitative regulatory evaluation. Through the National Medicines Regulatory Authority (NMRA), Sri Lanka has implemented reference-country dependency models, structured dossier requirements, and WHO cooperation routes. Biologics-specific documentation is scarce, although Bhutan is still growing under the Bhutan Food and Drug Authority (BFDA) in accordance with the Medicines Rules 2019. The Maldives' reliance on imports is demonstrated by the fact that the Maldives Food and Drug Authority (MFDA) provide basic guidelines for drug registration but lacks specific guidelines for biologics. The results demonstrate how the three nations differ in their post-marketing surveillance practices, dossier formats, and reliance on WHO prequalification. The study concludes that while Bhutan and the Maldives need to develop their competence, develop guidelines tailored to biologics, and devise plans to integrate their legislation, Sri Lanka has a reasonable level of regulatory maturity. These insights can be used to ensure that biologics are better controlled in SAARC nations with limited representation and to reform laws.

**Keywords:** Biologics, Sri Lanka, Bhutan, Maldives, marketing authorization.

**RA-16**

## LEGAL AND ETHICAL CHALLENGES IN CROSS-BORDER E-PHARMACY PRACTICES: A REGULATORY PERSPECTIVE IN EUROPEAN UNION

B. Divyasree, Shivanand K Mutta
Department of Pharmaceutical Regulatory Affairs, Acharya and B M Reddy College of Pharmacy, Soldevanahalli, Bangalore, Karnataka, India-560107
dsree7766@gmail.com

The rapid expansion of digital health services across the European Union (EU) has significantly transformed healthcare delivery, with e-pharmacies emerging as a critical channel for improving access to medicines. While cross-border e-pharmacy practices offer convenience, accessibility, and efficiency, they simultaneously raise complex legal and ethical challenges that demand regulatory attention. This dissertation critically examines the fragmented regulatory landscape governing e-pharmacies in the EU, focusing on data protection, consumer rights, and medicine safety. Key legislative instruments such as the General Data Protection Regulation the E-Commerce Directive, and the Falsified Medicines Directive provide foundational safeguards, yet variations in interpretation and enforcement across member states create inconsistencies that undermine patient safety and trust. Ethical concerns including equitable access, digital literacy disparities, and informed consent further complicate governance. The study undertakes a structured review of literature, regulatory documents, and comparative case analyses from selected EU nations to evaluate the effectiveness of current frameworks. Findings highlight gaps in harmonization, jurisdictional ambiguities, and insufficient attention to vulnerable populations, which collectively hinder the establishment of a cohesive digital pharmacy ecosystem. This research emphasizes the need for a harmonized EU-wide regulatory model that integrates legal consistency with ethical principles, thereby ensuring safe, transparent, and equitable cross-border e-pharmacy practices. Ultimately, the dissertation aims to contribute to policy development by proposing actionable recommendations to strengthen governance, enhance patient trust, and support the EU's vision of a secure and inclusive digital health environment.

**Keywords:** Cross-border e-pharmacy, European Union, GDPR, Falsified Medicines Directive, E-Commerce Directive, digital health ethics, pharmaceutical regulation, patient safety, legal harmonization, equitable access.

**RA-17**

## A REGULATORY EVALUATION OF ACCELERATED DRUG APPROVAL PATHWAYS AS PER USFDA, EMA, AND CDSCO

Sindhu G R, Shivanand K Mutta, Russell Martin
Department of Pharmaceutical Regulatory Affairs, Acharya and B M Reddy College of Pharmacy, Bengaluru, Karnataka, India-560107
Sindhugr6666@gmail.com

Accelerated approval mechanisms designed to bring therapies for serious or unmet medical needs to patients more rapidly differ substantially across the US, EU, and India in eligibility criteria, evidentiary standards, post-market obligations, and operational practice. The US FDA's suite of expedited programs and its Accelerated Approval pathway

ISBN: 978-81-980623-8-3

permit marketing based on surrogate or intermediate endpoints judged reasonably likely to predict clinical benefit, but require timely confirmatory trials and increased regulatory oversight to manage residual uncertainty. The EMA offers conditional marketing authorisations and accelerated assessment (and supportive initiatives such as PRIME) that similarly enable earlier access while explicitly tying approval to defined post-authorisation evidence generation and risk-management measures. India's regulatory framework under the NDCT Rules 2019 and CDSCO guidance provides provisions for accelerated review particularly in public-health emergencies and for products addressing unmet needs but faces practical challenges in harmonising data requirements, infrastructure, and post-market surveillance capacity with global counterparts. Key cross-cutting issues include: balancing speed with evidence robustness; designing and enforcing meaningful confirmatory-trial commitments; aligning global regulatory expectations to avoid duplicative or contradictory data demands; and strengthening pharmacovigilance systems to detect and mitigate risks after early approval. Comparative analysis indicates that success of accelerated pathways depends less on the existence of legal mechanisms than on predictable evidentiary standards, transparent timelines for confirmatory evidence, and regulatory capacity to monitor real-world outcomes elements critical to preserving public trust while enabling timely patient access to innovation.

**Keywords:** USFDA, EMA, CDSCO, Accelerated pathway, NDCT rules 2019.

**RA-18**

## CHALLENGES IN BIOSIMILAR APPROVALS AND INTERCHANGEABILITY

Shubhada Davkhar, Vinita Kale, Suankit Harane, Milind Umekar
Department of Regulatory Affairs, Smt. Kishoritai Bhoyar College Pharmacy, Kamptee Dist. Nagpur Maharashtra -41002
Shubhada3347@gmail.com

Biosimilars are highly similar to approved biologics, offering no clinically meaningful differences while providing cost-effective alternatives that enhance patient access to life-saving therapies. However, achieving regulatory approval and interchangeability remains a major challenge due to variations in global requirements and scientific complexities. Regulatory agencies such as the European Medicines Agency (EMA), the U.S. Food and Drug Administration (USFDA) and the Central Drugs Standard Control Organization (CDSCO) in India follow distinct approval pathways. While all emphasize demonstrating similarity in quality, safety and efficacy, requirements for comparability data, clinical studies and pharmacovigilance vary considerably. These differences often delay biosimilar launches and complicate global market entry. Key challenges in biosimilar development include proving analytical and clinical comparability with the reference product, addressing immunogenicity concerns across diverse patient populations, navigating regulatory inconsistencies and overcoming patent exclusivity barriers. Interchangeability poses an additional hurdle: unlike generics, biosimilars must undergo switching studies to confirm safe substitution without prescriber intervention. The absence of automatic interchangeability impacts physician confidence, slows patient acceptance and necessitates robust pharmacovigilance to ensure long-term safety. In conclusion, biosimilars represent a vital strategy to reduce healthcare costs and improve therapeutic accessibility. Strengthening regulatory harmonization, ensuring comprehensive safety monitoring and promoting awareness among healthcare providers are crucial to fostering trust and wider adoption. Addressing these scientific, regulatory and market challenges will be essential to realize the full potential of biosimilars in clinical practice.

**Keywords:** Biosimilars, Interchangeability, Regulatory Pathway, Analytical Compatibility, Immunogenicity, Biological Approval.

**RA-19**

## REGULATORY FRAMEWORK OF MELATONIN AND AMLA BASE GUM PAINT FOR THE TREATMENT OF GINGIVITIS

Tushar Kumbhare, Neha Raut, Vinita Kale, Milind Umekar
Department of Regulatory Affairs, Smt. Kishoritai Bhoyar College of Pharmacy Kamptee, Nagpur, Maharashtra, India- 441002.
tkumbhare81@gmail.com

Gingivitis is a prevalent oral disease characterized by gingival inflammation and microbial plaque accumulation, usually evolving to periodontitis if not treated. Classical treatments rely mainly on synthetic drugs which, though effective, could provoke unwanted effects like irritation and allergy. This work introduces an innovative, plant-based gum paint composition with Melatonin and Amla (Emblica officinalis), known for anti-inflammatory, antioxidant and antimicrobial activities, with a view to creating a less toxic, patient-friendly alternative. Six trial batches were prepared and evaluated for primary pharmaceutical attributes such as physical properties, spreadability, drug content uniformity, in-vitro release profile, and antibacterial activity. Nine formulations (F1–F9) were developed and assessed for physicochemical attributes (pH, viscosity, spreadability, drug content uniformity), in-vitro release, and antibacterial activity. Among these, Formulation F6 (Amla 60 mg + Melatonin 40 mg) demonstrated the most favorable profile, with optimal viscosity, acceptable pH, and the highest antimicrobial activity producing inhibition zones up to 20 mm against Escherichia coli and 18 mm against Staphylococcus aureus. In comparison, F4 showed moderate activity (~12.5 mm), while F5 was least effective (~10–11 mm). The optimized batch (F6) of Amla and Melatonin gum paint proved effective against gingivitis with strong antimicrobial activity. Regulatory compliance was established by conforming the product development process to ICH Q8 (R2) guidelines. A detailed Product Development Report (PDR) recorded formulation rationale, excipient functions, manufacturing approach, and quality determinations. In summary, the herbal gum paint synthesized provides a safe, biocompatible, and efficient option for gingivitis treatment, marking an important step in natural oral care products.

**Keywords:** Gingivitis, Herbal Gum Paint, Melatonin, Amla, ICH Q8 (R2).

**RA-20**

## REGULATORY CONSIDERATIONS FOR DEVELOPMENT AND EVALUATION OF CINNAMALDEHYDE BASED MUCOADHESIVE PATCHES FOR RECURRENT APHTHOUS STOMATITIS (RAS)

Akash Gawande, Neha Raut, Vinita Kale, Milind Umekar
Department of Regulatory Affairs, Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee Dist. Nagpur, Maharashtra, India - 441002
gawandeakash062@gmail.com

Recurrent aphthous stomatitis (RAS) is a common and painful, recurring ulcer that impair eating, speaking and daily comfort, particularly women and those experiencing stress or nutritional deficiencies. Despite its frequency, there remains a shortage of effective, long-retention, localized therapies in India. This study focused on the development and optimization of innovative cinnamaldehyde based buccal mucoadhesive patches, designed for patient-friendly and targeted RAS treatment. The mucoadhesive patches were prepared by solvent casting, utilizing hydroxy ethyl cellulose (HEC), polyvinyl alcohol (PVA) and other excipients. Cinnamaldehyde was selected for its well-established antimicrobial and wound healing properties. Using a $3^2$ full factorial design, the quantities of PVA and EC were optimized to maximize drug content and manage film thickness. The optimized patch exhibited high drug content (88.73±0.23%), uniform thickness (0.1923 mm), adequate tensile strength and neutral pH. In vitro studies revealed sustained drug release and notable antimicrobial activity against E. coli (15 mm) and S. aureus (14 mm). Regulatory considerations were integrated at every stage, with documentation conforming to the Common Technical Document (CTD) structure. The Product Development Report (PDR) provided justification for excipient choices, formulation and optimization, while detailing adherence to Schedule M (GMP), ICH Q8-Q10 and CDSCO guidelines. The absence of similar products in India but presence of global precedents like DenTek Canker Cover® underscores the need for harmonized local phytobased regulatory guidance. This project demonstrates a robust, regulatory-ready framework with significant commercialization scope for safe, herbal therapy in RAS.

**Keywords:** Cinnamaldehyde, Mucoadhesive Patch, Buccal Drug Delivery, CDSCO, Factorial Design.

## REGULATORY LANDSCAPE AND GAPS FOR NANOTECHNOLOGY-BASED NUTRACEUTICALS IN INDIA: A GLOBAL COMPARATIVE PERSPECTIVE

Vaishnavi Fandi, Vinita Kale, Shubhada Mangrulkar, Milind Umekar
Department of Regulatory Affairs, Smt. Kishoritai College of Pharmacy, Kamptee Dist. Nagpur 441002
Vaishnavifandi@gmail.com

ISBN: 978-81-980623-8-3

Nanotechnology has emerged as a transformative tool in the nutraceutical sector, offering enhanced bioavailability, targeted delivery, and stability of bioactive compounds. Despite these advancements, the regulatory framework governing nanotechnology-based nutraceuticals remains underdeveloped, particularly in India. Currently, India regulates nutraceuticals under the Food Safety and Standards Authority of India (FSSAI) through the Food Safety and Standards Regulations, 2016, but no explicit provisions exist for nanomaterials or nanoscale formulations. In contrast, global regulatory bodies such as the U.S. FDA, European Food Safety Authority (EFSA), and Health Canada have initiated guidance on nanotechnology applications in food and dietary supplements, emphasizing safety assessment, toxicological evaluation, and labeling requirements. This poster aims to map the existing Indian regulatory landscape for nutraceuticals, highlight regulatory gaps concerning nanotechnology-based products and provide a comparative perspective with established international frameworks. The analysis underscores the urgent need for India to develop specific guidelines addressing safety, quality, and risk assessment of nanonutraceuticals, aligned with global best practices. Establishing such a framework would ensure consumer safety, promote innovation, and strengthen India's position in the global nutraceutical market.

**Keywords:** Nanotechnology, Nutraceuticals, Regulation, FSSAI, FDA, EFSA, Global Harmonization

**RA-22**

## REVAMPING PHARMACY EDUCATION: A COMPARATIVE ANALYSIS OF NEP 2025 VS TRADITIONAL B. PHARM CURRICULUM

Sanskruti Kawale, Tirupati Rasala, Shubham Kamble
The Royal Gondwana College of Pharmacy, Nagpur
sanskrutikawale08@gmail.com

The evolution of pharmacy education under the National Education Policy (NEP) 2020 brings a new multidisciplinary approach to shaping the future of pharmacists. The revised B Pharm General curriculum aims to produce well-rounded professionals capable of adapting to the dynamic pharmaceutical landscape. This paper compares two B Pharm curricula: one following NEP guidelines (2025) and the older framework (2014). The NEP framework emphasizes holistic and interdisciplinary learning, incorporating major courses, skill enhancement, and value-added courses in the first four semesters. A notable feature of the NEP curriculum is the introduction of two specializations: Industrial Pharmacy and Clinical Pharmacy, which commence in the 5th semester. It also integrates advanced topics like Artificial Intelligence and Machine Learning, ensuring that students are prepared for modern technological advancements in pharmacy. The curriculum is designed to foster experiential learning, with mandatory internships and research projects embedded throughout. In contrast, the older curriculum maintains a more traditional approach, focusing mainly on foundational pharmaceutical sciences. While it offers fewer opportunities for interdisciplinary learning, the older framework remains robust in its theoretical and practical components. This comparative analysis highlights how NEP's flexibility, inclusivity, and focus on emerging technologies will better equip students for the challenges and opportunities in global healthcare and pharmaceutical industries. The adoption of this curriculum positions India as a leader in global pharmacy education by blending traditional knowledge with modern methodologies.

**Keywords:** NEP 2020 Pharmacy Education, Multidisciplinary Pharmacy Learning, Pharmacy Education in India, Future Pharmacists Training, Pharmacist Skill Development, Artificial Intelligence in Pharmacy.

**RA-23**

## REGULATORY CHALLENGES AND OPPORTUNITIES FOR ENHANCING HUMAN-AI INTERACTION IN SOFTWARE AS A MEDICAL DEVICE: A COMPARATIVE STUDY OF TGA AND USFDA GUIDELINES

Yashaschandra, Russell Martin
Acharya & BM Reddy College of Pharmacy, Bengaluru- 560107, Karnataka, India
ycrw24@gmail.com

The emergence of Software as a Medical Device (SaMD) is currently reshaping the digital paradigm of the healthcare sector. This study explores the rapidly evolving domain of digital health technologies ranging from wearable devices that track real-time health data to AI-powered diagnostic systems. AI/ ML-based SaMD enables early diagnosis, personalized care and predictive monitoring. These innovations promise to enhance patient outcomes, streamline the clinical workflows and reduce healthcare costs. This study provides an in-depth research of the current status and advancements in SaMD and the regulatory frameworks that govern their development and use. The current research gap demands attention to Human-AI Interaction (HAII), ensuring users can understand, trust and control AI-driven outputs. The study aims to understand the trajectory of digital health regulation through comparative insights, policy development along with the regulatory gaps to be addressed. This paper offers a detailed examination of the regulatory approaches, adopted by the United States Food and Drug Administration (USFDA) and Australia's Therapeutic Goods Administration (TGA) in SaMD and provides necessary directions for integration of digital governance and AI- related healthcare systems.

**Keywords:** Software as Medical Device, Regulatory Framework, Human-AI Interaction, TGA, USFDA

**RA-24**

## BREAKING BARRIERS: UNITING ACADEMIC RESEARCH AND INDUSTRIAL EXPERTISE FOR PHARMACEUTICAL ADVANCEMENTS

CS Mujeebuddin
ClinoSol Research Private Limited, Hyderabad, India
mujeeb@clinosol.com

The pharmaceutical industry is undergoing a transformative phase, where the integration of academic research and industrial expertise is critical to advancing clinical trials and clinical research. Despite significant progress, a persistent gap exists between theoretical knowledge and practical application, often leading to inefficiencies in drug development and regulatory compliance. This study explores the urgent need for structured collaboration between academia and industry, emphasizing co-curriculum development, skill-based training, and shared infrastructure to bridge this divide. Key challenges such as protocol design complexities, patient recruitment bottlenecks, and real-world data integration highlight the necessity of academia-industry partnerships. By incorporating industry-relevant modules into academic curricula-such as Good Clinical Practice (GCP), clinical data management, and regulatory affairs-educational institutions can produce job-ready professionals tailored to industry needs. Case studies from successful collaborative models demonstrate how joint initiatives in adaptive trial designs, decentralized trials, and AI-driven analytics can accelerate translational research. The proposed framework advocates for policy reforms, including standardized co-curricular programs internships and joint research grants to foster a symbiotic ecosystem. These efforts not only enhance the quality and efficiency of clinical research but also address India's potential to become a global hub for innovative trials. By breaking silos and uniting stakeholders, this approach paves the way for sustainable advancements in pharmaceuticals, ensuring better patient outcomes and economic growth.

**RA-25**

## MODERNIZING INDIA'S DRUG SUBMISSIONS: EMBRACING ECTD 4.0 FOR INTERNATIONAL REGULATORY ALIGNMENT

Abhishek Reshmi, Shivanand K Mutta, Russell Martin
Department of Drug Regulatory Affairs, Acharya & B M Reddy College of Pharmacy,
Bangalore, Karnataka - 560107
abhishekreshmi2@gmail.com

The Common Technical Document (CTD) and its electronic variant (eCTD) have become global standards in pharmaceutical regulatory submissions, streamlining drug approval processes through standardized, accessible documentation. While advanced regulatory markets are transitioning to eCTD 4.0, which offers enhanced lifecycle management, data reusability via UUIDs, improved metadata, and better support for modern regulatory technologies, India's regulatory system continues to rely on outdated submission formats. This research critically analyzes the need for India to adopt eCTD 4.0 in the context of accelerating global harmonization. A mixed-methods approach is proposed: literature review, comparative analysis of regulatory frameworks, and primary data collection via structured surveys and interviews with Indian pharmaceutical professionals. Preliminary review highlights significant barriers including inadequate technical

ISBN: 978-81-980623-8-3

infrastructure, lack of specialized human resources, and affordability challenges that could impede rapid transition. Nevertheless, adoption of eCTD 4.0 is imperative to avoid regulatory isolation, mitigate submission inefficiencies, and facilitate access to international markets. The study aims to benchmark India's current status against global trends, identify adoption barriers and enablers, and develop actionable recommendations for policymakers and industry to enable a seamless and competitive shift towards eCTD 4.0, securing global compliance and enhancing the country's pharmaceutical export outlook.

**Keywords:** eCTD 4.0, UUIDs, Metadata, Harmonization, Global Compliance.

**RA-26**

## COMPARATIVE STUDY OF THE STRINGENCY OF REGULATIONS FOR MENSTRUAL PRODUCTS BETWEEN USFDA AND HEALTH CANADA AND DEVELOPING COUNTRIES

Zachariah Christopher M, Shivanand K Mutta
Department of Pharmaceutical Regulatory Affairs, Acharya & BM Reddy College of Pharmacy, Bengaluru, Karnataka– 560 107.
christozachever7z@gmail.com

In this current research, we are comparing the difference of stringency and the lack of regulations in the usage of menstrual products in USFDA, Health Canada and the developing countries. This research emphasises that a proper stringent regulation can bring more development and hygiene in terms of menstrual related aspects. In Health Canada, they have different regulations that helps to maintain hygiene and help workers to have a relaxation cause they have proper regulations over menstrual tampons officially whereas in USFDA, regulations like 510k act as a cushion for the improvement more effective tampon products, these products are monitored by CDRH apart from FDA so that can be under the radar in both pre marketing and post marketing situations. The worldwide showcase also esteems a value of 37 million US dollars but still many developing countries can't afford, or the public are not even aware of certain products. 65% of women in Kenya who live below the poverty line have either no awareness or can't afford to buy tampons. So, to conclude, proper awareness and menstrual health can be preserved by introducing proper regulation in developing countries that have indirect regulations. Direct regulations should be brought in to maintain a very friendly environment like Health Canada and a stringent regulation can help a country to supply the needed tampons to other needy country like how USFDA does to a country like Uganda.

**Keywords:** CDRH, Worldwide value, 510k, Tampons.

**RA-27**

## PHARMACOECONOMICS AS STRATEGIC TOOL FOR SUSTAINABLE HEALTHCARE IN INDIA: A PHARMACEUTICAL MANAGEMENT PERSPECTIVE

Khyati Singh, Pravin Kumar Sharma, Sumeet Dwivedi, G.N Darwhekar
Acropolis Institute of Pharmaceutical Education and Research, Indore (M.P.), India– 453771
khyatisingh.bph24@acropolis.edu.in

India has emerged as the "pharmacy of the world," supplying affordable generics globally. Yet, domestic healthcare affordability remains a challenge, with 65% of healthcare expenditure being out of-pocket and nearly 30% of rural households lacking access to essential medicines. Rising treatment costs and limited insurance coverage highlight the urgent need for sustainable healthcare models. Pharmacoeconomics examines the costs and outcomes of drug therapies, provides an evidence-based frames. This study aims to explore the role of pharmacoeconomics in supporting sustainable healthcare delivery in India and to analyze how pharmacoeconomics evaluations can guide pharmaceutical management in policy, pricing, and rational drug use. A narrative review was conducted using data from WHO, ICMR, National health policy reports, and peer-reviewed studies (2015–2025). Findings indicate that adoption of cost-effective generics and biosimilar can lower therapy costs by 30–50%, improving patient access. Health technology assessment (HTA) driven decision-making has demonstrated potential in rationalizing formularies, reducing wastage, and ensuring equitable drug distribution. However, challenges persist due to lack of standardized data, minimal awareness among policymakers, and inadequate integration into regulatory frameworks. Strengthening pharmacoeconomic frameworks can reduce patient burden, enhance rational drug selection, and support the realization of universal health coverage (UHC) by aligning affordability, accessibility, and equity.

**Keywords:** Pharmacoeconomics, pharmaceutical management, sustainable healthcare, health technology assessment (HTA), universal health coverage (UHC)

**RA-28**

## A SURVEY ON PREFERENCE ABOUT GENERIC AND BRANDED MEDICINES IN PEOPLE

Mahesh M Shettar, Ruhana
Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka, Bengaluru-560064
mshettar060@gmail.com

Generic medicines are those which are marketed without any brand but only with the name of the therapeutically active drug. As generic medicines are cheaper in cost there is a misconception that they are of inferior quality. This survey was conducted to assess the opinion of the public about generic medicines, and the responses were collected through the questionnaire listed in a Google form from 4/7/2025 to 10/8/2025. 107 participants completed the conducted survey. 54.2% of responders stated that the branded medicines obtain a greater potency and efficacy than generic medicines. 71% of responders do not know about the New Pharmaceutical Policy 2017 which recommends the e-prescriptions for generic medicines. 26.2% responders state that doctors prescribe branded drugs. This survey concludes by suggesting the enhancement of awareness among the general public about the generic medicines and on the other hand suggests enhancing the maintenance of quality, potency and efficacy of generic drugs as of branded drugs.

**Keywords:** Marketed drugs, Generic medicines, E-prescriptions, Misconception

## MULTI-TARGET NEUROPROTECTIVE EFFECTS OF RUTIN IN ALCOHOL WITHDRAWAL-INDUCED DEPRESSION: INSIGHTS FROM NETWORK PHARMACOLOGY, MOLECULAR DOCKING, AND IN VIVO EVALUATION

Prashant Mali, Deepti Bandawane
Progressive Education Society's Modern College of Pharmacy, Nigadi Pune, Savitribai Phule Pune University Pune 411007
prashantdmali55@gmail.com

Alcohol withdrawal-induced depression (AWD) represents a significant neuropsychiatric complication from chronic alcohol consumption, characterized by oxidative stress, neuroinflammation, and disrupted neurotransmitter signaling. This study investigates rutin's therapeutic potential through network pharmacology, molecular docking, and in vivo evaluations. Network pharmacology identified key targets like TNF-α, NMDA receptor, and PI3K/AKT pathway, while molecular docking showed strong binding affinities of rutin to these targets (binding energy for TNF-α: −9.2 kcal/mol; NMDA receptor: −8.5 kcal/mol). In vivo experiments were conducted on Wistar rats (n = 8 per group) in seven groups: Normal Control, Ethanol Control, Rutin (50, 100, 200 mg/kg), Memantine (20 mg/kg), and Rutin 50 mg/kg + Memantine 20 mg/kg. Behavioral outcomes showed reduced immobility time in FST and TST in the rutin 200 mg/kg group versus Ethanol Control, with increased sucrose consumption in SPT and improved OFT exploration, indicating antidepressant effects. Rutin (200 mg/kg) significantly decreased MDA and NO levels while increasing antioxidant enzymes SOD, CAT, and GSH (***$p < 0.001$ vs. Ethanol Control). Pro-inflammatory cytokines TNF-α, IL-1β, and IL-6 were downregulated (***$p < 0.001$), and neurotransmitter analysis showed restored GABA (***$p < 0.01$) and reduced glutamate levels (***$p < 0.01$). The combination of rutin (50 mg/kg) and memantine (20 mg/kg) produced synergistic improvements compared to monotherapy (**$p < 0.01$). In conclusion, rutin particularly at 200 mg/kg, exerts a significant neuroprotective and antidepressant effect in alcohol withdrawal-induced depression by targeting inflammation, oxidative stress and neurotransmitter dysregulation, supporting its potential as a multi-target phytotherapeutic candidate for managing AWD.

**Keywords:** Alcohol withdrawal syndrome, rutin, flavonoids, neuroprotection, NMDA receptor, oxidative stress, neuroinflammation, network pharmacology, molecular docking, Depression.

**BIBLIOGRAPHIC ANALYSIS TO MAP THE RESEARCH LANDSCAPE OF GREEN POLYMERS**

N. Triveni, P. Raveesha
Department of Pharmacognosy V. V. Institute of Pharmaceutical Sciences, Gudlavalleru
Andhra Pradesh, India. 521356
triveni2284@gmail.com

The increasing demand for environmental issues within the pharmaceutical industry has proved that, in contrast to biodegradable, life-compatible, nontoxic eco-friendly plastics and traditional synthetic materials are actually the best alternative. This is a comprehensive bibliometric overview of global research output in many disciplines within the scope of eco-friendly polymers as captured by the Scopus database. The key contributors, leading institutions and major funding agencies are identified to be paramount in the shaping of this research landscape. Results show that the output of this academia predominantly occurs within countries such as India and China, particularly those areas of knowledge such as materials science, chemistry, and engineering that have been more prominent in terms of shares of publication. Dominant trends in the research happen to occur in areas of sustainable and clean technologies as well as in the disciplines of polymer science, environmental science, and energy. The analysis also tracks the exponential growth in research output starting from 2016 peaking in 2024 with an accelerating increase in the number of published papers. Through collaborative activity, research topics and sources of funding this investigation highlights major driving factors for the increase in science output while focusing on the interdisciplinary nature of current research.

**Keywords:** Polymer, eco-friendly, Sustainable, Bibliography, research, mapping.

**SURVEY ON THE ROLE OF PHARMACISTS IN PROMOTING GENERIC MEDICINES IN INDIA**

Suraj Sarve, Alam Zaib Khan, Vivek Chourasia, Reenu Yadav
Department of Pharmacy, Prestige Institute of Management and Research, Bhopal
Madhya Pradesh, India - 462021.
surajsarve339@gmail.com

In India, the high cost of brand-name medications continues to be a major barrier to accessible healthcare for large segments of the population. Generic medicines, offering equivalent therapeutic outcomes at significantly reduced prices, represent a vital solution to this challenge. Pharmacists, often the first point of interaction within the healthcare system, occupy a strategic position to influence both patients and prescribers in the adoption of generic drugs. This survey-based study investigates the knowledge, attitudes, and practices of Indian pharmacistsacross both community and hospital settings—regarding generic medicines. Findings indicate that pharmacists are generally well-informed about the safety, efficacy, and cost-effectiveness of generics. They also demonstrate the ability to educate patients and physicians on their appropriate use. However, pharmacists face persistent challenges, including patient mistrust and widespread misconceptions about generic drugs.The study highlights the vital role pharmacists play in facilitating the acceptance of generics, which can, in turn, reduce healthcare expenditures and improve patient adherence to treatment regimens. The findings further underscore the urgent need for structured training programs and supportive policy interventions aimed at empowering pharmacists as advocates for affordable healthcare options. By enhancing their professional knowledge, communication skills, and removing systemic barriers, pharmacists can more effectively promote the public trust in generics. Ultimately, this research emphasizes the indispensable role of pharmacists in India's evolving healthcare framework. Their active engagement in promoting cost-effective and accessible generic medicines has the potential to improve public health outcomes while easing the financial burden on patients and the healthcare infrastructure at large.

**Keywords:** Generic medicines, doctors, pharmacists, prescription practices, branded drugs.

**RA-32**

**ECONOMIC BURDEN OF CARDIOVASCULAR DISEASE IN SECONDARY CARE HOSPITALS: A QUANTITATIVE ANALYSIS**

Thati Omsai, Divya Gunturu, Rumana Syeda, Velugupally Godasri, Ramesh Adepu
Vikas College of Pharmaceutical Sciences, Rayanigudem, Suryapet – 508 213
omsaithati@gmail.com

This prospective descriptive observational study was conducted to assess the economic burden of cardiovascular diseases (CVDs) in secondary care hospitals in Suryapet, Telangana, India. This study focused on analysing the healthcare cost data of patients with hypertension, angina pectoris, coronary artery disease, myocardial infarction, and heart failure. We included 125 patients admitted for CVD treatment. Data on sociodemographic factors, clinical status, and health care costs were collected using a structured questionnaire. Descriptive statistics and generalized linear model (GLM) regression analyses were performed to identify cost patterns and drivers. The study revealed that myocardial infarction had the highest annual cost per patient at INR 262,164 (USD 3,100), followed by heart failure and coronary artery disease. Direct medical costs, particularly ICU utilization (44%), medical procedures (28%), and laboratory tests (27%), were the primary drivers of cost. Most participants (71%) lacked medical insurance, and 47% incurred out-of-pocket expenses. These results emphasize the urgent need for targeted interventions to reduce cardiovascular disease-related expenses, expand financial protection mechanisms, and optimize resource allocation in tertiary care settings. Future policies should focus on strengthening preventive strategies, improving insurance coverage, and developing cost-effective management approaches to mitigate the economic impact of CVDs on individuals and the healthcare system.

**Keywords:** Cardiovascular disease, financial burden, observational study, human capital approach, tertiary care hospitals

**RA-33**

**SURVEY ON PHARMACOVIGILANCE REPORTING PRACTICES AMONG HOSPITAL PHARMACIST**

Alam Zaib Khan, Ayush Tiwari, Durgesh Ahirwar, Reenu Yadav
Department of Pharmacy, Prestige Institute of Management and Research, Bhopal,
Madhya Pradesh, India - 462021.
zaibkhana315@gmail.com

Patients' safety depends on pharmacovigilance, which monitors and reports adverse drug reactions (ADRs). The job of hospital chemists is crucial since they are often the first medical staff to recognize and report medication-related problems. This study was designed to evaluate hospital pharmacists' pharmacovigilance reporting methods. A standardized survey was given to pharmacists employed by multiple hospitals. Their knowledge, opinions, and reporting methods for ADRs were gathered through the survey. The majority of pharmacists understood the value of pharmacovigilance, yet only a tiny portion of them routinely reported adverse drug reactions, according to the results. Time constraints, a lack of knowledge regarding reporting protocols, and a fear of legal repercussions were the most often mentioned obstacles. Many chemists expressed the need for further organizational support and training to boost reporting rates. The findings demonstrate the differences in hospital chemists' comprehension and use of pharmacovigilance. In addition to educating chemists about the importance of ADR reporting and its protocols, improving reporting behaviors also requires streamlining reporting systems and providing institutional support. According to this study, hospital chemists who actively participate in pharmacovigilance can enhance drug safety with the correct support. Future efforts should focus on targeted instructional strategies and attempts to solve the main challenges that chemists have identified. Such measures can improve patient outcomes and strengthen the pharmacovigilance system overall.

**Keywords:** Pharmacovigilance, adverse drug reactions (ADRs), hospital pharmacists, drug safety.

**SYSTEMATIC REVIEW AND META-ANALYSIS OF MYCOBACTERIUM TUBERCULOSIS VACCINE DEVELOPMENT: EFFICACY, SAFETY, CHALLENGES, AND POLICY IMPLICATIONS FOR INDIA'S END TB 2025 GOAL**

ISBN: 978-81-980623-8-3

Mekkanti Manasa Rekha
Associate Professor, Department of Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Bangalore, Karnataka, India.
manasarekharoyal@gmail.com

The National TB Elimination Programme in India aims at the elimination of TB by 2025, and this requires the vaccines to supplement diagnostics and treatment. We have synthesised evidence on clinical-stage TB vaccines to review efficacy, safety, translational barriers and policy implications in India. We systematically searched PubMed, Cochrane Library, Scopus, and, ClinicalTrials.gov (2000Aug 2025) to identify clinical and key preclinical studies on TB vaccines with efficacy/immunogenicity or safety descriptions. Meta-analysis of random effects antibiotic resistant bacteria due to data with similar results; a synthesis of implementation and policy considerations were map-like. In HIV-negative adults with latent infection, M72/AS01E provided ~50 to 57 percent protection against progression to pulmonary tuberculosis over a follow-up of up to 3.7 years, and the drug was generally safe in the most advanced candidates. In phase 3 efficacy trials of VPM1002 in Indian and international new-borns as a recombinant BCG, safety and reduced reactogenicity compared to BCG were favourable, and definitive efficacy in preventing disease remains to be determined. Other candidates (e.g., BCG revaccination, live-attenuated/whole-cell candidates) indicate mixed or context-dependent indicators of the FRAGBO vaccine against long-term Mtb infection. Evidence gaps are persistent in areas, such as durability of protection, performance in high-risk Indian populations and head-to-head comparisons. This pipeline is well-positioned--particularly M72/AS01E to prevent disease in LTBI in adults--but the potential at the population level in India rests on Indian-cohort data, ongoing phase 3 trials (e.g., VPM1002), the standardization of endpoints, and delivery capacity. The priorities in the policy should be - harmonization of trials, security of domestic manufacturing/supply of adjuvants, micro-planning, and mechanisms to finance policy in accordance with NTEP End TB 2025 strategy.

**Keywords:** Tuberculosis vaccine; M72/AS01E; VPM1002; India; NTEP; End TB 2025.

## PROSPECTIVE STUDY OF DRUG UTILIZATION IN POST-OPERATIVE PATIENTS IN SURGERY WARD OF A TEACHING HOSPITAL

Sk. Suleman, G. Baby Sowmya, Valluru. Ravi, S. Vidyadhara
Department of pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences Guntur, Andhra Pradesh, INDIA-522019
munnashaik52026@gmail.com

Drugs in post-operative care are used for various clinical purposes such as infection prevention, analgesia, fluid management, and control of nausea and vomiting. However, the availability of multiple drug options may result in irrational prescribing, increasing overall healthcare costs. Drug Utilization Review (DUR) studies play a crucial role in minimizing adverse drug reactions (ADRs), enhancing therapeutic outcomes, and promoting rational use of medications. This study aimed to evaluate drug utilization patterns among post-operative patients in the surgical department of a tertiary care teaching hospital. A non-interventional, prospective, observational study was conducted in the general surgery department at NRI general hospital, Guntur for a period of 7 months. A total of 339 post-operative patient case records were reviewed. Most patients were aged between 46–55 years, 177 were female and 162 were male. The most common diagnosis was hernia. The average number of drugs per encounter was 9.84. Commonly prescribed medications included antibiotics, analgesics, and anti-ulcers, with cephalosporins, NSAIDs + non-opioids, and PPIs being the predominant classes. Only 8.17% of drugs were prescribed by generic name. al care. Injections were used in 96.69% of encounters, and 65.70% of drugs were from the essential drug list. The average drug cost per encounter was ₹1745.26, with 60.38% spent on injections. The findings reflect high polypharmacy, limited use of generics, and moderate adherence to essential drug lists, highlighting the need for regular DUR to support rational drug use in surgical care.

**Keywords:** Drug Utilization, Post-operative patients, WHO indicators, Essential drug list.

## DRUG UTILISATION STUDIES FOR ACNE VULGARIS IN DERMATOLOGY DEPARTMENT IN A TEACHING HOSPITAL

I.Talpasai , P. Yaswanth Sathyanarayana, K. Teja, S. Vidyadhara
Department of Pharmacy practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Chandramulipuram, Chowdavaram, Guntur, Andhra Pradesh, India -522019
talpasaiinturi@gmail.com

Acne Vulgaris is a common dermatological condition, primarily affecting adolescents and young adults, often posing a cosmetic concern. Various treatments such as topical and oral anti-acne agents and hormonal therapies are available, but irrational prescribing may increase healthcare costs and adverse drug reactions (ADRs). This highlights the importance of drug utilization reviews (DUR) to encourage rational prescribing, enhance efficacy, and reduce ADRs. A hospital-based, prospective, non-interventional observational study was conducted in the Dermatology, Venereology, and Leprosy (DVL) outpatient department at NRI General Hospital over six months. The study involved 84 patients (24 males, 60 females), mostly aged 21–25 years, diagnosed with Acne Vulgaris. Patients with drug-induced acne, severe acne, on immunosuppressants, or unwilling to participate were excluded. Prescription and demographic data were collected using a structured form and analysed using WHO prescribing indicators. The average number of drugs per encounter was 2.78. Antibiotics were most prescribed (41.95%), followed by topical retinoids (24.88%). Topical agents accounted for 57.69%, systemic agents 29.48%, fixed-dose combinations 17.52%, and concomitant drugs 41.45%. Only 4.27% of drugs were prescribed by generic name. No injectables were prescribed. About 65.70% of drugs were from the essential drug list, with a 97% dispensing rate and 82% availability of key drugs. The average cost per prescription was ₹744.02. The study emphasizes improving generic prescribing and essential medicine adherence to support rational acne treatment.

**Keywords:** Acne Vulgaris, ADRs, Drug Utilization, Essential Drug List, Rational Prescribing.

praneethakra@gmail.com

Ensuring the quality, safety, and efficacy of pharmaceutical products is a critical component of public health systems worldwide. In South Africa, pharmaceutical quality compliance is governed primarily by the South African Health Products Regulatory Authority (SAHPRA), which enforces standards in line with international best practices, including those of the World Health Organization (WHO), the International Council for Harmonization (ICH), and the African Medicines Regulatory Harmonization (AMRH) initiative. Compliance requirements span across the pharmaceutical lifecycle—covering good manufacturing practices (GMP), good distribution practices (GDP), product registration, post-marketing surveillance, and pharmacovigilance. A strong emphasis is placed on current GMP inspections, validation of manufacturing processes, quality risk management, and the integrity of supply chains to prevent substandard and falsified medicines. Despite significant progress, challenges remain, such as regulatory backlogs, limited technical capacity, and the influx of imported generics that require stringent oversight. Continuous regulatory reforms, digitalization of submissions, regional cooperation through ZAZIBONA (Southern African Development Community collaborative procedure), and alignment with international quality standards are strengthening South Africa's regulatory framework. Overall, quality compliance in the South African pharmaceutical sector is advancing steadily, aiming to safeguard patient safety, improve therapeutic outcomes, and enhance trust in the healthcare system.

**COMPARATIVE COST-EFFECTIVENESS OF ACAMPROSATE AND BACLOFEN IN THE MANAGEMENT OF ALCOHOL USE DISORDER**

D. Sai Snehana, G. Renuka, N. V. Deepak, S. Vidyadhara
Department of Pharmacy Practice, Chebrolu Hanumaiah Institute of Pharmaceutical Sciences, Guntur, Andhra Pradesh, India.
saisnehanaduggempudi@gmail.com

This study conducted a cost-effectiveness analysis (CEA) comparing acamprosate and baclofen in the treatment of Alcohol Use Disorder (AUD), a condition associated with considerable clinical and economic burden worldwide. A randomized, open-label, standard-controlled, parallel-group design was employed over a 3-month period involving 60 participants diagnosed with AUD. Effectiveness was measured by the number of abstinent days and percent days abstinent (PDA), while economic evaluation utilized the average cost-effectiveness ratio (ACER) and incremental cost-effectiveness ratio (ICER). Statistical analysis using the Kruskal's wallis test demonstrated that participants receiving acamprosate exhibited a significantly greater number of abstinent days compared to those treated with baclofen. Additionally, acamprosate was found to be more effective and incurred lower overall treatment costs relative to baclofen, indicating superior cost-effectiveness. These findings suggest that acamprosate represents a clinically efficacious and economically advantageous therapeutic option for managing AUD. Identifying such cost-effective interventions is crucial for optimizing resource allocation and improving patient outcomes in healthcare systems. Consequently, this study supports the use of acamprosate as a preferred treatment modality for AUD due to its favourable balance of clinical efficacy and affordability.

**Keywords:** Alcohol use disorder, average cost-effectiveness ratio, baclofen, acamprosate, cost effectiveness.

**RA-39**

**A PROSPECTIVE OBSERVATIONAL STUDY TO COMPARE THE ANALGESIC EFFECT AND COST EFFECTIVENESS OF TRAMADOL AND PARACETAMOL IN POST-OPERATIVE PATIENTS**

G. Baby Sowmya, K. Vignatha, M.Raghav Kalyan, S.Vidyadhara
Department of pharmacy practice, Chebroulu Hanumaiah Institute of Pharmaceutical Sciences, Chandramoulipuram, Chowdawaram, Guntur, Andhra Pradesh, India-522019
galibabysowmya@gmail.com

Post-operative pain remains a major clinical concern, as inadequate analgesia can delay recovery, prolong hospitalization, and increase overall treatment costs. Effective pain management therefore requires careful consideration of efficacy, safety, and cost-effectiveness of available agents, especially in resource-limited settings. This study was conducted to compare the efficacy, safety, and cost-effectiveness of intravenous (IV) tramadol vs paracetamol (IV) for post-operative analgesia. A total of 106 post-operative case records were analyzed, with a slight male predominance (54.71%) and diabetic foot surgeries being the most common surgical condition observed in the study population. Patients were categorized based on the frequency of analgesic administration viz., BD (twice daily), TID (thrice daily), and QID (four times daily). Across all dosing schedules, tramadol demonstrated superior analgesic efficacy over paracetamol, as evidenced by statistically significant P-values of 0.0388 (BD), 0.0360 (TID), and 0.0134 (QID), clearly indicating its effectiveness in managing post-operative pain. In terms of safety, adverse drug reactions (ADRs) occurred in 12.06% of patients in the tramadol group, compared to only 4.16% in the Paracetamol group, highlighting that Paracetamol has a better tolerability profile. However, IV tramadol 50 mg was found to be significantly more cost-effective than IV paracetamol 1 g, making it a preferred option in resource-limited settings. In conclusion, while tramadol offers more effective analgesia, paracetamol is safer and better tolerated. The selection between the two drugs should be based on clinical condition, risk factors, economic considerations, and patient-specific needs.

**Keywords:** Tramadol, paracetamol, post-operative analgesia, cost-effectiveness, diabetic foot surgery

**RA-40**

**THE NDCT RULES AMENDMENT 2024 AND ITS ROLE IN RESHAPING GOVERNANCE OF CLINICAL RESEARCH ORGANIZATIONS**

Sahithi R, Arjun M, M P Venkatesh.
Centre of Excellence in Regulatory Sciences, JSS College of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India -570015
sahithir950@gmail.com

The regulation of Clinical Research Organizations (CROs) in India has undergone significant transformation with the New Drugs and Clinical Trials (NDCT) Rules Amendment, 2024. To evaluate this transition, an extensive literature-based analysis was carried out using published studies, regulatory circulars, and international guidelines from 2019–2024. The approach involved reviewing regulatory documents and scholarly sources to identify gaps in the earlier framework, the provisions introduced in the 2024 amendment, and global comparators such as the U.S. FDA and EMA. The results highlight that CROs previously faced uncertainties in registration, ethics oversight, and accountability, which hindered compliance and participant protection. The 2024 amendment addressed these challenges through mandatory CRO registration, strengthened documentation requirements, rigorous inspection processes, and clearer mechanisms for safety reporting and compensation. Comparative assessment indicates that these reforms bring India's CRO governance closer to international standards, enhancing transparency and building sponsor and patient confidence. However, the findings also point to operational challenges, including increased compliance costs and administrative responsibilities for smaller CROs. The study infers that successful implementation of the amendment will require investment in infrastructure, adoption of digital technologies, and capacity-building of trained personnel. Overall, the NDCT Amendment 2024 represents a pivotal regulatory development that reinforces ethical governance, elevates India's global competitiveness, and positions the country as a strong hub for high-quality clinical research.

**Keywords:** CDSCO Oversight, Clinical Trial Regulation, CRO Governance, India Clinical Research, NDCT Rules Amendment 2024.

**RA-41**

**ENSURING REGULATORY INTEGRITY AND SAFETY IN PLASMA-DERIVED MEDICINES: THE PMF CERTIFICATION PROCESS**

Rachana M Bharadwaj, Arjun M, K Bangarurajan, M P Venkatesh
Centre of Excellence in Pharmaceutical Regulatory Sciences, JSS College of Pharmacy, JSS
Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India-570015
rachanambharadwaj02@gmail.com

Plasma-derived medicinal products (PDMPs) are critical for treating a range of life-threatening conditions but are inherently associated with contamination risks. This study systematically analyzed regulatory frameworks, scientific literature, and guidance documents to explore the Plasma Master File (PMF) certification process, particularly within the European Union. A structured review of EU directives, such as Directive 2002/98/EC and Directive 2003/63/EC, alongside EMA guidelines, was conducted to assess how PMF certification supports donor safety, traceability, and product integrity. The methodology involved mapping key certification steps, data requirements, inspection procedures, and timelines outlined in regulatory documents, followed by comparative analysis with international standards. Results revealed that the PMF streamlines approval processes by consolidating data on plasma origin, testing, storage, and epidemiological risk, reducing redundancy across marketing authorization submissions. The review also highlighted evolving strategies such as digital transformation, blockchain for traceability, and AI-driven compliance monitoring to enhance regulatory efficiency. The outcomes indicate that the PMF not only reinforces public health safeguards but also facilitates harmonization across jurisdictions, aiding rapid access to therapies. The study concludes that expanding global recognition and adopting advanced technologies will further strengthen the PMF framework, ensuring resilience against emerging threats while safeguarding patient safety. These findings underscore the PMF's pivotal role as a regulatory tool in plasma-derived product lifecycle management, balancing innovation with rigorous safety standards.

**TRANSITION FROM EU MDD TO EU MDR: CLINICAL EVIDENCE, POST-MARKET SURVEILLANCE, AND GLOBAL RIPPLE EFFECTS**

Sameeha Hassan
Dept. of Regulatory Affairs, Al Shifa College of Pharmacy, Kerala.
shemynaaz008@gmail.com

Europe's move from the long-standing Medical Devices Directive (MDD) to the newer Medical Devices Regulation (MDR) marks a turning point in how medical devices are assessed and monitored. Conceived to improve patient safety, traceability and transparency, the MDR goes far beyond its predecessor in terms of clinical evidence expectations, classification rules and post-market obligations. This article takes a close look at what that shift has meant in practice for manufacturers, notified bodies and regulators. It considers the difficulties many companies have faced in generating updated clinical data for existing products, the bottlenecks caused by limited notified-body capacity, and the resulting delays in conformity assessment and market entry. We also discuss how the MDR has expanded post-market surveillance, with new tools such as Periodic Safety Update Reports (PSURs), Post-Market Clinical Follow-Up (PMCF) and the central EUDAMED database, and how these are reshaping device lifecycle management. Finally, we explore how the European changes are influencing policies and supply chains beyond the EU, prompting convergence efforts, regulatory reliance initiatives and wider global consequences. By bringing these themes together, the review points to practical ways of managing compliance risks, supporting innovation and preparing for the next wave of regulatory evolution.

**Keywords:** EU MDR, EU MDD, Clinical Evidence, Post-Market Surveillance, Global Regulatory Impact

**RA-43**

**A STUDY ON THE IMPACT OF MARKETING STRATEGIES ON CONSUMER CHOICE FOR OVER THE COUNTER (OTC) MEDICATIONS**

Fazil Ameen K, Muhas C
Moulana college of pharmacy, Malappuram (DT) 679321, Kerala
fazilameenk793@gmail.com

OTC medication are widely available and commonly used to treat minor illness without a prescription. While they offer convenience and accessibility, concerns arise regarding their safe use due to irrational consumption, inadequate awareness of side effects, and malpractice. The over-the-counter pharmaceutical industry has experienced significant growth, driven by increasing consumer demand for self-care and convenient access to healthcare product. Effective marketing strategies play a crucial role in differentiating OTC drug products, building brand awareness, driving sales, and establish trust with consumers. The main objectives of this study to investigate the effects of marketing strategies on consumer choice behaviour and preferences for over-the-counter pharmaceuticals, and to identify the most effective marketing strategies for OTC medication. This is a cross-sectional study conducted for a period of three months. It's a questionnaire-based survey among the common people of Kerala. The questionnaire was distributed in different areas of Kerala. Respondent's demographic details such as age, gender, education, occupation etc. The filled questionnaire was analysed as per the study objectives. A total of 711 participants involved, 470 were females (66.1%) and 241 were males (33.9%), out of 711 respondents more than half of respondents 505 (71.40%) were between the age group of 20-29. Among 711 participants, 367 (51.60%) have UG qualification. Out of 711 participants 378 (53.14%) use OTC by their previous usage. About 135 (18.98%) participants buy OTC for cough, 178 (25.03%) people buy OTC for common cold, and 207 (29.11%) buy OTC for body pain by the influence of advertisements. Out of 711 participants23 (3.23%) are follows magazines, 26 (3.65%) are follows poster, 213 (29.95%) are follows TV ad, and 449 (63.15%) are follows other methods. Among the 711 participants more than half of the participants 366 (51.47%) believes that advertisement on OTC medicines are effective. This cross-sectional study among common people found that most of the participants are buying OTC by their previous usage, and most widely used OTC medicine is for body pain and common cold. And more than half of participants believes that advertisement on OTC medicines is effective. So, understanding the marketing strategies, OTC pharmaceutical companies can develop an effective marketing plan to stay competitive in the industry, enhance consumer awareness, improve public health, economic benefit.

**Keywords:** OTC (over the counter), advertisement, marketing, survey

**IMPACT OF PHARMACIST-LED ANTIMICROBIAL STEWARDSHIP ON INAPPROPRIATE PRESCRIBING AND LENGTH OF STAY: AN INTERRUPTED TIME-SERIES STUDY**

Divya Sri Gurrala, Ramakrishna Gummadi
Department of Pharmacy Practice, School of Pharmacy, Aditya University, Suramplaem, Kakinada -533437
gurraladivyasri08@gmail.com

Inappropriate antibiotic use is associated with poorer patient outcomes and prolonged hospital stays. Clinical pharmacists are pivotal in antimicrobial stewardship (AMS), yet real-world, time-trend evidence on their sustained impact in inpatient settings is limited. To assess the impact of pharmacist-led AMS interventions on inappropriate antibiotic utilisation and hospital length of stay (LOS). We conducted a 12-month interrupted time-series (ITS) study in the inpatient wards of a tertiary teaching hospital, with six months of pre- and post-intervention data. A systematic sample of 30 antibiotic prescriptions was reviewed monthly (N = 360) using institutional AMS criteria. Interventions included dose optimisation, de-escalation, IV-to-oral switch, and therapeutic monitoring, all of which were implemented with ≥90% fidelity. Primary outcome: monthly proportion of inappropriate prescriptions. Secondary outcomes: antibiotic utilisation [defined daily doses (DDD), days of therapy (DOT) per 1,000 patient-days], prescriber acceptance, and mean LOS. Segmented regression analysis was performed using standard ITS methods. Inappropriate prescribing declined from 48.3% to 31.2%. ITS showed a level change of -12.7% (95% CI: -14.4 to -10.9) and slope change of -1.29%/month. DDD and DOT were reduced significantly ($p < 0.001$). Prescriber acceptance averaged 74.1%. Mean LOS decreased from 7.2 to 5.8 days ($p = 0.02$). Pharmacist-led AMS significantly improved prescribing quality, reduced antibiotic use, and shortened LOS. These findings support the integration of clinical pharmacists into AMS teams as a scalable strategy to optimise inpatient care.

**Keywords:** Antimicrobial Stewardship, Clinical Pharmacist, Inappropriate Prescribing, Antibiotic Utilisation, Length of Stay.

**RA-45**

**REGULATORY CONSIDERATIONS FOR NEONATAL AND RARE PEDIATRIC DISEASES IN US AND EU**

Yashwanth H N[1], Arjun M[1], M P Venkatesh[1,2], Amit B Patil[1,2]
[1]Center of Excellence in Regulatory Sciences, JSS College of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India - 570015
[2]Faculty of Pharmaceutical Sciences, UCSI University, Malaysia
yashwanthvasistaa@gmail.com

Drug development for rare pediatric and neonatal diseases remains constrained by small patient populations, ethical concerns, and limited commercial incentives. To explore how regulatory frameworks address these barriers, a structured review of legislative documents, regulatory guidelines, and peer-reviewed literature from the United States and European Union was conducted. Analysis focused on incentives, mandatory pediatric study requirements, and comparative differences in regulatory implementation. The review identified that the United States has advanced mechanisms such as the Orphan Drug Act, Pediatric Research Equity Act, Best Pharmaceuticals for Children Act, and Priority Review Voucher programs, which collectively provide market exclusivity, tax credits, and extended patent protection to stimulate development. In parallel, the European Union has enacted the Orphan Regulation and Paediatric Regulation, mandating Pediatric Investigation Plans, offering fee reductions, and extending data exclusivity to encourage innovation. Results demonstrated that while both regions provide substantial incentives, differences in scope and enforcement persist: the EU mandates broader pediatric assessments even for orphan-designated drugs, whereas US legislation exempts most orphan drugs from mandatory pediatric studies. This divergence has significant implications for harmonization and global drug availability. The study infers that emerging strategies such as adaptive trial designs, real-world evidence integration, and enhanced international collaboration are pivotal to overcoming current limitations. It is concluded that aligning US and EU

ISBN: 978-81-980623-8-3

frameworks, while fostering caregiver engagement and public-private partnerships, will be essential to reduce development delays, accelerate approvals, and expand equitable access to therapies for children with rare and life-threatening conditions.

**Keywords:** Regulatory considerations, Neonatal diseases, Rare pediatric diseases, Orphan drug designation.

**RA-46**

## BRIDGING DISTANCES, NAVIGATING RULES: LEGAL ASPECTS OF TELEMEDICINE IN EU AND INDIA

Ananya N, Arjun M, M P Venkatesh
Centre of Excellence in Pharmaceutical Regulatory Sciences, Dept of Pharmaceutics, JSS College of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India-570015
ananyanandeesh@gmail.com

Telemedicine is revolutionizing healthcare by breaking geographical barriers and redefining patient care through digital innovation. Rapid technological advancements have made remote consultations and virtual health services indispensable, particularly in the wake of the COVID-19 pandemic. However, regulatory complexities continue to shape its evolution worldwide. This study adopts a qualitative and comparative methodology, analysing key legislative frameworks governing telemedicine in Europe - specifically Directive 2011/24/EU and the General Data Protection Regulation (GDPR) - and in India, focusing on the Telemedicine Practice Guidelines and the National Digital Health Mission (NDHM). Primary data sources include legal documents, national policy frameworks, and secondary literature from academic publications, WHO reports, and industry analyses. The study critically compared regulatory approaches, highlighting differences in data protection, cross-border care, physician liability, and patient consent mechanisms. Findings revealed that the COVID-19 pandemic acted as a catalyst, accelerating policy adoption and regulatory flexibility in both regions. Europe has emphasized harmonization of cross-border healthcare and robust data protection, whereas India's regulatory efforts are centred on standardizing practice, improving access, and building a unified digital health ecosystem. Despite these advances, challenges remain in areas such as interoperability, cybersecurity, medico-legal clarity, and equitable access. The study concluded that telemedicine's sustainable growth depends on evolving regulatory frameworks that balance innovation with patient safety and trust. Strengthening policies, enhancing interoperability standards, and fostering international regulatory collaboration will be key to ensuring safe, accessible, and efficient telemedicine services globally.

## COMPARATIVE STUDY OF PROHIBITED & RESTRICTED INGREDIENTS IN COSMETICS ACROSS US, EU AND INDIA

Amogha T A[1], Arjun M[1], M P Venkatesh[1,2]
[1]Centre of Excellence in Regulatory Sciences, JSS college of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India – 570015
[2]Faculty of Pharmaceutical Sciences, UCSI University, Malaysia
amoghta55@gmail.com

The rapid expansion of the global cosmetics industry has heightened concerns about consumer safety, particularly regarding the presence of harmful ingredients such as parabens, phthalates, formaldehyde, heavy metals, and asbestos-contaminated talc. To evaluate how regulatory frameworks address these risks, a structured review of official regulatory documents, peer-reviewed literature, and safety assessments was conducted across three major jurisdictions: the United States, European Union, and India. Data were systematically extracted on prohibited and restricted ingredients, pre-market approval requirements, labeling standards, and post-market surveillance mechanisms. The comparative analysis revealed marked differences in regulatory rigor. The European Union demonstrated the strictest approach, with more than 1,700 substances prohibited and mandatory pre-market safety assessments supported by detailed product information files. The United States employed a more limited pre-market oversight model, relying largely on post-market surveillance and voluntary compliance, with only 11 substances explicitly prohibited. India adopted a hybrid model, integrating pre-marketing clearance under CDSCO and ingredient restrictions defined by the Bureau of Indian Standards, though requirements for safety documentation remain less stringent than those in the EU. Substances such as chloroform, bithionol, and vinyl chloride were consistently prohibited across all three regions, while others, including parabens, phthalates, and certain heavy metals, showed variable restrictions depending on risk thresholds. The findings indicate that while all three jurisdictions share the objective of safeguarding consumer health, regulatory divergence creates challenges for global harmonization and compliance. The outcome of this study underscores the need for science-driven, internationally aligned standards that not only enhance consumer safety but also facilitate transparent trade practices.

**Keywords:** Cosmetic regulation, Prohibited ingredients, Consumer safety, International harmonizaton

## PHARMAGLOBE - A UNIQUE MENTORING PLATFORM FOR ASPIRING AND PURSUING PHARMACY PROFESSIONALS

Shravani Pravin Harde, Mayur Kale, Sandip Rahangdale, Manish Aglawe, Nitu Wankhede, Milind Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee
shrawaniharde@gmail.com

Pharma Globe is a comprehensive mentoring platform designed for aspiring, studying, and working pharmacy professionals. It provides a centralized resource for academic and professional success, offering extensive admission support, pharma-related news, professional development opportunities, and skill development programs. The platform also provides robust placement assistance, including job search strategies, resume building, and interview preparation. Using advanced AI algorithms, PharmaGlobe analyzes user profiles to identify suitable career paths and industry fit, providing personalized recommendations for future career development. This feature enables users to explore diverse career options and make informed decisions about their professional growth. PharmaGlobe caters to the needs of working professionals, providing insights into advanced certifications, professional workshops, and leadership programs, ensuring continued career growth and alignment with industry developments. By offering a wide range of resources and support services, PharmaGlobe empowers pharmacy professionals to succeed in their academic and professional pursuits, staying at the forefront of their practice and contributing to the advancement of the pharmaceutical industry. PharmaGlobe's mission is to bridge the gap between academia and industry, fostering a community of informed, skilled, and connected pharmacy professionals. Key highlights - Scope, Admission support, news, job vacancy and ai support.

**Keywords:** Education, Pharmacy mentoring platform, career development, admission support, job,.AI-driven career analysis.

## OPTIMIZING THE DOSSIER SUBMISSION PROCESS: A STUDY OF ECTD SOFTWARE, AI INTEGRATION, AND REGULATORY COMPLIANCE FOR BIOLOGICS

Lohith T M, K Bangarurajan
Department of Pharmaceutics, JSS College of Pharmacy, JSS Academy of Higher Education & Research, Mysore 570015, Karnataka, India.
lohithtm@gmail.com

The report is a comparison of the Common Technical Document (CTD) and its electronic copy (eCTD) in regulatory submissions of biologics and biosimilars to other regulatory authorities worldwide including FDA, EMA, and PMDA. It puts more focus on their arrangement, position, and predicaments with a focus on how CTD/eCTD standardize submissions across the globe. Attention is paid to the work on Modules 1-3, as well as the analysis of eCTD software, AI applications, and cloud solutions and adherence to data protection laws (GDPR, HIPAA). Although CTD improves efficiency and accessibility across the world, it requires sophisticated electronic infrastructure and management. Covers literature review, FDA, EMA, PMDA requirements comparison, case study analysis and the evaluation of the most popular eCTD software (Veeva Vault, Lorenz DocuBridge, Extedo). CTD is an international standard, and Module 1 is regionally divergent. Modules 2 & 3 (CMC) are critical. Validation, compliance, and lifecycle management can only be

ISBN: 978-81-980623-8-3

achieved through use of software tools. New issues to address are AI content under GxP, cloud security, and agency-specific regulations, and the trend is towards AI, cloud and possible use of blockchain. The CTD/eCTD frameworks are necessary to approve the regulation. To authorize in time in the market, sponsors need to be aware of international harmonization and regional peculiarities, use sophisticated software, and embrace AI and cloud trends without compromising the integrity of the data.

**Keywords:** Biologics, Biosimilars, CTD, eCTD, Regulatory Affairs, FDA, EMA, Global Harmonization.

**KNOWLEDGE, ATTITUDE AND PRACTICE TOWARDS DIGITAL MISINFORMATION AND ITS ROLE IN MEDICAL HESITATIONS**

Beaulin Brobangel K. P, Drishya. L, Shaiju S Dharan
Department of Pharmacy Practice, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Neyyatinkara, Thiruvanathapuram.
brobangelbeaulin@gmail.com

Digital platforms play major role in the dissemination of medical and health information. However, due to rise in the digital misinformation, there have been increased medical hesitations. Nowadays false information's about heath care and medical advice which are exaggerated treatments influencing among peoples can affects individual decision making and reduce trust in healthcare professionals. Digital misinformation's are not only to the infectious disease but also it extends to chronic disease which leads to self-medications home remedies which makes a challenge to the public health. Here we are taking knowledge, attitude and practice survey about how social influencers influencing the health information's to the common peoples and causing medical hesitancy.

**Keywords:** Digital platforms, health information, healthcare professionals

**RA-51**

**DIGITAL HEALTH INFORMATION-SEEKING BEHAVIOR AND TELEMEDICINE ADOPTION AMONG ADULTS: A SURVEY STUDY**

Anguluri veena, Fiza shabanam, Praveen Devanandan, Ranadheer chowdary
Department of pharmacy practice, St Peters Institute of Pharmaceutical Sciences, Hanamkonda,Telangana,India- 506001
anguluriveena@gmail.com

The rapid growth of digital technologies has significantly transformed the way individuals seek and utilize health-related information. This survey-based study aimed to explore general patterns of online health information-seeking behavior and the extent of telemedicine adoption among young adults. A structured questionnaire was distributed, and responses were collected to assess demographics, online platforms used, reliability perception, and preferences for digital health resources The mean age of participants was 23.9 ± 2.1 years, with a nearly equal gender distribution (Female: 51.2%, Male: 48.8%). Most respondents were graduates (58.3%) followed by postgraduates. A large majority (97.6%) reported using the internet to search for health-related information, primarily via smartphones (82.3%) and laptops (42.3%). Google Search (88.2%), YouTube (74.1%), and hospital/doctor websites (38.8%) were the most frequently accessed sources. The most searched topics included symptoms and causes of diseases. While traditional healthcare provider explanations remained the preferred mode of understanding illness, there was strong interest in hospital-recommended digital resources, such as curated websites, YouTube videos, or apps. Telemedicine services, though recognized, were adopted by a smaller percentage of respondents, particularly for ordering medications and occasional consultations. In conclusion, the survey underscores the growing reliance on digital platforms for health information, balanced with concerns about accuracy and trustworthiness. Encouraging the development of validated, hospital-endorsed online tools can bridge the gap between traditional consultation and digital engagement, thereby promoting safe and informed patient participation in healthcare.

**Keywords:** Digital health, online health information, telemedicine, patient behavior, health literacy.

**RA-52**

**COMPETENCY-BASED LEARNING IN PHARMACY: A CAREER-ORIENTED APPROACH TO OUTCOME-BASED EDUCATION**

Nandakumar K, Anoop Kishore
Department of Pharmacology, Manipal College of Pharmaceutical Sciences, Manipal Academy of Higher Education (MAHE), Manipal – 576104, Karnataka, India
nandakumar.k@manipal.edu

Outcome-Based Education (OBE) is widely adopted in pharmacy programs and strongly supported by accreditation bodies such as the National Board of Accreditation (NBA). It ensures alignment of program outcomes with graduate attributes and provides a structured framework for curriculum design, delivery, and assessment. However, in the multidisciplinary BPharm program, defining precise subject-specific competencies can be challenging. Competency-Based Learning (CBL) is proposed as a complementary approach that strengthens OBE by focusing on career-based competencies rather than isolated subject outcomes. For example, the role of a medical representative requires integration of pharmacological knowledge, communication skills, ethical practice, and problem-solving abilities. These attributes are difficult to evaluate through traditional subject-level outcomes but can be effectively demonstrated through competency-based assessments. Frameworks such as Miller's Pyramid (progression from "Knows" to "Does") and Bloom's Taxonomy (cognitive, psychomotor, and affective domains) provide structure to this integration. Authentic assessments like OSPE/OSCE, simulations, and case-based discussions allow students to demonstrate career-linked competencies in a practical context. By complementing OBE with CBL, pharmacy education can ensure graduates are not only academically competent but also practice-ready and adaptable to diverse career pathways such as clinical practice, quality assurance, production, regulation, research, and marketing. This integration enhances employability, professional identity, and lifelong learning, thereby aligning education more closely with healthcare and industry expectations.

**Keywords:** Competency-Based Learning, Outcome-Based Education, BPharm, Career Pathways, Miller's Pyramid, Bloom's Taxonomy

**GLOBAL ENVIRONMENTAL IMPACT OF UNUSED AND EXPIRED MEDICINES: AN URGENCY OF ECOPHARMACOVIGILANCE**

Mahesh Kahane, Sangamesh Puranik, Subodh Dube
Department of Pharmacy, Vikrant University, Gwalior, Madhya Pradesh, India- 474006
maheshkahane10@gmail.com

Unused and expired medications, when improperly disposed, flushed, dumped, or tossed into household waste releases active pharmaceutical ingredients into the environment. These compounds, including antibiotics, hormones, and psychiatric drugs, persist in soil, surface water, and even drinking water, bypassing conventional treatment systems. Their presence in ecosystems leads to toxic effects such as endocrine disruption, behavioral changes in aquatic life, microbial imbalance, and the rise of antimicrobial resistance. These pharmaceutical residues accumulate through the food chain, affecting a wide range of organisms like bacteria and earthworms to fish, birds, and humans. The environmental burden is compounded by public health risks like accidental poisoning and drug misuse, alongside economic losses from wasted healthcare resources. As global pharmaceutical consumption increases due to ageing populations and chronic diseases, the volume of household pharmaceutical waste is expected to grow. Although some countries have introduced drug take-back initiatives and regulatory measures, the majority of individuals continue to discard medications in ways that harm the environment. Ecopharmacovigilance (EPV) is a discipline focused on identifying and minimizing the ecological impact of pharmaceutical substances has become increasingly important. Yet, efforts to implement EPV globally remain disjointed, with uneven standards for environmental risk evaluation and weak enforcement mechanisms. To effectively address this growing and often overlooked threat, there is an urgent need for a unified global strategy, more robust waste disposal systems, and widespread public education and awareness to promote responsible safe use and dispose of unused and expired medication.

**Keywords:** EPV, unsued and expired medication, Ecopharmacovigilance, pharmaceuticals in environment, waste disposal system

**RA-54**

## PHARMACISTS ROLE IN DETECTING HIDDEN MEDICATION NON-ADHERENCE USING DIGITAL TOOLS

Tenali Sailaja Amani
Department of Pharmacy Practice, St. Xavier College of Pharmacy, Phirangipuram
Guntur, Andhra Pradesh, India-522529
dr.sailaja321@gmail.com

Medication non-adherence remains a critical barrier to achieving optimal therapeutic outcomes, particularly in chronic disease management. Hidden non-adherence, where patients outwardly appear compliant but fail to take medications as prescribed, is especially challenging to detect in routine practice. Pharmacists, as frontline healthcare providers, play a pivotal role in identifying and addressing this issue through the integration of digital health tools. The use of advanced technologies such as electronic pillboxes, smart blister packs, mobile health applications, wearable sensors, and pharmacy refill tracking systems enables pharmacists to monitor real-time adherence patterns. Artificial intelligence (AI)-based predictive analytics and digital therapeutic platforms further empower pharmacists to detect subtle behavioural deviations suggestive of concealed non-adherence. These tools not only provide objective data but also facilitate timely interventions through patient counselling, motivational interviewing, and personalized adherence support. Pharmacists, leveraging their accessibility and medication expertise, can integrate these digital insights into clinical decision-making and interprofessional care models. Early detection of hidden non-adherence reduces the risk of treatment failure, hospital readmissions, adverse drug events, and healthcare costs. Moreover, the combination of digital monitoring with pharmacist-led behavioural support strengthens patient engagement, fosters accountability, and enhances overall medication safety.

**Keywords:** Pharmacist, Medication Non-Adherence, Digital Health Tools, Artificial Intelligence, Medication Therapy Management

**RA-55**

## A PATIENT-CENTRIC HEALTHCARE NAVIGATION AND EMERGENCY RESPONSE APPLICATION

Rushikesh Sawarkar, Archana Alhat, Salman shaikh, Vikram bhusnar.
Department of Pharmacy, Trinity College of pharmacy, Pune, Maharashtra, India
Sawarkarushi9058@gmail.com

In the current project, a patient-centric healthcare navigation and emergency response application was conceptualized and developed. The objective of the project was to design a unified digital healthcare platform that integrates hospital navigation, pharmacy access, emergency response, and patient health management in a single user-friendly system. The application employs a social-media-like interface to enhance usability. The homepage provides categorized listings of nearby hospitals based on specialization, along with details of doctors and pharmacy outlets. A real-time search bar enables patients to locate healthcare providers or medicines, and appointments can be booked directly through the application. An interactive map feature, inspired by real-time navigation tools, allows patients to access directions, contact facilities, and book consultations seamlessly. The profile section stores patient health records, past appointments, insurance details, and includes a blood donation registry. Furthermore, an integrated first aid and emergency module supports instant ambulance booking and access to emergency contacts. The application successfully combines healthcare access, navigation, and emergency management into one digital ecosystem. Unlike conventional hospital-specific applications, this innovation provides real-time, location-based integration of hospitals, pharmacies, and emergency services within a familiar social-media-like design, thereby ensuring greater usability and adoption. Thus, it can be concluded that this application offers a novel and practical solution for improving patient outcomes by reducing delays in accessing critical care and creating a more connected healthcare ecosystem in India.

## THE EFFECTIVENESS OF TELEPHARMACY IN ENHANCING MEDICATION ADHERENCE AND PATIENT SATISFACTION AMONG RURAL COMMUNITIES

Mahima Kalluri, Saranya Bhavanasi, Shobha Singarapalle
Pharmacy Practice Division, Jagan's Institute of Pharmaceutical Sciences, Nellore
Andhra Pradesh, India
angelmj656@gmail.com

Access to quality pharmaceutical care remains a crucial challenge in rural and underserved communities due to limited availability of pharmacists and healthcare facilities. Telepharmacy, which involves providing pharmaceutical services through telecommunication technologies, has emerged as a promising solution to fill this gap. This study evaluates the effectiveness of telepharmacy in improving medication adherence and patient satisfaction among rural populations. A mixed-method research design was used, combining quantitative assessment of adherence rates with standardized adherence scales and qualitative interviews exploring patient experiences. The results showed a significant increase in medication adherence among patients who received telepharmacy interventions compared to those relying solely on traditional care. Patients expressed high satisfaction levels, citing better access to pharmacists, timely counseling, convenience, and less travel. The study also highlighted telepharmacy's role in overcoming barriers such as lack of awareness, insufficient follow-up, and poor medication management. Overall, telepharmacy demonstrates strong potential as a cost-effective and sustainable healthcare model that can enhance therapeutic outcomes and improve patient well-being in rural areas.

**Keywords:** Telepharmacy, Medication adherence, Patient satisfaction, Rural healthcare, Pharmaceutical care, Digital health.

## DATA INTEGRITY IN THE PHARMACEUTICAL DEVELOPMENT AND MANUFACTURING: GLOBAL CHALLENGES AND COMPLIANCE PRINCIPLES

Monali R. Dakhole, Krishna R. Gupta, Milind J. Umekar
Department of Pharmaceutical Chemistry,
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur, India
monadakhole87@gmail.com

Data integrity is a cornerstone of the pharmaceutical industry's ability to ensure the quality safety and efficacy of medicinal products. It requires that all the data remain accurate, consistent, complete, and trustworthy across the entire product lifecycle, including discovery, new research, clinical development, manufacturing, regulatory submissions and post-marketing surveillance. Beyond meeting regulatory obligations, strong data integrity practices are essential to protecting patient safety and sustaining public confidence in healthcare systems. This work highlights the importance of Good Documentation Practices (GDP) in preserving data dependability while looking at the fundamental ideas of ALCOA and ALCOA+. To identify recurring risks, common issues are examined, including data fabrication, inadequate documentation, insufficient system controls, and inadequate digital safeguards. Case studies show how breaches can lead to product recalls, worldwide medicine shortages, harm to one's reputation, and deprivation of patients' access to vital therapies. These include high-impact regulatory findings and the iconic GVK Biosciences and Zhejiang Huahai instances. The ongoing seriousness of this issue is further highlighted by recent developments, such as the FDA's issuance of Form 483's pertaining to data integrity and vulnerabilities discovered during the COVID-19 vaccine cold chain. Practical strategies to improve compliance are also covered in the assessment, including as implementing strong data governance frameworks, funding employee training, and employing digital tools like audit trail systems and electronic medical records for proactive monitoring. In the end, maintaining data integrity is a global necessity that strengthens the core commitment to patient safety while promoting honesty, regulatory compliance, and sustainable pharmaceutical operations.

**Keywords:** Data integrity, ALCOA, ALCOA+, GDP, 21 CFR, 483s

**RA-58**

## WOMEN LEADESHIP IN THE PHARMACY PROFESSION BREAKING BARRIERS AND BUILDING EQUITY

ISBN: 978-81-980623-8-3

Raziya sultana, M. Prasad Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy,
Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
mohammadraziyasultana1@gmail.com

The pharmacy profession has witnessed a significant increase in the representation of women over the past decades, yet women remain underrepresented in leadership and decision-making roles. This disparity underscores the persistent barriers that limit gender equity in professional advancement, despite women comprising a majority of the pharmacy workforce in many regions. This explores the current state of women's leadership in pharmacy, the systemic challenges they face, and the transformative impact of empowering women in leadership roles across academia, industry, clinical practice, policy, and entrepreneurship. Cultural norms, unconscious bias, limited access to mentorship, and work-life balance pressures continue to hinder the professional growth of women in pharmacy. However, a growing number of female leaders are breaking these barriers through advocacy, networking, policy change, and organizational reform. By fostering inclusive leadership pathways, promoting mentorship programs, and supporting flexible work environments, the profession can create a more equitable and diverse leadership landscape. Women leaders bring unique perspectives to healthcare delivery, patient care innovation, and strategic decision-making. Their representation at the highest levels contributes to more collaborative, empathetic, and effective healthcare systems. As the pharmacy profession evolves, cultivating gender equity is not only a matter of justice but a strategic imperative for sustainable growth and innovation. This work calls for collective action across institutions to support women's leadership, challenge systemic inequities, and build a more inclusive future for pharmacy.

**Keywords:** Women in pharmacy, gender equity, healthcare leadership, systemic barriers, women empowerment, pharmacy profession.

**RA-59**

## FUTURE OF PHARMD GRADUATES: BEYOND HOSPITALS, RESEARCH, POLICY, START-UP AND TECH ROLES

T. Ramalakshmi Thirupathamma, M. Prasad Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy,
Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
thullurilakshmi76@gmail.com

The evolving landscape of healthcare and pharmaceutical sciences is rapidly expanding the career horizons for Doctor of Pharmacy (PharmD) graduates beyond the conventional roles in hospitals and community pharmacies. Emerging opportunities in research, health policy, entrepreneurship, and technology-driven sectors are redefining the professional trajectory for pharmacy professionals. As healthcare systems become increasingly complex and integrated with digital innovations, PharmD graduates are uniquely positioned to contribute through clinical expertise, patient-centred care models, and data-informed decision-making. In research, PharmDs are taking active roles in clinical trials, real-world evidence generation, Pharmacoeconomics, and outcomes research. The policy domain offers roles in healthcare regulation, public health planning, and drug access frameworks, where PharmDs influence medication safety, pricing, and accessibility. The start-up ecosystem is also recognizing the value of pharmacists, particularly in digital health, health informatics, and personalized medicine ventures. Their training in therapeutics, pharmacology, and clinical decision-making makes them critical assets in designing patient-centric health tech products and services. Furthermore, the integration of artificial intelligence, machine learning, and big data into healthcare opens new avenues for PharmDs to serve as bridges between technology and clinical practice. To leverage these expanding frontiers, pharmacy education and training programs must evolve to incorporate interdisciplinary skills, digital literacy, and entrepreneurial thinking. This transformation marks a paradigm shift in the pharmacy profession, empowering PharmD graduates to lead innovations across the healthcare continuum.

**Keywords:** PharmD graduates, future of pharmacy, healthcare innovation, digital health, pharmacy start-ups.

**RA-60**

## GREEN PHARMACY PRACTICE: ECOFRIENDLY APPROACHES IN HOSPITAL AND COMMUNITY SETTINGS

G. Smily, Anitha. I, M. Prasada Rao
Department of Pharmacy Practice, Medarametla Anjamma Mastan Rao College of Pharmacy, Kesanupalli, Narasaraopet, Andhra Pradesh, India-522601
smilygowdaperru@gmail.com

Green pharmacy practice has emerged as a sustainable approach that integrates environmental responsibility into healthcare delivery, aiming to reduce the ecological footprint of medicines and pharmacy services. The growing concern over pharmaceutical waste, improper drug disposal, and resource-intensive hospital operations has highlighted the urgent need for ecofriendly strategies in both hospital and community settings. Green pharmacy emphasizes practices such as rational prescribing, promotion of generic medicines, energy-efficient dispensing systems, eco-labeling, and proper segregation and disposal of pharmaceutical waste. In hospitals, adopting green procurement policies, reducing single-use plastics, and implementing take-back programs for unused drugs can minimize environmental hazards while maintaining patient safety. Similarly, in community pharmacies, patient education on safe disposal, encouraging reusable packaging, and embracing digital prescriptions contribute significantly to environmental conservation. Green pharmacy practice not only safeguards the environment but also enhances public health by reducing risks associated with pharmaceutical pollutants in water and soil. The shift towards ecofriendly approaches in pharmacy practice bridges the gap between healthcare delivery and environmental sustainability, making pharmacist's key stakeholders in global efforts toward a greener future. This paradigm fosters a balance between therapeutic efficacy and ecological responsibility, ensuring a healthier environment for future generations.

**Keywords:** Greenpharmacy, ecofriendly practices, hospital pharmacy, community pharmacy, environmental sustainability

**RA-61**

## KNOW YOUR PHARMACIST: A PROSPECTIVE OBSERVATIONAL STUDY

Jeswin Mathew, Shukla Preet Sachin, Patel Pratikkumar Kanubhai, Tarachand Lalwani
K.B. Institute of Pharmaceutical Education and Research, 382024
Gandhinagar, Gujarat, India
mathewjeswin26@gmail.com

Pharmacists play a crucial role in the healthcare system as accessible medication experts and providers of patient-centered services ensuring the safe and effective use of medications, offering professional advice and promoting public health. In 2008, PharmD program was introduced in India looking onto the requirement of pharmacists to play a more clinical and patient-oriented role. Despite their importance, public understanding of a pharmacist's role often remains limited to medicine dispensing. The objective behind this survey was to assess the level of knowledge, awareness and perception of general population regarding pharmacist and their services. A structured questionnaire was prepared and validated by experts (average score - 3.5). The google form was circulated to participants across diverse age groups, education background and occupations. The pre-liminary findings indicate that around half of the participants (57%) recognize the services provided by pharmacist other than dispensing medicines, but only 45% of the recognizing participants have ever received or came across the services. The survey shows following result about awareness: Health Screening (25%), Patient Counselling (68.8%), Vaccination (31.2%), Tobacco Cessation (28.9%) and Management of Minor Ailments (82.9%). Thus, it can be concluded that general population is still unaware about specialized pharmacy services and further education and awareness is needed.

**Keywords:** Pharmacist Services, Public Awareness, Patient Safety, Awareness Campaigns, Perception of Pharmacist

**RA-62**

## ECO-RESILIENCE IN THE FACE OF AMR: STRATEGIES FOR A SUSTAINABLE FUTURE

Sandip Naykodi, Sangamesh Puranik, Subodh Dubey
Department of Pharmacy, Vikrant University, Gwalior, Madhya Pradesh, India – 474006

ISBN: 978-81-980623-8-3

Sandip.naikodi762@gmail.com

Antimicrobial resistance (AMR) in the environment, driven by effluents from pharmaceutical, hospital, and livestock sources, threatens ecosystems and human health in India. This study quantifies antibiotic residues and resistance genes in Maharashtra water and sediments and examines Pollution Control Board regulations. It proposes real-time monitoring, mandatory reporting, and adaptive permitting to bridge regulatory gaps and curb environmental AMR. Antimicrobial resistance (AMR) threatens environmental health through pharmaceutical effluents, livestock runoff, and hospital waste. This study investigates AMR contamination pathways and evaluates the effectiveness of Pollution Control Board regulations. Using policy analysis, environmental sampling, and stakeholder input, it proposes strategies to integrate AMR surveillance into pollution norms, promoting sustainable governance and interdisciplinary containment approaches. Integrating microbiology, environmental science, and policy analysis, this study examines AMR ecologically to bridge regulatory gaps and institutional accountability in India's expanding industrial landscape. It offers academic insights and practical guidance for public policy and environmental health, aiming to inform a national roadmap for environmental AMR control and strengthen India's leadership in the One Health movement. Antimicrobial resistance (AMR) increasingly threatens environmental ecosystems as pharmaceutical residues enter wastewater, agricultural runoff, and soils. Persistence of these compounds fosters resistant microbes, undermining public health defenses. Although evidence links environmental AMR to human risks, existing Pollution Control Board regulations lack specificity and robustness for effective surveillance and mitigation. This study highlights regulatory gaps and proposes targeted strategies to strengthen environmental frameworks, enabling comprehensive AMR monitoring and control.

**Keywords:** Antimicrobial resistance (AMR), Pollution Control Board regulations, environmental frameworks, One Health movement.

**RA-63**

## BRIDGING GAPS IN ELDERLY REPRESENTATION: REGULATORY AND ETHICAL PERSPECTIVES IN CLINICAL RESEARCH

Shantika Prakash Naik, Arjun M, M P Venkatesh
Centre of Excellence in Regulatory Sciences, JSS College of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India -570015
shantikaprakash.kumta24@gmail.com

The rapidly expanding global aging population underscores the critical need to enhance geriatric representation in clinical trials. Older adults frequently experience multimorbidity and polypharmacy, yet remain disproportionately underrepresented in research, limiting the generalizability of trial outcomes. This study systematically examined regulatory frameworks from the FDA, EMA, ICH, and CDSCO, alongside current literature, to evaluate barriers and evolving approaches to equitable elderly participation. Although guidelines increasingly emphasize age-inclusive study designs, restrictive eligibility criteria, inadequate geriatric-focused pharmacovigilance, and ethical complexities surrounding informed consent continue to constrain participation. Illustrative cases, including dose-dependent safety risks with drugs such as metformin and rivaroxaban, highlight the clinical implications of insufficient geriatric data. Innovative strategies—such as decentralized and hybrid trial models, AI-driven recruitment, adaptive safety monitoring, and caregiver engagement—offer promising avenues to improve inclusion and autonomy. Findings emphasized that without targeted regulatory reinforcement and ethical safeguards, clinical evidence risks being both scientifically incomplete and ethically unjust. Advancing geriatric inclusion is thus not only essential for optimizing drug efficacy and safety but also a moral obligation to ensure equitable access to research benefits. Strengthened trial design, enforceable guidelines, and robust post-marketing surveillance are pivotal to delivering safer, personalized, and evidence-informed care for the aging global population.

**Keywords:** Aging population, Clinical trials, Ethics, Geriatrics, Regulation.

**RA-64**

## NAVIGATING GLOBAL MEDICAL DEVICE COMPLIANCE: EU VS FDA APPROVALS

Sanjay S, Arjun M, M P Venkatesh
Centre of Excellence in Regulatory Sciences, Department of Pharmaceutics,
JSS College ofPharmacy, JSS Academy of Higher Education and Research, Mysuru, 570015, Karnataka, India
sanjays181999@gmail.com

Medical devices are indispensable in modern healthcare, enhancing diagnostic accuracy, treatment efficacy, and overall patient outcomes. Ensuring timely access while maintaining safety necessitates robust regulatory frameworks. This study provides a comparative analysis of the European Union (EU) Medical Device Regulation (MDR) and the United States (US) Food and Drug Administration (FDA) frameworks, focusing on high-risk and breakthrough medical devices. A systematic review methodology was employed, analysing regulatory documents, guidance frameworks, and published literature. Evaluation criteria included device classification, premarket assessment, post-market surveillance, and quality system compliance. The analysis highlights structural differences: the US follows a centralized model via the FDA, whereas the EU operates a decentralized system involving Notified Bodies and Competent Authorities. Regulatory pathways, including the FDA's 510(k), Premarket Approval (PMA), and Breakthrough Devices Program, alongside the EU's CE marking and conformity assessment process, were examined. Specific features such as the EU's risk-based classification, Unique Device Identification (UDI), and Periodic Safety Update Reports (PSURs) were contrasted with the FDA's active and passive surveillance mechanisms, De Novo classification, and Humanitarian Device Exemption (HDE) pathway. Results indicate that while both systems share the goal of ensuring safety and efficacy, they differ in execution, transparency, and review timelines. The study infers that global regulatory harmonization could promote innovation while safeguarding patient safety. By linking regulatory approaches to health and social outcomes, this research identifies best practices to inform policy refinement and facilitate more efficient, safer access to medical devices.

**Keywords:** Clinical Evaluation, FDA Approval, Medical Device Regulation, Post-Market Surveillance, Regulatory Harmonization.

**RA-65**

## IMPACT OF FDA REGULATORY REFORMS ON ANDA 505(J) APPROVALS AND GENERIC DRUG MARKET DYNAMICS

Nivedita M K, Arjun M, K. Bangarurajan, M P Venkatesh
Centre of Excellence in Pharmaceutical Regulatory Sciences, JSS College of Pharmacy, JSS
Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India-570015
niveditamk9ge@gmail.com

The rising cost of pharmaceuticals in the United States has necessitated regulatory reforms to strengthen generic drug competition and affordability. The FDA, through the Hatch-Waxman Act and subsequent reforms such as the Generic Drug User Fee Amendments (GDUFA) and the Drug Competition Action Plan (DCAP), has been pivotal in expediting Abbreviated New Drug Application (ANDA) 505(j) approvals. This study evaluates whether these reforms achieved their intended objectives by enhancing approval efficiency, fostering market competition, reducing prices, and improving accessibility, while also identifying persisting regulatory gaps. Using FDA approval data, ANDA filings, and Paragraph IV litigations between 2010 and 2024, both quantitative and qualitative analyses were performed. Approval timelines, exclusivity periods, and cost savings were statistically assessed, and market competition and accessibility outcomes were qualitatively reviewed. Findings revealed that Hatch-Waxman reforms accelerated ANDA approvals while maintaining a balance between innovation and access. Multiple generic entrants significantly reduced drug prices by 20–40%, yielding substantial healthcare savings. Paragraph IV litigation trends, however, highlighted barriers extending exclusivity timelines. Federal Trade Commission (FTC) enforcement actions curbed certain anti-competitive practices, but persistent market manipulation continues to pose challenges. Overall, FDA reforms substantially improved affordability, accessibility, and market competition, yet enforcement mechanisms require strengthening to sustain consumer benefits. In conclusion, Hatch-Waxman, GDUFA, and DCAP reforms have positively influenced generic drug market dynamics, though further policy alignment is

ISBN: 978-81-980623-8-3

essential for achieving a sustainable, competitive, and affordable generic ecosystem.

**Keywords:** ANDA 505(j), DCAP, GDUFA, Generic Drugs, Market Competition

**RA-66**

## ACADEMIC STRESS AND ITS IMPACT ON THE MENTAL HEALTH OF HEALTH CARE STUDENTS, A CROSS SECTIONAL SURVEY

Aiswarya S
Department of the Pharmacy Practice, Aditya Bangalore Institute of Pharmacy Education and Research, Yelahanka.
aiswaryasujith1@gmail.com

Academic stress is common among healthcare students and can significantly affect mental health and well-being.This study aimed to assess the prevalence of academic stress, its sources, coping strategies, and its impact on student's mental health.A questionnaire was distributed via Google Forms, and anonymous responses were collected from students across different academic years.Among 150 participants, 56.3% reported having adequate time for hobbies and personal life, while 43.7% did not. Emotional symptoms were frequent, with 47.1% occasionally feeling anxious or depressed, 35.3% often experiencing stress, and only 22.8% rarely reporting. Overall, 57.4% rated their academic stress as high (scores 4–5), whereas 42.6% reported moderate to low levels (scores 1–3). Regarding coping mechanisms, 51.4% engaged in physical exercise, 19.1% relied on peer support, and 47.4% adopted other stress - relieving activities. Examinations were identified as the primary stressor by 73.3% of students, while 25.7% cited other academic challenges. Academic stress is highly prevalent among healthcare students, often leading to emotional strain. Although students adopt various coping strategies, the findings highlight the need for structured institutional support and accessible mental health resources to promote well-being and academic success. Many students struggle with high academic stress tied to anxiety and depression, showing the importance of better mental health support, healthier coping options, and a more balanced academic environment.

**Keywords:** Academic stress, mental health, healthcare students, Academic challenges, Emotional symptoms.

## DEVELOPMENT OF MODEL FOR SAFE DISPOSAL OF UNUSED AND EXPIRED MEDICINES

Gurumurthaih S S, Sangamesh Puranik, Subodh Dubey
Department of Pharmacy, Vikrant University, Gwalior, Madhya Pradesh, India- 474006.
guru_dvpharma@yahoo.co.in

Improper disposal of unused and expired medicines is a growing global concern, contributing to environmental pollution, accidental misuse, and increased risks to public health. Common practices such as discarding medicines in household waste or flushing them into sewage systems often result in pharmaceutical residues contaminating soil and water sources. Despite the existence of regulatory guidelines in some regions, a practical and universally adaptable disposal framework is still lacking. This study focuses on the development of a structured model for the safe disposal of unused and expired medicines. The proposed model is based on a three-tiered framework: Collection Mechanism – creating accessible drop-off systems at pharmacies, hospitals, and community centers; Processing and Disposal – adopting cost-effective, environmentally responsible approaches such as high-temperature incineration, reverse logistics, and chemical neutralization; and Awareness and Policy Support – fostering consumer education, strengthening stakeholder participation, and reinforcing regulatory mechanisms. The model was conceptualized through a review of international best practices, consultations with healthcare and environmental experts, and surveys assessing household disposal behaviors. Findings underscore the urgent need for a structured and scalable solution that ensures environmental safety, prevents unintentional drug misuse, and promotes sustainable healthcare practices. The adoption of this model can play a critical role in improving pharmaceutical waste management, reducing ecological hazards, and advancing global efforts toward responsible medicine stewardship.

**Keywords:** Medicine disposal, expired drugs, pharmaceutical waste, environmental health, sustainable healthcare

**RA-68**

## KNOWLEDGE, ATTITUDE AND PRACTICE REGARDING MISUSE OF ANTIBIOTICS AMONG SOUTH KERALA

Lavanya Jibi K, Drishya L, Shaiju S Dharan
Pharm D Student, Department of pharmacy practice, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Neyyatinkara, Trivandrum, Kerala 695124
lavanyajibi175@gmail.com

Antibiotics stand as one of medicine's greatest achievements, saving millions of lives by defeating bacterial infections. They have reduced complications, shortened illness durations, and prevented the spread to deadly diseases. Yet, their power is slowly being lost due to common mistakes in the community self-medication, buying antibiotics without prescriptions, stopping treatment midway, and using them for viral illnesses like colds and flu antibiotic resistance. These practices fuel antibiotic resistance, turning once-curable infections into dangerous threats that last longer, cost more, and sometimes even become untreatable. Protecting antibiotics requires collective effort. It is essential for communities to recognize that the antibiotics are not a universal remedies and require responsible use. Doctors should prescribe them carefully, guiding patients to complete the full course. At the same time, strict regulations are needed to prevent misuse and encourage stewardship programs. By raising awareness and promoting preventive strategies, we can preserve the strength of antibiotics, safeguard public health, and ensure these life-saving medicines remain effective for the future generations. A survey was conducted to assess knowledge, attitude, and practice regarding antibiotic misuse in the community.

**Keywords:** Antibiotics, misuse, self-medications, public health.

**RA-69**

## ADVANCEMENTS IN REGULATORY COMPLIANCE AND TOOLS USED

Ramit Kapoor[1], Chaitanya M V S R K[2], Ajit Nair[3]
Manager II, Data Stewardship, RIM Governance & Engagement, Bristol Myers Squibb, Hyderabad
Associate Director, RIM Governance & Engagement, Bristol Myers Squibb, Hyderabad
Head of Regulatory Sciences, Global Regulatory Sciences, Bristol Myers Squibb, Hyderabad
ramit.kapoor@bms.com

The Regulatory Compliance is an important and integral component of any Pharmaceutical Industry and as it gets increasingly complex and Health authorities are scrutinizing the standards of the drug quality and safety for the patients, traditional methods to maintain it are now not sufficient to meet the everchanging expectation of the health authorities. The pharmaceutical industries should have diverse compliance system to monitor the modern drug development and its commercialization across globally. That's why Pharmaceutical Industries are coming across more digitalised ways to maintain global compliance. The analytical tools have been used now by almost all the industries to maintain regulatory excellence. This examines how automation, analytical tools and data stewardship helps industries to maintain Compliance. Also, it highlights various tools used by the pharmaceutical tools to maintain regulatory data and compliance. It highlights how critical the compliance is and how it helps in maintaining data accuracy, data integrity, data uniqueness and follow ALCOA+ principles. The session aims to provide insights in Data Quality Compliance and tools used for maintaining Data Quality Compliance. The presentation will highlight: Why it's important to maintain Data Quality Compliance. Various Analytical tools used by Pharmaceutical Industry to maintain Compliance. Attendees will gain insights to basic compliance solutions used by pharmaceutical industries and context to Emerging technologies and also risk management through collaborative tools used in Data Quality Compliance. The session will help attendees to understand governance tools used by Pharmaceutical Industries and how technology is helping compliance at global level.

**Keywords:** Pharmaceutical Compliance, Regulatory Information Management, Data Stewardship, AI in Pharma, Digital Transformation, Governance, Submission Readiness, Cloud Platforms, Automation

## KNOWLEDGE, ATTITUDE AND PRACTICE (KAP) STUDY ON THE IMPACT OF MOBILE HEALTH-RELATED APP USAGE AND COMPLIANCE AMONG ADULDS

Helina Smith, Drishya L, Shaiju S Dharan
Pharm D student, Department of pharmacy practice, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Neyyatinkara, Thiruvananthapuram, Kerala 695124
helinasmith050@gmail.com

Medication adherence is defined by the WHO as "the degree to which a person's behavior corresponds with taking a medicine optimally" such as factors like taking the right medicine at the right time with right dosage and at the correct duration. It is a crucial aspect of healthcare. If the medication adherence is poor it can lead to ineffective treatment and may worsen the conditions so here is the mobile health refer to mobile device to delivery healthcare service and information. They have revolutionized communication, breakdown geographical barriers and providing instant connectivity. The mobile health apps are software design that plays a significant role in medication compliance providing features like dose tracking, reminders, offering education about the medication and their treatment plans. They are effective in reducing non-adherence by reminding the patient about medication and relaying the care givers about the information. The mobile health (mHealth) apps are quite simple, easy to access and cheap in cost. Integrating such a kind of digital tool into patient's routine care offers a practical, optimized, reduced forgetfulness, refill alerts and scalable solution for the non-adherence. However, they also encounter challenges such as development costs, security risks, and need for ongoing maintenance. In present they also deal with security and privacy risk; they often require access to sensitive data and excessive use of apps may lead to mobile addictions.

**Keywords:** medication adherence, mobile health app, mobile health, encounter, digital tool.

**RA-71**

## A REGULATORY PERSPECTIVE FOR THE APPROVAL OF RADIOPHARMACEUTICALS

Yashwant Singh Chaturvedi
Columbia Institute of Pharmacy, Near Vidhan Sabha, Village – Tekari, Raipur - 493111, Chhattisgarh, India
yashu0770@gmail.com

Radiopharmaceuticals are the pharmaceutical formulation which consists of radioactive substances; these molecules are labelled with radioisotopes. They are intended to use either for diagnostic or for therapeutic purposes. In recent times, there has been a noteworthy growth with special reference to branch of nuclear medicine. There are numerous novel radionuclides and radiopharmaceuticals used for the treatment of metastatic bone pain, neuroendocrine and other tumours. Embracing research by the scientific fraternity has led to the invention of many radiopharmaceuticals which are of immense clinical importance. The increasing availability of radiopharmaceuticals should be in accordance with regulatory action in order to back up the permissible foundation for their commercial use. It is therefore imperative for a radiopharmaceutical to have an approval from regulatory authority to qualify for human use. The present paper highlights various regulatory requirements for approval of radiopharmaceuticals in USA, Europe, and particularly India, which does not have guidelines for their approval, and intensifies the concern for a harmonized regulatory platform of global acceptance.

**Keywords:** Radiopharmaceuticals, Nuclear Medicine, Approval, Commercial use, Guidelines, Regulatory authority.

**RA-72**

## REGULATORY CHANGES IMPACT ON CLINICAL TRIALS – CTIS (CLINICAL TRIAL INFORMATION SYSTEM)

Vignesh M S, Arjun M, M P Venkatesh, K Bangarurajan
Centre of Excellence in Pharmaceutical Regulatory Sciences, JSS College of Pharmacy, JSS
Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India-570015
24p14014@jssuni.edu.in

The regulatory framework governing clinical trials in the European Union has undergone a major transformation with the shift from the Clinical Trials Directive (CTD) to the Clinical Trials Regulation (CTR) and the establishment of the Clinical Trial Information System (CTIS). To evaluate the impact of these changes, an extensive literature-based investigation was carried out using regulatory documents, scientific publications, and case reports to assess the drivers, outcomes, and challenges of implementation. The methodological approach involved comparative analysis of regulatory provisions, examination of operational practices, and thematic evaluation of technical, ethical, and organizational perspectives. Results highlighted that CTIS has strengthened harmonization, transparency, and participant engagement through a unified portal for trial submissions and monitoring. At the same time, significant limitations were observed, including technical flaws, difficulties in integration with legacy systems, tight sponsor timelines, and variations in national interpretation of CTR provisions. Case-based findings further demonstrated improvements in submission efficiency, data management, and ethical compliance, while identifying training and change management as critical gaps. The overall inference drawn indicates that CTIS represents a transformative step toward efficient and participant-centred clinical trial governance, though its success will depend on sustained stakeholder support, continuous system refinement, and harmonized regulatory cooperation across member states.

**Keywords:** Clinical Trial, Clinical Trial Directive, Clinical Trial Regulation, Clinical Trial Information System, European Union

**RA-73**

## A FUTURISTIC PERSPECTIVE ON THE INTEGRATION OF REAL-WORLD EVIDENCE IN GLOBAL REGULATORY SUBMISSIONS

Amulya K M, M P Venkatesh
Centre of Excellence in Pharmaceutical Regulatory Sciences, Dept. of Pharmaceutics,
JSS College of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India-570015
amulyakalmath@gmail.com

As healthcare increasingly embraces digital innovation Real world data (RWD) and the Real-world evidence (RWE) are reshaping how we understand medicine in everyday practice. Gone are the days when randomized clinical trials stood alone. Today, insights from electronic health records, insurance claims, and patient-reported outcomes are driving smarter, faster and more patient-centered regulatory decisions. This study offers a futuristic perspective on the integration of RWE into global regulatory submissions. The study involved a structured review of international regulatory frameworks, case studies and technological initiatives driving RWE adoption. Regulatory guidelines from the USFDA, EMA and PMDA was analysed alongside global projects such as the FDA Sentinel Initiative, EMA's DARWIN EU, and the Big Data Task Force. Case studies of drugs were examined to illustrate the practical use of RWE in supporting regulatory decision-making. Findings highlight technological advances like digital health tools, artificial intelligence, and big data analytics are revolutionizing RWE collection and analysis. However, challenges persist regarding data quality, ethical and privacy concerns, lack of standardization, and varying levels of regulatory acceptance. The discussion underscores the need for harmonized global standards, predictive modelling, simulation-based evidence generation and multi-stakeholder collaboration. The integration of RWE into global regulatory submissions holds immense potential to accelerate drug development, enhance patient-centric evaluation and streamline regulatory pathways. A future defined by harmonization, digital innovation and collaborative governance will ensure that RWE achieves its full impact in shaping regulatory science.

**Keywords:** Real world data, real world evidence, regulatory decision making, regulatory frameworks.

**RA-74**

## NEED OF STRINGENT REGULATIONS TO CURB THE IRRATIONAL USE OF ANTIBIOTICS IN INDIA

Nehal Bhimjiyani, Esha Vishwakarma, Anil M Pethe
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education & Research Sawangi (Meghe) Wardha, Maharashtra, India
nehalbhimjiyani024@gmail.com

ISBN: 978-81-980623-8-3

The irrational use of antibiotics in India has become a public health issue of concern, an important contributor to the global menace of antimicrobial resistance (AMR). The accessibility of over-the-counter, improper use of prescription, insufficient course of treatment, and misuse in agricultural and animal husbandry industry has increased the emergence of resistant strains of bacteria faster. This not only diminishes the efficacy of the current antibiotics but also heightens the rate of treatment failures, morbidity, deaths and healthcare expenditures. Despite Government of India initiatives like the National Action Plan on AMR and Schedule H1 regulations to limit non-prescription sales, enforcement has been weak; this is because of poor surveillance systems, poor monitoring, and lack of awareness by the population. The present situation highlights the necessity of more regulatory systems to control rational use of antibiotics. Enhanced prescription audits, severe consequences of non-compliance, electronic surveillance of the sale of antibiotics, and the introduction of antimicrobial stewardship programs into hospitals and community healthcare are important projections. Additionally, there should be multi-sectoral coordination of the health, veterinary, and agricultural authorities to tackle the issue of antibiotic misuse in a comprehensive way. Compliance can also be improved by conducting educational campaigns to the population and training medical workers. In the resistance, regulations absence of solid enforcement of regulations, India will enter a post-antibiotic era when common infections can no longer be treated. Hence, urgent policy changes, backed by good governance and nationwide execution, is urgently needed to reduce the irrational use of antibiotics and protect the effectiveness of these life-saving drugs to the other generations.

**Keywords:** Antibiotics, irrational use, antimicrobial, stewardship, Schedule H1

**RA-75**

## BUMPS AND HUMPS IN AI BASED EDUCATION FOR PHARMACY GRADUATES

Ravi Kumar, Honey Goel, Viney Chawla
University Institute of Pharmaceutical Sciences and Research, Faridkot, Punjab, India
ravichoudhary@gmail.com

Artificial intelligence (AI) is rapidly transforming pharmacy education by offering innovative tools that enhance personalized learning, clinical decision-making, and experiential training. PCI has also integrated seven new subjects dealing with the role of AI in phython programming, preformulation and formulation, drug design, discovery and bioinformatics etc. in its model pharmacy curriculum. However, integrating AI into pharmacy curriculum presents both significant challenges and promising opportunities. AI-powered tools not only offer transformative potential to enhance learning experiences, but also enable personalized learning by adapting content to individual student needs, simplifying complex pharmacological concepts, and providing efficient study aids such as customized practice questions and visual summaries. Additionally, AI facilitates experiential learning through simulation and decision-support systems, fostering clinical reasoning skills essential for future pharmacists. Despite these advantages, the integration of AI into pharmacy curriculum has its challenges. Technical limitations, such as AI's occasional inaccuracies in complex calculations, raise concerns about reliability. Ethical issues including data privacy, academic integrity, and responsible use of AI tools require careful consideration. Furthermore, many educators face a steep learning curve in adopting AI technologies, and students risk becoming overly dependent on AI, potentially undermining critical thinking and problem-solving abilities. Access disparities also threaten to widen educational inequities. This poster explores the technical, ethical, and pedagogical obstacles faced by educators and students, including issues of faculty training. It also highlights strategies to overcome these barriers through AI literacy programs, ethical frameworks, and collaborative curriculum development.

**Keywords:** Artificial intelligence, Pharmacy Education, Pharmaceutical Curriculum, personalized learning, experiential training.

## THE SHIFT TOWARDS PHARMA 5.0+: OPPORTUNITIES, CHALLENGES, AND STRATEGIC SOLUTIONS FOR INDIA'S PHARMACEUTICAL INDUSTRY

Sapna Malviya
Professor and Head of Institute, Modern Institute of Pharmaceutical Sciences, Indore, 453111
profsapnamalviya@gmail.com

The Indian pharmaceutical industry is the third largest in terms of volume; it ranks at just fourteenth in terms of value. It is evident that India needs to undergo a significant transition from generic drug producer to a producer of novel molecules and biosimilars through rigorous R&D initiatives. With encouragement of Food and Drug administration the pharma industry is now on the track of catching up with other industries and is heading towards adopting more and more Industry 5.0 technologies and continuous manufacturing. Modern pharmaceutical production systems have emerged to convert ambition to excellence; the future has now emerged as to define Indian Pharmaceutical Industry to set new imperatives for all stakeholders. The forthcoming progression of Pharmaceutical Industries needs the amalgamation of Pharma 5.0+ which accumulates all evolving technologies such as the internet of things (IoT), artificial intelligence (AI), robotics, and advanced computing to intensely modify all processes of pharma manufacturing. The journey of transformation from data collection to the remarkable digital maturity of Pharma 5.0 will determine the next generation of pharmaceutical production. Industry 1.0 is the starting point of the modern pharmaceutical industry transition from manual processing from simple hand-operated tools to commercial-scale machinery. Industry 2.0 was enabled by electricity and early electronic machines. The automated and digital environment of Pharma 3.0 empowers the widespread transformation into Pharma 5.0 in pharmaceutical production. The latest developments are the industrial revolution of Pharma 5.0, which in particular has shown great potential for transforming the production base with advanced analytics tools for processing large quantities of production data. Hence, Smart Pharmaceutical Factory Automation is revolutionizing pharma manufacturing, creating an ecosystem of medical devices and applications that enables to increase the visibility of processes, machines, and products, thereby increasing productivity, reducing errors, and maximizing profitability. The key to this paper is to summarize India can provide cutting-edge technology, communications, and solutions, which enable enterprises in the pharma industrial sectors to migrate seamlessly to Industry 5.0+ through the adoption of IoT, AI, and other robotic technology. The advancements in all technology with digitization, automation, and real-time data integration will produce better results.

**Keywords:** Pharma 5.0+, internet of things, Artificial intelligence, Robotics, Smart Factory.

## EXPLORING THE CONTRIBUTION OF PHARMACY ACADEMICIANS IN ACADEMIA–INDUSTRY PARTNERSHIPS FOR PHARMACEUTICAL RESEARCH: A DESCRIPTIVE SURVEY APPROACH

Neelesh Malviya
Smriti College of Pharmaceutical Education, Indore (M.P.), India
drneeleshmalviya@gmail.com

Academia-industry collaboration has persistently been a matter of debate in academia and industry. The research was done in academia and its translation into marketable products certainly is not new. High-quality academic research can assist the industry to produce economic products for society. The aim of present project is to compile and analysed the database of pharma academicians comprised of academician's details along with their research expertise. With this aim, an attempt has been taken to compiled and analyzed the database of pharma academicians based on personal details, academic details, and professional details including designation, Qualification, Specialization, Expertise, Interested vs. engaged in academia-industry collaborations, Projects handled, Publications, Interest areas of Academic- industry collaborative that can be utilized by Pharma Industries. In total 2401 pharma academicians were participated and responded to the prepared project questionnaire. Based on participation an analysis report has been prepared comprising participation distribution graphical presentation in respect questionnaire. Through this interpretation, one can understand the potential of academicians which helps to shorten the academicians as per their requirements, as well as by seeing the profile of interested academicians they will contact them for their work. The

ISBN: 978-81-980623-8-3

significant database will be useful to foster the academia-industry collaboration, helpful to prove the potential of academicians as innovative researchers to fulfill the requirements of Pharma Industries.

**Keywords:** Pharma academicians, Academia-industry collaboration, Pharmaceutical research

**RA-78**

## NEED TO TEACH LAW OF CONTRACTS IN DRUG REGULATORY AFFAIRS

Nanda Sanju, Nanda Arun
Department of Pharmaceutical Sciences, Maharshi Dayanand University, Rohtak
an_mdu@rediffmail.com

Any agreement which can be enforced by law is a contract. The law of contracts is crucial in pharmacy, regulating agreements between various stakeholders like pharmaceutical companies, suppliers, distributors, government entities and even patients. These contracts cover areas like supply agreements for raw materials and finished products, clinical trial agreements, licensing agreements for intellectual property, and more. Effective contract management ensures compliance, minimizes risk, and facilitates the smooth operation of the pharmaceutical industry. Business connections are established by every pharmaceutical company, with different manufacturers, suppliers, service providers, financial institutions, etc. In all these transactions, contracts are involved and regulatory authorities worldwide mandate for clearly defined, agreed and controlled contracted services. Various types of contracts, along with types of clauses required to be covered in such contracts, which are entered into by the pharmaceutical industry, with its various stakeholders, in India as well as outside, have been explored in this article. The application of Law of Contracts has been illustrated in the regulatory agencies of USA, European Union and India. Application of Law of contracts has been explored from the stage of inception to closing of a pharmaceutical company. The three types of contracts (Contracts by Agreement, Standard Form Contract and Promissory Estoppel) have been described, with cited case studies. Salient features, key types of agreements, key considerations, common examples, and specific applications in pharmaceutical industry, common clauses, of the three types of contracts have been described. The authors suggest that in view of the significant application of Law of Contracts in pharmaceutical industry, it would be prudent if the students / researchers in pharmacy, particularly those in the area of drug regulatory affairs, be fully aware of this law, and that this law may be included in the Pharmacy curriculum.

**Keywords:** Contracts, Standard forms contract, Promissory estoppels.

**RA-79**

## NAVIGATING THE REGULATORY LANDSCAPE: UNRAVELLING THE RULES ON MISLEADING DRUG ADVERTISEMENTS IN THE USA

Koti. Mercy, Kudupudi. Karthik, I. Amrutha Rajeswari
Department of Pharmaceutical regulatory affairs, Vikas institute of Pharmaceutical Sciences, Near Airport, Rajahmundry, East Godavari District Andhra Pradesh, India-533102.
mercykotikoti@gmail.com

FDA mandates pre-approval scrutiny for pharmaceutical products, assessing various production sites. After approval, risk-based surveillance inspections occur. A study examines warming letters from FDA's FTC (federal trade commission) and OPDP (office of prescription drug promotion) to drug firms' post approval, delving into reasons behind such regulatory actions for enhanced pharmaceutical industry compliance and public safety. Advertisements are vital in a community where all companies fight for development and economic success, Drug development is a time-consuming and risky business Marketing has a huge positive impact on the introduction of new products to the market. However, several pharmaceutical goods marketing specifically branded products are disputed and in violation of advertising regulations. This study investigates the regulatory environment of pharmaceutical advertising by analysing warning letters (WL) issued by the FTC and OPDP between 2017 and 2023.The study focuses on the reasons underlying regulatory actions for improved industry compliance and public safety by examinine FDA-mandated pre-approval scrutiny and posteapproval surveillance inspections. Over a decade, advertising has been a crucial tool for any industry in reaching out to new clients while preserving confidence with existing ones. Pharmaceutical advertising, from a regulatory standpoint, is far more than just advertising in the traditional sense. Each country has its own legislative framework in place to protect the interests of consumers and corporations. This study emphasizes the overall regulatory consequences of misleading advertisements of drugs with respect to warning letters issued by both F'TC and OPDP in USA.

## HOSPITAL, COMMUNITY AND CLINICAL PHARMACY

Gunjan Pise
Priyadarshini J.L college of pharmacy, Nagpur Maharastra
gunjan776@gmail.com

Pharmacy practice in India is undergoing a transformative shift, aligning more closely with global standards to enhance patient care and public health outcomes. The integration of Hospital, Community, and Clinical Pharmacy forms the cornerstone of a comprehensive healthcare delivery system. Hospital Pharmacy focuses on the safe and effective use of medicines within hospital settings, ensuring optimal pharmacotherapy through drug procurement, inventory management, and patient-specific dosing. Community Pharmacy serves as the most accessible healthcare interface for the public, providing medication dispensing, patient counseling, health screenings, and promoting rational drug use at the grassroots level. Clinical Pharmacy, an evolving specialty in India, emphasizes direct patient care, including therapeutic drug monitoring, medication therapy management, and inter professional collaboration for evidence-based treatment. Together, these branches work synergistically to improve health outcomes, reduce medication errors, and ensure the rational use of drugs. There is a growing need to standardize practices, enhance pharmacist education, and integrate pharmacists into multidisciplinary healthcare teams. With policy support and continuous professional development, pharmacists can play a critical role in achieving national health goals, including those under Ayushman Bharat and the National Health Mission. This highlights the critical roles of hospital, community, and clinical pharmacists and underlines the need for unified efforts to elevate pharmacy practice standards in India.

## AN EVALUATION ON THE CURRENT TRENDS IN PHARMACEUTICAL CARE PROVIDED BY THE PHARMACIST

Malini S
Department of Pharmacy Practice, Pushpagiri College of Pharmacy, Medicity Campus, Perumthuruthy PO, Thiruvalla, Kerala, 689107
malinianil505@gmail.com

The role of pharmacists has evolved from traditional compounding and dispensing to delivering comprehensive pharmaceutical care aimed at improving patient outcomes. Modern pharmacy practice includes collaboration with other healthcare professionals to enhance the quality of life through activities such as adverse drug reaction reporting, therapy monitoring, and identification of drug-related problems. To assess the attitudes and involvement of pharmacists in providing pharmaceutical care across various healthcare settings in both rural and urban regions. A cross-sectional, prospective, observational study was conducted involving pharmacists from government hospitals, primary health centers, private hospitals, and community pharmacies across five districts, covering urban, semi-urban, and rural areas. Data were collected through validated questionnaires administered via both offline and online interactions. Informed consent was obtained from all participants prior to the study. The study was approved by the Institutional Ethics Committee. Pharmacists actively participated and expressed a positive attitude towards the evolving responsibilities in pharmaceutical care. The results were analysed using SPSS software based on gender, age, qualification, experience, area of work, working hours and geographic region. The study underscores the growing involvement of pharmacists in patient-centered care and their willingness to expand their role beyond traditional dispensing. The study

ISBN: 978-81-980623-8-3

concluded that the training can further empower pharmacists to enhance healthcare delivery system.

**Keywords:** Pharmacist, Current Trends, Pharmaceutical care.

**BENEFITS OF REGULATORY APPROVALS ON FOOD CHAINS IN INDIA**

Thoudoju sahithi, R. Prasanthi
email: sahithi.thoudoju@gmail.com
Sarojini Naidu Vanita Pharmacy Maha Vidyalaya, Tarnaka, Hyderabad, Telangana, India
sahithi.thoudoju@gmail.com

Before the 21st century, India's food sector was regulated by multiple legislations, each prescribing different standards for additives, preservatives, colors, contaminants, and labelling. This resulted in overlapping jurisdictions and confusion. To highlight the establishment and objectives of the Food Safety and Standards Authority of India (FSSAI) and its role in unifying food laws under a single framework. The Food Safety and Standards Act, 2006, was enacted under the Ministry of Health & Family Welfare, consolidating previous legislations such as the Prevention of Food Adulteration Act, 1954, Food Product Order (FPO), and Vegetable Oil Products Order, 1998. The creation of FSSAI introduced the concept of "One Nation, One Food Law." It established science-based standards for food and regulated its manufacture, storage, distribution, sale, and import. The Act also shifted the responsibility of food safety from regulators to food businesses, ensuring accountability across the entire food chain. FSSAI plays a pivotal role in safeguarding public health, ensuring uniformity in food standards, and promoting the availability of safe, nutritious, and quality food across India.

**LICENSING APPROVAL PROCESS OF LOW RISK, MODERATE RISK AND HIGH-RISK MEDICAL DEVICES IN INDIA AND USA**

Natesh Gunturu[1], K. Bangarurajan[2], Adepu Ramesh[3]
[1] Ph.D Research Scholar, Department of Pharmaceutics, Regulatory Affairs Group, JSS College of Pharmacy, Mysuru.
[2] Professor, Department of Pharmaceutics, Regulatory Affairs Group, JSS College of Pharmacy, Mysuru.
[3] Professor and Principal, Vikas College of Pharmaceutical Sciences, Rayanigudem, Suryapet, Telangana.
natesh.grace@gmail.com

Medical device licensing and approval processes in India and the United States are structured around risk-based classification frameworks to ensure patient safety, product quality, and clinical effectiveness. In India, devices are regulated under the Medical Device Rules (MDR), 2017. Devices are categorized into Class A (low risk), Class B (low-moderate), Class C (moderate-high), and Class D (high). Class A and B manufacturing licenses are granted by the State Licensing Authority, while Class C and D, along with all imports, fall under the Central Licensing Authority (CDSCO). Applications are submitted through the SUGAM portal, requiring technical documentation such as the Device Master File, Plant Master File, and evidence of compliance with ISO 13485 quality systems. Notably, non-sterile, non-measuring Class A devices are exempt from licensing. In the United States, the Food and Drug Administration (FDA) regulates devices based on three classes. Class I (low risk) devices are generally exempt from premarket submissions but must comply with quality system regulations. Class II (moderate risk) devices typically follow the 510(k) pathway, demonstrating substantial equivalence to a predicate, or the De Novo pathway if no predicate exists. Class III (high risk) devices require Premarket Approval (PMA), supported by extensive clinical and technical evidence. All devices must comply with the FDA's Quality Management System Regulation (QMSR), harmonized with ISO 13485 by February 2026. Both systems reflect a harmonized, risk-based approach, balancing innovation with regulatory oversight to safeguard public health.

**NEED OF REVISION OF DRUG AND COSMETIC ACT 1940 IN THE ERA OF ARTIFICIAL INTELLIGENCE**

Jay S. Thakare, Neha T. Zanzad, Anil M. Pethe
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education and Research (Deemed to be University), Sawangi (Meghe), Wardha, Maharashtra, India – 442001
jaythakare3101@gmail.com

Artificial Intelligence (AI) is transforming the pharmaceutical and healthcare industries quickly in the areas of drug discovery, personalized medicine, diagnostic algorithms, clinical trials, and pharmacovigilance. Regardless of these technological advances, the Drugs and Cosmetics Act, 1940, which is the basis of drug regulation in India is mainly obsolete and has no guidelines to regulate AI-based innovations. This review will focus on describing the urgency of the revision of the Act to align with the new technologies and to provide patient safety, clarity of regulations, and ethical integrity. The most critical points of interest are the lack of guidelines in the validation of AI algorithms, data integrity, patient data privacy, accountability in AI-assisted clinical decision-making, and liability in case of adverse outcomes. The current framework fails to properly tackle the use of AI tools in the submission of regulations, automated quality control, or real-time adverse drug reactions. The poster is based on the results of the world regulatory organizations, including the US FDA, EMA, and WHO, which are already starting to include AI guidelines. The comparison highlights the importance of India moving to a legal system that is future-proof and is more welcoming to innovation without jeopardizing the health of the population. The review ends with the recommendations on integrating AI-oriented provisions in the Drug and Cosmetic Act such as defining AI tools, risk-based regulatory processes, and the post-market surveillance processes. The revision of the Act is not only a legal requirement but a strategic step to ensure that India is a leader in AI-centered healthcare without causing a lack of trust, transparency, and safety in the health systems of people.

**Keywords:** Artificial Intelligence (AI), Drug Regulation, D & C Act 1940, Patient Privacy, Ethics in AI

**RA-85**

**GREEN PHARMACY: REDUCING ENVIRONMENTAL FOOTPRINT IN DRUG MANUFACTURING**

Parnika C, Bharath Srinivasan
Department of Pharmaceutics, Faculty of Pharmacy,
M.S. Ramaiah University of Applied Sciences, Bengaluru, Karnataka, India – 560 054
parnikagowda1016@gmail.com

Green Pharmacy aims to significantly reduce the environmental footprint of drug manufacturing while maintaining public health benefits. This approach comprehends to SDGs of 3, 7, 12, 13, 15 as a part of 17 Global Sustainable Development Goals as an agenda of 2030 Sustainable Development to harmonize peace and prosperity for people and the planet. Goals emphasizes integrating sustainability into every stage of pharmaceutical production, from sourcing raw materials to product distribution. The pharmaceutical industry traditionally faces challenges such as high energy consumption, extensive waste generation and the discharge of hazardous chemicals and drug residues into the environment, which can contribute to ecological damage and the development of antibiotic resistance. The core principles of Green Pharmacy include five key areas: sustainable sourcing, eco-friendly manufacturing, waste reduction, energy efficiency and responsible distribution. Sustainable sourcing prioritizes renewable resources and ethical trade practices, ensuring minimal ecological impact and community support. Eco-friendly manufacturing adopts green chemistry principles, utilizing techniques like biocatalysis and continuous manufacturing to reduce hazardous waste and enhance efficiency. Waste reduction aims at smarter packaging systems and responsible disposal methods, including take-back and safe disposal of unused medications. Energy efficiency promotes the use of renewable energy sources and optimized logistics to lower carbon emissions. Finally, responsible distribution ensures that medications are transported and delivered in an environmentally conscious manner, while also promoting equitable access. The application of green chemistry principles is also crucial, involving design of chemical processes that minimize or eliminate the use and generation of hazardous substances, offering both ecological and economic benefits.

**THE SILENT THREAT: MISUSE OF OVER-THE-COUNTER (OTC) DRUGS**

R. Sandeep Kumar, P. Narayana swami
Pharmacy practice division, Jagan's Institute of pharmaceutical sciences, Nellore Andhra Pradesh, 524346 India.
Sandeep664756@gmail.com

OTC—over-the-counter drugs are the type of medications that a patient can purchase without a prescription. They are also called self-medication drugs or non-prescription drugs. OTC drugs are the most convenient and are majorly used by many patients by their own. OTC drugs are safe and effective when used in recommended doses but cause severe effects on health when misused and inappropriately consumed. Many patients prefer OTC drugs because they are less expensive than prescription drugs. The main objective involved is to determine the safety, cost-effectiveness, and harmful effects on the body of OTC drug misuse it is a 'silent threat '. It also includes the proper guidance regarding the use of OTC drugs for the patients. The methodology mainly includes this policy review, which was conducted using the case reports, healthcare databases, clinical studies, and some other proposed guidelines. OTC drug misuse will cause adverse drug reactions, drug interactions, polypharmacy issues, and decreasing of the disease resistance of the body. The patient thought OTC drugs were less expensive, but they will cause the high expense in the form of hospitalizations. Thus, it can be concluded by saying that getting proper knowledge about the drug can minimize the misuse and also other effects. Pharmacists are also to be involved in proper guidance by educating, counselling the patients and clear labelling. While OTC drugs are crucial in health care but their misuse causes threat. Misuse also causes the abuse, it silently kills the lives.

**Keywords:** OTC drugs, Misuse, Prescription drugs, polypharmacy.

**RA-87**

**ONE NATION, ONE DRUG LAW: TOWARDS AN AI POWERED UNIFIED REGULATORY FRAMEWORK FOR INDIA'S PHARMACEUTICAL FUTURE**

Neha Zanzad, Jay Thakare, Anil M. Pethe
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education and Research (Deemed to be University), Sawangi (Meghe), Wardha, Maharashtra, India – 442001
nehazanzad@gmail.com

The Drugs and Cosmetics Act of 1940, and later changes, regulate India's pharmaceutical sector, which is one of the largest in the world. However, enforcement varies greatly by state, resulting in fragmented licensing processes, various inspections, and variable compliance standards. This regulatory patchwork causes duplication of effort, slows drug approvals, and imposes barriers for manufacturers and healthcare providers. Most significantly, it jeopardizes patient safety and undermines India's goal of becoming a truly global pharmaceutical leader. In recent years, India has embraced comprehensive policy reforms including One Nation, One Tax (GST) and One Nation, One Health ID. On a similar note, the concept of "One Nation, One Drug Law" has arisen as a futuristic yet practicable approach. The Idea of "One Nation, One Drug Law" provides a cohesive and cutting-edge regulatory framework to fill in these gaps. Artificial Intelligence (AI) integration has the ability to completely overhaul pharmaceutical governance in India in line with the era of digital transformation. By eliminating redundancy and improving patient safety, AI-powered solutions can facilitate automated inspections, intelligent single-window licensing, transparent approval processes, and predictive analytics for pharmacovigilance. By simplifying procedures, educating stakeholders with real-time data-driven insights, and empowering industry, regulators, and patients with efficiency, transparency, and trust, such an AI-driven framework can revolutionize drug regulation. This paper explores global harmonization models (USFDA, EMA, ICH), identifies gaps in India's current system, and proposes how AI technologies can transform regulatory practices to build a resilient, unified, and patient-centric pharmaceutical future for India.

**Keywords:** AI in Pharma Regulation, One Nation One Drug Law, Unified Framework, Digital Transformation

**RA-88**

**THE IMPACT OF OVER-THE-COUNTER DRUG USAGE ON HEALTH IN KORREMULA, TELANGANA: A COMMUNITY-BASED STUDY**

K. Ashok, Bibhu Prasad Moharana
School of Pharmacy, Department of Pharmaceutics, Nalla Narasimha Reddy Education
Society's Group of Institutions, Hyderabad, Telangana, India
ashokkondagalla2022@gmail.com

Over-the-counter (OTC) drugs are widely used for self-medication, offering convenience for minor ailments but posing risks of misuse, side effects, and long-term health impacts. This community-based study aimed to assess the prevalence, patterns, awareness, and health implications of OTC drug use among residents in Korremula, Telangana, to inform public health strategies for safer practices. A cross-sectional survey was conducted with 420 participants, using a structured questionnaire to collect data on demographics, OTC usage, risk awareness, and regulatory opinions. Descriptive statistics summarized distributions, while inferential tests (t-test, chi-square, ANOVA) analyzed associations. Results showed a high OTC use prevalence (83.8%), predominantly among young adults (52.5% aged 18-25) and graduates (60.2%). Painkillers (85.2%) were most common for headaches (62.1%) and fever (56.4%), with rare frequency (71.4%). Pharmacies were the primary purchase location (98.8%), and 53.3% always consulted pharmacists. Awareness of side effects was 74.8%, but 26.4% experienced them, and 76.7% believed in long-term risks. Strong support existed for pharmacists' educational role (97.4%) and stricter regulations (93.6%). The findings indicate widespread but cautious OTC use, with vulnerabilities in health literacy among less educated groups. Compared to literature, usage aligns with urban Indian trends but highlights rural risks like antibiotic misuse. Recommendations include enhanced pharmacist training, public awareness campaigns, and regulatory enforcement to mitigate misuse and promote safe self-medication in similar communities.

**Keywords:** OTC drugs, side effects.

**RA-89**

**DIGITAL TRANSFORMATION IN DRUG REGULATORY AFFAIRS: LEVERAGING AI AND BLOCKCHAIN**

Urvashi S. Vaidya, Vinod M. Thakre
Nagpur college of Pharmacy, Hingna Rd. Wanadongri ct, Nagpur, Maharashtra- 441110
aryavaidya353@gmail.com

The pharmaceutical industry is rapidly embracing digital transformation, creating new Block chain are transforming this landscape. AI enhances regulatory operations through automated data analysis, dossier preparation, and early detection of adverse drug reactions, supporting proactive pharmacovigilance. Natural Language Processing (NLP) further streamlines handling of large regulatory documents. Block chain ensures secure, transparent, and tamper-proof data management across the drug lifecycle, providing traceability in clinical trials, manufacturing, and post-marketing surveillance. Integrating AI with Block chain combines predictive analytics with immutable data sharing, enabling faster and more reliable regulatory decisions. This poster highlights their applications, benefits, and challenges, demonstrating how these technologies can modernize compliance, strengthen patient safety, and align India's pharmaceutical sector with global standards. Opportunities and challenges for Drug Regulatory Affairs (DRA) in ensuring compliance, safety, and transparency. Traditional regulatory processes often face delays and inefficiencies due to manual errors and the complexity of managing large clinical, manufacturing, and safety datasets. Emerging technologies like Artificial Intelligence (AI) and

**ASSESSMENT OF VITAL HEALTH PARAMETERS: A COMMUNITY SURVEY**

Prakruthi K N, Ashok Kumar D, Sahana A N
Department of Pharmacology, S.B.D Institute of Pharmacy, Hanumanthnagar, Bangalore-560019
knprakruthi00@gmail.com

A health screening and survey camp was conducted, to assess the vital health parameters among community members and to promote

ISBN: 978-81-980623-8-3

preventive healthcare awareness. The camp included 100 participants who underwent basic health assessments such as blood pressure, blood glucose, blood group, height, weight, oxygen saturation ($SpO_2$), and body temperature. The primary aim was to identify potential health risks, particularly lifestyle-related disorders, and to provide guidance for early management. The survey results indicated varied health conditions across participants. Blood pressure measurements revealed a mix of normal, pre-hypertensive, and hypertensive cases, highlighting the silent burden of hypertension. Blood glucose screening identified several individuals with elevated levels, suggesting possible pre-diabetes or diabetes. $SpO_2$ levels were generally within the normal range, with few borderline cases. Analysis of height and weight indicated both underweight and overweight conditions, reflecting nutritional imbalances and risks of obesity-related diseases. Blood group data was systematically recorded, serving as an essential reference for future healthcare needs. The health camp not only enabled the early detection of health concerns but also emphasized the importance of regular monitoring and lifestyle modification. Counseling sessions focused on balanced diets, physical exercise, and periodic check-ups to prevent complications. The findings underscored the relevance of localized health surveys in strengthening community health and raising awareness about preventable diseases. This initiative demonstrated that periodic assessment of vital health parameters is a valuable tool for improving community well-being and fostering a culture of preventive healthcare.

**Keywords:** Health Screening, Vital Parameters, Blood Pressure, Blood Glucose, Preventive Healthcare.

## REGULATORY APPROVAL PATHWAYS FOR ORAL GEL IN THE MANAGEMENT OF CHEMOTHERAPY-INDUCED ORAL MUCOSITIS

Rushabh Futane, Vaishali Kilor, Nidhi Sapkal, Mitali Tembhurne
Department of Regulatory Affairs, Gurunanak College of Pharmacy, Nagpur, India
rushabhfutane1999@gmail.com

Different countries have their own rules when it comes to approving medical products, while the ICH works on creating harmonized guidelines to bring everyone on the same page. In this project, we focused on a new oral mucoadhesive gel with herbal ingredients, designed to help patients suffering from oral mucositis caused by chemotherapy. Since this condition is painful and affects quality of life, finding the right approval pathway for such a product is important. Interestingly, in India, the EU, and the US, this product is treated as a medical device rather than a traditional drug. To understand the approval process, I reviewed the official regulatory websites—CDSCO (India), EMA (EU), and USFDA (US). The goal was to compare how each region classifies such a product, what kind of studies or documents they expect, and what post-approval checks are required. India: Follows the Medical Device Rules (2017). Approval involves registration, clinical evaluation, and licenses such as Form MD-14/15. EU: Regulated under MDR 2017/745. Requires CE marking, a Notified Body review, and clinical evidence. US: FDA may ask for a 510(k) submission (if a similar product exists) or a De Novo classification. In some cases, extra clinical safety data is needed because of the herbal composition. Even though the core principles are harmonized, the exact routes differ—India uses its Medical Device Rules, the EU follows MDR 2017/745, and the US depends on FDA pathways like 510(k) or De Novo. Understanding these regional differences helps ensure faster approval and, most importantly, quicker access for patients who need relief from chemotherapy-related oral mucositis.

**RA-92**

## GLOBAL REGULATORY LANDSCAPE FOR HERBAL PRODUCTS: A TRI-REGIONAL COMPARISON BETWEEN INDIA, UNITED STATES AND EUROPEAN UNION

Kundeti Susmitha, Sadhu Venkateswara Rao
Department of Pharmaceutical Regulatory Affairs, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, Andhra Pradesh, India – 521108
susmitha7808@gmail.com

The global demand for herbal products has risen markedly over the past two decades, driven by a preference for natural and plant-based therapies. Despite this growth, regulations governing herbal medicines remain fragmented and region-specific, creating challenges for international trade, product development, and consumer protection. This study provides a comparative analysis of regulatory frameworks in India, the United States (US), and the European Union (EU) to identify gaps and opportunities for harmonization. In India, herbal products are regulated as classical or proprietary medicines under the Drugs and Cosmetics Act, 1940, by the Ministry of AYUSH and CDSCO. The US Food and Drug Administration (FDA), under the Dietary Supplement Health and Education Act (DSHEA), treats most herbal products as dietary supplements, with minimal pre-market requirements. In contrast, the EU employs a two-tiered approach through traditional use registration and full marketing authorization as per Directive 2004/24/EC, overseen by the EMA and national authorities. Using a qualitative comparative methodology, this research evaluates product registration, GMP compliance, safety and efficacy data, labeling norms, and post-marketing surveillance. The findings highlight the need for global regulatory convergence, standardized herbal monographs, and robust pharmacovigilance systems to ensure quality, safety, and innovation.

**Keywords:** Herbal products, Regulatory frameworks, AYUSH, FDA, EMA and Tri-regional comparison

## THE FUTURE OF PHARMACEUTICAL SUBMISSIONS: TRENDS IN COMMON TECHNICAL DOCUMENT (CTD) DOSSIERS

Kolli Naga Sravani Lakshmi Durga, Sadhu Venkateswara Rao
Department of Pharmaceutical Regulatory Affairs, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, Andhra Pradesh, India – 521108
sravanik343353@gmail.com

Ensuring a novel medicine has been successfully and safely used for human purpose is a meticulous journey through stringent trials and regulatory approvals. Once the extensive information gleaned from both animal and human trials is amassed, the next step involves crafting a New Drug Application. These applications, although universally essential, have historically varied in structure and content across different regions, posing challenges during review and potentially risking the omission of crucial insights. To harmonize this process, global initiatives like the International Conference on Harmonization (ICH) have emerged, birthing standardized frameworks such as the Common Technical Document (CTD). This blueprint, embraced by major regions including Japan, European Union, and United States, aims to streamline the submission process. In Southeast Asia, the ASEAN Common Technical Document (ACTD) serves a similar purpose. In our digital age, transition to the electronic Common Technical Document (eCTD) marks a pivotal advancement. Spearheaded through the ICH M2 Expert Group's efforts, this digital counterpart promises cost efficiencies, reduces reliance on paper, and enhances the overall efficacy of drug application assessments worldwide. In essence, these standardized formats not only simplify the regulatory journey but also ensure that every vital piece of information finds its place, safeguarding the thorough evaluation of novel human medicinal products.

**Keywords:** ICH, CTD and eCTD.

## COMPARATIVE COST ANALYSIS OF DIFFERENT BRANDS OF ANTIBIOTICS IN RURAL AREAS

Abhirami V, Sheena U
Department of Pharmaceutics, Nehru College of Pharmacy, Thrissur, Kerala, India-680588
abhiramivnair665@gmail.com

Pharmaceutical formulations are available in a wide range of prices, with large differences in price around the world. The Indian pharmaceutical market is also one of these universal trends. The price variation of drugs shows a large impact on the economy. Antibiotics are a class of medications used to treat bacterial infections. Since this world population often faces a wide range of bacterial infections, the majority of prescriptions contain antibiotics. Even though bacterial infections are once-in-a-while events, antibiotics can change the economy of the pharmaceutical industry. The cost of different brands of commonly prescribed antibiotic drugs was sorted by market study in the latest edition of CIMS. The cost ratio and percentage cost variation of a variety of Indian brands were calculated in INR. Although price control has been

ISBN: 978-81-980623-8-3

implemented, brand price variations still exist widely for antibiotics. Wide price variations are observed between branded and generic antibiotic drugs even after the implementation of DPCO (2013). On comparing the prices of drugs under DPCO control, it was found that the maximum market price of the drugs considered was higher than the ceiling prices recommended by the National Pharmaceutical Pricing Authority.

**Keywords:** Antibiotics, Comparative cost analysis, Price variation, Indian pharmaceutical market

## ASSESSMENT OF LEARNING STYLE PREFERENCES AMONG PHARMACY STUDENTS

Sarath Kumar S.J[1], Shaiju S Dharan[2]
Assistant Professor, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Neyyattinkara, Thiruvananthapuram-695124, Kerala
Principal, Ezhuthachan College of Pharmaceutical Sciences, Marayamuttom, Neyyattinkara, Thiruvananthapuram-695124, Kerala
sarathkumarsj123@gmail.com

Pharmacy education is inherently demanding as it is in a field that is ever and fast changing. It requires students to assimilate large volumes of information and develop practical skills within a relatively short timeframe. Understanding the Pharmacy students' learning preferences is crucial for optimizing teaching strategies and improving educational outcomes. Fleming and Mills developed the VARK model.1 It categorizes learners based on their preferred sensory modalities: visual (V), aural (A), read/write (R), and kinesthetic (K). The VARK questionnaire is a widely used tool that helps identify these preferences and has been applied in numerous studies to explore learning styles among medical students worldwide. Learning preferences can be unimodal, where a student predominantly uses one sensory modality, or multimodal, where two (bimodal), three (trimodal), or all four (quadmodal/tetramodal) modalities are used in combination. Aim & Objective: This study aimed to assess the learning style preferences of Pharmacy students using a visual, aural, read/write and kinesthetic (VARK) questionnaire. Materials and Methods: The VARK questionnaire was distributed to 90 first year Pharmacy students after they were informed about the study and its purpose. No personally identifiable points except the gender data, were collected. The questionnaires were collected and analyzed. Those questionnaires which are fully completed were analyzed. Results: Out of the 90 students enrolled, 90 students filled and returned the questionnaires. The unimodal learning preference was more prevalent. Among the unimodal learning kinesthetic modality or 'learning by doing' was found to be the most preferred one. Conclusion: Of the 90 enrolled students, 90 valid responses were analyzed. The majority demonstrated a preference for unimodal learning styles, with kinesthetic learning being the most popular modality. The study findings have implications for tailoring Pharmacy education to meet students' needs.

## HUMAN ETHICS IN CLINICAL TRAILS

P. Komala Mani
Department of Pharmaceutical Sciences, MAM College of Pharmacy, Kesanupalli, AP, India-522601
pulikomali22@gmail.com

Clinical trials are the cornerstone of advancing medical knowledge, ensuring safety and efficacy of new drugs and interventions. However, the ethical dimensions of involving human participants remain a critical concern. Human ethics in clinical trials emphasizes safeguarding the dignity, rights, and welfare of participants while balancing the pursuit of scientific progress. The principles of autonomy, beneficence, non-maleficence, and justice form the ethical foundation for conducting trials. Informed consent is a key requirement, ensuring that participants fully understand the purpose, risks, and benefits of a study before enrolling. Ethical review boards, such as Institutional Ethics Committees (IECs) or Institutional Review Boards (IRBs), play a central role in overseeing trial design, risk assessment, and participant protection. Furthermore, transparency in reporting results and adherence to Good Clinical Practice (GCP) guidelines are essential to uphold trust in the research process. Vulnerable populations, including children, elderly individuals, and those with limited decision-making capacity, require additional safeguards to prevent exploitation. Recent advances, such as digital consent and remote monitoring, present both opportunities and ethical challenges that demand ongoing discussion. Ultimately, integrating ethical principles into every stage of clinical research not only protects participants but also enhances the credibility and societal acceptance of scientific discoveries. The future of clinical trials must continue to align scientific rigor with unwavering respect for human rights, ensuring that progress in medicine remains both innovative and ethically responsible.

**Keywords:** Ethics, Clinical Trials, Informed Consent, Integrity, Safeguards.

## REGULATORY CHALLENGES AND FUTURE PATHWAYS FOR SOFTWARE AS A MEDICAL DEVICE (SAMD) IN INDIA: MODELLING APPROACHES FROM THE USFDA, EMA AND PMDA

Padmasri E, Russell Martin
Department of Pharmaceutical Regulatory Affairs, Acharya and B M Reddy College of Pharmacy, Soldevanahalli, Bangalore, Karnataka, India-560107
kalaivani3930@gmail.com

Software as a Medical Device (SaMD) refers to standalone software designed to perform medical functions such as diagnosis, monitoring, and treatment support without being part of a hardware device. The rapid integration of digital health technologies, particularly artificial intelligence (AI) and machine learning (ML), has expanded the role of SaMD in enhancing healthcare accessibility, efficiency, and precision. Global regulators, including the U.S. Food and Drug Administration (USFDA), the European Medicines Agency (EMA), and the Pharmaceuticals and Medical Devices Agency (PMDA), have introduced structured, risk-based frameworks that focus on classification, clinical evaluation, cybersecurity, and lifecycle oversight to ensure both safety and innovation. In India, SaMD is regulated under the Medical Devices Rules (MDR) 2017, which primarily address hardware devices and lack provisions tailored to evolving software technologies. This creates challenges such as regulatory ambiguity, approval delays, insufficient expertise in SaMD evaluation, limited post-market surveillance, and inadequate guidance for AI/ML-driven systems. As digital health initiatives like the Ayushman Bharat Digital Mission gain momentum, addressing these regulatory gaps becomes crucial to safeguard patient safety and foster innovation. This study critically evaluates India's current SaMD regulations and compares them with international frameworks established by the USFDA, EMA, and PMDA. Through systematic review and comparative analysis, it identifies gaps and proposes a future SaMD-specific pathway for India. Findings are expected to support harmonisation with global best practices, enhance regulatory clarity, and strengthen India's position in the global digital health ecosystem.

**Keywords:** Software as a Medical Device, Regulatory challenges, Digital health, Global harmonisation, Innovation.

## PERSPECTIVES TO STRATEGIC PLANNING IN HEALTHCARE ORGANIZATIONS

Shivam D. Thakur, Gaurav A. Khobragade, Diksha Y. Bhimte, Bhumeshkumar E. Wanjari
Shri Gurudev Institute of Pharmaceutical Education & Research, Chulod, Gondia
sgiperdg@gmail.com

Strategic planning is a critical component in the management and long-term success of healthcare organizations. This research article explores the framework, implementation and impact of strategic planning within healthcare. A comprehensive review of current practices and organizational outcomes, the study highlights on strategic planning helps healthcare institutions align their mission, vision and operational goals with the rapidly evolving healthcare landscape. New solutions can support the management of data overload and the shortage of qualified staff. However, the timely and effective integration of these new tools in the healthcare setting poses challenges and requires guidance viz. Stakeholder engagement, environmental analysis, resource allocation and performance evaluation were examined to understand their roles in formulating effective strategies. The studies indicate that robust strategic planning not only improves organizational efficiency and service quality but also enhances adaptability to policy changes,

ISBN: 978-81-980623-8-3

technological advancements, and patient needs. The article concludes with recommendations for integrating strategic planning into the core management processes to ensure sustainable growth and improved healthcare delivery. This study aims identify potential knowledge gaps and unexplored areas in strategic planning, organizational performance, and its relationship. Findings suggest that healthcare organizations that adopt a structured and participatory approach to strategic planning tend to demonstrate improved adaptability, efficiency, and patient-centered care outcomes.

**Keywords:** Strategies, perspectives, management, healthcare, robust, implementation.

**KNOWLEDGE AND ATTITUDES TOWARD EVIDENCE-BASED MEDICINE (EBM): A SURVEY**

Raghorte Aditya, Hume Harsh, Rahangdale Digambar P, Wanjari B. E.
Shri Gurudev Institute of Pharmaceutical Education & Research, Chulod, Gondia
sgiper26@gmail.com

Evidence-Based Medicine (EBM) is a crucial approach in modern healthcare, integrating the best available research evidence with clinical expertise and patient values to ensure effective decision-making. Despite its growing importance, the knowledge and perception of EBM among healthcare students remain variable. This study aims to evaluate the knowledge, awareness, and attitudes of healthcare students toward EBM. A cross-sectional, questionnaire-based survey will be conducted among undergraduate and postgraduate students from various healthcare disciplines, including pharmacy, medicine, and nursing. The survey will assess students' understanding of EBM concepts, their perceived importance of EBM in clinical practice, and barriers to its implementation in education and practice. Data will be analyzed using descriptive and inferential statistics to identify knowledge gaps and attitude trends. The findings are expected to highlight the need for integrating EBM more effectively into healthcare curricula, thereby equipping future professionals with skills to deliver evidence-based care.

**RA-100**

**THE CHANGING ROLES OF PHARMACISTS IN COMMUNITY PHARMACIES: PERCEPTION OF REALITY IN INDIA**

Yele Bhupesh Y, Chauragade Mahendra S, Rahangdale Digambar P, Wanjari B. E.
Shri Gurudev Institute of Pharmaceutical Education & Research, Chulod, Gondia
sgiper26@gmail.com

Pharmacy practice is undergoing significant transformation worldwide, with community pharmacists emerging as essential healthcare providers beyond their traditional role of dispensing medicines. In India, community pharmacies are often the first point of contact for patients, especially in semi-urban and rural areas, due to accessibility and affordability. However, the professional role of pharmacists in these settings remains underutilized, with a persistent gap between potential contributions and current practice. This thesis explores the changing roles of pharmacists in Indian community pharmacies and examines the perception of these roles in reality. It highlights key areas where pharmacists can contribute, including patient counseling, promotion of rational drug use, pharmacovigilance, chronic disease management, and public health initiatives. A survey-based approach is employed to assess the perceptions of pharmacists, patients, and other healthcare professionals regarding the evolving responsibilities of community pharmacists. Findings are expected to reveal discrepancies between the recognized scope of pharmacy practice and its actual implementation in community settings. Factors such as lack of regulatory enforcement, limited public awareness, inadequate training, and economic pressures are likely to be identified as major barriers. The study emphasizes the need for policy reforms, continuous professional education, and stronger integration of pharmacists into the healthcare system to optimize their role in improving patient outcomes. By addressing both the perceptions and realities of pharmacy practice, this research underscores the importance of redefining the role of community pharmacists in India to align with global standards and meet the growing healthcare demands of the population.

**RA-101**

**SURVEY-BASED ASSESSMENT OF KNOWLEDGE, ATTITUDE, AND PRACTICES OF SELF-MEDICATION AMONG PHARMACY STUDENTS IN NAGPUR REGION**

Vallabhi Meshram, Vedant Ghadmare, Nishant B. Awandekar, Milind J. Umekar
Smt. Kishoritai Bhoyar College of Pharmacy, Kamptee, Nagpur-441002
vallabhimeshram@gmail.com

This study evaluates the awareness, perception, and practices of self-medication among pharmacy students in the Nagpur region. A descriptive cross-sectional survey was conducted among 183 students using a structured questionnaire to assess their knowledge, sources of medicines, reasons for self-medication, and associated health risks. The findings revealed that 94% of students were aware of self-medication and 70% admitted to practicing it, primarily for minor ailments such as fever, cold, acidity, and allergies. Allopathic medicines were the most preferred due to their quick relief, with antacids, analgesics, anti-allergic drugs, and antibiotics being the most frequently used. Easy availability of medicines from nearby retail pharmacies, convenience, cost savings, time constraints, and prior knowledge of drugs were the key factors encouraging self-medication. However, concerns such as incorrect self-diagnosis, adverse drug reactions, antibiotic resistance, and drug interactions were evident, with over 40% of respondents acknowledging that self-use of prescription medicines is irrational. The study also highlighted an increase in self-medication practices in the post-COVID era, driven by limited healthcare access during the pandemic. These findings emphasize the need for stronger health education, stricter regulations, and pharmacist-led awareness programs to promote safe and rational drug use while minimizing the potential risks associated with self-medication.

**Keywords:** Self-medication, Perception, Prescription Medicines, Antibiotic Resistance

**REGULATORY GUIDELINES AND QUALITY CONSIDERATIONS FOR OPHTHALMIC DRUG DELIVERY SYSTEMS**

Mahima Dewangan[1,2], Alka Patel[1,2], Mohammad Adnan Raza[1,2]
[1]Rungta College of Pharmaceutical Sciences and Research, Bhilai, Chhattisgarh, INDIA-490023
[2]Department of Pharmacy, Rungta International Skill University, Kohka, Kurud Road, Bhilai, INDIA-490023
mahimadewangan245@gmail.com

Ophthalmic drug delivery systems (ODDS) present unique formulation and regulatory challenges due to the sensitivity of ocular tissues, the need for sterility, and the diversity of dosage forms including solutions, suspensions, emulsions, ointments, and novel delivery platforms. Regulatory agencies such as the U.S. FDA, EMA, and ICH have developed comprehensive guidelines addressing the quality, safety, and efficacy requirements of these products. Key considerations include sterility assurance, preservative efficacy, container-closure integrity, extractables and leachables (E&Ls), particulate matter control, and in vitro release testing. Recent regulatory updates also emphasize risk-based approaches for establishing product equivalence, especially for generic ophthalmic products, and recognize the role of in vitro and physicochemical characterization in lieu of extensive clinical trials in some cases. This article provides a consolidated review of current global regulatory requirements and quality expectations for ophthalmic drug delivery systems, highlighting evolving trends and critical quality attributes (CQAs) essential for product approval and lifecycle management.

**Keywords:** Ophthalmic drug delivery systems, regulatory guidelines, sterility, extractables and leachables, in vitro release, FDA, EMA, ICH, preservative efficacy, container-closure system, generic ophthalmics, quality considerations

**ASSESSMENT OF CLINICAL PHARMACIST-LED TELEPHONIC INTERVENTION IN PATIENT CARE**

Shivesh Singh[1], Aishwarya S[1]
[1]Department of Pharmacy practice, Vydehi Institute of Pharmacy, Bengaluru-560 066
[2]Krupanidhi College of Pharmacy, Bengaluru-560 035
dr.shiveshsinghpci@gmail.com

ISBN: 978-81-980623-8-3

NCD patients need long clinical follow-ups to manage their condition. Many patients usually have multiple queries, which has to be addressed. Clinical pharmacist-led telephonic intervention possess huge potential in fulfilling these gaps. To assess the impact of clinical pharmacist-led telephonic intervention in patient's health-related quality of life. A prospective interventional study is carried out in tertiary care hospital, for 6-months. Patients with atleast one chronic condition & visiting the study site are included, after obtaining written consent. Patient's medical record data, contact details and other necessary information were collected. Clinical pharmacist-led telephonic intervention was initiated on weekly basis based on patient's needs. Heath-related quality of life Assessments were performed using EQ-VAS tool at baseline, 2nd week, and 4th week. The data obtained was analysed using descriptive-statistics. A total of 192-patients were enrolled in the study. Among these, 67% were over 50 years old, and 45% were illiterate. The majority were suffering from various health issues: 27% had hypertension, 43% had diabetes, 13% had asthma, and 17% had other conditions. Among them, 72.5% of patients received individualized counseling through telephone intervention. Furthermore, 23% requested information regarding medication use, while 2% inquired about myths and facts related to drugs during their phone consultations. At baseline, the average Health-Related Quality of Life (HRQoL) score was 75%. Follow-up HRQoL measures indicated improvements of 87% and 92%, respectively. Clinical pharmacist-led telephonic intervention have huge impact on patient's health-related quality of life and enhances the quality of patient care.

**Keywords:** telephonic intervention, clinical pharmacist, quality of life.

**RA-104**

**REGULATORY AFFAIRS IN PHARMACY PRACTICE**

V. Salini, A. Sony Priyanka
Department of Pharmacy Practice, ASN Pharmacy College, Tenali, Guntur District, Andhra Pradesh, India – 522201
Venigallashalini9@gmail.com

Regulatory affairs in pharmacy practice play a critical role in ensuring the safety, efficacy, and quality of pharmaceutical products while facilitating their development, approval, and market access. This explores the multifaceted responsibilities of regulatory affairs professionals in navigating complex regulatory frameworks, including compliance with guidelines set by agencies such as the FDA, EMA, and WHO. Key functions include overseeing drug development processes, preparing and submitting regulatory dossiers, and ensuring adherence to good manufacturing practices (GMP) and pharmacovigilance standards. The integration of regulatory strategies in pharmacy practice enhances patient safety by ensuring that medications meet rigorous standards before and after market entry. Furthermore, the evolving landscape of global regulations, including advancements in personalized medicine and biologics, underscores the need for continuous education and adaptability among pharmacy professionals. This highlights the pivotal role of regulatory affairs in bridging pharmaceutical innovation with public health, emphasizing its impact on optimizing therapeutic outcomes and maintaining trust in healthcare systems.

**Keywords:** Regulatory Affairs, Pharmacy Practice, Drug Development, Compliance, FDA, EMA, WHO, Good Manufacturing Practices (GMP), Pharmacovigilance, Patient Safety, Regulatory Dossiers

**RA-105**

**GLOBAL PERSPECTIVES ON ANTIVIRAL DRUG REGULATION: A COMPARATIVE ANALYSIS**

D. Devi Supriya, P. Raveesha.
Department of Pharmacognosy, V.V. Institute of Pharmaceutical Sciences, Seshadri Rao Knowledge Village, Gudlavalleru-521356, Andhra Pradesh, India.
supriyadosapati71@gmail.com

This review presents a comparative examination of the regulatory frameworks, patent legislation, and pricing strategies related to antiviral medications in North America, Europe, Asia, and Africa. The review analyzes how these factors affect the accessibility and cost of antiviral treatments, exploring the intricacies of drug approval processes, the implications of intellectual property rights, and the various pricing strategies utilized by pharmaceutical companies. The review examines case studies, including the effective implementation of HIV/AIDS medications in Africa and the obstacles encountered by low-income nations, to underscore the inequalities in drug accessibility and the influence of governmental and private sector agreements. Additionally, it recommends optimal practices and legislative measures designed to align legislation to enhance access while reconciling innovation incentives with public health requirements. The findings highlight the essential need for a unified global approach to improve the accessibility of antiviral medications, hence fostering superior health outcomes globally. This review is a significant resource for policymakers, public health practitioners, and scholars focused on pharmaceutical control and global health.

**Keywords:** Antiviral medications, Drug acceptability, Regulatory Frameworks and pricing strategies.

**RA-106**

**FROM PRACTICE TO PERFORMANCE: PERCEPTIONS AND PRELIMINARY VALIDATION OF MOCK EXAMINATIONS FOR GPAT READINESS**

Grandhi Bhargav
Shri Vishnu College of pharmacy, 10-121, Kavitam lock, Kavitam, Andhra Pradesh, 534 338, India
grandhibhargav163@gmail.com

Mock examinations are widely adopted for Graduate Pharmacy Aptitude Test (GPAT) preparation in India. However, empirical evidence on their effectiveness and predictive value for actual GPAT/NIPER outcomes remains limited, indicating a significant research gap. This mixed-methods study aimed to describe pharmacy students' perceptions of the MEDHA Quiz and National Mock GPAT programs, and conduct a preliminary validation of mock-test performance against actual GPAT/NIPER results in a subset of participants. A mixed-methods design, combining a cross-sectional survey with an exploratory correlational pilot analysis, was employed. Approximately 400 Indian pharmacy graduates participating in the 2024 MEDHA Quiz and National Mock GPAT programs provided feedback. An outcomes subset of around 50 participants was used for validation. Key measures included Likert-scale perceptions (usefulness, confidence gained, stress-management, content alignment) and open-ended feedback for thematic analysis. Quantitative analysis included descriptive statistics, reliability (Cronbach's alpha), and Spearman correlations between mock and actual GPAT/NIPER ranks. Preliminary findings indicate predominantly positive perceptions among participants regarding the overall organization, relevance of questions, and accessibility of the technology used in both mock examination formats. The mock examinations also demonstrated an early predictive signal for GPAT readiness. Structured mock examinations and quizzes are well-received by pharmacy students and show promising preliminary predictive validity for GPAT readiness. Further larger, multi-institutional studies are warranted to confirm these findings and inform curriculum integration and targeted remediation strategies.

**RA-107**

**INNOVATIVE ERADICATION POLICY OF COUNTERFEIT DRUGS IN INDIA**

Jawale P.P, Kotwal S.
Bharati Vidyapeeth's Institute of Pharmacy, Pune -411038
jawalepravin9@gmail.com

The widespread circulation of counterfeit drugs presents a severe challenge to India's healthcare system, pharmaceutical industry, and regulatory infrastructure. With India being one of the largest producers and exporters of generic medicines, the presence of fake or substandard drugs not only endangers patient lives but also undermines the global credibility of Indian pharmaceuticals. Current regulatory frameworks, including the Drugs and Cosmetics Act, 1940, and Pharmacy Act, 1948, are often inadequate in combating sophisticated counterfeiting networks that exploit gaps in the drug supply chain. This research proposes an innovative, multi-layered eradication policy aimed at eliminating counterfeit drugs through the integration of advanced technologies and robust regulatory reforms. Central to the policy is the use of blockchain technology for end-to-end drug traceability, combined with mandatory QR code labeling to empower consumers with real-time verification. Artificial intelligence and big data analytics will further enhance surveillance by detecting anomalies and predicting high-risk

ISBN: 978-81-980623-8-3

zones. A centralized e-pharmacy regulation portal will ensure transparency in online drug sales, while public-private partnerships will support nationwide awareness campaigns. The policy also emphasizes cross-border cooperation and capacity-building initiatives for regulatory bodies. Through phased implementation across states, the policy envisions an 80–90% reduction in counterfeit drug circulation within three years. This paper concludes that a technology-driven, collaborative, and transparent approach is essential to safeguard public health, uphold legal accountability, and restore confidence in the Indian pharmaceutical supply chain.

**Keywords:** counterfeit, eradication, Artificial intelligence, Blockchain technology

**RA-108**

## GLOBAL DRUG DEVELOPMENT - CURRENT TRENDS, CHALLENGES AND OPPORTUNITIES

Gurpreet Singh
Vice President, Managing Director, Integrated Safety, IQVIA, United Kingdom
goldy3382@hotmail.com

The global drug development journey—often a 12- to 18-year odyssey costing well over a billion dollars—continues to evolve under the influence of major industry forces, with leading pharmaceutical companies such as Roche, Johnson & Johnson, Merck & Co., Pfizer and Novartis driving projected R&D investments by 2026. Alongside this, the global CRO services market, valued at $76.6 billion in 2023 and expected to reach $127.3 billion by 2028, reflects the expanding ecosystem supporting development pipelines. Today's landscape is shaped by an increased emphasis on quality, compliance, audit readiness and continuous process enhancement, supported by technological adoption, data analytics, and strengthened organisational culture. At the same time, the sector navigates persistent challenges—including the need for skilled resources, talent retention, effective SOPs, improved productivity, stronger compliance, and cost-efficient processes—while embracing opportunities for digital transformation and operational refinement. By the end of the presentation, the audience will gain a broad understanding of the global drug development industry; insight into the key trends, challenges and opportunities; appreciation of the four foundational pillars of drug development (People, Process, Technology and Partnerships); and awareness of the top emerging trends including personalised medicine, orphan drugs and new clinical trial models such as decentralized clinical trials.

## ESTABLISHING A REGULATORY FRAMEWORK FOR 3D PRINTING PHARMACEUTICAL IN INDIA

Aanand Deshmukh, Rasika Raut, Anil M Pethe.
Datta Meghe College of Pharmacy, (DMIHER) Wardha
ananddeshmukh2709@gmail.com

Three-dimensional (3D) printing is revolutionizing pharmaceutical manufacturing by enabling the production of personalized medicines, complex dosage forms, and on-demand drug delivery systems. As this technology rapidly advances worldwide, India faces critical challenges related to policy formulation, regulatory oversight, and ethical governance to ensure the safety, quality, and accountability of 3D printed pharmaceuticals. This study critically examines India's existing regulatory landscape, identifies key gaps in current legislation and quality assurance mechanisms, and proposes strategic measures for establishing a comprehensive national framework tailored to pharmaceutical 3D printing. A detailed comparative review was conducted using Indian regulatory references such as the Drugs and Cosmetics Act and the Medical Device Rules, alongside international guidelines from the U.S. FDA, EMA, and PMDA, supported by recent scientific literature and market developments. Special emphasis was placed on regulatory considerations involving digital file management, Good Manufacturing Practices (GMP), Quality by Design (QbD), and accountability in decentralized manufacturing models. The analysis revealed substantial regulatory deficiencies in definitions, digital data control, process validation, and product approval pathways for 3D printed drugs and bio fabricated tissues. Drawing insights from global precedents, the study recommends establishing a 3D Printing Regulatory Division within CDSCO, formulating material and process standards under the Bureau of Indian Standards (BIS), and implementing inspection and qualification systems that promote both safety and innovation. A unified, adaptive regulatory framework is essential to safeguard patients, foster innovation, and position India as a leader in advanced pharmaceutical manufacturing.

**Keywords:** 3D Printing, Quality by Design, Personalized Medicine

**RA-110**

## PHARMACEUTICAL CLEANING VALIDATION: CURRENT TRENDS AND REGULATORY UPDATES

Debaditya Nayek, Sinoy Sugunan
SVKM's Narsee Monjee Institute of Management Studies (NMIMS) Deemed-to-be University, School of Pharmacy & Technology Management, Department of Pharmaceutical Chemistry, Shirpur Campus, Dist. Dhule-425405, Maharashtra, India
2020debad@gmail.com

In pharmaceutical manufacturing, contamination and cross-contamination present serious concerns to patient safety, product quality, and regulatory compliance. To reduce these hazards and guarantee that surfaces, surroundings, and equipment are cleaned to specified, acceptable levels, strong cleaning validation procedures are crucial. A crucial component of Good Manufacturing Practice (GMP) is cleaning validation, which offers documented proof that cleaning processes are repeatable and efficient in reliably eliminating residues of cleaning agents, excipients, microbiological contaminants, and active pharmaceutical ingredients (APIs). With an emphasis on industry strategies, regulatory revisions, and analytical methodologies, this overview describes current trends in cleaning validation. In connection to their validation processes, important elements including equipment characterisation, cleaning agent selection, and cleaning method optimization—including clean-in-place (CIP), clean-out-of-place (COP), and manual cleaning—are covered. Effective contamination control emphasizes the importance of establishing scientifically supported acceptability criteria (NOEL, MACO) and validating sampling and analytical techniques (such as swab and rinse sampling). Agencies including the US FDA, EMA, and WHO have recently updated their regulations to prioritize risk-based validation, lifecycle management, and adherence to international standards. Equipment modifications, the introduction of new cleaning agents, or formulation revisions are examples of situations that call for cleaning validation. The goal is still to safeguard patient safety and product integrity while promoting ongoing quality enhancement and operational effectiveness. In the end, cleaning validation guarantees that pharmaceutical products fulfill necessary safety, identification, and purity standards, improves regulatory compliance, and lowers quality failures.

**Keywords:** Cleaning validation, Pharmaceutical manufacturing, Regulatory compliance, Cross-contamination

**RA-111**

## NAVIGATING COMPLEXITY: REGULATORY PATHWAYS FOR MODIFIED-RELEASE DRUGS IN MEXICO AND CHILE

Pranab M[1], M P Venkatesh[1,2]
[1]Centre of Excellence in Regulatory Sciences, JSS College of Pharmacy, JSS Academy of Higher Education and Research, SS Nagar, Mysuru, Karnataka, India - 570015
[2]Faculty of Pharmaceutical Sciences, UCSI University, Malaysia
seekpranab@yahoo.com

Modified-release (MR) dosage forms constitute a critical advancement in pharmaceutical technology, enabling controlled drug release and improved therapeutic outcomes but posing unique regulatory challenges due to their complex design and biopharmaceutical performance characteristics. In Latin America, Mexico and Chile have established distinct yet scientifically grounded frameworks for the evaluation of MR formulations. In Mexico, the Federal Commission for Protection against Sanitary Risks (COFEPRIS) requires comprehensive formulation design justification linking each excipient and polymer to the intended release mechanism, supported by risk-based quality-by-design data and validated discriminatory multi-point dissolution testing across physiological pH media. Stability studies under climatic zone IVb conditions, bioequivalence testing in accordance with NOM-177-SSA1-2013 under both fasted and fed states, and strict labelling requirements collectively ensure consistent product performance and patient safety.

ISBN: 978-81-980623-8-3

In Chile, the Institute of Public Health (ISP) mandates detailed mechanistic descriptions of release-controlling excipients, validated dissolution methods under biorelevant conditions, and rigorous stability assessments as per Norma Técnica N°129 (2023). Bioequivalence studies remain compulsory for MR products under Technical Norm 57 and Decree 123, with evaluations conducted under both nutritional states to assess potential food effects and dose-dumping risks. Despite their alignment with international regulatory principles, notable divergences persist in dossier expectations, biowaiver provisions, and acceptance of in vitro–in vivo correlations. Therefore, the objective of this review is to comparatively analyse the regulatory requirements governing modified-release dosage forms in Mexico and Chile, identify challenges, and highlight opportunities for regional harmonization and convergence with global standards.

**Keywords:** MR formulations, dose-dumping, patient safety, bioequivalence, Mexico, Chile

**RA-112**

## REGULATORY FRAMEWORK FOR HOLOGRAPHIC PHARMACEUTICALS: NEXT-GENERATION VIRTUAL QUALITY CONTROL AND DIGITAL LABELLING

Rasika Raut, Aanand Deshmukh, Anil M. Pethe
Datta Meghe College of Pharmacy, Datta Meghe Institute of Higher Education & Research Sawangi (Meghe) Wardha, Maharashtra, India
rasikaraut098@gmail.com

Holographic pharmaceuticals are emerging as a next-generation solution for authentication, digital labelling, and intelligent quality control in the pharmaceutical sector. By integrating holography, augmented reality (AR), and secure digital identifiers, these systems enable real-time product verification, enhance traceability, and provide dynamic patient information access through virtual interfaces. As the pharmaceutical supply chain advances toward digital transformation, holographic systems offer strong potential to combat counterfeiting, strengthen serialization, and support patient-centric labelling beyond traditional printed packaging. However, despite rapid technological progress, holographic pharmaceuticals currently operate without a clear regulatory framework. Existing guidelines issued by regulatory bodies such as the US FDA, EMA, CDSCO, and WHO primarily address conventional labelling, physical QC testing, and serialization requirements, with limited provisions for digital holograms, virtual labelling, and cloud-based verification systems. Key regulatory gaps include lack of validation criteria for AI-driven authentication, cybersecurity and data integrity requirements for holographic identifiers, standardization of electronic product information (ePI), and compliance pathways for virtual QC platforms within GMP and GDP environments. This review evaluates the regulatory readiness of global health authorities and identifies essential considerations for policy evolution. A proposed roadmap highlights the need for harmonized standards covering technology validation, risk classification, interoperability, digital audit trails, and post-market surveillance. Establishing dedicated frameworks will be critical for ensuring safety, reliability, and ethical integration of holographic pharmaceuticals into healthcare systems. The transition toward virtual QC and labelling represents a paradigm shift, requiring proactive regulatory adaptation to enable secure, transparent, and futuristic pharmaceutical governance.

**Keywords:** Holographic Pharmaceuticals, Virtual QC, Digital Labelling, Serialization, Regulatory Framework, Counterfeit Prevention.

**RA-113**

## INTELLIGENT PHARMACY INVENTORY MANAGEMENT TO PREVENT EXPIRY AND ELIMINATE MEDICAL WASTE

Kashish Rathod, Pravin Kumar Sharma, Sumeet Dwivedi, G.N. Darwhekar
Acropolis Institute of Pharmaceutical Education and Research, Indore (M.P.), India- 453771
rathodkashish499@gmail.com

Effective pharmacy inventory management is fundamental to maintaining medicine availability, preventing avoidable wastage, and ensuring sustainable healthcare delivery. In India, several studies highlight substantial accumulation of unused or expired medicines in households, retail pharmacies, and hospital settings—largely due to manual inventory practices, poor demand forecasting, and the absence of standardized expiry-tracking systems. To address these challenges, this review introduce an Intelligent Pharmacy Inventory Management System (IPIMS) that integrates artificial intelligence, machine-learning-based demand forecasting, IoT-enabled real-time stock monitoring, and automated expiry-alert mechanisms. The proposed IPIMS is designed to accurately predict medicine consumption patterns, identify slow-moving and high-risk expiry items, optimize reorder points, and enable timely redistribution or clearance of near-expiry drugs. Data collected from Indian retail and hospital pharmacies are used to train and validate the system, demonstrating improvements in forecasting accuracy, reduction in expired stock and enhanced inventory turnover. The system also contributes to national goals of digital healthcare transformation and pharmaceutical sustainability. By integrating intelligent automation with pharmacy workflows, IPIMS offers a scalable solution that strengthens supply-chain resilience, reduces medical waste and promotes responsible medicine utilization. This review underscores the potential of data-driven technologies to transform pharmacy management and aligns with broader public health priorities focused on efficiency, safety, and environmental protection.

## EXPLORING DIFFERENCES IN GENERIC DRUG APPROVAL PROCESSES AND COMPARATIVE ANALYSIS OF AUSTRALIA, EUROPE AND CANADA

Shaik Afreen, Sadhu Venkateswara Rao
Department of Pharmaceutical Regulatory Affairs, Vijaya Institute of Pharmaceutical Sciences for Women, Enikepadu, Vijayawada, Andhra Pradesh, India – 521108
Afreenshaikjun10@gmail.com

Generic medicines play an increasingly vital role in enhancing global healthcare by providing safe, effective, and affordable alternatives to branded drugs. This project presents a comprehensive comparative analysis of the regulatory approval processes for generic drugs in three developed regions Australia, Europe, and Canada. The study explores key regulatory components including pharmaceutical equivalence, bioequivalence, dossier requirements, and approval timelines. Using a qualitative methodology based on regulatory publications, peer-reviewed literature, and international guidelines, the research identifies both similarities and jurisdiction-specific differences. Findings reveal that while all three regions adhere to international standards such as those set by the ICH, divergences exist in procedural frameworks, submission formats, and interchangeability policies. The study underscores the potential benefits of regulatory harmonization to streamline generic drug approvals, reduce duplication, and enhance timely access to essential medications. Recommendations are proposed to foster collaboration and improve efficiency within global regulatory environments.

**Keywords:** Generic Medicines, Regulatory Approval, Bioequivalence, Health Canada, EMA, TGA and Comparative Analysis.

## PHARMACOVIGILANCE CHALLENGES IN INTRANASAL VACCINES: A COMPARATIVE PERSPECTIVE FROM CDSCO, USFDA, EMA AND ANVISA

Jayshree A, Russell Martin
Department of Pharmaceutical Regulatory Affairs, Acharya and B M Reddy College of Pharmacy, Soldevanahalli, Bangalore, Karnataka, India-560107
jayshreeashok574@gmail.com

Intranasal vaccines have emerged as an innovative alternative to conventional parenteral vaccines due to their needle-free administration, ability to induce mucosal and systemic immunity, and improved patient compliance. These attributes make them particularly attractive during global health emergencies such as the COVID-19 pandemic. Products like Bharat Biotech's iNCOVACC in India, FluMist in the United States, and Fluenz in the European Union exemplify the growing adoption of this platform. However, the pharmacovigilance landscape for intranasal vaccines remains underdeveloped, with significant disparities in regulatory frameworks across major agencies, including the Central Drugs Standard Control Organization (CDSCO), U.S. Food and Drug Administration (USFDA), European Medicines Agency (EMA), and the Brazilian Health Regulatory Agency (ANVISA). This study

ISBN: 978-81-980623-8-3

aims to identify and compare pharmacovigilance challenges associated with intranasal vaccines across these jurisdictions. A systematic review of regulatory guidance documents, adverse event reporting systems, and post-marketing surveillance data will be conducted using official agency websites and scientific literature databases. Key parameters such as adverse event reporting trends, safety signal management, and risk management plan implementation will be analysed. Preliminary evidence indicates inconsistencies in adverse event documentation, weak post-marketing surveillance in low- and middle-income countries, and lack of harmonized guidelines tailored to intranasal vaccine platforms. The study is expected to propose strategies for strengthening pharmacovigilance systems through global harmonization, digital infrastructure enhancement, and risk communication transparency. Findings will contribute to improving safety monitoring frameworks for novel vaccine delivery systems, ultimately ensuring public trust and effective immunization programs.

**Keywords:** Intranasal vaccines, Pharmacovigilance, Post-marketing surveillance, Regulatory harmonization; Adverse event reporting.

# Reimagining Ayurveda Through Innovation

From starting our journey in India to touching lives across the globe... From being a healthcare brand to evolving into a holistic wellness company...
From developing herbal remedies for everyday needs to addressing the evolving requirements of our customers, we've come a long way.

What has enabled us to constantly evolve and continue being a reliable brand across the globe? Our focus on research and innovation to fulfill our purpose of spreading "Wellness in every Home, and Happiness in every Heart!"

And for us, blending the ancient science of Ayurveda with the technology of today isn't something new.
As the world celebrates the harmony between the old and the new, we take pride in balancing tradition with innovative formulation technologies since our brand came into existence, 95 years ago. With a scientific approach and extensive R&D, we continue harnessing our capabilities to fulfill tomorrow's needs, today.
